Re: MVP Southgate Project – Lambert Compressor Station Minor New Source Article 6 Permit Application – Revised Application – Supplemental Information on Environmental Justice

Dear Ms. Walthall:

Mountain Valley Pipeline, LLC ("Mountain Valley") filed a revised minor new source review Article 6 permit application for the proposed Lambert Compressor Station on July 1, 2020. At that time, Mountain Valley indicated that it was preparing an analysis and report on Environmental Justice related issues consistent with Va. Code §10.1-1307.E and legislation enacted by the 2020 Session of The Virginia General Assembly. Enclosed is a complete hard copy of Supplemental Information on Environmental Justice report. A complete hard copy also is being delivered to Lauren Stewart in the VADEQ Central Office, with hard copies of the report and select appendices being delivered to the remaining Central Office recipients. Access to an electronic copy has also been provided.

We look forward to continuing working with you and your staff on this project. If you have any questions or comments regarding this supplement or any other information provided in support of the proposed air permit application, please contact me at 561-691-7065 or christina.akly@nee.com.

Sincerely,

Christina Akly

SUPPLEMENTAL INFORMATION ON ENVIRONMENTAL JUSTICE

Supplement to Application for Article 6 Air Permit for the Lambert Compressor Station MVP Southgate Project

Mountain Valley Pipeline, LLC

September 2020

TABLE OF CONTENTS

I. INTRODUCTION

On July 1, 2020, Mountain Valley Pipeline LLC ("Mountain Valley") submitted to the DEQ a revised application for a minor new source permit for the Lambert Compressor Station ("Station").[1] The Station is a part of the MVP Southgate Project ("the Project"), and is proposed for location next to a long-existing Williams Company-owned compressor facility ("Transco Compressor") near the Town of Chatham in Pittsylvania County.

Section 7.0 of the Revised Application provided information related to compliance with Va. Code §10.1-1307.E., which requires consideration of the following:

1) Character and degree of injury to, or interference with, safety, health, or the reasonable use of property which is caused or threatened to be caused;

2) Social and economic value of the activity involved;

3) Suitability of the activity to the area in which it is located; and

4) Scientific and economic practicality of reducing or eliminating the discharge resulting from such activity.[2]

That information included Section 7.3, addressing site-suitability, including the benefits of the use of the site, alternatives considered, and compliance with local ordinances.[3] Mountain Valley did not include information at that time pertaining to environmental justice, which must be considered under Va. Code §10.1-1307.E and new environmental justice statutes[4] that became effective July 1, 2020. As noted in the Revised Application, some necessary fieldwork was delayed as a result of the COVID-19 pandemic and civil unrest.

Generally, there are three steps to an environmental justice analysis:

1) Identify whether an environmental justice community is implicated; and if so,

2) Provide enhanced public participation to ensure environmental justice communities have meaningful involvement in the process; and

[1] *See* Letter from Christina Akly to Anita Walthall dated June 30 and attachments ("Revised Application").
[2] Revised Application at 67-76.
[3] *Id.*at 74-75 and relevant attachments.
[4] These include the Virginia Environmental Justice Act, Va. Code § 2.2-234, *et seq*. ("VEJA"), which is applicable to all agencies, and two statutes directed specifically at the Department of Environmental Quality ("DEQ"), Va. Code § 10.1-1182 (defining "Environmental Justice" consistent with the VEJA definition) and §10.1-1183 (making it a purpose of DEQ to "further environmental justice" in regulatory and permitting processes and to "ensure the fair treatment and meaningful involvement of all people regardless of race, color, national origin, faith, disability, or income with respect to the administration of environmental laws, regulations, and policies").

3) Ensure no environmental justice community bears a disproportionate share of any negative environmental impacts, considering any mitigation and enhancement measures.

Mountain Valley is committed to environmental justice and has taken a comprehensive and proactive approach here that not only satisfies the applicable requirements, but exceeds what the statutes require and what others have done in Virginia. To ensure that the environmental justice analysis for the Station would be expansive and inclusive, Mountain Valley invited Alexa Sutton Lawrence, Ph.D. of Land and Heritage Consulting LLC to assist with the process. Dr. Lawrence has prepared a far-reaching analysis of environmental justice principles[5], and she has expanded on the community outreach that Mountain Valley has conducted and is continuing to conduct. Dr. Lawrence's curriculum vitae and Environmental Justice Report are provided as Appendix A to this Supplemental Information. This Supplemental Information and all its Appendices should be incorporated into and considered part of the Revised Application submitted July 1, 2020.

This Supplemental Information demonstrates compliance with environmental justice requirements and principles, and it provides information to make the necessary findings under Va. Code § 10.1-1307.E. and VEJA. It includes:

1) Applicable criteria under VEJA, the State Air Pollution Control Law, and *Friends of Buckingham* decision.

2) Summary of work performed and conclusions reached on environmental justice and cultural resources in the proceeding before the Federal Energy Regulatory Commission ("FERC");

3) Identification of environmental justice communities as defined in VEJA within a radius of 1-mile from the proposed Station;

4) Discussion of Mountain Valley's community engagement to enhance meaningful involvement by environmental justice community members;

5) Evaluation of impacts from the proposed Station, and confirmation that no environmental justice community bears a disproportionate share of any such impacts;

6) Summary of supplemental work performed by Land and Heritage Consulting, LLC to expand the investigation of potential environmental justice communities beyond the specific requirements of VEJA at radii of 3, 5, and 10 miles from the proposed Station (plus additional analyses out to 30 miles), and to engage with all the environmental justice communities to identify any additional potential and perceived impacts and possible mitigation measures;

7) Proposal to further facilitate meaningful involvement of environmental justice communities in the Station's permitting process; and

[5] For instance, Dr. Lawrence did not limit herself to actual impacts from the Station, but also perceived impacts of the Station, the Project as a whole, and pipelines generally at distances out to 30 miles from the Station.

8) Commitment for additional, practicable mitigation and community enhancement.

The analysis concludes that environmental justice communities exist in the vicinity of the Station, but that no environmental justice community—indeed, no community—bears a disproportionate share of any negative environmental consequences.

II. APPLICABLE CRITERIA UNDER VIRGINIA ENVIRONMENTAL JUSTICE ACT, STATE AIR POLLUTION CONTROL LAW, AND *FRIENDS OF BUCKINGHAM* DECISION.

VEJA expressly establishes environmental justice as the Commonwealth's policy and, for the first time in Virginia, provides critical definitions relevant to environmental justice. The Air Pollution Control Board ("Board") has not yet adopted regulations to implement VEJA. The recent changes to the State Air Pollution Control Law also expressly make it a purpose of DEQ to "further environmental justice" in permitting actions.[6] In addition to VEJA and Va. Code § 10.1-1183, Va. Code §10.1-1307.E establishes certain factors the Board is required to consider when issuing permits. Site suitability and the potential for impacts on health are among these factors. Environmental justice has come to be considered in conjunction with the site suitability analysis.

Here, Mountain Valley has gone beyond the literal requirements of VEJA and Va. Code §10.1-1307.E in its assessment of environmental justice issues.

A. Summary of Recent Virginia Environmental Justice Legislation

VEJA states that, "[i]t is the policy of the Commonwealth to promote environmental justice and ensure that it is carried out throughout the Commonwealth, with a focus on environmental justice communities and fenceline communities."[7] Other new Code sections reiterate the Commonwealth's commitment to, and DEQ's responsibility for, environmental justice.[8]

---

[6] Va. Code § 10.1-1183.

[7] Va. Code §2.2-235. Although environmental justice literature speaks at times of "fenceline communities," VEJA defines the term more narrowly than some common usages of the term. *See* Va. Code § 2.2-234 ("'Fenceline community' means an area that contains all or part of a low-income community or community of color *and that presents an increased health risk to its residents due to its proximity to a major source of pollution*.") (emphasis added).

[8] *See* Va. Code §§ 10.1-1182, 1183 (one of the purposes of DEQ is to "further environmental justice and enhance public participation in the regulatory and permitting processes"). Other statutory and policy directives require consideration of environmental justice principles. The Energy Policy of the Commonwealth ("Energy Policy") seeks to develop "energy resources and facilities in a manner that does not impose a disproportionate adverse impact on economically disadvantaged or minority communities…." Va. Code § 67-101.12. In turn, the Virginia Energy Plan must propose actions to implement the Energy Policy, and must include, among other things, "[a]n analysis of siting of energy resource development, refining or transmission facilities to identify any disproportionate adverse impact of such activities on economically disadvantaged or minority communities…." *Id*. § 67-201.B.7. The current Energy Plan states that "Virginia is dedicated to ensuring that there are not disproportionate impacts on economically-disadvantaged or minority communities during the siting of energy resources. Ensuring that certain populations are not disproportionately impacted during energy development is critical to Environmental Justice efforts." Office of the Secretary of Commerce and Trade, Dept. of Mines, Minerals and Energy, The Commonwealth of Virginia's 2018 Energy Plan at 58 (Oct. 2018). It further states that "DEQ's

"Environmental justice" is defined as

> the fair treatment and meaningful involvement of every person, regardless of race, color, national origin, faith, disability, or income, in the development, implementation, and enforcement of environmental laws, regulations, and policies.[9]

VEJA provides a series of cascading, additional definitions to implement environmental justice.[10]

> "*Community of color*" means any geographically distinct area where the population of color, expressed as a percentage of the total population of such area, is higher than the population of color in the Commonwealth expressed as a percentage of the total population of the Commonwealth. However, if a community of color is composed primarily of one of the groups listed in the definition of "population of color," the percentage population of such group in the Commonwealth shall be used instead of the percentage population of color in the Commonwealth.
>
> "*Environment*" means the natural, cultural, social, economic, and political assets or components of a community.
>
> "*Environmental justice community*" means any low-income community or community of color.
>
> "*Fair treatment*" means the equitable consideration of all people whereby no group of people bears a disproportionate share of any negative environmental consequence resulting from an industrial, governmental, or commercial operation, program, or policy.
>
> "*Fenceline community*" means an area that contains all or part of a low-income community or community of color and that presents an increased health risk to its residents due to its proximity to a major source of pollution.
>
> "*Low income*" means having an annual household income equal to or less than the greater of (i) an amount equal to 80 percent of the median income of the area in which the household is located, as reported by the Department of Housing and Urban Development, and (ii) 200 percent of the Federal Poverty Level.
>
> "*Low-income community*" means any census block group in which 30 percent or more of the population is composed of people with low income.
>
> "*Meaningful involvement*" means the requirements that (i) affected and vulnerable community residents have access and opportunities to participate in the full cycle of the decision-making process about a proposed activity that will affect their environment or

existing obligations to ensure that all regulated entities comply with health-based standards [e.g., NAAQS, state air toxic requirements] will continue in all permitting activities to reduce public health burdens on all populations." *Id*.

[9] Va. Code §2.2-234.

[10] *Id.*

health and (ii) decision makers will seek out and consider such participation, allowing the views and perspectives of community residents to shape and influence the decision.

"*Population of color*" means a population of individuals who identify as belonging to one or more of the following groups: Black, African American, Asian, Pacific Islander, Native American, other non-white race, mixed race, Hispanic, Latino, or linguistically isolated.

B. *Friends of Buckingham v State Air Pollution Control Bd.*, 947 F.3d 68 (4th Cir. 2020)

Before these principles of environmental justice were expressly codified in Virginia law, the United States Court of Appeals for the Fourth Circuit considered environmental justice in the context of site suitability under Va. Code §1307.E. As relevant here, the Court found that the Board had failed to explain its permitting decision regarding site suitability and environmental justice.[11] Remanding an air permit for a compressor station proposed in a historic area of descendants of enslaved people, the Court directed the Board to "make findings with regard to conflicting evidence in the record, the particular stud(ies) relied on, and the corresponding local character and degree of injury from PM [particulate matter] and toxic substances threatened" by the compressor station.[12]

In conjunction with the Revised Application, this Supplemental Information provides information to allow the agency to make the necessary findings for the Station's air permit, including (i) the presence or absence of environmental justice communities, (ii) the local character and degree of injury from the Station's air emissions, (iii) compliance with other aspects of Va. Code § 10.1-1307.E, and (iv) compliance with VEJA.

C. Virginia Department of Transportation ("VDOT") Environmental Justice Guidelines

VDOT has long implemented environmental justice principles in its work, and VDOT has issued Guidelines that are informative here.[13] The VDOT Guidelines are based on federal guidance. While not binding on DEQ, the VDOT Guidelines represent a reasonable approach used by a sister agency to implement environmental justice.

Several aspects of the VDOT Guidelines are especially pertinent here. To identify an environmental justice community, VDOT recognizes that census data is only a starting point to "flag" potential environmental justice communities.[14] VDOT notes that local site visits and/or calls should be conducted to identify localized pockets of minority or low-income persons overlooked by census data.[15] VDOT further suggests contacting specific sources to refine demographic information.[16]

---

[11] 947 F.3d at 86.

[14] *Id.* at 7.

[15] *Id.*

[16] *Id.* at 9.

The VDOT Guidelines further address how to determine whether an environmental justice community will suffer disproportionate impacts, including impacts to historic, religious, and cultural resources that are "especially important" to the community. The guidelines provide a list of specific items and questions to consider when performing this evaluation.

Mountain Valley has conducted local site visits and calls with local leaders to refine the demographic analysis. Moreover, as discussed in Section VII below, Dr. Lawrence expanded the investigation of environmental justice communities and conducted interviews of community members to address details that census data alone might not uncover.

D. Framework for Environmental Justice Assessment

In light of the applicable criteria above, the following three-part framework is an eminently reasonable approach to implement environmental justice that complies in all respects with the statutory mandates:

1) Conduct a demographic survey, both desk-top and in the field to identify "environmental justice communities" – both "communities of color" and "low income communities," using the definitions provided in VEJA and considering other available information, including but not limited to census data. Characterize and evaluate any site-specific health issues in those populations using available information. Include fieldwork to validate and ground truth that information, as well as fill in gaps in the data and characterize the information in appropriate cultural context so the perspectives offered by the environmental community are fully and properly understood.

2) Provide meaningful involvement of those environmental justice communities in the entire permitting process. In addition to the traditional opportunities for public participation, promote engagement of the environmental justice community through active notice, education and discussion by the applicant, agency staff, and permit decision-makers. Examples include publishing notices in foreign languages as appropriate, offering additional workshops for such communities, outreach to community leaders, and other accommodations to foster active participation by environmental justice community members such that their views are reflected in the decision.

3) Ensure fair treatment in the decision making process and the decision itself so that environmental justice communities do not bear greater negative impacts from the permitted activity compared to non-environmental justice communities.

III. SUMMARY OF ENVIRONMENTAL JUSTICE CONSIDERATIONS IN FERC PROCEEDINGS

Environmental justice was considered by FERC for the Project as a whole, as well as the Station individually, as required under federal law. Although the details of the federal standards are different from VEJA, the fundamental principles of environmental justice are the same. As a result, Mountain Valley developed substantial information and implemented procedures to

address environmental justice principles in FERC proceedings. Information and analysis provided by Mountain Valley and further analyses independently conducted by FERC Staff**,** supported FERC's completion of the Final Environmental Impact Statement ("FEIS") and issuance of a Certificate of Convenience and Necessity ("CPCN") for MVP Southgate Project.[17]

While the information was developed and considered in the context of federal criteria for environmental justice, the FERC data and analyses are relevant to DEQ's consideration of environmental justice under VEJA and Va. Code §10.1-1307.E. Likewise, while FERC's conclusions are not dispositive here and DEQ must reach an independent determination, the conclusions of a sister agency support a finding that environmental justice principles have been satisfied.

A. Context of Federal Evaluation of Environmental Justice

President Clinton issued Executive Order 12898 *Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations* ("EO12898").[18] Its purpose is to focus federal attention on the environmental and human health effects of federal actions on minority and low-income populations with the goal of achieving environmental protection for all communities. EPA has continually developed and updated guidance and tools for the implementation of EO 12898. EPA requires federal agencies to consider if impacts on human health or the environment (including social and economic aspects) would be disproportionately high and adverse for minority and low-income populations and appreciably exceed impacts on the general population or other comparison group. Consistent with EO 12898, the EPA's environmental justice policies focus on agencies seeking out and providing enhanced and effective opportunities for those potentially affected to participate in decision-making about a proposed activity that will affect their environment and/or health, and ensuring that agencies consider those comments in the decision-making process.

B. FERC's Evaluation and Findings Regarding Environmental Justice

FERC conducted a thorough investigation of environmental justice as it pertains to the Project, including the Station. It concluded that federal justice principles and requirements were satisfied.

In evaluating the environmental justice issues related to the Project, FERC considered if impacts on human health or the environment (including social and economic aspects) would be disproportionately high and adverse for minority and low-income populations and appreciably exceed impacts on the general population or other comparison group.[19] To this end, FERC considered whether:

1) potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health;

---

[17] *See* Resource Report 5 (Appendix C); FEIS (Appendix D); CPCN (Appendix E).
[18] 59 Fed. Reg. 7629 (Feb.26, 1994).
[19] FEIS at 40140.

2) the public's contributions can influence the regulatory agency's decision;

3) the concerns of all participants involved will be considered in the decision-making process; and

4) the decision-makers seek out and facilitate the involvement of those potentially affected.

Procedurally, there were many opportunities for and forms of public involvement during FERC's environmental review process. FERC issued multiple notices regarding the Project that were posted on public dockets, published in the Federal Register, and sent to FERC's environmental mailing list that included local libraries (such as the Pittsylvania County Public Library in Chatham) and newspapers (such as the Chatham Star Tribune) and posted on the Project website. FERC also held multiple public scoping meetings in the Project area, including a meeting in Chatham at 5:30 p.m. on June 28, 2018. FERC also conducted a public meeting in Chatham on August 20, 2019, to take comment on the draft Environmental Impact Statement ("draft EIS"), which addressed environmental justice considerations.[20] Any comments received, whether in writing or in person, were treated equally and considered by the agency.[21]

FERC identified potential environmental justice communities by reference to census data.[22] Within one mile of the Station, FERC identified two census block groups containing environmental justice populations under federal standards.[23] In response to a general comment on the draft EIS regarding siting of compressor stations near environmental justice populations, FERC concluded the siting of compressor stations is based on engineering factors associated with the design of a pipeline system. It further explained compressor stations are anchored by the pipeline corridor and hydraulically bound to a specific segment of the pipeline, with some flexibility within the segment (depending on project-specific conditions). Additionally, the co-location of natural gas pipelines and associated facilities with existing rights-of-way is frequently a consideration to avoid and minimize impacts on the environment. The siting of the Station specifically, FERC found, was based on engineering constraints of the pipeline system as well as co-location with existing facilities.[24]

FERC considered other comments from the public, including those concerning potential disparate health impacts on more vulnerable environmental justice populations.[25] FERC concluded for all of the reasons laid out in the FEIS that impacts would not be significant.[26] Specifically, although FERC found that vulnerable populations (*i.e.* groups with high asthma rates) may exist within environmental justice populations near the Project and/or Station, FERC concluded that the Project would not result in high and adverse impacts on any vulnerable

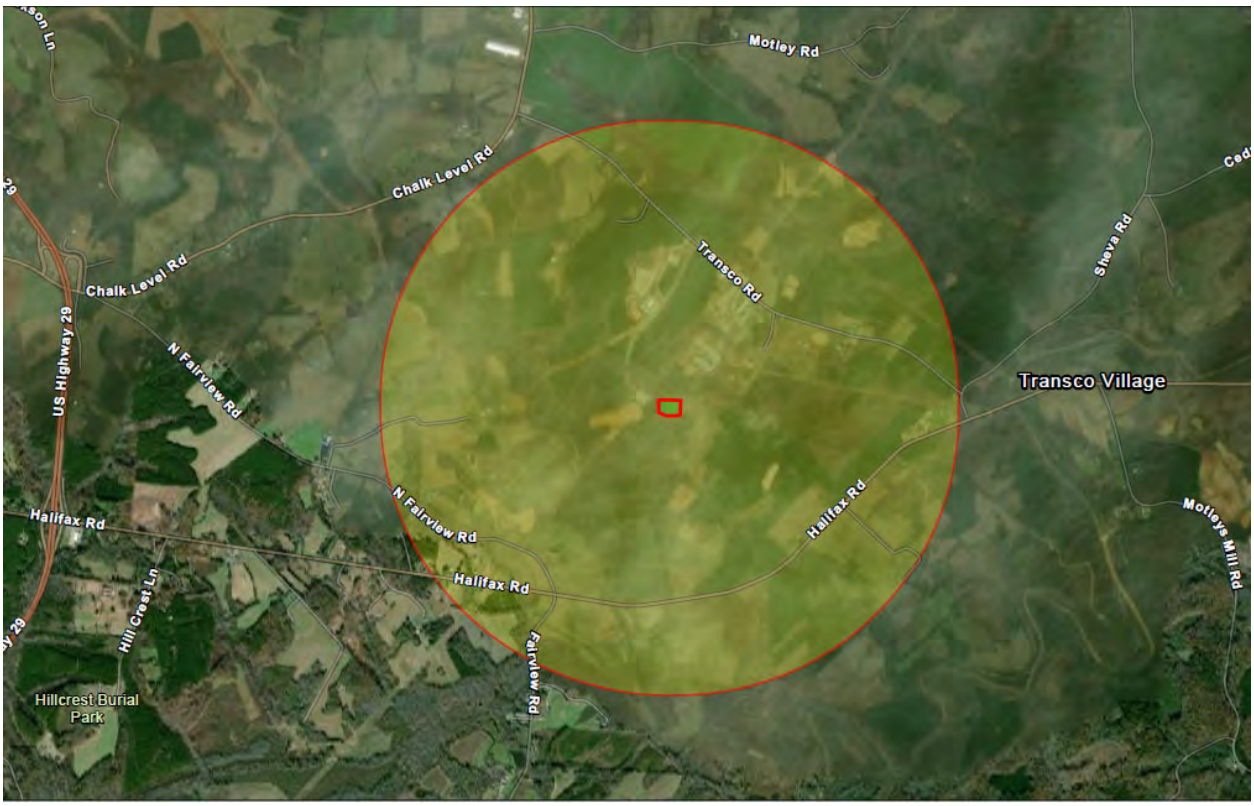
populations and would not have a disproportionately high and adverse impact on the remaining environmental justice populations.[27]

IV. IDENTIFICATION OF ENVIRONMENTAL JUSTICE COMMUNITIES UNDER VEJA WITHIN RADIUS OF 1-MILE OF THE PROPOSED STATION.

Applying the definitions in VEJA, Mountain Valley evaluated the presence of an environmental justice community within proximity to the compressor station, as shown in Figure 1.[28] A 1-mile radius around the facility was selected as the study area because it encompasses the population most likely to be impacted, if at all, by this minor source of air emissions. Air modeling confirms that use of a 1-mile radius is reasonable and appropriate.[29]

FIGURE 1

1-Mile Radius Study Area



To determine if there was an environmental justice community in the area around the compressor station, Mountain Valley looked to the latest census block group data.[30] The area around the

[27] *Id.* at 4-153.

[28] EJSCREEN Report for 1-mile area around the facility. Appendix F.

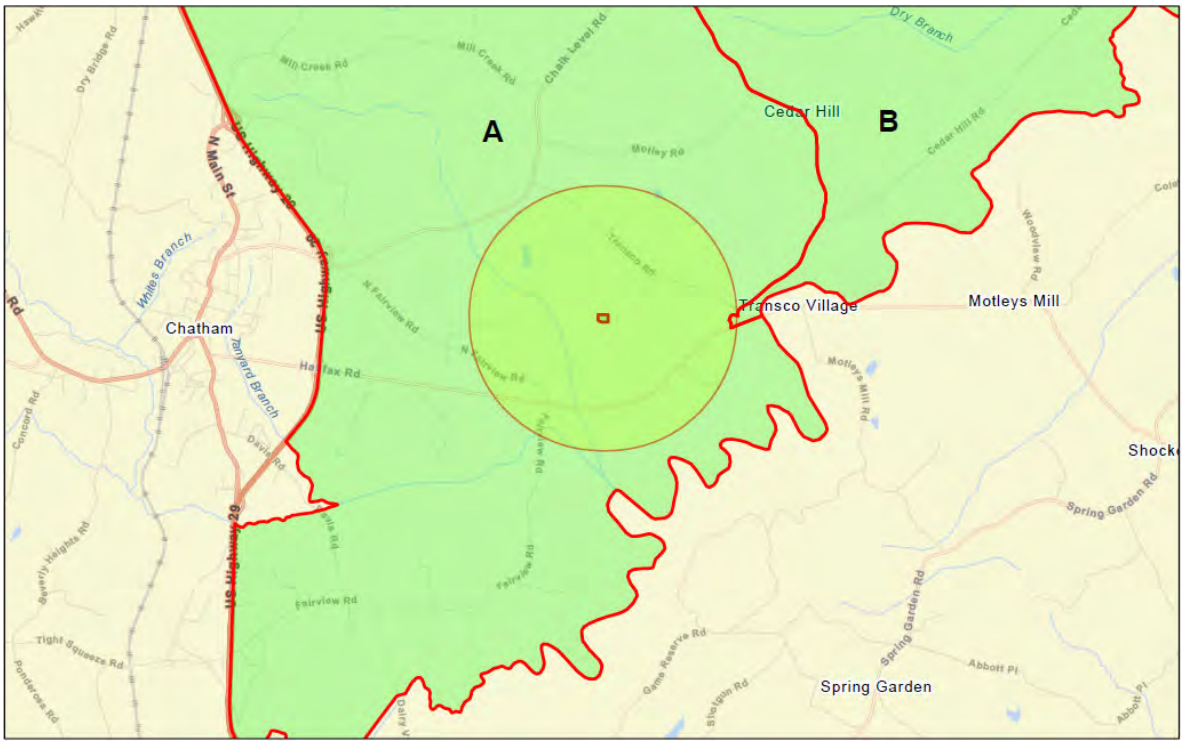
[29] *See* § VI.A below.

[30] A "census block group" is a subset of a "census tract." A census tract is composed of multiple census block groups. Census block groups therefore give a more localized perspective on community demographics than the larger census tracts. Hence, VEJA uses census block groups in its definition of low-income environmental justice community. Va. Code § 2.2-234. *See also* EPA "Technical Guidance for Assessing Environmental Justice in

compressor station is primarily located within one census block group, 511430105001, with a very small area east of the facility in a second census block group, 511430107001, as shown in Figure 2 and labeled A and B, respectively.[31]

FIGURE 2

1-Mile Radius Census Block Groups[32]



The demographics for the 1-mile radius study area are provided in Table 1, below.

TABLE 1

EJSCREEN 1-Mile Radius Demographic Indicators

Selected Variables	Value	State Avg.	%ile in State	EPA Region Avg.	%ile in EPA Region	USA Avg.	%ile in USA
Demographic Indicators							
Demographic Index	28%	32%	49	30%	57	36%	46
Minority Population	22%	37%	34	32%	50	39%	41
Low Income Population	33%	26%	67	28%	66	33%	56
Linguistically Isolated Population	4%	3%	76	3%	78	4%	66
Population With Less Than High School Education	3%	11%	22	11%	20	13%	19

Regulatory Analysis" (June 2016) (outlining particular technical approaches and methods to help Agency analysts analyze potential EJ concerns for regulatory actions including use of census block group data and interpreting EJSCREEN); available at https://www.epa.gov/sites/production/files/2016-06/documents/ejtg_5_6_16_v5.1.pdf.

[31] EJSCREEN (version 2019) available at https://ejscreen.epa.gov/mapper/.

[32] Figure 2 is taken directly from EJSCREEN.

Population Under 5 years of age	3%	6%	25	6%	26	6%	24
Population over 64 years of age	25%	14%	88	16%	87	15%	88

As explained below, the vast majority of the 1-mile study area is not a "community of color" environmental justice community as defined by VEJA; the study area contains one very small part of a census block group that qualifies as a community of color under VEJA. The study area does qualify as a "low-income" environmental justice community.

Additionally, the population in the study area has a higher percentage over the age of 64 at 25% as compared to the state average of 14%, while there is a lower percentage under the age of 5 at 3% as compared to the state average of 6%. There are no known schools, community centers or retirement homes located within the 1-mile radius of the facility. The closest school is a private all-girls high school, Chatham Hall, approximately 2.5 miles west of the facility. The study area also has a lower percentage of the population with less than a high school education at 3% as compared to the state average of 11%.

A. Community of Color Evaluation

Mountain Valley evaluated whether there was community of color within the study area using the following VEJA definitions.

- "Community of color" means any geographically distinct area where the population of color, expressed as a percentage of the total population of such area, is higher than the population of color in the Commonwealth expressed as a percentage of the total population of the Commonwealth. However, if a community of color is composed primarily of one of the groups listed in the definition of "population of color," the percentage population of such group in the Commonwealth shall be used instead of the percentage population of color in the Commonwealth.

- "Population of color" means a population of individuals who identify as belonging to one or more of the following groups: Black, African American, Asian, Pacific Islander, Native American, other non-white race, mixed race, Hispanic, Latino, or linguistically isolated.

To determine if there was a community of color, Mountain Valley compared the minority populations in the study area and the two census block groups to both the total minority percentage and the population of color group (e.g., Black) percentages in the Commonwealth using census data obtained from EPA's Environmental Justice Screening and Mapping Tool ("EJSCREEN").[33] Under both scenarios, census block group A does not meet the criteria of VEJA for a community of color, while census block group B qualifies. Relevant data are presented in Table 2 below.[34]

[33] The EJSCREEN materials for the study area and census block groups are provided in Appendix F. EJSCREEN data are provided for census block groups within a 5-mile radius of the compressor station although the evaluation presented here focuses on the 1-mile study area.

[34] According to EJSCREEN, the study area and both census block groups are below 80% of the percentile in Commonwealth for total minorities and for Black.

TABLE 2

Community of Color Data for 1-Mile Study Area

ID	Census Block	Minority Group	Percent Minority	Percentage in Commonwealth	Community of Color?
Site	1-mile Radius	Total	22	37	No
		Black	18	19	No
A	511430105001	Total	22	37	No
		Black	18	19	No
B	511430107001	Total	46	37	Yes
		Black	38	19	Yes

As can be seen in Figure 2, only a tiny portion of the study area (the extreme southwestern tip of census block group B) qualifies as a community of color according to census data.

Going beyond the census data (and consistent with VDOT Guidelines), Mountain Valley has communicated with local leaders to determine whether any "localized pockets" of minority persons have been overlooked by census data. According to this additional investigation, the African-American population present within the 1-mile study area is less than reflected in the census block groups as a whole, possibly as low as five to seven percent, and no distinct geographic areas within that area contain localized pockets of African-Americans or other populations of color.[35] That is, no "distinct geographic area" contains a community of color that will be disproportionately impacted when compared to non-minorities.

B. Low-Income Community Evaluation

Mountain Valley also evaluated whether a low-income community exists within the study area using the following VEJA definitions.

- "Low-income community" means any census block group in which 30 percent or more of the population is composed of people with low-income.

- "Low-income" means having an annual household income equal to or less than the greater of (i) an amount equal to 80 percent of the median income of the area in which the household is located, as reported by the Department of Housing and Urban Development, and (ii) 200 percent of the Federal Poverty Level. .

The Department of Housing and Urban Development ("HUD") median family income ("MFI") for FY 2020 for Pittsylvania is $58,900.[36] Applying the VEJA definition, the HUD-based low-income population threshold is 80 percent of the MFI, or $47,120. The 2020 Federal Poverty Level ("FPL") depends on the number of people in the household. Assuming a four-person

[35] Dr. Lawrence has identified dispersed African-American Freedman descendants in and around Chatham who are connected to a larger community centered in Blairs, Virginia approximately 14 miles from the Station. Appendix A at 37. The dispersed nature of the group in areas near the Station is consistent with Mountain Valley's separate communications with community leaders and with the census block group percentages.

[36] HUD, Estimated Median Family Incomes for Fiscal Year (FY) 2020, Notice PDR-2020-01 (Apr. 1, 2020).

household, the 2020 FPL is $26,200.[37] Applying the VEJA definition, the FPL-based low-income population threshold is 200 percent of the FPL, or $52,400. The appropriate income threshold to evaluate whether there is a low-income population is the greater of the two, or $52,400 based on the FPL.

For the low-income population analysis, Mountain Valley evaluated the same 1-mile radius study area. The study area and both census block groups qualify as low-income populations according to census data in EJSCREEN, which uses the 200 percent of the FPL threshold as shown in Table 3. Compared to the rest of the Commonwealth, all are below the 80th percentile.

TABLE 3

Low-Income Community Data for 1-Mile Study Area

	Census Block	Percent Low Income	Percentile in Commonwealth	Low-Income Population?
Site	1-mile Radius	33	67	Yes
A	511430105001	33	67	Yes
B	511430107001	41	78	Yes

Mountain Valley's conclusion that these two census bock groups qualify as low-income environmental justice communities is consistent with FERC's conclusion as to those same census block groups.[38] Mountain Valley also went beyond the census data and communicated with local leaders regarding the low-income communities within the study area. According to this additional investigation, the study area contains one of the more affluent pockets within the affected census blocks.

V. MOUNTAIN VALLEY'S COMMUNITY ENGAGEMENT TO ENHANCE MEANINGFUL INVOLVEMENT

To facilitate public involvement, Mountain Valley has been actively involved in community engagement efforts for several years. During the FERC process, Mountain Valley developed a Public, Stakeholder, and Agency Participation Plan for the entire Project, including the Station. The plan was submitted to and accepted by FERC.[39] This plan outlines a commitment to engage proactively with environmental justice communities and other stakeholders throughout the life cycle of the Project and provides the steps Mountain Valley identified to ensure successful ongoing communication with stakeholders. Among many other things, Mountain Valley established a Project website (www.mvpsouthgate.com), a toll-free phone line (833-MV-SOUTH), and email mail@mvpsouthgate.com. Examples of information available on the website are provided in Appendix H. The Project continues to meet and communicate with stakeholders to discuss the developments associated with the Project, including the Station.

Mountain Valley has provided regular updates to all local residents within 0.5 miles of the Station via direct mailings and newsletters since 2018. Sample copies of these are provided in

[37] 85 Fed. Reg. 3060 (Jan. 17, 2020).
[38] FEIS at 4-142.
[39] *See* Appendix G ("Public, Stakeholder, and Agency Participation Plan").

Appendix I. These newsletters (1) apprise the community of the status of the Project and next steps; (2) list where community members can access documents from FERC and otherwise; (3) include a Frequently Asked Questions section; and (4) reiterate that public input is important, with ways to communicate comments about the Project to Mountain Valley. In December 2019, the fifth newsletter notified community members that Mountain Valley had applied for an air permit for the Station. The sixth and seventh newsletters note the ongoing permitting process at DEQ.

In addition, Mountain Valley remains in regular contact with elected and appointed officials representing constituents in Pittsylvania County, and with local community leaders.

Mountain Valley has also actively engaged with tribes and Indigenous Peoples about the Project and the Station specifically. During the FERC process, Mountain Valley conducted outreach consistent with EPA's Policy on Environmental Justice for Working with Federally Recognized Tribes and Indigenous Peoples. Mountain Valley coordinated with federal tribes that are cooperating agencies in the FERC process. In addition, Mountain Valley has conducted outreach with state tribes and has been actively coordinating with interested tribal representatives.

As part of its efforts, Mountain Valley communicated with 41 federally-recognized and state-recognized Indian tribes and Native Americans organizations in Virginia and North Carolina.[40] Twelve responded back to Mountain Valley. Mountain Valley was providing information to the tribes as early as May 2018, and sent an email dated November 2, 2018 to tribes and Native American organizations with information about the Project. Mountain Valley provided copies of cultural resources survey reports to Indian tribes and Native American organizations that requested them. Information on tribal contacts through August 2020 is provided in Appendix J.

For the Station specifically, Mountain Valley has commissioned additional outreach to tribes and Indigenous Peoples by Dr. Lawrence. These additional efforts are discussed in Section VII below. Dr. Lawrence further recommended additional outreach to the community surrounding the Station, and Mountain Valley is following that recommendation. These efforts are described in Section VIII below.

VI. EVALUATION OF IMPACTS FROM THE PROPOSED STATION, AND CONFIRMATION THAT NO ENVIRONMENTAL JUSTICE COMMUNITY BEARS DISPROPORTIONATE SHARE OF ANY SUCH IMPACTS.

As an initial matter, the environmental justice community will bear no adverse disproportionate health risks because *no* community will face any appreciable health risk as a result of the facility's emissions, notwithstanding any particular sensitivities or vulnerabilities in the environmental justice community. This is apparent from graphic representations of the modeling overlaid on the aerial photographs of the surrounding communities. Likewise, the Station will cause no cumulative overburdening effect in combination with other sources of pollution.

The siting and design of the Station are meant to minimize impacts, including impacts to environmental justice communities. The location and surrounding area are not densely

[40] *See* FEIS Appendix E.3, Table 4.10-3.

populated. The Station is located just off the proposed pipeline route supporting co-location with the pipeline corridor and existing compressor facilities. The property is sufficient in size to provide a significant buffer, and the nearest residences are over a half mile away (more than 3,000 feet). For all members of the community, this distance reduces or eliminates impacts from air emissions and noise, as well as potential impacts on views and historic and cultural resources. From a landscape perspective, construction and operation of a compressor station in this area will not be foreign to community members as it will be adjacent to the long-existing Transco Compressor. And from a design perspective, the Station is a minor source that will have state-of-the-art controls and stringent permit conditions to minimize air emissions.

With that background, Mountain Valley turns to a specific discussion of the potential and perceived impacts from the Station.

A. Air Emissions and Health Impacts

For the Station's air permit, potential adverse impacts from air emissions must be considered. Mountain Valley conducted and presented computer modeling analyses of projected ambient concentrations for criteria pollutants of the Station alone and the Station in conjunction with other air emission sources, including the adjacent Transco Compressor.[41] Mountain Valley also conducted modeling of relevant air toxics. The results of the modeling were compared to approved and well-accepted health-based standards, including those that specifically take into account sensitivities or vulnerabilities associated with environmental justice communities.[42] These analyses demonstrate that the facility will not cause injury to any surrounding community, including the environmental justice community.

Sources considered include standards approved by regulatory agencies specifically to assess and protect against potential health impacts in all populations, including sensitive populations. The analyses include:

1) Consideration of National Ambient Air Quality Standards ("NAAQS") as compared to modeled impacts[43];

2) Air toxics screening as compared to Virginia's state regulatory levels and other risk-based screening levels; and

3) Assessment showing that the area is not overburdened with cumulative exposures

[41] *See* Revised Application §6.0.

[42] EPA, *Environmental Justice Research Roadmap*, EPA 601/R-16/006, iv (Dec. 2016) ("…these population groups tend to be most burdened with adverse health conditions that either have environmental triggers or affect similar physiological systems as environmental pollution, such as cardiovascular disease, preterm birth, low birth weight, and asthma.").

[43] While the *Friends of Buckingham* decision appeared to criticize the Board for "falling back on the NAAQS" in the evaluation of potential health impacts, the Board had not made any written findings explaining why it was relying on the NAAQS and why the NAAQS are persuasive in the context of Environmental Justice. *See* 947 F.3d at 90. Thus, the Court had no record on which to determine whether reliance on the NAAQS was arbitrary and capricious. Here, the agency should make specific findings that the NAAQS and state air toxics Significant Ambient Air Concentration ("SAAC") standards are protective of public health, including the health of vulnerable populations such as asthmatics, with an explanation why reliance on the NAAQS and SAACs is appropriate.

from other sources of pollution.

These analyses are summarized below, and they demonstrate that no environmental justice community bears a disproportionate share of any adverse environmental impacts from the Station.

1. NAAQS

Compliance with the NAAQS has traditionally been the methodology used to evaluate the potential for health impacts from concentrations of pollutants in the air, specifically including potential impacts on sensitive environmental justice populations in state and federal regulatory proceedings and related appeals. As health-based standards specific to air concentrations, NAAQS have been expressly accepted for this purpose in Virginia policy.[44]

a. The Fundamental Purpose of NAAQS is Protection of Human Health and the Environment

As discussed below and in Appendix F of the Revised Application, the NAAQS are promulgated to protect sensitive populations at the local level and only after a comprehensive, science-driven process that includes substantial public participation. EPA sets the NAAQS after extensive review of the latest scientific studies, including studies of the most sensitive populations such as asthmatics.

The Clean Air Act requires EPA to set NAAQS for pollutants considered harmful to public health with an "adequate margin of safety."[45] While the NAAQS are national standards, they are applied on the local level to protect everyone. This is illustrated by EPA eliminating the option of using spatial averaging to assess compliance with the $PM_{2.5}$ NAAQS when it realized the technique could result in averaging away locally higher s in areas with larger populations of minorities or with lower socioeconomic status.[46]

More generally, EPA sets the primary NAAQS to protect public health, including the health of "sensitive" populations such as asthmatics, children, and the elderly, wherever they may reside.[47] Congress "emphasize[d] that among those persons whose health should be protected by the ambient standard are particularly sensitive citizens such as bronchial asthmatics and emphysematics who in the normal course of daily activity are exposed to the ambient environment."[48] The standard is to be set at "… the maximum permissible ambient air level…which will protect the health of any [sensitive] group of the population," and that for this purpose "reference should be made to a representative sample of persons comprising the sensitive group rather than to a single person in such a group."[49]

---

[44] *See* 2018 Energy Plan at 58 (directing DEQ to continue to use health-based standards in permitting).

[48] S. Rep. No. 91:1196 at 10, reprinted in 1 S. Comm. on Pub. Works, 93d Cong., *A Legislative History of the Clean Air Act Amendments of 1970*, at 410 (1974).

[49] *Id.*

The NAAQS are based on the best available science. The Clean Air Act directs EPA to set NAAQS based on criteria that "accurately reflect the latest scientific knowledge."[50] The primary NAAQS must be set "at a level that avoids unacceptable risks to public health, including the health of at-risk populations."[51] The standards take into consideration that risks from exposure to a pollutant may be influenced by intrinsic factors such as pre-existing disease, genetic factors, life stage, or extrinsic factors such as sociodemographic status, which may be present alone or in combination. For instance, subsets of the population may be at increased risk due to socioeconomic status and also have a pre-existing condition. EPA sets the NAAQS to be protective for even these sub-populations.

b. NAAQS Are Widely Accepted for Environmental Justice

The 2018 Energy Plan directs DEQ to apply health-based standards, such as the NAAQS, when evaluating environmental justice: "DEQ's existing obligations to ensure that all regulated entities comply with health-based standards will continue in all permitting activities to reduce public health burdens on all populations."[52] Thus, it is the policy of Virginia to use the health-based NAAQS to ensure that environmental justice communities do not bear disproportionate health burdens from energy facilities.

The use of the NAAQS for this purpose is consistent with EPA's long-term policy. EPA and the Environmental Appeals Board ("EAB"), in its role of adjudicating permit appeals, have long accepted that compliance with the NAAQS demonstrates no negative impacts on environmental justice communities. The EAB has found that the NAAQS are "the most reliable source of scientific information on which to base decisions" because of the "rigor of review" in setting them.[53]

The EAB recognizes that it is inherently reasonable and appropriate to use the NAAQS to determine whether environmental justice communities are protected. The following are examples where EAB has upheld agencies' use of NAAQS for that purpose:

- *In re Pio Pico Energy Ctr.*, 16 E.A.D. 56 (EAB 2013) ("NAAQS are standards designed to protect public health, including the health of 'sensitive' populations such as asthmatics, children, and the elderly, with an adequate margin of safety,

[50] 42 U.S.C. §§ 7408(a)(2), 7409(b)(1)-(2).

[51] Health and Envtl. Impacts Div., Office of Air Quality Planning and Standards, EPA, EPA-452/R-16-005, *Integrated Review Plan for the National Ambient Air Quality Standards for Particulate Matter* 6-1 to 6-2 (2016), *available at* https://www.epa.gov/naaqs/particulate-matter-pm-standards-planning-documents-current-review ("IRP"). For example, when reducing the level of the annual $PM_{2.5}$ NAAQS from 15 $\mu g/m^3$ to 12 $\mu g/m^3$ in 2013, EPA was "mindful" that the Act required the standard be set "at a level that reduces risk sufficiently so as to protect public health, including the health of at-risk populations, with an adequate margin of safety." 78 Fed. Reg. 3086, 3161 (Jan. 15, 2013). EPA rejected 13 $\mu g/m^3$ because it "would not appropriately take into account the more limited evidence of effects in some at-risk populations (e.g., low birth weight)." *Id*. at 3162. EPA decision was based in part on quantitative health risk and exposure assessments. IRP at 4-1 to 4-5. EPA recently proposed to retain the current $PM_{2.5}$ NAAQS after reviewing thousands of studies, identifying populations at increased risk of pollution-related health effects, and considering analyses by agency experts and input from the Clean Air Act Scientific Advisory Committee. https://www.epa.gov/pm-pollution/national-ambient-air-quality-standards-naaqs-pm.

and to protect public welfare, including protection against visibility impairment and damage to animals, crops, vegetation, and buildings. Because NAAQS are health-based standards, the Agency often uses compliance with the NAAQS in the context of environmental justice as an indicator that Agency action will not result in disproportionately high and adverse human health or environmental effects on minority and low-income populations residing near a proposed facility.") (citing *In re Avenal Power*, 15 E.A.D. 384, 399 (EAB 2011); *In re Shell Offshore*, 13 E.A.D. at 404-05 (EAB 2007); *In re Knauf Fiber Glass, GmbH*, 9 E.A.D. 1, 16-17 (EAB 2000); *In re Ash Grove Cement Co.*, 7 E.A.D. 387, 417-18 (EAB 1997)).

- *In re Sutter Power Plant*, 8 E.A.D. 680, 692 (EAB 1999) (describing the NAAQS as the "bellwether of health protection").

- *In re Energy Answers Arecibo, LLC*, 16 E.A.D. 294, 326 (EAB 2014) (NAAQS are appropriate to use in environmental justice analysis because they "are designed to protect public health with an adequate margin of safety, including sensitive populations such as children, the elderly, and asthmatics.").

- *In re Shell Gulf of Mex. Inc.*, 15 E.A.D. at 156 ("In the context of an environmental justice analysis, compliance with the NAAQS is emblematic of achieving a level of public health protection that, based on the level of protection afforded by a primary NAAQS, demonstrates that minority or low-income populations will not experience disproportionately high and adverse human health or environmental effects due to exposure to relevant criteria pollutants.").

Courts have also upheld the use of NAAQS as reasonable when evaluating environmental justice impacts: "The Coast Guard's determination that air quality in the communities immediately adjacent to the Project would comply with NAAQS even during the construction phase further supports its conclusion that such local adverse impacts would not be significant."[54]

c. Concentrations are Below NAAQS

The air modeling shows that the facility will not cause or contribute to an exceedance of any of NAAQS anywhere, including within the study area where the highest impacts are seen.[55] Since the NAAQS are set to protect even the most sensitive populations with an adequate margin of safety, modeled concentrations below the NAAQS further support that the low-income environmental justice community is protected.[56] Even to the extent that other possible

[54] Co*alition for Healthy Ports v. U.S. Coast Guard*, 2015 WL 7460018, *25 n.33 (S.D.N.Y. Nov. 24, 2015).

[55] As discussed in the modeling report provided in Appendix G of the Revised Application, Mountain Valley performed two cumulative modeling runs for the Station to address the neighboring Transco Compressor. One run was for receptor locations except for those located on Transco property: that run included the project sources as well as all the offsite sources provided by DEQ. The other run was for receptor locations on the Transco property: it included the project sources and offsite sources except for the Transco sources. The maximum impacts were modeled at receptors located outside of the Transco property.

[56] *See In re Energy Answers Arecibo, LLC*, 16 E.A.D. at 329 (agreeing that where modeled concentrations are far below the NAAQS, emissions do not pose a disproportionate or adverse impact); *In re Ecoelectrica*, L.P., 7 E.A.D. 56, 68-69 (EAB 1997) (same).

environmental justice communities may exist outside the 1–mile study area, the impacts would be even less.

As Table 4 below shows, the highest total cumulative modeled concentrations will not just be below the NAAQS, but far below them, except for the 1-hour NO_2 concentration, little of which is attributable to the Station.[57]

TABLE 4

Maximum Cumulative Modeled Impacts[58]

Pollutant (Averaging Period)	Highest Modeled Concentration (Facility and Other Sources) ($\mu g/m^3$)	Background Concentration ($\mu g/m^3$)	Total Concentration (Modeled plus Background) ($\mu g/m^3$)	NAAQS ($\mu g/m^3$)
NO_2 (1-hour)	178.8[a]		178.8	188
NO_2 (Annual)	21.8	13.2	35.0	100
CO (1-hour)	2151	2300	4,451	40,000
CO (8-hour)	1106	1380	2,486	10,000
$PM_{2.5}$ (24-hour)	5.8	17	23	35
$PM_{2.5}$ (Annual)	1	7.2	8.2	12
PM_{10} (24-hour)	9.1	31	40.1	150

[a] Season and hour of day variable background values were used for the 1-hour NO_2 modeling.

As shown in Table 5, Mountain Valley's contribution is less than three percent of the NAAQS for all pollutants and averaging times except for the 1-hour NO_2, which is less than ten percent.[59]

[57] The 1-hour NO_2 results are driven by one source (an old engine) at the Transco facility. It is Mountain Valley's understanding that Transco intends to use the old engine as a backup for the new equipment which was recently permitted. As shown in the DEQ's Engineering Analysis for the Transco permit, the NOx potential to emit after the project will decrease by over 3,000 tons per year, more than enough to offset the Station's NOx potential to emit of 12.37 tons per year. *See* DEQ Engineering Analysis for Transcontinental Gas Pipeline Company, LLC (Station 165), at 12 (January 28, 2020). This is supported by Transco's modeling which resulted in a 1-hour NO_2 highest modeled concentration of 178.3 $\mu g/m^3$, only 0.5 $\mu g/m^3$ less than the Station's highest cumulative modeled concentration that included the Transco sources. *Id*. at 13. Additionally, as part of its recent permit, Transco is required to install an NO_2 ambient air monitor upon startup of its new turbines to ensure the NAAQS are met. Transco Permit Condition 49 (January 28, 2020).

[58] *See* Revised Application, Appendix G, Table 4-2, for the complete cumulative modeling table, which shows the results for all the modeling scenarios (various operating loads, startup, shutdown).

[59] *See* Revised Application, Appendix G, Table 4-3, for the complete Station-only modeling table, which shows the results for all the modeling scenarios (various operating loads, startup, shutdown).

TABLE 5

Maximum Facility Modeled Impacts

Pollutant (Averaging Period)	Facility Design Concentration ($\mu g/m^3$)	NAAQS ($\mu g/m^3$)	% of Standard
NO_2 (1-hour)	17.48	188	9.3%
NO_2 (Annual)	1.36	100	1.4%
CO (1-hour)	156.37[a]	40,000	0.4%
CO (8-hour)	47.74	10,000	0.5%
$PM_{2.5}$ (24-hour)	0.8	35	2.3%
$PM_{2.5}$ (Annual)	0.14	12	1.2%
PM_{10} (24-hour)	1.27	150	0.8%

[a] Based on startup scenario

Isopleths for the 1-hour NO_2 results are provided on pages 65 and 66 of the Revised Application. As shown, the highest cumulative modeled impacts are located northeast of Transco Compressor, where the Station's impacts are negligible (less than 2 $\mu g/m^3$).[60] The isopleths confirm that potential impacts from the facility are confined to areas very close to the facility where there are no residences, schools, senior care facilities, churches, or other historical or cultural resources of special importance to the environmental justice community.

For $PM_{2.5}$, the facility-alone design concentrations are more than 40 times less than the 24-hour NAAQS and more than 85 times less than the annual NAAQS. Indeed, they are even less than the concentrations that EPA determined would not be detectable. In recommending the $PM_{2.5}$ SILs for PSD modeling analysis, EPA used a statistical approach to derive levels that are "indistinguishable from the inherent variability in the measured atmosphere [that] may be observed even in the absence of the increased emissions," – annual concentration of 0.2 $\mu g/m^3$ and a 24-hour concentration of 1.5 $\mu g/m^3$.[61] The highest modeled concentrations attributable to the Station are well below those levels at 0.14 $\mu g/m^3$ annual and 0.8 $\mu g/m^3$ 24-hour.

[60] Although of a different form and not directly comparable to the NAAQS results shown on the isopleth, EPA' recommended interim significant impact level (SIL) of 7.5 $\mu g/m^3$ (based on the highest of the five-year averages of the maximum modeled 1-hour concentration, instead of the eighth highest like the NAAQS) illustrates the Station's minimal contribution to the modeled cumulative impact for the 1-hour NO_2 NAAQS. Memorandum from Anna Marie Wood, Acting Dir., Air Quality Policy Div., to Regional Air Division Dir., *General Guidance for Implementing the 1-hour NO2 National Ambient Air Quality Standard in Prevention of Significant Deterioration Permits, Including an Interim 1-hour NO2 Significant Impact Level* (June 28, 2010); available at https://www.epa.gov/sites/production/files/2015-07/documents/appwno2.pdf.

[61] Memorandum from Peter Tsirigotis, Dir., Office of Air Quality Planning & Standards, EPA, to Regional Air Div. Dirs., Regions 1-10, Attachment at 10-11 (Apr. 17, 2018) available at https://www.epa.gov/nsr/guidance-significant-impact-levels-ozone-and-fine-particles-preventionsignificant-deterioration; Air Quality Assessment Division, Office of Air Quality Planning & Standards, EPA, EPA-454/R-18-001, Technical Basis for the EPA's Development of the Significant Impact Thresholds for $PM_{2.5}$ and Ozone 8-22 (2018), *available at* https://www.epa.gov/nsr/significant-impact-levels-ozone-and-fine-particles.

2. Air Toxics

Virginia regulates toxic air pollutants under the "state toxics rule."[62] This rule sets health-based criteria for toxic emissions. DEQ has established both exemption rates (i.e., screening thresholds below which no additional analysis is necessary) and SAACs for toxics.

The exemption rates and SAACs are based on published Threshold Limit Values ("TLVs") for toxic compounds. TLVs are based solely on health factors without consideration to economic or technical feasibility.[63] They represent an exposure level that "does not create an unreasonable risk of disease or injury."[64] DEQ went further and set the exemption rates and SAACs at a fraction of the health-based TLVs.

If emissions are below the exemption rates, no further action is required. If the exemption rates are exceeded, then modeling is required to demonstrate compliance with the SAACs. For the Station, only formaldehyde exceeded the exemption rates and thereby was subject to modeling. Although below the exemption rates, Mountain Valley also modeled hexane emissions.[65] The modeled air concentrations for formaldehyde and hexane emissions from the compressor station are well below the SAACs as shown in the following table.

TABLE 6

Toxic Air Pollutants Modeled Concentrations[66]

Pollutant (Averaging Period)	Highest Modeled Concentration (Facility) ($\mu g/m^3$)	SAAC ($\mu g/m^3$)	% of Standard
Formaldehyde (1-hr)	2.8 / 9.9[a]	62.5	4% / 16%
Formaldehyde (annual)	0.050	2.40	2%
Hexane (1-hr)	1,295 / 5,435[b]	8800	15% / 62%
Hexane (annual)	0.28	352	0.1%

[a] The modeled hourly formaldehyde concentration of 2.8 $\mu g/m^3$ represents routine operations, whereas the 9.9 $\mu g/m^3$ is for hours that include startup of the turbines.

[b] Two conservative scenarios were modeled for hexane as described in the Revised Application, Appendix G at 2-2, neither of which are expected to occur with any frequency if ever. The modeled hourly hexane concentration of 1,295 represents facility-wide individual unit blowdown with concurrent startup or shutdown of the other unit along with pigging activities. The highest modeled hourly hexane concentration of 5,435 represents a true emergency shutdown event along with pigging activities.

In addition to showing that the ambient air concentrations will be well below the Virginia health-based standards, the modeling also shows that no receptors have concentrations at or above risk-based concentrations ("RBCs"), which are set to protect sensitive populations and to provide

[62] 9 VAC 60-300, et seq.

[63] https://www.acgih.org/tlv-bei-guidelines/policies-procedures-presentations/overview

[64] *Id*.

[65] As described in Section 3.3 and 7.4 of the Revised Application, Mountain Valley is voluntarily proposing controls that will limit toxic emissions, particularly hexane which will be reduced by approximately 78 percent.

[66] *See* Revised Application, Appendix G, Table 4-4 for the complete Lambert Station only table, which shows the results for all the modeling scenarios (various operating loads and startup and shutdown).

margins of safety to account for uncertainty.[67] As shown on the following isopleths, the offsite concentrations drop off precipitously, with all below a tenth of the SAACs and RBCs at less than a quarter mile from the Station boundary. There are no residences within that area.

Thus, no group, including the environmental justice community, should suffer any appreciable health risks from the compressor station air toxic emissions. Indeed, for all pollutants, there can be no adverse disproportionate impacts on an environmental justice community, because the Station's emissions are not expected to have adverse health impacts on *any* community, including sensitive populations. With no adverse impacts on anyone, the "fair treatment" requirement of VEJA is satisfied because "no group of people bears a disproportionate share of any negative environmental consequence."

[67] The formaldehyde inhalation cancer RBC of 0.22 µg/m^3 corresponds to an excess lifetime cancer risk of 1 x 10^{-6}. The inhalation non-cancer chronic RBC for formaldehyde of 10 µg/m^3 and hexane of 730 µg/m^3 corresponds to a hazard quotient of 1. EPA, *Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites* (May 2020); available online at https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables (last accessed on September 2, 2020). The formaldehyde inhalation acute RBC of 55 µg/m^3 and chronic RBC of 9 µg/m^3 correspond to a hazard quotient of 1. California Environmental Protection Agency, Office of Environmental Health Hazard Assessment ("OEHHA"), *Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary* (2018); available online at https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary (last accessed August 28, 2020). The hexane inhalation acute RBC of 910,000 µg/m^3 is the DOE Protective Action Criteria ("PAC")-Revision 29 (May 2016).

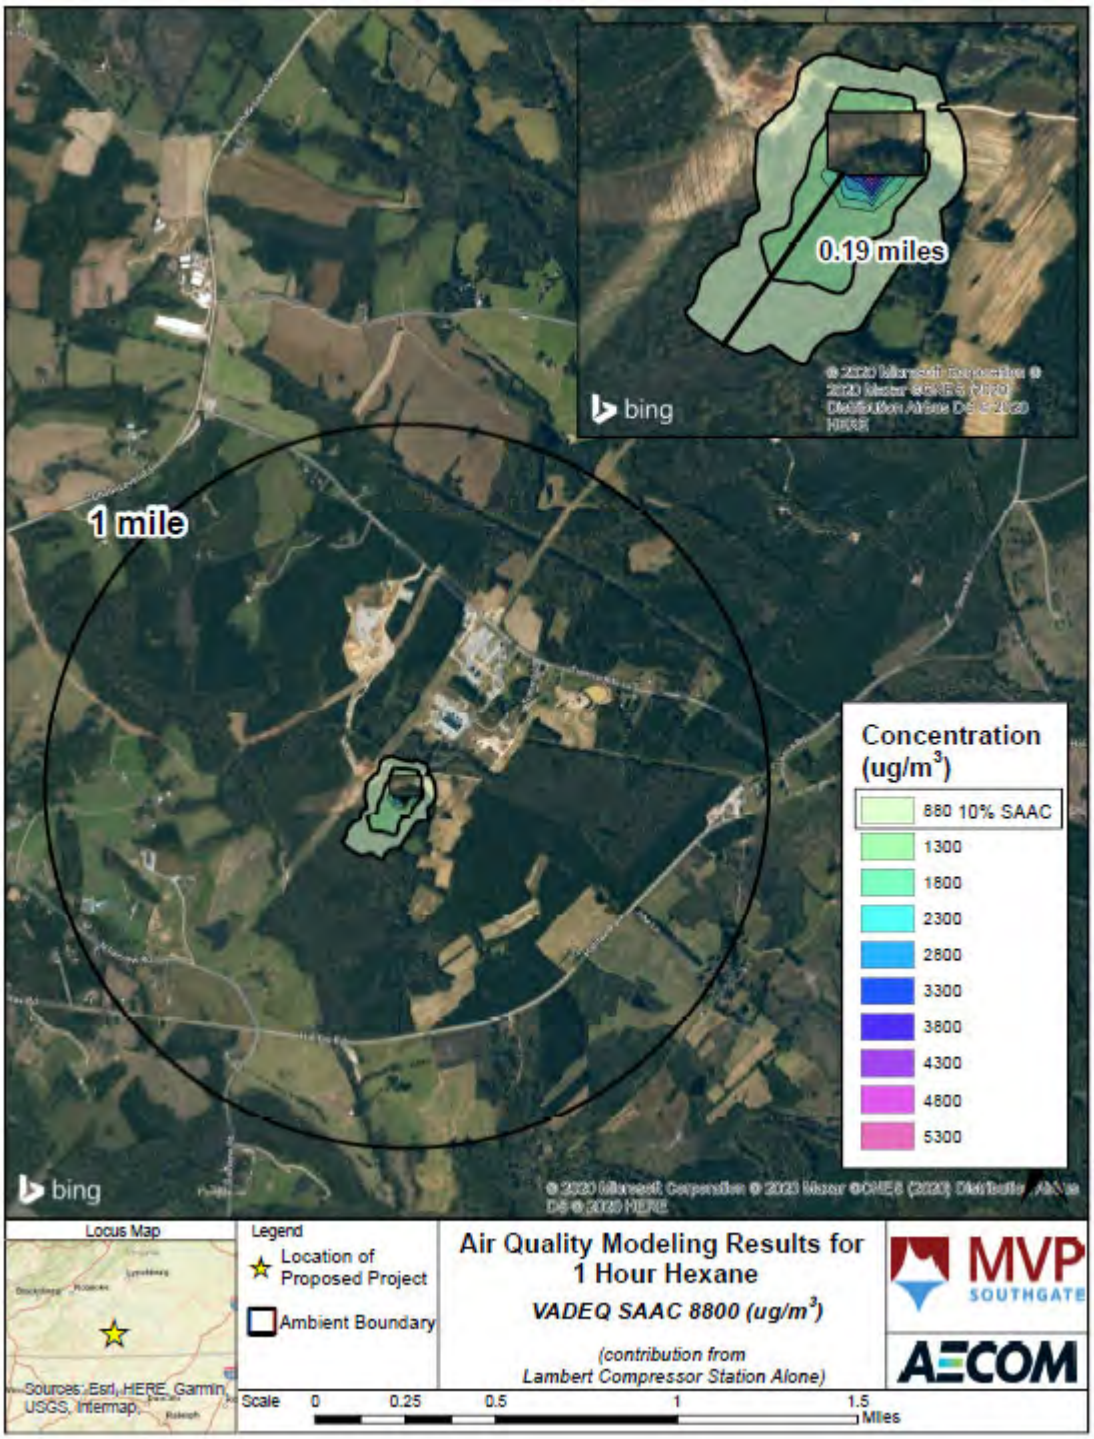

FIGURE 6

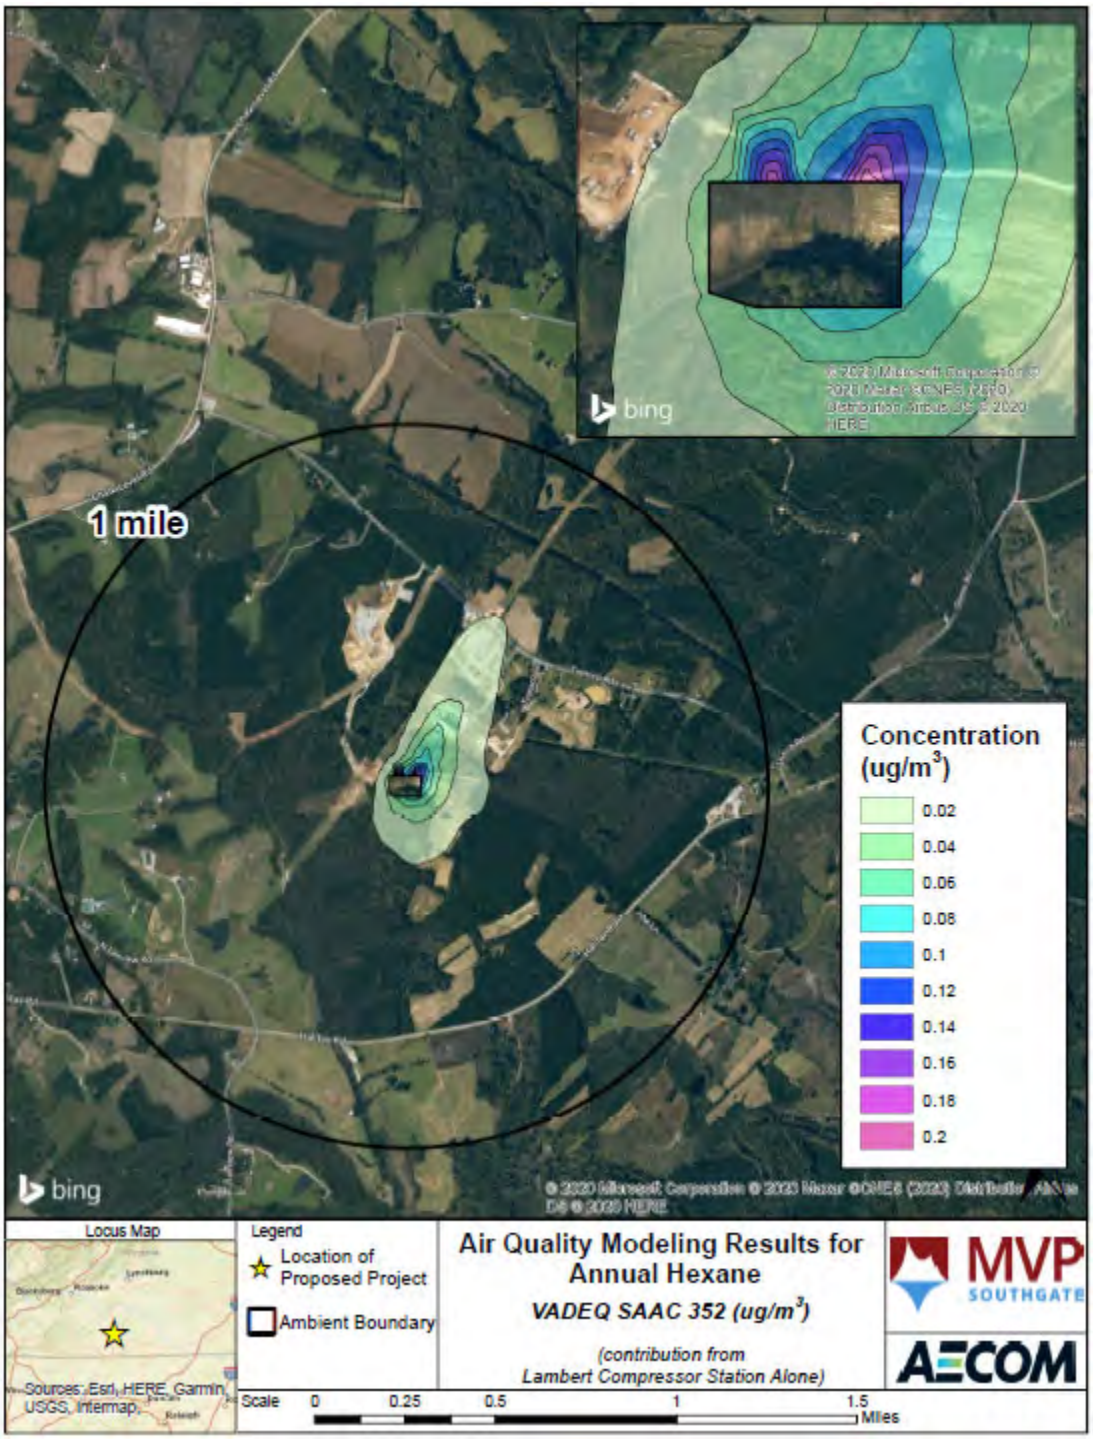
Isopleth for Annual Hexane



3. Consideration of cumulative exposures from other sources of pollution

The environmental justice communities are also not overburdened by other sources of pollution.[68] Within the 1-mile study area, there are no hazardous waste sites, and none is closer than approximately 5 miles away. Dr. Lawrence's analysis found no communities within a 5-mile radius that are subject to pre-existing cancer risk exceeding the state or national averages.[69]

Moreover, recent reductions in pollution will inure to the benefit of local residents. The Station will be located adjacent to the Transco Compressor comprising two compressor stations, Stations 165 and 166. Transco recently received a permit to install two new turbines with air pollution controls at Station 165. Contemporaneous with that project, Transco is shutting down ten of its old uncontrolled engines at that location. The potential emission decreases from shutting down those ten pre-1972 vintage engines more than offset the combined emissions of both Transco's new turbines and the Station, such that overall emissions should be significantly less.[70]

As previously discussed, the NAAQS analysis assessed cumulative impacts by including other sources such as the Transco facilities in air modeling (i.e., cumulative modeling) along with background concentrations. In addition to the NAAQS modeling, Mountain Valley used EJSCREEN to evaluate various indicators of cumulative burdens. As shown in Table 7, of the 11 indicators, only two were above the state average ($PM_{2.5}$ and lead paint), while all were less than the 80th percentile in the state.[71]

---

[68] *See, e.g., Environmental Justice: Research Roadmap* at 4 (EPA Dec. 2016) ("'Overburdened'" describes ethnic minority, low-income, Tribal, and indigenous populations or communities in the United States that potentially experience disproportionate environmental harms and risks due to exposures or cumulative impacts or greater vulnerability to environmental hazards. This increased vulnerability may be attributable to an accumulation of both negative and lack of positive environmental, health, economic, or social conditions within these populations or communities, including the inability to participate meaningfully in the decision-making process."), *available at* https://www.epa.gov/sites/production/files/2017-01/documents/researchroadmap_environmentaljustice_508_compliant.pdf.

[69] *See* Appendix A, Attachment A, Data Table 3.

[70] The total potential criteria and hazardous air pollutants (HAP) emissions from the Transco Compressor will decrease by 4,050 tons per year, while the Station's annual potential criteria and HAP emissions are less than 50 tons per year, resulting in a potential decrease of approximately 4,000 tons per year in the community. *See* DEQ Engineering Analysis for Transcontinental Gas Pipeline Company, LLC (Station 165), at 12 (January 28, 2020) and Revised Application Table 3-3 at 17.

[71] Although the $PM_{2.5}$ exposures are slightly higher than the state average, they are less than the regional and national averages of 8.64 and 8.3 $\mu g/m^3$, respectively. *See* Appendix F, EJSCREEN for 1-mile radius. The highly localized air impacts from the Station, as a minor source, are negligible (i.e., non-measurable) beyond the fence boundary. The analysis by Dr. Lawrence revealed no communities within a 5-mile radius of the Station with pre-existing exposure rates greater than the national average for $PM_{2.5}$. *See* Appendix A, Attachment A, Data Table 3. If the radius from the Station is increased to 10 miles, then communities are found that are subject to exposures in excess of national averages for $PM_{2.5}$ and increased cancer risk. *Id.* Thus, consistent with environmental justice principles, siting the plant farther away from those communities avoids burdening community members already burdened by other sources of pollution.

TABLE 7

EJSCREEN 1-Mile Radius Environmental Indicators

Selected Variables	Value	State Avg.	%ile in State	EPA Region Avg.	%ile in EPA Region	USA Avg.	%ile in USA
Environmental Indicators							
Particulate Matter (PM 2.5 in µg/m³)	8.05	7.79	64	8.64	29	8.3	40
Ozone (ppb)	41.2	42.5	33	44.9	11	43	35

B. Cultural and Historic Resources

In coordination with the Virginia Department of Historic Resources ("VDHR"), Mountain Valley conducted extensive review of possible historic and cultural resources that could be impacted by the Station.[72] This analysis encompassed impacts to historic and cultural resources that are or may be significant to the environmental justice community. The Station is not likely to impact any such known resources.[73] As discussed below, to the extent there may be currently unknown or unidentified resources, an approved plan is in place to address those unforeseen impacts.[74]

The entire Mountain Valley Southgate Project, including the Station, has been reviewed under Section 106 of the National Historic Preservation Act ("NHPA"). Section 106 requires federal agencies, including FERC, to take into account the effect of the Project on cultural resources listed or eligible for listing in the National Register of Historic Places ("NRHP") and to afford the Advisory Council on Historic Preservation ("ACHP") an opportunity to comment. The Section 106 compliance process is coordinated at the state level by the State Historic Preservation Officer ("SHPO"), represented in Virginia by VDHR. Federally-recognized and state-recognized Native American tribes were also consulted.[75]

---

[72] *See* Resource Report 4 (Appendix K). As of the date of submittal this Supplemental Information, Mountain Valley has continued to expand upon the investigation. Phase I archaeological surveys and architectural history surveys have been completed for all but less than 0.5 acre of the proposed construction areas at and within a one-mile radius of the Lambert Compressor Station; the remaining area will be surveyed and reported prior to construction.

[73] *See* Appendix L (VDHR correspondence).

[74] Appendix M (Plan for Unanticipated Discoveries of Historic Properties and Human Remains).

[75] FERC consulted with tribes in accordance with its policy "to address the effects of proposed projects on tribal rights and resources though consultations; and [to] ensure that Tribal resources and interests are considered whenever the Commission's actions or decisions have the potential to adversely affect Indian tribes or Indian trust

The primary goals of cultural resources investigations conducted as part of the Section 106 review are to locate, document, and evaluate buildings, structures, objects, landscapes, and archaeological sites that are listed, or eligible for listing, in the NRHP; to assess potential effects of the Project on those resources; and to provide recommendations for subsequent treatment of the resources, if necessary.

Here, Mountain Valley went beyond the Section 106 process for the Station and applied the VDOT Guidelines on Environmental Justice, which ask whether the project will impact any "especially important social, religious, or cultural function" for the environmental justice community.[76] Dr. Lawrence inquired about important historic and cultural resources during her interviews of Indigenous communities.[77] Those concerns were considered and are addressed below.[78]

Distance plays a large role in avoiding impacts to historic and cultural resources. The Station will be well outside the viewshed of identifiable resources, and conditions in the FERC certificate and the air permit will protect against air and noise impacts to such resources. Trees and buffers provide additional protection against impacts. Moreover, the Station is co-located with an existing industrial site, the Transco Station. Thus, the Station is not disturbing an untouched site or pristine landscape.

VDHR has reviewed the potential archaeological sites or finds within a mile of the Station. VDHR has determined that those sites are either not eligible for listing on the NRHP or not impacted by the Project, with one exception. A mid-twentieth century farm complex sits immediately across Transco Road from the Transco Compressor, which remains unevaluated due to inaccessibility.[79] VDHR has previously determined the farm eligible for the NRHP listing for environmental review purposes. Although the Transco Compressor site is located directly between the Station and the farm complex (thereby subsuming any relative impact from the Station), Mountain Valley will complete and report an effects assessment for that property prior to construction.[80]

To protect against impairing unforeseen historic or cultural resources, Mountain Valley developed a Plan for Unanticipated Discoveries of Historic Properties and Human Remains outlining the steps to be taken if currently unknown resources are later discovered during construction or otherwise (e.g., unmarked gravesites).[81] VDHR approved the Plan on September

---

resources." FEIS at 4-157. FERC contacted tribes that may attach religious or cultural significance to sites in the region or may be interested in potential Project impacts on cultural resources. *Id.* This included consulting with, among others, state-recognized tribes, namely the Sappony Tribe, Occaneechi Band of the Saponi Nation, and Nottoway Indian Tribe of Virginia, as requested by commenters. *Id*. at 4-158–4-159. Government-to-government consultations also occurred with the Monacan Indian Nation, Nansemond Indian Tribe, and Upper Mattaponi Indian Tribe. *Id.* In total, FERC coordinated with 26 federally-recognized tribes and 11 state-recognized tribes. *Id.* at 4-160.

[76] Appendix B, VDOT Guidelines at 12.

[77] *See* Appendix A at 41-47 and Section VII below.

[78] *See* Section VI.C.5 below.

[79] *See* Letter from R. Kirchen, VDHR, to P. Webb at 2 (January, 15, 2020) (Appendix L).

[80] FERC CPCN Environmental Condition 20, at 76-77 (June 18, 2020).

[81] Appendix M ("Plan for Unanticipated Discoveries of Historic Properties and Human Remains").

14, 2018, and Mountain Valley addressed comments on the plan that the Monacan Nation filed with FERC.[82]

The Plan for Unanticipated Discoveries is based on, among other sources, the following[83]:

- Secretary of the Interior's Standards for Archeology and Historic Preservation[84];
- ACHP's Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects (February 23, 2007);
- FERC Office of Pipeline Regulations Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects (2017);
- VDHR's Guidelines for Conducting Historic Resources Survey in Virginia (2017); and
- Virginia Antiquities Act, Va. Code § 10.1-2305, "Permit required for the archaeological excavation of human remains."

Mountain Valley's employees and contractors are required to have a basic understanding of the nature of cultural resources, and all inspectors and construction contractor personnel will receive basic training in recognition of cultural resource sites. The cultural resource training will review the Project's commitments regarding cultural resources compliance and provide examples of the types of archaeological resources that may be encountered during construction. In addition, the training program will emphasize the procedures to be followed in the event of a significant site discovery or a discovery of human remains during construction.[85]

The Plan for Unanticipated Discoveries requires, among other things, immediate cessation of work and prompt notification of the Project Archaeologist upon a discovery. Any human remains and/or funerary items will be left in place and treated with dignity and respect. All efforts will be made to exclude the general public from viewing any gravesites and/or funerary objects. Depending on the nature of the discovery, notifications will be made to FERC, VDHR, the Virginia State Police, and potentially interested tribes. Again depending on the nature of the discovery, plans will be developed in consultation with, among others, interested tribes.[86]

In sum, the Station will have no impacts on known cultural and historic resources, and the Plan for Unanticipated Discoveries will provide protection in the event of discovery of unforeseen resources.

[85] Appendix M at 2.
[86] *Id.* at 2-5.

C. Other Potential or Perceived Impacts

To ensure that all possible environmental justice communities have a meaningful voice in the process, Dr. Lawrence elicited concerns over potential or perceived impacts during her investigation and interviews.[87] Mountain Valley has addressed those additional concerns as follows.

1. Noise

A number of environmental justice community members raised the issue of noise from construction and operation of the Station on various community facilities (e.g., child care & senior facilities, churches, food banks and community gardens, community service groups).[88]

Mountain Valley will employ noise mitigation measures, such as compressor building walls, roof, doors, and ventilation systems designed to reduce noise emissions, along with turbine exhaust and air intake with insertion loss silencers, compressor unit venting silencers, and underground suction and discharge piping.

Both FERC and Pittsylvania County have their own noise standards that the Station must meet. FERC's regulations are based on EPA's comprehensive evaluation of the impact of noise on public health and welfare.[89] Mountain Valley will comply with all the applicable standards, thus ensuring that all communities will be protected from unacceptable noise impacts. In addition, FERC is requiring a plan in the event of any nighttime construction to achieve even lower levels at night.

To confirm that the Station will be able to comply with all standards, Mountain Valley performed detailed noise studies for both construction and operations.[90] The study expressly identified and evaluated Noise Sensitive Areas ("NSA"), all four of which were determined to be residences.[91] No child care centers, schools, senior care facilities, or other sensitive receptors were found within the study area.

As a general matter, distance tends to mitigate potential noise concerns from operations. The nearest residences are over 3,000 feet away from the Station. Moreover, the distance is significant between the Station and the facilities identified by community members. The closest church is the Cornerstone Church of Christ, which is more than a mile away. The other facilities are even farther away. During operation of the Station, FERC concluded that, at the NSA, noise "increases over the existing ambient noise levels of 0.0 dBA to 3.7 dBA would range from not

[87] *See* Section VII below and Appendix A at 37-47.

[88] *See* Appendix A at 38-39.

[89] EPA's Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (available at https://archive.epa.gov/epa/aboutepa/epa-identifies-noise-levels-affecting-health-and-welfare.html).

[90] *See* Section 9.3, Resource Report 9 (Appendix N) (describing both federal and County noise requirements).

[91] *See* Figure 4.11-1, FEIS at 4-191 (showing 4 identified NSAs and distances).

detectible to barely detectible to the human ear."[92] To confirm, Mountain Valley will conduct and file a noise survey with the Secretary within 60 days of placing the Station in service.[93]

For these reasons, noise from the Station will not impose disproportionate impacts on environmental justice communities.

2. Dust

Dust at the site should not have any significant impact on environmental justice communities. Dust is highly localized, and is expected to be temporary during construction. There are no homes or major roadways within 0.5 mile of the station. The closest residence is about 0.6 miles southeast of the compressor station site, opposite the planned construction entrance. In addition, during construction, Mountain Valley will employ proven construction-related practices to control fugitive dust, such as application of water or other commercially approved dust control, as well as potentially other optional mitigation measures as necessary to control dust.

3. Traffic and Emergency Services

Members of environmental justice communities expressed concerns about possible impacts of increased traffic, especially on emergency services such as fire and police.[94] Mountain Valley has worked with the relevant agencies, as well as directly with Pittsylvania County emergency services, to ensure that traffic will not impede emergency services. Mountain Valley has taken a proactive approach to ensure that local emergency services will not be negatively impacted.[95]

Mountain Valley representatives made a formal presentation on November 6, 2019, to the Tunstall Fire/Rescue, Blairs Fire/Rescue, Brosville Fire/Rescue, Bachelors Fire Hall, Mount Hermon Fire/Rescue, as well as representatives of the Virginia State Police, Virginia Department of Hazardous Materials, and the Pittsylvania Department of Public Safety. There were more than twenty attendees and command staff present. Because Pittsylvania County has hosted a compressor station owned and operated by Transco for many years, the County has trained first responders capable of addressing any hazardous situations that might arise.

In addition, Mountain Valley has had regular communications with the Pittsylvania Director of Public Safety, and there have been no concerns raised by him or EMS personnel about the Station.

Mountain Valley has developed and will implement a traffic control plan accepted by FERC that applies during construction of the Station, as well as during operation.[96] It should be noted that

[92] FEIS at 4-209.

[93] FERC CPCN Environmental Condition 22, at 77 (June 18, 2020).

[94] *See* Section VII below and Appendix A at 39-40.

[95] It should be noted in interviews by Mountain Valley's environmental justice consultant, community members cited investments that Mountain Valley had already made in the community surrounding the proposed Station as reasons to anticipate future benefits ("I think they are good stewards of the community. They have always been very receptive to help fire and rescue. Always been open about issues."). Appendix A at 38.

[96] *See* Appendix O (Traffic and Transportation Management Plan).

little to no traffic impacts are expected during operation of the Station. During the construction phase, any traffic impacts will be temporary, localized, and minor.[97]

In short, environmental justice communities will not bear a disproportionate share of negative environmental consequences as a result of traffic.

4. Safety

Some community members have expressed concerns about the safety of pipelines generally. Safety is a priority for Mountain Valley. Regarding compressor stations, some of the concerns are related to the potential natural gas leaks from the station as well as blowdowns related to maintenance. Mountain Valley is committing to the following measures and procedures to prevent and minimize any planned or unplanned releases of natural gas at the compressor station. Additional specific safety measures that will be implemented at the Station were provided in Appendix H of the Revised Application.

- Audio, visual, olfactory (AVO) surveys will be conducted periodically at the facility to check for any potential leaks throughout the site. These inspections ensure equipment is operating properly and any potential failures can be detected long before they become an issue.

- Leak detection and repair (LDAR) surveys also will be conducted periodically using specialized equipment to visually detect any potential equipment fugitive emissions. Detected leaks will be timely repaired to minimize fugitive emissions

- Maintenance related blowdowns for the compressors will be conducted using a vent gas recovery system (VGRS) to minimize the amount of natural gas that is released to the atmosphere.

- After the initial emergency blowdown test, subsequent emergency blowdown tests will be capped, i.e., they will be conducted using an emergency blowdown valve with block valve in series that will prevent the release of natural gas to the atmosphere during the emergency blowdown test.

Furthermore, while likely beyond the scope of this air permit proceeding for the Station, Mountain Valley has sought to educate the community about pipeline safety by sharing facts via mailers, newsletters, the Project website and other sources.[98]

Among these facts are the following:

- The natural gas pipeline network has the best safety record of any energy delivery system according to the National Transportation Safety Board and the U.S. Department of Transportation ("U.S. DOT").

---

[97] *See* Letter from Douglas K. Iles, TRC Engineers, Inc., *Lambert Compressor Site Traffic Impacts and Mitigation* (September 14, 2020) (Appendix P).

[98] *See, e.g.,* Appendix I (landowner welcome packet enclosure).

- Federal and state regulations govern the design, construction, operations, and maintenance of natural gas pipelines.

- Pipelines are the safest way to transport natural gas over long distances.

- Natural gas pipelines are built according to rigorous safety standards and have an outstanding safety record.

- According to the U.S. Energy Information Administration, the U.S. natural gas pipeline network consists of more than 300,000 miles of interstate and intrastate transmission pipelines.

- Mountain Valley will meet or exceed all U.S. DOT safety requirements during construction.

- Safety will be engineered into all facets of pipeline design, construction, and operation.

- The project will utilize trained and experienced inspectors who will carefully monitor pipeline construction to ensure compliance with safety standards and construction specifications.

- High quality steel pipe will be used in the construction of Mountain Valley Pipeline, including adding protective coatings to the pipe during manufacturing.

- All pipe will be carefully inspected before it is installed to ensure it meets quality standards.

- After installation all pipeline field welds will be tested and inspected.

- Before being placed into operation, the line would be pressure tested to certify integrity.

- Once in service, the pipeline would be patrolled, monitored, inspected, and maintained by the pipeline operator.

- No construction of buildings or other structures would be permitted on the permanent right-of-way.

- No planting of trees or other deep-rooting plants that may obstruct the permanent right-of-way would be permitted.

- No excavation or impounding water within the permanent right-of-way would be permitted without permission from the company.

- Mountain Valley would ensure safe operation by maintaining the right-of-way to provide ready access and operate the pipeline in accordance with U.S. DOT and FERC regulations.

- Regular inspections will occur to ensure pipeline integrity. The pipeline will be monitored 24-hours-a-day, 365-days-a-year using sophisticated computerized systems and around-the-clock personnel.

Analyzing pipeline safety for an interstate pipeline project falls under FERC's purview. After a comprehensive review, FERC found that "Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety."[99]

5. Other Comments from Community about Perceived Impacts

In addition to the potential impacts discussed above, members of communities out to 10 miles expressed the following general comments to Dr. Lawrence about perceived impacts, all of which have been considered. Among those already familiar with the Project, a majority of non-Indigenous respondents expressed comfort with the Station's proposed location, citing its proximity to the Transco Compressor, and they appreciated Mountain Valley's use of existing corridors and already-impacted landscapes.[100] Others cited investments in the community that Mountain Valley had already made as reasons to expect positive impacts in the community from the Project. Where comments were negative, many reflect sincere misperceptions or misconceptions about pipelines, compressor stations, or the scope of Station impacts. Consequently, education is an important aspect of the ongoing community engagement process to address and allay unfounded concerns.

Included in Table 8 below is how Mountain Valley has considered and/or addressed each perceived impact of the Station.

TABLE 8

Consideration of Perceived Impacts

Perceived Impact	How Considered/Addressed
Child care, senior facilities, or churches could be forced to move as a result of land use changes, noise, or reduced air quality; internet capacity could be degraded.	No land use changes, water or soil impacts are expected from the Station that would affect these facilities, the closest of which is 1.1 miles from the Station.[101] The Station is being located adjacent to the existing Transco Compressor, which has been in operation since 1957. There are no known child care or senior care facilities, churches, or schools within a 1-mile radius of the facility. The closest school is Chatham Hall approximately 2.5 miles west

[99] FEIS at 5-13.
[100] Appendix A at 37.
[101] *See* FEIS at 5-2 through 5-5.

Perceived Impact	How Considered/Addressed
	of the facility. Cornerstone Church of Christ is approximately 1.1 miles to the west of the facility, while Mill Creek Baptist Church is approximately 1.8 miles to the north north-west. Likewise, the air permit and compliance with air quality standards will protect against significant air impacts from this minor source. Indeed, air quality (which is already good) should be no worse than in the recent past even after adding the Station. The combined maximum air emissions for both the Station and the adjacent Transco Compressor are lower than Transco's past maximum emissions alone for most pollutants (Transco recently modified its facility). Furthermore, the maximum potential emissions from the modified Transco site and the Station combined will be lower than the actual emissions reported by Transco alone in 2018 for most pollutants. Air impacts will be limited to a small area around the Station. Noise impacts will be prevented via compliance with federal and Pittsylvania County standards, and none of these facilities (which would represent "Noise Sensitive Receptors") were identified within the impact area for noise in noise studies.[102] Internet capacity will not be affected by presence of the Station because the Station will not be using the local internet service providers. In addition, as a good partner during the COVID-19 pandemic, Mountain Valley has been financially supporting community efforts in Pittsylvania County by the Rotary Club of Chatham and the Boys & Girls Clubs of the Danville Area. The Rotary Club teamed with Pittsylvania County Public Schools to fund meal deliveries to families of students in need,

[102] *See* § VI.C.1 above.

Perceived Impact	How Considered/Addressed
	while the Boys & Girls Clubs staffed and maintained food supplies at drive-through pick-up areas. Because environmental justice communities are most acutely affected by COVID, Mountain Valley's support is benefitting community members.
Food banks and community gardens could be forced to move as a result of reduced water or soil quality as a result of land use changes or catastrophic failures at the Station.	No land use changes, water or soil impacts are expected from the Station that would affect these community resources. No food banks have been identified within 2 miles of the Station.[103] Fear of catastrophic failure is addressed by strict federal safety requirements.[104] FERC reviewed the safety issues and concluded that "Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety."[105] As mentioned above, Mountain Valley has been financially supporting the Rotary Club of Chatham and the Boys & Girls Clubs of the Danville Area, both of whom are involved in providing food to the communities.
Community service groups could be forced to reduce or change activities (e.g. outdoor recreation activities, gatherings) as a result of land use changes, noise, or reduced air quality that impeded their ability to operate; internet capacity could be degraded.	No land use changes, water or soil impacts are expected from the Station that would affect these groups.[106] *See* above regarding how perceived noise, air quality, and internet capacity impacts have been considered and addressed.
Outdoor recreation activities could be impacted.	No land use changes, water or soil impacts are expected from the Station that would affect outdoor activities.[107] As previously mentioned, the Station is being located adjacent to Transco

Perceived Impact	How Considered/Addressed
	Compressor, which has been in operation since 1957. *See* above regarding how perceived noise and, air quality impacts have been considered and addressed.
Landscape and way of life could degrade views/landscapes, reduce access to hunting/fishing opportunities, or impact rural way of life as a result of land use changes, noise, or reduced soil or air quality; sick animals or impacts on local agriculture as a result of land use changes, noise, or reduced soil or air quality.	Incremental view and landscape impacts will be negligible to non-existent from the Station. There will be limited, if any, visibility of the Station, and the existing Transco Compressor has long been part of the overall landscape. The Station will be surrounded by trees on three sides shielding it from public view. There are no homes or major roadways within 0.5 miles. The closest residence is about 0.6 miles southeast of the compressor station site, and it will have no direct views of the site during construction or operation due to existing vegetation around the site and near the residence. There are several other homes southwest of the Station, and the Station will not be visible from these residences due to natural vegetative screening.[108] No water or soil impacts are expected from the Station that would affect outdoor activities such as hunting, fishing, animals, or agriculture.[109] *See* above regarding how perceived noise and, air quality impacts have been considered and addressed.
For indigenous respondents, concerns about landscape degradation, ecological integrity of soil and water, impeding cultural practices such as ceremonies and tribal medicine, and improper handling of artifacts	*See* above regarding lack of landscape degradation by Station. Also, the Station will have no impact on ecological integrity of soil or water, or on cultural practices and ceremonies involving use of water or land. The Station is located adjacent to site of existing Transco Compressor. Under the NHPA Section 106 process and consultations, no specific cultural

[108] *See* FEIS at 4-129.
[109] *See* FEIS at 5-2 through 5-5.

Perceived Impact	How Considered/Addressed
	practices were identified in the area near the Station that would be impacted by the limited view of the Station. The cultural resource investigation discovered no sensitive historic or cultural sites at or in the vicinity of the Station that are likely to be impacted by the Station, as confirmed by VDHR.[110] To address the possibility of discovering unforeseen or unknown artifacts during construction or operation of the Station, Mountain Valley has developed a Plan for Unanticipated Discoveries of Historic Properties and Human Remains that has been approved by DHR.[111] In addition, Mountain Valley addressed specific concerns that the Monacan Nation filed with FERC.[112]
Fear for Indigenous women's safety due to influx of out-of-state or nonlocal workers in 'man camps'; over-policing affecting community members who are of mixed African-American and Indigenous heritage	This concern is based on accounts of violence against Indigenous women at residential "man camps" for thousands of male workers used during construction of pipelines in western parts of the country. No such camps or living arrangements will be used for construction of the Station. Fear of "over-policing" by private security will be addressed by ensuring proper training and monitoring of security officers. To lessen concerns of "over policing", Mountain Valley uses only unarmed security agencies. Per their protocol, they report any crimes to local law enforcement for investigation. All security personnel have undergone a pre-hire background check and have received the following training:

[110] *See* Appendix L (VDHR correspondence).
[111] *See* § VI.B above.
[112] FEIS at 4-172.

Perceived Impact	How Considered/Addressed
	Sexual Harassment Training: enables employees and employers to identify and avoid and/or correct behavior which might harm others and lead to liability. Culture Diversity Training: Cultural diversity training is an important component of an overall inclusion and diversity strategy. Diversity training provides the knowledge, skills and tools to assist team members for behaving differently. Sensitivity Training: Sensitivity training is a form of training with the goal of making people more aware of their own goals as well as their prejudices, and more sensitive to others and to the dynamics of group interaction. De-escalation Techniques: Recognizing, defusing and controlling aggressive behavior through the use of crisis intervention techniques, communications in conjunction with an understanding of attitudes, emotions and behavior.
Fear of impact on intertribal relations if Mountain Valley introduces cash subsidies or cash payments to tribes that are unevenly distributed	This is beyond the scope of this permitting. Nevertheless, Mountain Valley does not anticipate cash subsidies or payments to certain tribes.
For indigenous respondents, concerns about impacts on native language	The Station should have no impacts on teaching or reviving native languages. The Station is being located adjacent to existing compressor stations, which have had no documented impact on native languages.

VII. ADDITIONAL INVESTIGATION BY ENVIRONMENTAL JUSTICE EXPERT COMMISSIONED BY MOUNTAIN VALLEY.

Dr. Lawrence's work promotes three elements of environmental justice. First, to ensure identification of all potential environmental justice communities, she expanded both the geographic and definitional scope of the analysis beyond the criteria of VEJA. Second, Dr. Lawrence engaged personally with a wide range of community members to solicit their varied

viewpoints on the Station and its perceived impacts.[113] Finally, Dr. Lawrence gathered ideas from the communities about potential mitigation and community enhancement measures.

In light of Dr. Lawrence's report and recommendations, Mountain Valley in Section VIII below proposes a plan to encourage additional community involvement.

A. Expanded Identification of Environmental Justice Communities

As an initial phase of her work, Dr. Lawrence performed desktop census reviews to identify potential environmental justice communities located within 3-mile, 5-mile, and 10-mile radii of the Station. In addition to the definitions in VEJA, she considered definitions and policies from North Carolina DEQ, EPA, and FERC. Dr. Lawrence supplemented these criteria with environmental justice principles from the academic literature and professional experience. These expanded criteria ensure identification of all potential environmental justice communities that may perceive impacts from or may have concerns about the Station.

Within radii of 3 and 5 miles of the proposed Compressor Station, Dr. Lawrence identified four census tracts (105, 106, 107, and 109) under VEJA's "environmental justice community" parameters,[114] as expanded to include criteria used by NCDEQ, EPA, and FERC. These census tracts are low-income (all four) or have high minority concentrations (census tracts 105 and 107). Some are further made vulnerable by pre-existing negative environmental exposure due to the proximity of hazardous waste sites or brownfields (census tract 109); and the co-location of hazardous waste sites with populations made exceptionally vulnerable due to reduced mobility (i.e. public housing, incarceration facilities).

Dr. Lawrence also identified ten census tracts (101, 103, 104, 105, 106, 107, 108.01, 108.02 109, and 114) within a broader concentric radii of study – 10 miles from the Station – under VEJA's "environmental justice community" criteria, as expanded to include criteria used by NCDEQ, EPA, and FERC. These include census tracts adjacent to the city of Danville, and are also low-income or have high minority concentrations. The identified census tracts further include established communities of linguistically isolated households, as well as members of the indigenous Yesàh community. Within this radius, Dr. Lawrence determined that these specific communities could be vulnerable to impacts from industrial development, or could require assistance in participating meaningfully in the public comment process, due to either (1) their historic connections to place and reliance on landscape for conducting essential cultural practices; (2) their isolation from resources (including linguistically appropriate information and geographically convenient meeting points/times) that would be essential to fair opportunity for

[113] Not surprisingly, Dr. Lawrence's interviews of community members as far away as 10 miles from the Station elicited perspectives not just about the Station at issue in the permit proceeding, but also on the Mountain Valley Pipeline mainline, the Southgate pipeline, and pipelines generally. *See* Appendix A at 37. Those facilities are beyond the scope of this air permit, but Dr. Lawrence's report includes those comments for completeness.

[114] VEJA (and FERC) prescribe use of "census block groups" for low-income communities, and Dr. Lawrence used "census tracts" for her analysis, choosing not to use "census blocks." Appendix A at 5-6. "Census blocks" are the smallest units of analysis in the census data. "Census block groups," however, are combinations of census blocks and are often used for environmental justice analyses. Both EPA and VEJA prescribe use of census block groups, not tracts. Block groups are subsets of census tracts (i.e., tracts are composed of multiple block groups). Some have argued that census tracts can be too large for environmental justice purposes. *See, e.g., Friends of Buckingham*, 947 F.3d at 88.

participation in the public process of infrastructure siting; or (3) their pre-existing health vulnerabilities due to historic overexposure to negative environmental factors (e.g. hazardous waste sites, brownfields, high particulate matter concentrations, etc.).

In the broadest analysis at a scope of 30 miles, Dr. Lawrence noted the presence of the Yesàh tribes of the region: primarily, the Monacan and Saponi (listed in separate bands as the Sappony Tribe, Occaneechi Band of the Saponi Nation, Haliwa-Saponi Tribe, and Saponi Nation of Ohio) who descend from the original Eastern Siouan inhabitants of the region, and who possess historic connections to place and rely on this landscape for conducting essential cultural practices.

B. Solicitation of ideas about possible mitigation and community enhancement

Dr. Lawrence interviewed individuals in the communities at radii of 3, 5, and 10 miles, including tribe members, to ground-truth the desktop work and to identify perceived potential impacts. During her interviews, Dr. Lawrence also solicited ideas from the community on possible mitigation or community enhancement to address perceived impacts. While some of the ideas are infeasible or unrelated to the Station itself, Mountain Valley has carefully considered the community input, and either has already implemented or will implement a number of the ideas. This section summarizes the ideas received from the community.

TABLE 9

Consideration of Community Ideas for Mitigation/Enhancement

Community Idea	Comment
Make additional donations to support critical service providers in the immediate Station area and nearest towns, including Chatham, throughout the period of construction and after initial operation begins.	Mountain Valley supports the communities in which it operates, and where its employees live, work, and play. It has already demonstrated its support for critical service providers in Pittsylvania County and will continue to do so.
Be willing to avoid construction in or around areas currently used for critical service provision.	Mountain Valley has coordinated with local first responders and will continue to do so. In addition, Mountain Valley will follow its approved traffic plan to minimize impacts on critical service providers.
Maintain current investment practices to support local civic needs & organizations, including community colleges, fire & rescue services, community service groups, etc.	Mountain Valley supports the communities in which it operates, and where its employees live, work, and play. It has already demonstrated its support for critical service providers in Pittsylvania County and will continue to do so.
Retain mediators or Community Liaisons with authority to speak on behalf of Mountain Valley to de-escalate conflicts between	Mountain Valley does not expect conflicts at the Station during or after construction. In addition, it has land agents whose main role

Community Idea	Comment
security forces, employees, and local community members	during construction is to act as an interface between landowners and Mountain Valley. There are multiple ways for landowners and the public to contact Mountain Valley (e.g. dedicated email and phone number). Additionally, FERC has a complaint resolution procedure which includes the ability for landowners and the general public to file comments directly on the FERC docket.
Be willing to avoid construction in or around areas currently used for recreation	The Station will be adjacent to Transco Compressor, so construction and operation should not impact any areas currently used for recreation.
Train security forces to reduce conflict with local community members and avoid contributing to the over-policing of low-income, African-American, and Native American community members	As discussed previously, the security personnel hired by Mountain Valley are trained to reduce conflict and avoid over-policing.
Donate to support the establishment or formalization of localized recreation opportunities, including low-cost options and green/open space recreation such as sports fields	Mountain Valley supports the communities in which it operates, and where its employees live, work, and play. It has already demonstrated its support for residents in Pittsylvania County and will continue to do so.
Thoughtfully avoid impactful activities that could create negative impacts on the rural landscape and way of life; hiring practices that support local benefit via jobs and job training opportunities	The Station should not impact on the rural landscape or way of life, as discussed in comments above and Table 8. The Station is adjacent to an existing compressor facility, and thereby will not disturb a pristine landscape. Mountain Valley will avoid or minimize impacts where possible. Mountain Valley has adopted hiring practices that support the local community and anticipates working with local workforce unions.

Community Idea	Comment
For Indigenous respondents,[115] divert pipelines' routes in response to the discovery of sensitive artifacts or remains, as well as in response to notification from tribal leadership of sensitive cultural or historical sites.	Routes of pipelines are beyond scope of the Station's air permit proceeding, and have already been approved by FERC. Nonetheless, Mountain Valley has engaged in the NHPA section 106 process in regards to the Station; no cultural or historic resources were identified near the Station; and Mountain Valley has adopted and will follow the approved plan for any unforeseen or unknown historic or cultural resources that may be discovered.[116]
Be willing to act in good faith to assist tribes in acquiring uncovered artifacts or human remains (even if these were held by private landowners) so that such artifacts or remains could be protected, appropriately honored, and if appropriate, reburied in alignment with cultural beliefs around land, ancestors, and sanctity.	Mountain Valley has adopted and will follow the comprehensive approved plan for any unforeseen or unknown historic or cultural resources that may be discovered.[117]
Provide direct financial support to existing tribally-led efforts toward the preservation of historical artifacts and material culture (e.g. the Monacan Museum; the Haliwa-Saponi History Legacy Project)	This is beyond the scope of the Station's air permit proceeding, and goes beyond any expected impacts.
Establish endowment for a Yesàh Archaeological Preservation & Cultural Arts Revitalization Program at a major university (chosen collectively by the members of the Yesàh Land Trust) with the space and capabilities to archive materials under the best available preservation measures, while ensuring continued access to tribal preservation officers or designated safekeepers for study + research.	This is beyond the scope of the Station's air permit proceeding, and goes beyond any expected impacts.
Establish a process to work with private landowners to encourage/incentivize the donation of artifacts uncovered during Project	Mountain Valley has adopted and will follow the comprehensive approved plan for any

[115] Indigenous respondents' ideas focused primarily on the MVP mainline and MVP-Southgate pipelines, not the Station. *See, e.g.,* Appendix A at 48-49.

[116] *See* § VI.B above.

[117] *Id.*

Community Idea	Comment
or pipeline construction to tribal preservation officers or designated safekeepers; or to the above-described Preservation Program to prevent artifact loss or destruction.	unforeseen or unknown historic or cultural resources that may be discovered.[118]
Support local economies and employment in all hiring practices and processes; prioritize local employees over out-of-state or non-local hires, and create training programs to move local employees into management positions.	Mountain Valley has adopted hiring practices that support the local community and anticipates working with local workforce unions.
Donate to support construction of proposed African-American Leaders Memorial in downtown Chatham	Mountain Valley supports the communities in which it operates, and where its employees live, work, and play. It has already demonstrated its support for residents in Pittsylvania County and will continue to do so.

VIII. PLAN FOR FURTHER COMMUNITY ENGAGEMENT

Dr. Lawrence will continue her engagement with the community.[119] She has also recommended further outreach by Mountain Valley.[120]

Mountain Valley is supplementing the original Public, Stakeholder, and Agency Participation Plan to assist Dr. Lawrence and to further engage the rural community where the Station is proposed. Mountain Valley is sending an informational packet and response card by certified mail to every residence within 1.5 miles of the Station. This mailer, included in Appendix I, provides additional detailed information about the Station, encourages community members to offer comments, and notifies them of the pending application before DEQ. The mailer augments the previous outreach as follows:

- Describes the Project and Station, including a map and fact sheet;
- Informs the community of opportunities to get meaningfully involved via DEQ's public participation process;
- Solicits questions and comments through MVP's website or toll-free phone number;

[118] *Id.*
[119] *See* Appendix A at 36.
[120] *Id.*

- Explains the basic principles of environmental justice and Mountain Valley's ongoing efforts to satisfy environmental justice through Dr. Lawrence's work; and

- Provides three additional options to learn more about or comment on the Station, including the opportunity (i) to ask questions directly to Mountain Valley, (ii) to schedule a confidential interview with Dr. Lawrence; and (iii) to provide written comments on a stamped response card.

In conjunction with prior outreach efforts and with DEQ's public participation opportunities, this additional engagement helps to ensure that environmental justice communities are able to have meaningful involvement in the process.

IX. CONCLUSIONS

This supplement and supporting material demonstrate that the application for the Station satisfies all legal requirements for environmental justice, whether under VEJA or Va. Code § 10.1-1307.E. The information provides ample basis for DEQ and the Board both to find that the principles of environmental justice are satisfied and to issue detailed findings.

Community Impact Assessment of Lambert Compressor Station

(September 2020)

Community Impact Assessment of Lambert Compressor Station

Prepared by: Land & Heritage Consulting, LLC

Executive Summary

As part of the MVP Southgate Project ("Project"), Mountain Valley Pipeline, LLC ("Mountain Valley") proposes to construct the Lambert Compressor Station ("Station") in Pittsylvania County, Virginia. Land & Heritage Consulting, LLC was invited to act as a third party consultant, and has prepared this Community Impact Assessment of the Station to identify potential environmental justice communities and the issues they might face as a result of the proposed Station. As the primary author, my curriculum vitae and that of my co-author, Christy Hyman, are provided in Attachment B.

Our intention in this assessment was to identify communities who might be impacted by the proposed Station and to subsequently conduct outreach to those communities to clearly identify (a) ways in which community members anticipated impact that had not been identified by past research, and (b) potential actions that community members felt Mountain Valley could take to ensure distributive justice in the impacts and outcomes of the proposed Station.

Our outreach was impacted by (1) the timeline (April – August) to complete this assessment; (2) restrictions on travel and in-person outreach imposed by the emergent coronavirus pandemic (beginning in March 2020, and ongoing); and (3) restrictions on in-person outreach imposed by the acute period of community protests against racial injustice following the killing of George Floyd (May – July 2020). As a result of these restrictions, this report presents findings based on a finite number of informative community interviews. While the number of interviews may not be consistent with an academic study without any time constraints, the information gained reflects a hard look at the environmental justice communities, the perceived potential impacts of the compressor station on them and possible approaches to mitigating those impacts.

The Station is located in the eastern portion of census tract 105 (*see Figures 1 - 10*). Our initial desktop work identified environmental justice communities located within a fenceline area of 3 miles, as well as within 5-mile and 10-mile radii of the proposed Station. Rather than limit the areal extent of our review to the immediate 3-mile "fenceline community"[1] radius reflected in currently published literature (e.g., air modeling or noise studies), we identified environmental justice communities at a broader scale, extending our review to connected communities even beyond the points of expected direct impact. MVP agreed to assess impacts at this distance,

[1] White, R. "Life at the Fenceline: Understanding Cumulative Health Hazards in Environmental Justice Communities." *Coming Clean, The Environmental Justice Health Alliance for Chemical Policy Reform, The Campaign for Healthier Solutions*. (2018).

not because they affirm the expectation of direct impacts at this range, but rather because they sought to (1) avoid missing environmental justice communities based on any preconceived notions of where impacts occur; and to (2) identify and facilitate early engagement *(i.e.,* before the normal public participation process) with environmental justice communities.

We used definitions from the Virginia Environmental Justice Act, supplemented by criteria from the North Carolina Department of Environmental Quality ("NCDEQ"), the United States Environmental Protection Agency ("EPA") and the Federal Energy Regulatory Commission ("FERC") to identify the maximum number of environmental justice communities. We implemented this expanded criteria to ensure we broadly identified environmental justice communities consistent with past and future work on this topic in this region (Virginia & North Carolina: the Southern Appalachian Basin). As explained below; however, we used census tract information rather than census block group information.

Within a 3-mile fenceline radius, and within a broader radius of 5 miles of the proposed Station, we have identified four communities (census tracts 105, 106, 107, and 109) that meet the "environmental justice community" parameters as defined in the Virginia Environmental Justice Act, as well as the criteria used by NC DEQ, EPA or FERC using census tract information. These communities are disproportionately low-income or have high minority concentrations, or are made vulnerable by pre-existing negative environmental exposure (due to proximity to hazardous waste sites, degraded landscape conditions, or limited access to healthy and affordable food (i.e. "food deserts")).

The primary adverse impacts to "fenceline communities" associated with the construction of compressor station include temporary noise, dust/particulate matter, and traffic impacts; the primary impacts from operations include air emissions and noise[2]. However, some community members have reported or publicly expressed concerns relating to additional perceived risks; these include negative health impacts, cultural or historic site/artifact destruction (including but not limited to enslaved persons' burial grounds; Native American sacred sites, artifact deposits, and gravesites; and other historic and archaeological sites), and negative economic impacts.

Within a radius of 10 miles of the proposed Station, we have identified ten communities (census tracts 101, 103, 104, 105, 106, 107, 108.01, 108.02 109, and 114) that meet the same "environmental justice community" criteria. These communities include census tracts adjacent to the city of Danville, and are also disproportionately low-income or have high minority concentrations; the identified areas further include established communities of linguistically isolated households. Within this 10 mile radius, we have determined that these identified communities could be vulnerable to impacts, or could require assistance in participating meaningfully in the public comment process, due to either (1) their historic connections to place and reliance on landscape for conducting essential cultural practices; (2) their isolation from resources (including linguistically appropriate information and geographically convenient

[2] Page ES-8, Federal Energy Regulatory Commission. "Southgate Project Final Environmental Impact Statement." FERC/EIS-0297F (February 2020)

meeting points/times) that would be essential to fair opportunity for participation in the public process of infrastructure siting; or (3) their pre-existing health vulnerabilities due to historic overexposure to negative environmental factors (e.g. hazardous waste sites, brownfields, high particulate matter concentrations [from agricultural sources], etc.).

At all radii, the project overlaps with traditional and current home lands of the related Native American tribes of the Yesàh diaspora, a language/culture grouping which includes the Monacan Indian Nation, Sappony Tribe, Occaneechi Band of the Saponi Nation, Haliwa-Saponi Tribe, Saponi Nation of Ohio, Catawba Indian Nation, and New River Band of Catawba. The members of these tribal communities descend from the original Eastern Siouan inhabitants of the Virginia Blue Ridge & foothills region, possess historic connections to place, and continue to rely on this landscape for conducting essential cultural practices.

Within our analyzed 3, 5, and 10 mile radii and at our broader review range of 30 miles, we also noted the presence of an extensive and continuous African-American community composed of Freedmen descendants, connected to a larger community centered in Blairs, Virginia (also known as 'the Blairs'), located approximately 14 miles from the proposed Station site[3] [4]. However, we were unable to interview any members of that community for this report. We strongly recommend that targeted outreach to that community continue so that the specific and unique needs and concerns of its members are explicitly understood.

A preliminary set of community outreach interviews were performed to ground-truth the desktop work, identify impacts to the environmental justice communities resulting from the construction and operation of the Station, and ask community members to propose additional actions that they believe should be taken to mitigate those impacts.

Background

The 2020 Session of the Virginia General Assembly enacted The Virginia Environmental Justice Act,[5] intended to "promote environmental justice and ensure that it is carried out throughout the Commonwealth, with a focus on environmental justice communities and fenceline communities."[6] That Statute defines "environmental justice" as "the fair treatment and meaningful involvement of every person, regardless of race, color, national origin, income, faith, or disability, regarding the development, implementation, or enforcement of any environmental law, regulation, or policy."[7] "Fenceline community" is defined as an area that "contains all or part of a low-income community or community of color and that presents an increased health risk to its residents due to its proximity to a *major* source of pollution."[8] We

[6] Va Code § 2.2-235.

[7] Va Code §2.2-234

[8] Va Code §2.2-234 (emphasis added).

use the term “fenceline communities” in this report as referring to communities within a 3-mile radius of the station, consistent with definitions found in the environmental justice literature.[9]

In our approach, we employed distributive justice theory, a framework that extends the critical analysis of traditional environmental justice approaches to holistically assess the equitable allocation of costs and benefits throughout communities.[10] [11] In our case, the communities of interest were those who might be impacted by the construction and operation of the proposed Station (here defined to include the Station and all laydown/contractor yard/additional workspace areas directly associated with the construction of the Station) within a 3-mile (fenceline) radius, 5-mile radius, or 10-mile radius.

To further ensure we identified any environmental justice communities potentially affected by the proposed Station; and in order to ensure the fair treatment and meaningful involvement of all Station neighbors, we undertook a community impact assessment from May 2020 through August 2020 that included a desktop geospatial analysis and an outreach and interview campaign.

Geographic Context: Pittsylvania County

Pittsylvania County is located in the southern part of Virginia, bordering North Carolina. The county seat is Chatham. As of July 1st 2019, the estimated population of Pittsylvania County is 60,354, a 4.9% decrease from the census of April 1st 2010.[12] By land area, Pittsylvania is the largest county in Virginia, covering 968.94 sq mi.[13] 76.2% of Pittsylvania County residents describe themselves as white alone, and 21.5% identify as Black or African-American alone.[14] Those who identify as Hispanic or Latino make up 2.7% of the population.[15] The median age is 46.7 years in Pittsylvania County, almost 9 years higher than the national average of 37.9.[16]

Methods: Parameters & Scope

We used a mixed-methods approach to identify potential environmental justice communities and potential impacts of the proposed Station.

[16] Virginia Demographics Data.

This approach consisted of two major parts: first, we conducted a geospatial baseline assessment with metrics adherent to the criteria of the Virginia Environmental Justice Act, as well as criteria used by NC DEQ, EPA, or FERC. We conducted this assessment over concentric circles of radii of 3, 5, and 10 miles from the Station. We applied these expanded criteria over the larger area to ensure we identified environmental justice communities in the area and to ensure consistency with past and future work related to the Project conducted by and for other agencies. We further added a set of expanded criteria that we believed could indicate vulnerable communities who would not be captured by the current VADEQ criteria; these expanded criteria included food desert status, landscape degradation, and pre-existing exposure to health hazards or other conditions of social vulnerability.

Second, we conducted a cultural impact assessment built on a literature review and a series of semi-structured interviews with members of communities within ten miles of the Station site, as well as with members of the more geographically dispersed Yesàh Indigenous community. By not limiting the scope of our interviews to the narrow areas where impacts would typically be expected by project proponents, we were able to identify potential issues related to the Station through the eyes of the environmental justice communities themselves.

Geospatial Baseline Assessment

Scale of Analysis: Census Tract

Because of the rural nature of Pittsylvania County, and the desire for comparisons at scale smaller than the county level, we used census tracts as the areal unit of analysis for certain metrics.

Census tracts are made of census block groups (which are composed of several census blocks which are typically the size of a block in a city or suburb).[17] Census tracts were used for our analysis as the smallest areal unit of scale that could provide the most robust information at the sub-county level. Generally, a census tract contains between 2500 and 8000 people.[18] The use of census tracts for analysis of socioeconomics reveal inequities that are not always observable at a scale finer than the tract level in sparsely populated rural counties. Data available at the census tract level with regard to race, poverty and language in Pittsylvania County provided a more effective spatial representation. Thus to maximize overall data availability and rural data accuracy,[19] we used census tract as the scale of analysis for this assessment.

Census tracts in Pittsylvania County & the City of Danville vary from 'micropolitan area core' to 'rural' in the United States Department of Agriculture Economic Research Service Rural-Urban

[17] US Census Bureau. "Census tracts and block numbering areas." (2000).

[18] US Census Bureau. "Census Tracts and Block Numbering Areas." (2000). https://www2.census.gov/geo/pdfs/reference/GARM/Ch10GARM.pdf

[19] Cromartie, John B., and Linda L. Swanson. "Census tracts more precisely define rural populations and areas." *Rural America/Rural Development Perspectives* 11.2221-2019-2634 (1996): 31-39.

Commuting Area (ERS-RUCA) codes.[20] The United States Census Bureau has historically defined any non-metropolitan area as 'rural,' [21] [22] but now defines two types of non-rural urban area: (1) "urbanized Areas" have a population of 50,000 or more, and (2) "urban Clusters" have a population of at least 2,500 and less than 50,000 [23] (nearly overlapping the USDA 'micropolitan area core' designation for regions with populations up to 49,999).

Thus, by US Census Bureau standards, Pittsylvania County is a rural county with no urbanized areas or urban clusters (despite containing several USDA Economic Research Service Rural-Urban Commuting Area ("ERS-RUCA") micropolitan commuting areas),[24] while the independent City of Danville is an 'urban cluster' (a 'micropolitan area core' by ERS-RUCA standards), whose tracts contain both rural and urban components. Ground truthing conducted on August 26, 2020 confirmed that the rural nature of the area surrounding the proposed Station lent itself more appropriately to census tract level analysis than census block group level analysis for this report.

In 2019, the Natural Resources Defense Council reviewed the use of census tract level data to assess the potential impact of the proposed Atlantic Coast Pipeline and identified several ways in which this approach threatened environmental justice by overlooking, diluting, or erasing known minority communities.[25] We specifically addressed that concern in the second phase of our assessment, which included ground-truthing our desktop analysis through interviews with community members, to preclude these risks from our analysis of the proposed Station. In addition, as part of our ground-truthing, we also reviewed census block group level data, where available, and refined our analysis accordingly.

Baseline Environmental Justice Criteria Used for Analysis (Virginia Environmental Justice Act, Supplemented by Criteria From NCDEQ, EPA or FERC)

[20] These include tracts 51143010100, 51143010200, 51143010300, 51143010400, 51143010500, 51143010600, 51143010700, 51143010801, 51143010802, 51143010900, 51143011001, 51143011002, 51143011100, 51143011200, 51143011300, and 51143011400 in Pittsylvania County, and tracts 51590000100, 51590000200 51590000300, 51590000400, 51590000500, 51590000600, 51590000700, 51590000800, 51590000900, 51590001000, 51590001100, 51590001200, 51590001301, 51590001302, 51590001400, and 51590980100 in Danville City. Data from https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes/documentation/, using the 2010 RUCA codes, the most recent available data.

For this analysis, we used the definition of "environmental justice community" provided by the Virginia Environmental Justice Act (VEJA): which defined an "environmental justice community" as "*any low-income community or community of color."* We further used the definitions of "low-income community" and "community of color" as described in that same legislation.[26] The VEJA definition of "environmental justice" provided is consistent with the definitions under current usage by the the U.S. Department of Transportation (DOT), U.S Department of Housing and Urban Development (HUD), and the U.S Environmental Protection Agency (EPA), through the Partnership for Sustainable Communities (PSC).[27]

However, the Virginia Environmental Justice Act definitions and criteria led our analysis, as they were inclusive of, and more expansive than, the criteria recommended by other agencies. This expanded scope provides rigor to the analysis and ensures that we have accurately and fully identified environmental justice communities.

Parameters to Identify EJ Communities of Color

FERC: census block groups that have a minority population of more than 50 percent, or census block groups that have a minority population that is 10 percentage points higher than their respective county.

EPA: EJSCREEN's minority demographic indicator refers to "the percent of individuals in a block group who list their racial status as a race other than white alone and/or list their ethnicity as Hispanic or Latino. That is, all people other than non-Hispanic white-alone individuals. The word "alone" in this case indicates that the person is of a single race, not multiracial."

Virginia Environmental Justice Act: any geographically distinct area where the population of color, expressed as a percentage of the total population of such area, is higher than the population of color in the Commonwealth expressed as a percentage of the total population of the Commonwealth. However, if a community of color is composed primarily of one of the groups listed in the definition of "population of color," the percentage population of such group in the Commonwealth shall be used instead of the percentage population of color in the Commonwealth. "Population of color" means a population of individuals who identify as belonging to one or more of the following groups: Black, African American, Asian, Pacific Islander, Native American, other non-white race, mixed race, Hispanic, Latino, or linguistically isolated.

[26] Va Code § 2.2-234.

[27] Environmental Protection Agency. "Environmental Justice-Related Terms As Defined Across the PSC Agencies – 05/13/13" (May 13, 2013) https://www.epa.gov/sites/production/files/2015-02/documents/team-ej-lexicon.pdf

Parameters to Identify EJ Low-Income Populations

FERC: census block groups that have a household poverty rate of more than 20 percent or census block groups that have a household poverty rate that is 10 percentage points higher than their respective county.

EPA: EJSCREEN's low-income demographic indicator refers to "the number or percent of a block group's population in households where the household income is less than or equal to twice the federal "poverty level."

Virginia Environmental Justice Act: census block groups in which 30 percent or more of the population is composed of people with low income; "low income" means having an annual household income equal to or less than the greater of:

i) an amount equal to 80 percent of the median income of the area in which the household is located, as reported by the Department of Housing and Urban Development, and
ii) 200 percent of the Federal Poverty Level.

In the Final Environmental Impact Statements ("FEIS") issued by FERC in February 2020 for the MVP Southgate Project, "English-Limited Households" were included as an additional data parameter. The Virginia Environmental Justice Act criteria includes linguistically isolated households as "communities of color," which would hold them to the same statistical parameters as other minority groups.

However, because of the extraordinarily small number of such households at our scale of analysis, we treated linguistically isolated (LI) households as a dichotomous variable in our analysis -- that is, census tracts were labeled as containing linguistically isolated households if even a single household that was linguistically isolated existed within the tract. This labeling will facilitate proper notice and other assistance for meaningful participation by such households.

Parameters to Identify EJ Linguistically Isolated[28] or English-Limited Households

Land & Heritage Consulting, LLC Criteria: Any geographically distinct region with any number of (i.e one or more) Linguistically Isolated or English-Limited households.

Virginia Environmental Justice Act: *Linguistically isolated households fall under the definition of "populations of color" linked to the parameters for communities of color; i.e. any geographically distinct area where the population of [linguistically isolated households], expressed as a percentage of the total population of such area, is higher than the population of [linguistically isolated households] in the Commonwealth expressed as a percentage of the total population of the Commonwealth. However, if a community of color is composed primarily of [linguistically isolated households], the percentage population of such group in the Commonwealth shall be used instead of the percentage population of color in the Commonwealth.*

Additional guidance received by Mountain Valley from the FERC in April 2019 highlighted concerns that "effects can be amplified in EJ communities due to factors such as cumulative impacts in the community, unique cultural practices and social determinants of health."[29] We addressed this by looking at two additional parameters: one assessing cumulative impacts on unique cultural practices, and another assessing potential amplification of impact due to social determinants of health -- which we added to those in the Virginia Environmental Justice Act to address overall health status, health inequality, and environmental health metrics.

Parameters to Identify Communities with Pre-existing Exposure or Elevated Health Risk [30]

Land & Heritage Consulting, LLC Criteria: EXPOSURE PARAMETERS

(i) Proximity to Hazardous Waste Facilities above national average;
(ii) Pre-existing Particulate Matter 2.5 Exposure above national average;
(iii) Pre-existing Ozone exposure above national average;
(iv) Cancer rates above national average OR in-county differences in cancer rates by race or ethnicity

Within communities identified by the above criteria, also specifically note:

(v) presence of Limited Mobility Individuals, defined as individuals who do not have the ability to adapt their location or daily routines to reduce or minimize exposure -- i.e. hospitals, schools, prisons, public housing.

Additional Criteria Used for Analysis (Land & Heritage Consulting, LLC Specific Framework)

At the outset of this assessment, Mountain Valley Pipeline, LLC expressed a strong desire to exceed the currently required and recommended environmental justice parameters in order to

[28] 2020 Acts of the Virginia General Assembly. Title§ 2.2-234 and 2.2-235. Section 1257. April 22, 2020.

[29] Correspondence between the Federal Energy Regulatory Council and Mountain Valley, LLC (February 2019).

[30] Correspondence between the Environmental Protection Agency and Mountain Valley, LLC (April 2019)

protect the well-being of neighboring communities. To that end, we identified a set of additional criteria in the environmental health & justice literature that would allow us to identify potentially overlooked environmental justice communities – food deserts, and landscape quality.

Food Deserts

"Food deserts" are areas characterized by reduced access to food or grocery items, at levels contributory to disparate health outcomes.[31, 32] In urban areas, this limitation often occurs due to the uneven distribution of grocery stores and grocery items; in rural areas, this reduced availability often manifests in the form of geographic distance to grocery stores.[33]

Dutko (2012) describes them as follows: "Relative to all other census tracts, food desert tracts tend to have smaller populations, higher rates of abandoned or vacant homes, and residents who have lower levels of education, lower incomes, and higher unemployment. Census tracts with higher poverty rates are more likely to be food deserts than otherwise similar low-income census tracts in rural and in very dense (highly populated) urban areas. For less dense urban areas, census tracts with higher concentrations of minority populations are more likely to be food deserts, while tracts with substantial decreases in minority populations between 1990 and 2000 were less likely to be identified as food deserts in 2000."[34]

To assist in identifying environmental justice communities, we used "food deserts" as a parameter possibly indicative of poverty and lack of access to resources, as well as potentially for geographic isolation and reliance on minimal, distant sources of food items (an indicator of both poor urban and isolated rural communities).

Landscape Quality

Landscape condition "refers to the state of the physical, chemical, and biological characteristics of natural ecosystems, and their interacting processes. Many human land uses affect ecological condition, through vegetation removal or alteration, stream diversion or altered natural hydrology, introduction of non-native and invasive species, and others."[35]

[35] NatureServe. "Modeling Landscape Condition: The Effects of Landscape Fragmentation on Biodiversity." (2020) https://www.natureserve.org/conservation-tools/modeling-landscape-condition

Landscape condition is a type of greenspace assessment of the ecological condition of the natural environment in an area, the degradation of which is associated with economic inequality and poorer mental and physical health outcomes for low-income communities.[36]

We used data from NatureServe as an indicator for lack of access to greenspace and ecosystem services, as well as for elevated health risks and elevated risk of asthma and respiratory conditions.

Cultural Community Identification Criteria

The statutory language of the Virginia Environmental Justice Act defines the term "environment" to include the "cultural… assets or components of a community."[37] To define the scope of the cultural communities present in the area of the Station, we drew on guidance from three sources: first, from the literature on Indigenous cultural impact assessment (and in particular, from recent conference proceedings from the International Association for Impact Assessment); second, from the Section 106 process as defined by 136 CFR Part 800 -- Protection of Historic Properties;[38] and third, from the State of Hawai'i, which is a leader in its state-mandated cultural impact assessments.

Indigenous Communities

Indigenous communities have uniquely long-lasting and impactful relationships to land and place; for that reason, we undertook a separate, additional process to identify potentially impacted Indigenous communities in our desktop work.

Our first task was to define the geographic extent of Indigenous experience that we would assess relative to the proposed Station. The State of Hawai'i uses the term "*ahupua'a*" as the typically appropriate geographical unit for assessing potential cultural impacts, particularly if the *ahupua'a* includes areas extending beyond the immediate project area, but in which cultural practices may be carried out that could be impacted by the proposed project.[39]

Although the *ahupua'a* is a specifically Hawaiian term for a traditional Indigenous land/territory delineation, we believe it can be extended analogously to identify appropriate cultural-linguistic areas as "language territories" – regions in which a shared language or set of mutually intelligible languages were spoken – based on preliminary data provided by native-land.ca[40] and verified by community outreach and literature review.

---

[36] Cushing, Lara, et al. "The haves, the have-nots, and the health of everyone: the relationship between social inequality and environmental quality." *Annual Review of Public Health* 36 (2015): 193-209.

[37] 2020 Acts of the Virginia General Assembly. Title§ 2.2-234 and 2.2-235. Section 1257. April 22, 2020.

[38] Advisory Council on Historic Preservation. "Protection of Historic Properties." 36 CFR § 800.1

[39] Environmental Council, Office of Environmental Quality Control (OEQC), State of Hawaii. "Guidelines for Assessing Cultural Impacts." (November 7, 1997).

[40] *Native Lands Map*. https://native-land.ca/ Accessed 28 August 2020.

In the Blue Ridge/Ridge & Valley/Piedmont Region, the appropriate term for this traditional Indigenous language-territory delineation would probably be an 'amanīnechi' ("ah-my-ee-neh-chee"), meaning 'land/territory language' in Tutelo-Saponi/Yesànechi, the commonly shared language of the Eastern Siouan Yesàh tribes of this region.

Parameters to Identify Indigenous Cultural Communities

Land & Heritage Consulting LLC Criteria: Any Indigenous community demonstrating current residence within, or cultural-linguistic connection to the identified amanīnechi (language territory); or any Indigenous community demonstrating descent from historical Indigenous communities with cultural-linguistic connection to the amanīnechi.

"Indigenous community" is defined here to include any of the following:

(i) an Indigenous band, tribe, nation, or reservation;
(ii) a group of Indigenous individuals practicing some form of culturally-specific self-governance and operating in the manner of a tribe or nation;
(iii) a group of Indigenous individuals possessing a shared cultural identity and engaging in shared cultural practices; or
(iv) a set of Indigenous bands, tribes, nations, or groups collectively operating in the manner of a federation, confederacy, alliance, or union.

Non- Indigenous Cultural & Regional Communities

This literature on Indigenous cultural impact assessment provided a useful list of domains which could also be generalizable to non-Indigenous communities. However, for non-Indigenous communities, which are not defined in terms of shared languages, we applied these parameters in a narrower geographic scope (i.e. we restricted our identification and outreach to the region within a 30-mile radius of the proposed Station, and restricted interviews to those working or living within a 10-mile radius of the proposed Station).

To make any necessary cultural delineations within our narrowed geographic area, we rely on the definitions of "microcultures" found in the social psychology literature,[41] and adapted for our specific purposes as below.

[41] Neuliep, James W. *Intercultural communication: A contextual approach*. SAGE Publications, 2020.

Parameters to Identify Non-Indigenous Cultural Communities

Land & Heritage Consulting: Any identifiable groups of people who differ from the mainstream culture and:

(i) possess a distinct set of shared values, beliefs, and behaviors;
(ii) possess a common history; and
(iii) are bonded together by similar experiences, traits, values, or in some cases, histories.

Methods: Techniques & Approaches

Analysis of Spatial Data

We conducted a baseline assessment using GIS software and drawing on free, publicly-available data, in order to identify any potential environmental justice communities (low-income, minority, linguistically isolated, or pre-exposed) within concentric radii of three (3), five (5) and ten (10) miles surrounding the proposed Station.

To assess the geographic range of census tracts in Pittsylvania County, VA meeting the identified criteria as environmental justice communities, the team sought to gather data on the following metrics:

- Race – Data on race was analyzed from the American Community Survey of 2018 [42] and census tracts that had a minority population of more than 50 percent, or 10 percentage points higher than Pittsylvania County, or higher than the state of Virginia were flagged.
- Poverty – Data on poverty was analyzed from the American Community Survey of 2018 and census tracts that had a household poverty rate of more than 20 percent, or 10 percentage points higher than Pittsylvania County, or where 30% of the population within the tract were composed of people designated as low income were flagged. Low income was determined if a household income showed 80% of the median income for Pittsylvania County or if any census tract showed 30% of the population being designated at 200% of the Federal Poverty Level.
- English Language Speaking Proficiency – Data from the American Community Survey of 2018
- Mobility – Data on mobility was analyzed from the American Community Survey of 2018 in terms of people living in group quarters, people enrolled in school, and people residing in public housing. Additional data was collected from georeferencing institutions listed on public search engines.
- Access to Food – Data on the presence of food deserts was analyzed from the United States Food and Drug Administration Food Research Data Analysis.

[42] The Census Bureau's American Community Survey of 2018 provides statistics about people and housing for every community in the nation. It is the only source for local estimates of over 40 topics it covers.

- Landscape Condition – Data on landscape condition value was analyzed and rendered from a geospatial model compiled by NatureServe.

Additionally, the team sought data related to health risk parameters set forth by the EPA including:

- Ozone
- Wastewater Discharge Proximity
- Hazardous Waste Proximity
- Respiratory Hazard
- Atmospheric particulate matter

These data sources were collected from Census data, the American Community Survey of 2018, the EPA's Environmental Justice Screening and Mapping Tool, the Department of Housing and Urban Development, the United States Department of Agriculture, the Center for Disease Control Social Vulnerability Index Geodatabase of 2016, the NatureServe geospatial model of Landscape Condition Values, and the Virginia Department of Forestry. EPA and DEQ rely on census data for demographics in assessing environmental justice.

The geospatial unit on which the cartographic representations in this study rely are based on the Census TIGER/LINE shapefiles, analyzed at the level of census tract. TIGER/Line files are a digital database of geographic features, such as roads, railroads, rivers, lakes, political boundaries, and census statistical boundaries covering the entire United States. For the purposes of the area under investigation for this study, the Pittsylvania County and Danville City census tracts were selected for spatial querying. The data compiled from the range of sources used were "joined" with the TIGER/LINE file using ArcGIS Pro software. This process involves modifying the original TIGER/LINE file by adding a duplicate field that serves as the entity that connects new data to it. The data collected, usually in the form of a flat comma separated values file was also modified in order for the two sources to merge effectively. This results in a combined file that not only holds spatial data related to geographic boundaries but also the socioeconomic measures contained that are referenced to those areal units of inquiry. These data table modifications were required for the findings related to race, poverty, English Language Proficiency, access to food, and mobility.

For cartographic renderings of the EPA risk parameters, the information related to those data were already contained within a geodatabase provided by EJSCREEN. For those maps, the team analyzed the data measures for Ozone, Wastewater Discharge Proximity, Hazardous Waste Proximity, Respiratory Hazard, and Atmospheric Particulate Matter that exceeded state or national averages and identified those census tracts that fell into those risk categories. Similarly, for cartographic renderings related to the Center for Disease Control Social Vulnerability Index of 2016, data was contained within a geodatabase provided by the agency that compiled it. For that map, the team analyzed measures within the 90th percentile that demonstrated risk parameters related to the community's ability to respond to disaster and identified those census tracts that fell into those risk categories.

For the landscape condition values map, the NatureServe Landscape Condition Model dataset was used. The data was queried in ArcGIS for the study area and rendered on the map with the allocated land condition values for display.

Upon identifying the tracts with accompanying risk categories for analysis, the next step involved the use of a buffer, a geoprocessing tool that creates polygons around specified features to a certain distance. In this case the specified feature was the Station site and the distance parameters were three, five and ten miles. For each risk category, the census tracts contained within the buffers were identified.

To map the extent of the Indigenous language-territory (amanīnechi) with which the proposed Station overlapped, we used baseline language data from Native-Land.ca, then extended the Tutelo-Saponi (Yesànechi) language polygon to incorporate the modern-day homesites of two tribal communities who surfaced during our literature review (the Saponi Nation of Ohio and the Haliwa-Saponi Tribe).

Community Interview Collection

Ground-truthing the results of our desktop analysis is an essential part of completing a successful community impact assessment. Failing to do so could potentially result in the exclusion of local minorities/people of color from the planning process; increases in community opposition due to lack of understanding, engagement and opportunity for input; and unjust outcomes in the distribution of benefits and risks across adjacent communities.

In adaptation to the COVID-19 pandemic, we made the determination to shift to conducting interviews primarily via phone or Skype. Out of deference to the protests related to the killing of George Floyd, we postponed the beginning of our interview collection phase to June 15, following the conclusion of funerals and memorials for George Floyd over the June 6 weekend, and the passing of the anniversary of the June 10, 1963 “Bloody Monday” in Danville, when peaceful civil rights activists protesting segregation clashed with police.

Ongoing restrictions as a result of both crises led us to shift the entirety of our interviews to phone or Skype as of July 1, 2020. Our only physical visit to Pittsylvania County and the proposed Station site (and surrounding towns, etc.) took place on August 26, 2020 and did not entail any person-to-person contact. For purpose of the analyses below, we have equated the term “community” with “census tract,” so that environmental justice community means a census tract meeting the applicable criteria, and does not carry any implications regarding the presence or absence of any shared values or cultural cohesion within that area.

Results

GIS Baseline Summary: 3 Mile Fenceline

Within a radius of 3 miles of the proposed Station, we have identified four communities (census tracts 105, 106, 107, and 109) that meet the "environmental justice community" parameters as defined in the Virginia Environmental Justice Act, and expanded to include criteria used by NC DEQ, EPA or FERC and as further expanded by Land & Heritage Consulting. In all figures, the 3-mile buffer is indicated by the closest of the three concentric circles around the Station. The attachment number for the data tables are shown in the text for each criterion, as applicable.

GIS Baseline Summary: 5 Mile Buffer

Within a radius of 5 miles of the proposed Station, we have identified four communities (census tracts 105, 106, 107, and 109) that meet the "environmental justice community" parameters as defined in the Virginia Environmental Justice Act, and expanded to include criteria used by NC DEQ, EPA or FERC and as further expanded by Land & Heritage Consulting.

GIS Baseline Summary: 10 Mile Buffer

Within a radius of 10 miles of the proposed Station, we have identified ten communities (census tracts 101, 103, 104, 105, 106, 107, 108.01, 108.02 109, and 114) that meet the "environmental justice community" parameters as defined in the Virginia Environmental Justice Act, and expanded to include criteria used by NC DEQ, EPA or FERC and supplemented by Land & Heritage Consulting.

Geospatial Data

3-Mile Fenceline: Communities of Color & Social Vulnerability

We identified two communities (census tracts 105, 107) meeting the "communities of color" criteria, according to the criteria provided by the Virginia Environmental Justice Act (i.e. any census tract with a minority percentage exceeding the average for the Commonwealth of Virginia). *See Figure1, below; see also Data Table 1 in Attachment A.*

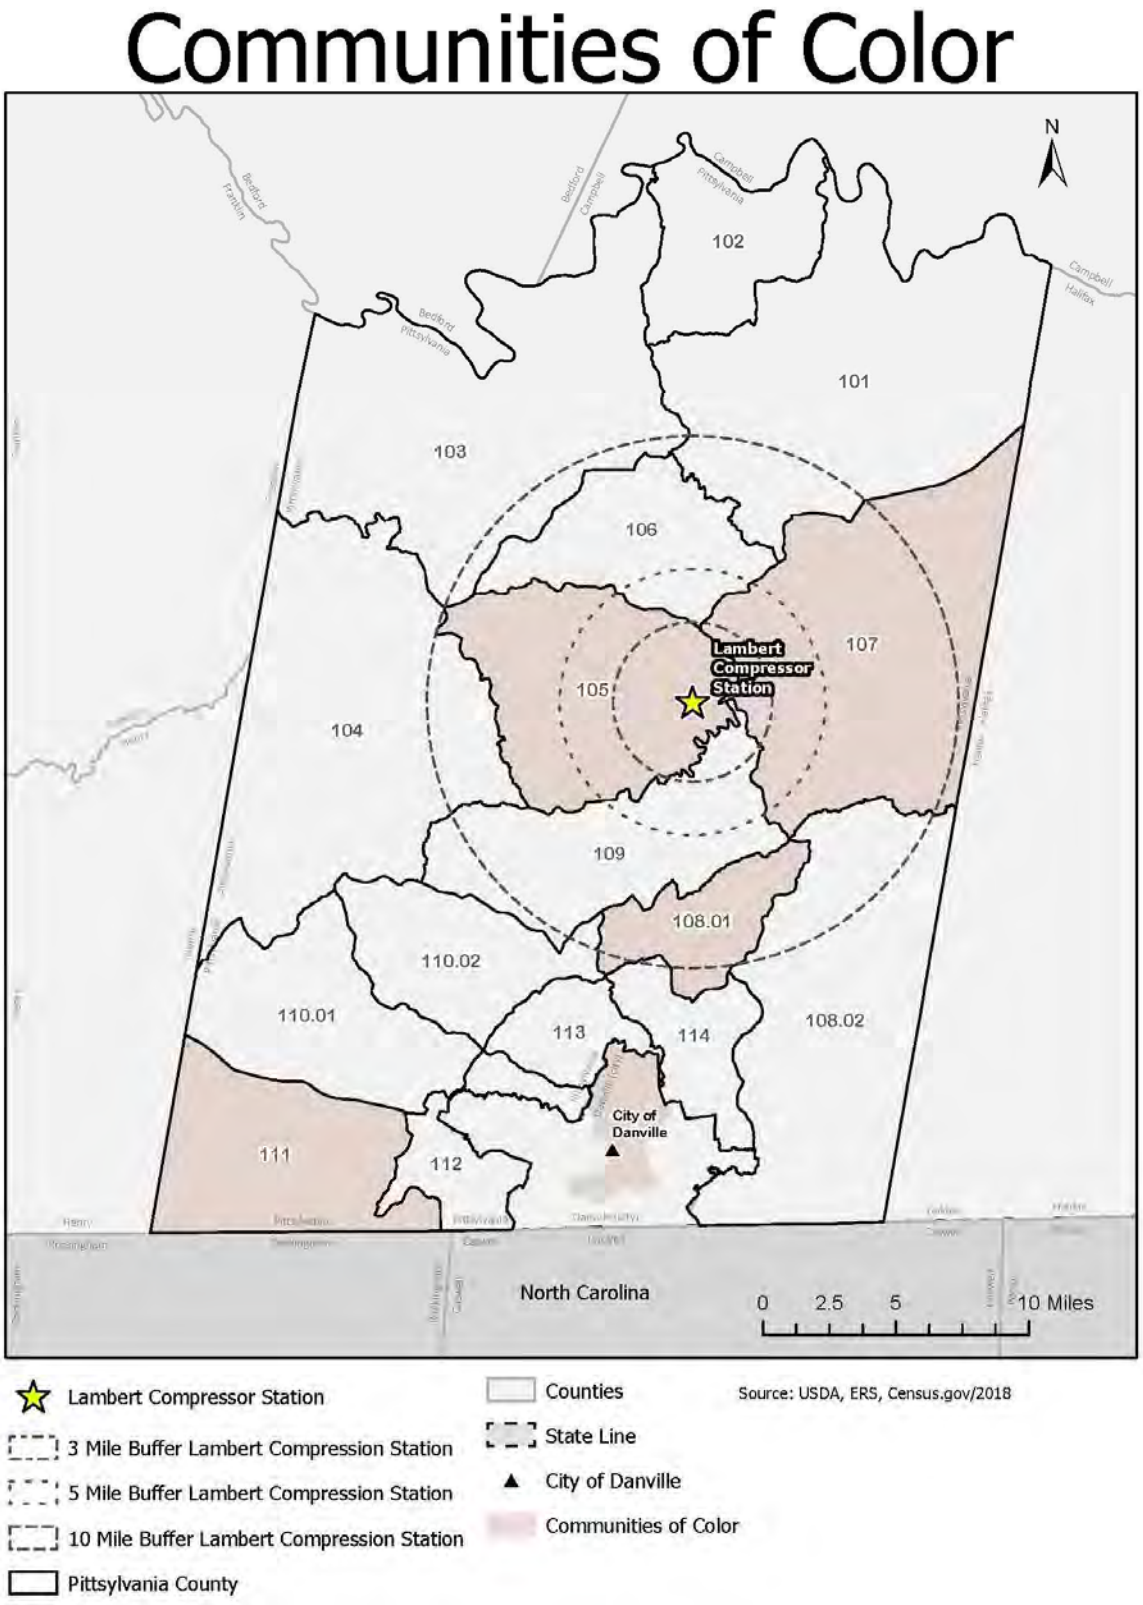
5-Mile Buffer: Communities of Color & Social Vulnerability

We identified two communities (census tracts 105, 107) meeting the "communities of color" criteria, according to the criteria provided by the Virginia Environmental Justice Act (i.e. any census tract with a minority percentage exceeding the average for the Commonwealth of Virginia). *See Figure1, below; see also Data Table 1 in Attachment A.*

10-Mile Buffer: Communities of Color & Social Vulnerability

We identified four communities (census tracts 104, 105, 107, and 108.01) meeting the "community of color" criteria of the Virginia Environmental Justice Act as expanded to include criteria used by NC DEQ, EPA or FERC (i.e. any census tract with a minority percentage exceeding the average for the Commonwealth of Virginia). *See Figure1, below; see also Data Table 1 in Attachment A.*

Figure 1. Map of Census Tracts Defined as "Communities of Color"



Because the VA DEQ definition of "communities of color" includes linguistically isolated households, we also identified census tract 109 as a "community of color;" however, because of the difference in the way that we analyzed linguistic isolation data (as a dichotomous rather than continuous variable), we have presented that data on a separate map below.

3-Mile Fenceline: Linguistically Isolated or English-Limited Households

We identified two census tracts (105, 109) within a five-mile radius of the proposed Lambert Compressor Station with at least one household identified as linguistically isolated. *See Figure 2, below as well as Data Table 8 in Attachment A.*

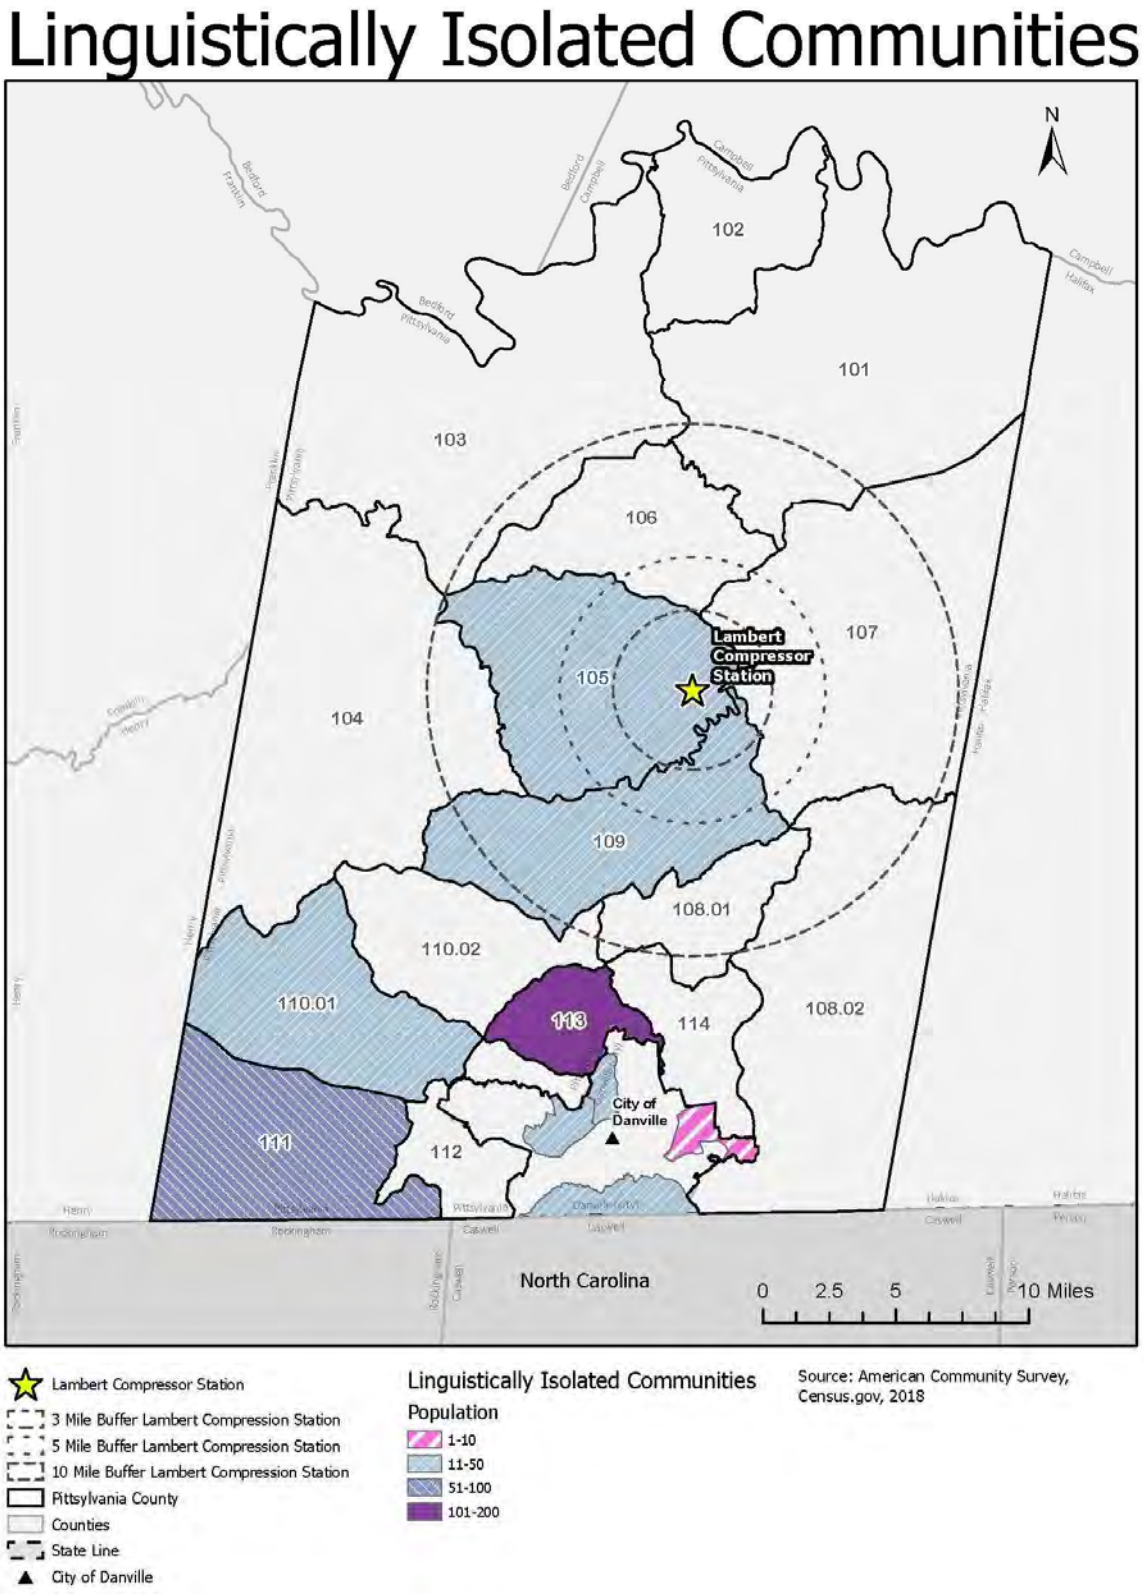
5-Mile Buffer: Linguistically Isolated or English-Limited Households

We identified two census tracts (105, 109) within a five-mile radius of the proposed Lambert Compressor Station with at least one household identified as linguistically isolated. *See Figure 2, below as well as Data Table 8 in Attachment A.*

10-Mile Buffer: Linguistically Isolated or English-Limited Households

We identified two census tracts (105, 109) within a ten-mile radius of the proposed Lambert Compressor Station with at least one household identified as linguistically isolated. *See Figure 2, below as well as Data Table 8 in Attachment A.*

Figure 2. Map of Census Tracts Defined as "Linguistically Isolated Communities"



3-Mile Fenceline: Low-Income Populations

All four of the census tracts we identified (105, 106, 107, and 109) as environmental justice communities within a 3-mile radius of the proposed Lambert Compressor Station met the Virginia Environmental Justice Act definition of "low-income communities;" specifically, under the provision that "'low income' means having an annual household income equal to or less than…200 percent of the Federal Poverty Level. 'Low-income community' means any census block group in which 30 percent or more of the population is composed of people with low income." *See Figure 3, below & Data Table 2 in Attachment A.*

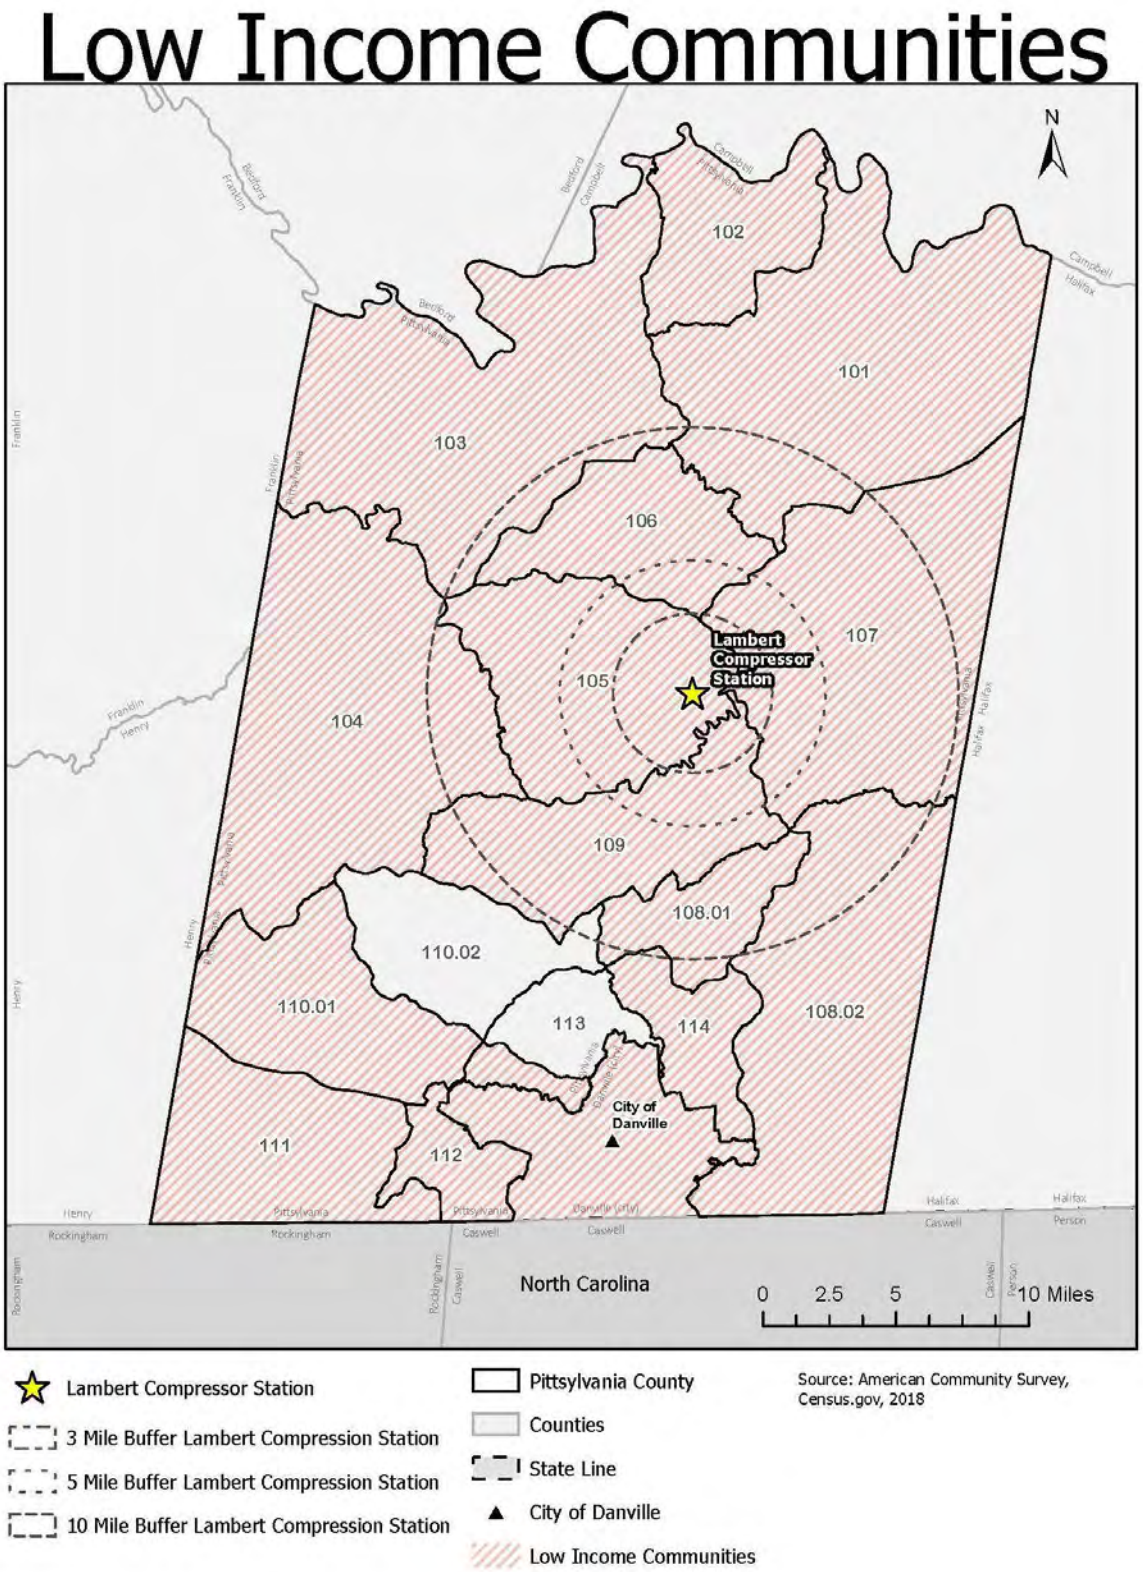
5-Mile Buffer: Low-Income Populations

All four of the census tracts we identified (105, 106, 107, and 109) as environmental justice communities within a 5-mile radius of the proposed Lambert Compressor Station met the Virginia Environmental Justice Act definition of "low-income communities;" specifically, under the provision that "'low income' means having an annual household income equal to or less than…200 percent of the Federal Poverty Level. 'Low-income community' means any census block group in which 30 percent or more of the population is composed of people with low income." *See Figure 3, below & Data Table 2 in Attachment A.*

10-Mile Buffer: Low-Income Populations

We also identified ten communities (census tracts 101, 103, 104, 105, 106, 107, 108.01, 108.02 109, and 114) within a broader concentric radii of study – 10 miles from the Lambert Compressor Station– meeting the "environmental justice community" criteria of the Virginia Environmental Justice Act as expanded to include criteria used by NC DEQ, EPA or FERC. All ten of these tracts were identified as "low-income communities" following the criteria provided by DEQ that includes households earning under 200% of the federal poverty threshold. *See Figure 3, below & Data Table 2 in Attachment A.*

Figure 3. Map of Census Tracts Defined as "Low Income Communities"



3-Mile Fenceline: Identified Communities with Pre-existing Exposure or Elevated Health Risk

We did not identify any communities within a 3-mile radius with pre-existing exposure rates greater than the national average for PM 2.5 or ozone. *See Figures 4 & 5, below & Data Table 3 in Attachment A.*

We did not identify any communities within a 3-mile fenceline radius who are subject to cancer risk that exceeds the state or national averages. *See Figure 6, below.*

We did identify one community within the 3-mile fenceline radius (census tract 109) with elevated proximity to Hazardous Waste Facilities. Although these facilities themselves are located closer to the 5-mile radius line, the census tract that is impacted extends through the 3-mile fenceline, and thus is considered here. We also identified limited mobility individuals (i.e., those with less control over their daily movements, habits and activities) within these communities, including residents of public housing, children enrolled in school, and incarcerated persons. *See Figures 7, 8a & 8b, below & Data Tables 4, 5, and 6 in Attachment A.*

5-Mile Buffer: Identified Communities with Pre-existing Exposure or Elevated Health Risk

We did not identify any communities within a 5-mile radius with pre-existing exposure rates greater than the national average for PM 2.5 or ozone. *See Figures 4 and 5, below & Data Table 3 in Attachment A.*

We did not identify any communities within a 5-mile radius who are subject to cancer risk that exceeds the state or national averages. *See Figure 6, below.*

We did identify one community (census tract 109) with elevated proximity to Hazardous Waste Facilities. We also identified limited mobility individuals (i.e., those with less control over their daily movements, habits and activities) within these communities, including residents of public housing, children enrolled in school, and incarcerated persons. *See Figures 7, 8a & 8b, below & Data Tables 4, 5, & 6, Attachment A.*

10-Mile Buffer: Identified Communities with Pre-existing Exposure or Elevated Health Risk

We identified two communities (census tract 108.02, 114) within a 10-mile radius with pre-existing exposure rates greater than the national average for PM 2.5. *See Figure 4, below & Data Table 3 in Attachment A.*

We also identified one community (census tract 114) within a 10-mile radius whose residents are subject to cancer risk that exceeds the state or national averages. *See Figure 6, below & Data Table 3 in Attachment A.*

We further identified five communities (census tracts 108.01, 108.02, 109, 110.2, and 114) with elevated proximity to Hazardous Waste Facilities. We also identified limited mobility individuals (i.e., those with less control over their daily movements, habits and activities) within these communities, including residents of public housing, children enrolled in school, and incarcerated persons. *See Figures 7, 8a & 8b, below & Data Tables 4, 5, and 6 in Attachment A.*

Figure 4. Map of Census Tracts w/ Exposure to Fine Particles (PM 2.5) Exceeding Nat'l Average

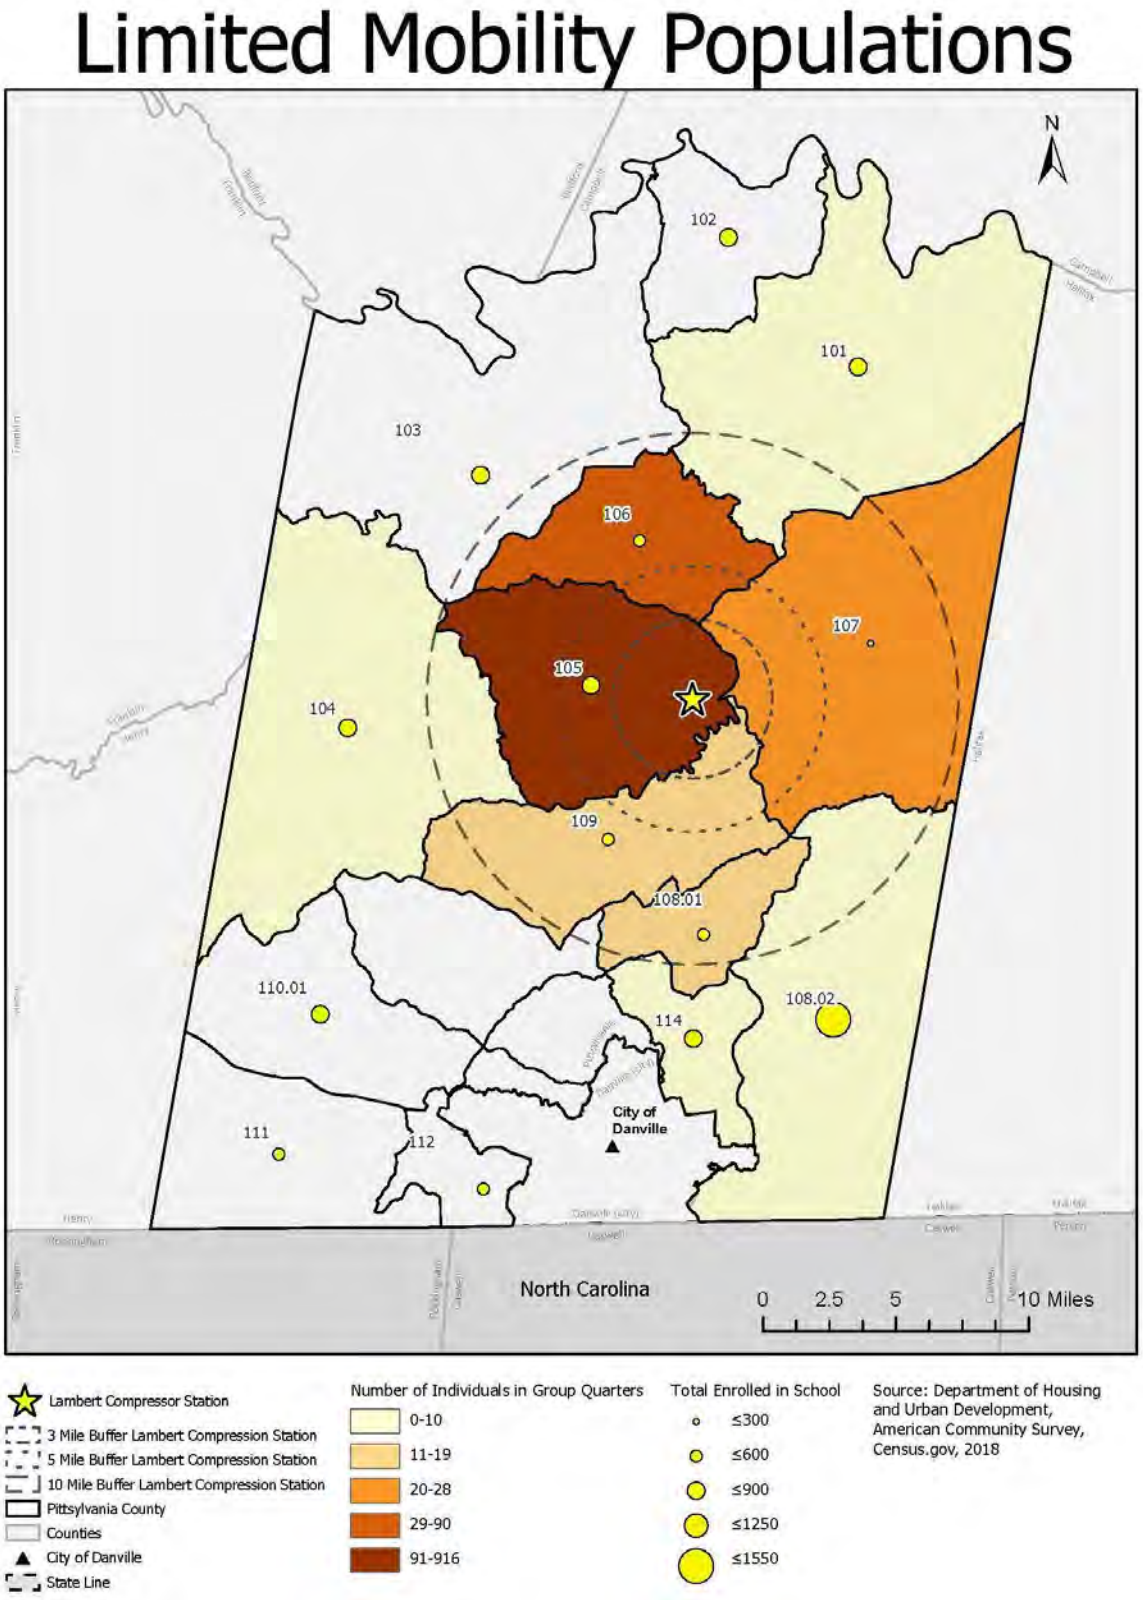

Figure 8b. Map of Census Tracts w/Limited Mobility Sites Identified

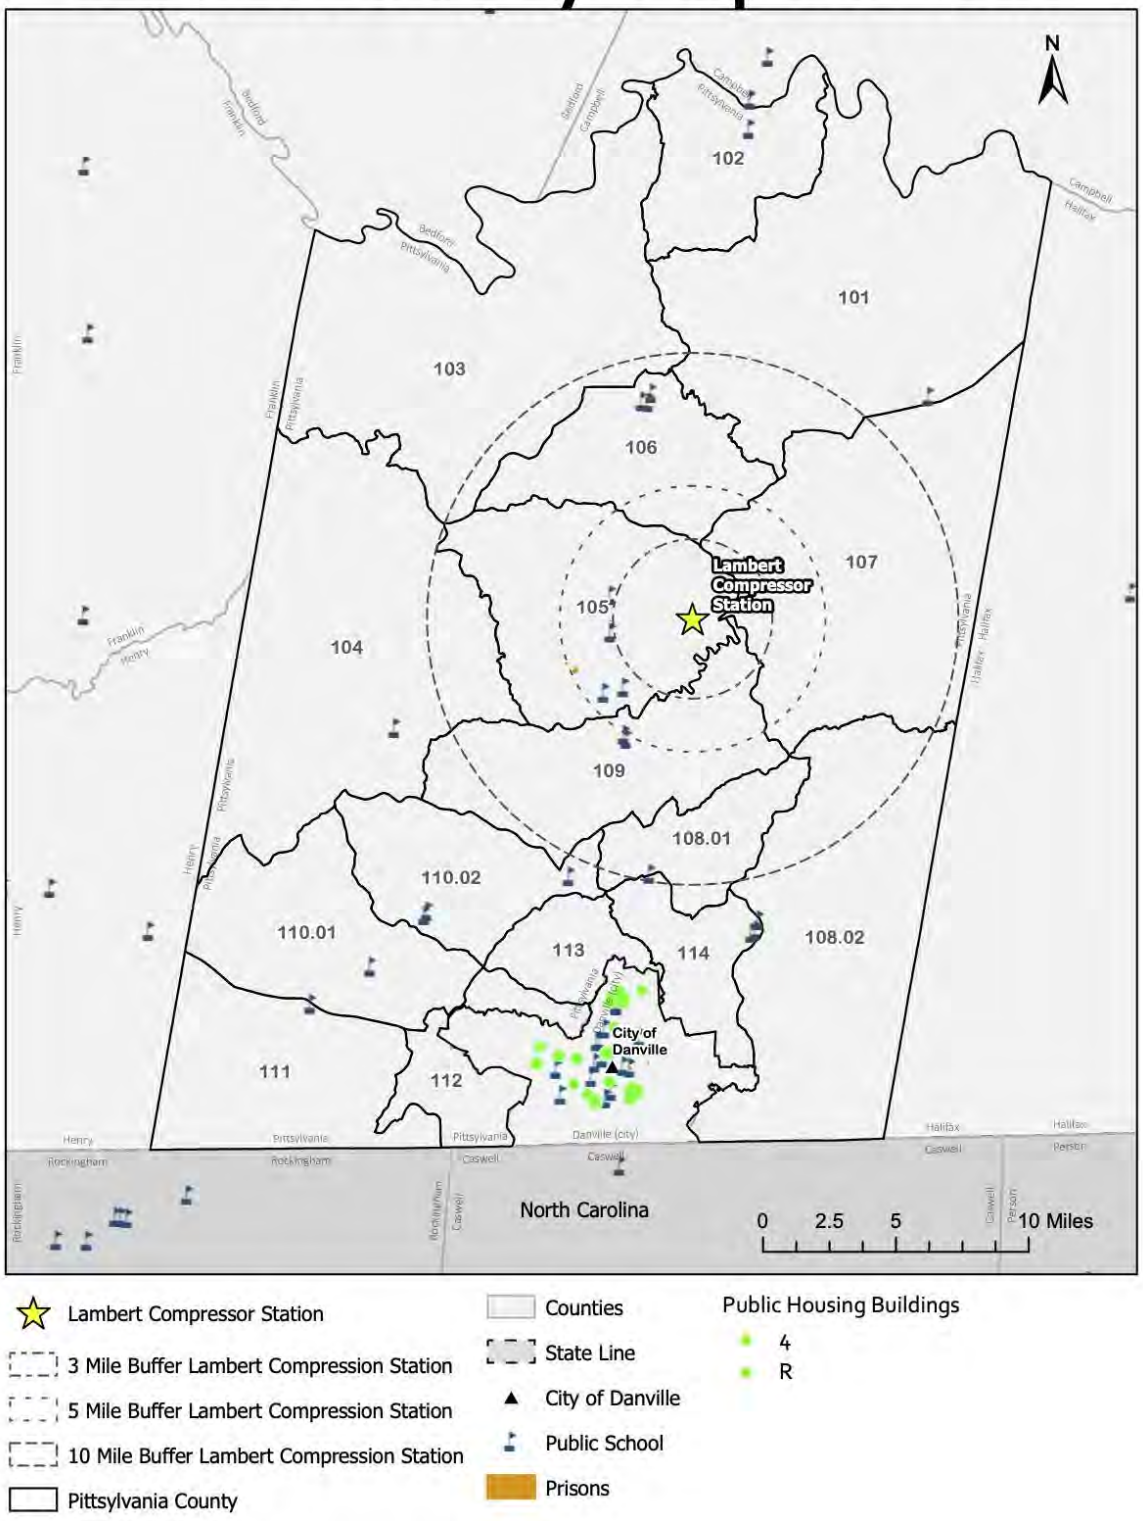
Low Mobility Population



3 Mile Fenceline: Additional Vulnerabilities

Food Deserts

As explained earlier in this report, while not a criteria for defining environmental justice communities, food deserts indicate low income and vulnerable populations. The USDA defines 'food deserts' as "census tract[s] that meet both low-income and low-access criteria including: (1) poverty rate is greater than or equal to 20 percent OR median family income does not exceed 80 percent statewide (rural/urban) or metro-area (urban) median family income; (2) at least 500 people or 33 percent of the population located more than 1 mile (urban) or 10 miles (rural) from the nearest supermarket or large grocery store."[43]

We identified four communities (census tracts 105, 106, 107, and 109) within a 3-mile fenceline that meet the definition of a "food desert" (communities with reduced access to healthy and affordable food) as given by the United States Department of Agriculture. This included (a) census tracts labeled by the USDA as "low-income and low-access (LILA) at 1 mile (urban) or 10 miles (rural)" – tracts where a significant number or share of residents are more than 1 mile (urban) or 10 miles (rural) from the nearest supermarket, as well as (b) census tracts labeled by the USDA as "low-income and low-access (LILA) using vehicle access" – tracts where more than 100 housing units do not have a vehicle and are more than ½ mile from the nearest supermarket, or a significant number or share of residents are more than 20 miles from the nearest supermarket. *See Figure 9, below & Data Table 7 in Attachment A.*

Degraded Landscapes

We further noted that the majority of the landscape (particularly census tracts 105 and 109) within a 3-mile radius of the proposed site is rated as "poor" or "low" condition value by NatureServe, via the model designed by Comer et al. (2017).[44] NatureServe is a preeminent entity for the collection and analysis of scientific data pertaining to ecological health and status, and this model is widely used for ecological impact and other related assessments. *See Figure 10, below.*

5 Mile Buffer: Additional Vulnerabilities

Food Deserts

We identified four communities (census tracts 105, 106, 107, and 109) that meet the definition of a "food desert" as given by the United States Department of Agriculture. *See Figure 9, below & Data Table 7 in Attachment A.*

Degraded Landscapes

We further noted that the majority of the landscape (particularly census tracts 105 and 109) within a 5-mile radius of the proposed site is rated as "poor" or "low" condition value by NatureServe, via the model designed by Comer et al. (2017).[45] *See Figure 10, below.*

Qualitative Interview Data

Limitations

Because of the restricted timeline in which we were operating, the results of community interviews shared here do not reflect sufficient practices to meet the standards of academic inquiry. The information provided herein is instead a rapid-praxis assessment of fenceline, frontline, and footprint communities -- and the potential impacts to them from the project, along with possible mitigation for those impacts.

We recommend strongly that Mountain Valley continue targeted and thoughtful outreach to impacted communities and individuals through the public participation, permitting and construction process.

Indigenous Community Identification Results

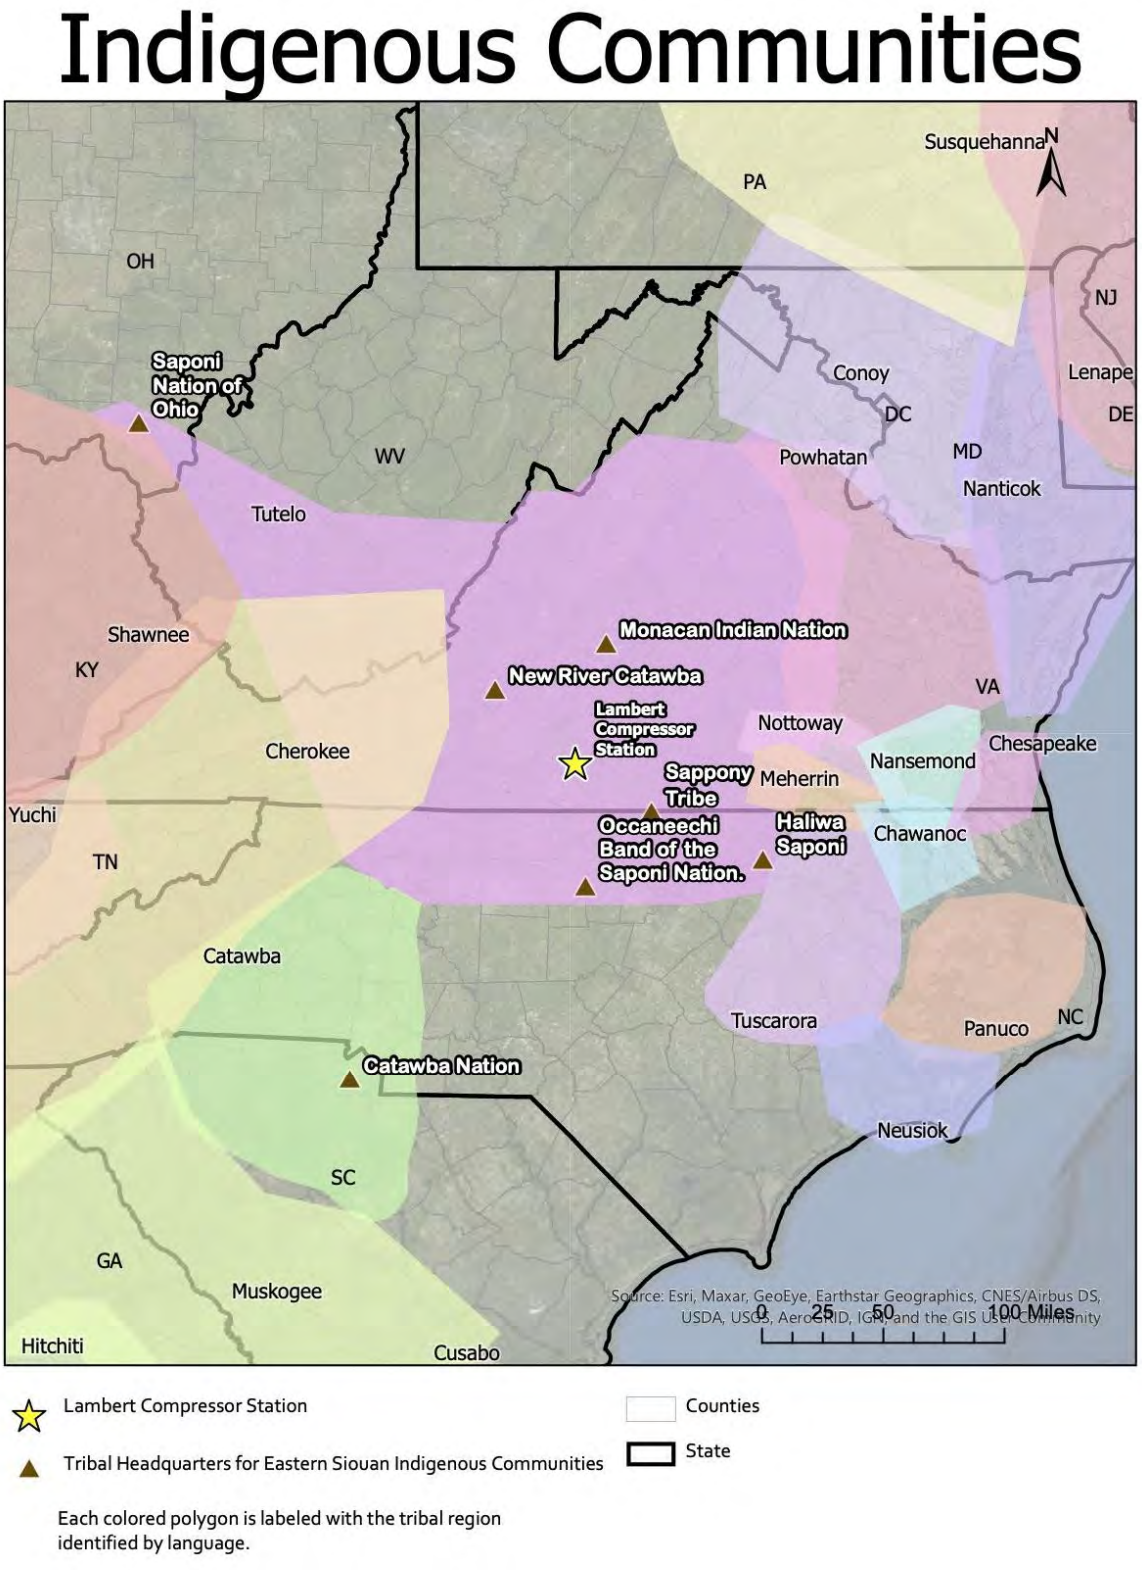
The proposed Station location overlaps with the ancestral lands of the Tutelo-Saponi speaking Eastern Siouan tribes (autonym: Yesàh/Essaw/Issaw). *See Figure 11, below.*

The members of these tribes and communities descend from the original Eastern Siouan inhabitants of the Virginia Blue Ridge & foothills region, possess historic connections to place, and continue to rely on this landscape for conducting essential cultural and religious practices.

This cultural/language group includes two (2) federal and six (6) nonfederal tribes; nonfederal tribes included a mix of three (3) state-recognized tribes and two (2) tribal communities acknowledged or identified by members of the federal and state recognized tribes as holding legitimate Indigenous identities through kinship ties and cultural practices. These included:

- Monacan Indian Nation (Federal)
- Catawba Indian Nation (Federal)
- Occaneechi Band of the Saponi Nation (Nonfederal; State)
- Sappony Tribe (Nonfederal; State)
- Haliwa-Saponi Tribe (Nonfederal; State)
- Saponi Nation of Ohio (Nonfederal)
- New River Band of Catawba (Nonfederal)

Figure 11. Map of Historic Indigenous Language Regions of the Tidewater



Non-Indigenous Cultural Community Identification Results

African-American Descendants of Freedmen

We identified at least one (1) additional special cultural community via the criteria we identified in our methods (whose experiences or history are distinct from the dominant culture within 10 miles of the proposed Project. Members of this community include persons whose African-descended ancestors were enslaved for agricultural labor (tobacco plantations) in Pittsylvania County, and who retain strong ties and community networks that were formed in the county post-Emancipation and persist through today.

This community is dispersed throughout Chatham and the broader census tracts within our radii of analysis, but literature reviews, reviews of current local media, and interviews indicate that many generational African-American community members have current or ancestral connections to Blairs, Virginia [46] [47] (also "the Blairs"), a community within the larger Chatham-Blairs Election District[48] that is located approximately 14 miles south of proposed Station.

Interviews Conducted & Plans for Further Outreach

Between June 22 and continuing through August 31, 2020 we conducted two types of interviews: (1) interviews with members of the identified Indigenous communities native to this *amanīnechi*; (2) interviews with non-Indigenous community members resident within a 10-mile radius of the proposed Lambert Compressor Station. We interviewed community members, asking them to share their opinions and experiences regarding potential or actual impacts of the proposed Station.

Response Rate

We sent recruitment emails either directly or through website contact forms to 264 individuals or organizations who are living or working within Pittsylvania County, with a primary focus on those within a 10 mile radius of the Lambert Compressor Station. Of those emails, thirteen (13) responded, and six (6) resulted in extensive interviews – a response rate of 4.9% and a completion rate of 2.3%.

We also sent messages of recruitment to twelve (12) individuals and six (6) organizations via Facebook Messenger, and posted recruitment messages in four (4) additional Facebook Groups. These contacts resulted in 14 responses and 10 interviews – with a response rate of 67% for individuals, 0% for organizations, and 50% for Groups.

Our response rates for email recruitment were expectedly low, and aligned with prior published research on response rates for recruitment of this type (rates varied between 2% and 5% in one

[46] Virginia Department of Historic Resources. "071-5820 Southside High School" (2020).

study,[49] and up to 6.1% in another[50]). Our data and analyses are based solely on desktop information and these interviews with the resulting limitations.

Plans for Further Outreach

Outreach and inquiry will continue through September 2020 to members of impacted Indigenous communities, members of the African-American Freedmen descendant community, individuals who live within the 10-mile radius of the proposed Station, and organizations whose primary scope of activity overlaps the maximum 10-mile radius.

Participants were invited to participate in 30-minute interviews by phone or over Skype (or other appropriate online platform). The interviews had an expected duration of 30 minutes, with a maximum duration of 1.5 hours. Participants were identified through targeted research and snowball sampling methods, and invitations were extended by email, through website contact forms, or through the Facebook Messenger service (for the latter, this form of contact was only used when public pages were available for contact; no friend requests were made in order to access communication privileges through these means).[51]

Interview questions were guided by the parameters listed above, and asked participants to reflect on their experiences in their immediate surroundings, including the ways in which they use the landscape; their sense of place in relating to the landscape; any cultural practices or community rituals undertaken within the landscape; what they know already about the proposed Station; whether they anticipate any points of conflict between the Station and their communities; whether they anticipate any points of mutual benefit between the Station and their communities; what their attitudes are toward Mountain Valley Pipeline, LLC, the executor of the project; and what their attitudes are toward energy infrastructure in the United States, overall.

Due to the extremely sensitive nature of the project, the interviews we conducted are confidential, although they were not anonymous (both the interviewee and the interviewer remained aware of each other's identities), and were digitally recorded only when interviewees consented to recording. Any recordings are stored on a password-secured hard-drive, and have only been made accessible to the interviewer/interviewee pair (and a translator, if one was needed).

Respondent Data

From the respondents, we gathered the following preliminary information. Where possible, we have identified whether the impacts are the result of the Station or the pipeline. This discussion

of impacts is based on the interviews and reflects concerns of the community. The discussion does not indicate the likelihood of the impacts occurring or whether they will occur at all.

General Opinions on the Proposed Project

Relating to Energy Infrastructuring, Overall

In general, our respondents were not opposed to energy infrastructure overall, but expressed concerns about exclusion from planning processes and possible poor siting of infrastructure. Concerns further expressed below were specific to Mountain Valley and the Project. Where possible, comments relevant to the compressor station were identified as such.

Relating to the Proposed Compressor Station

A majority of our respondents were not familiar with the proposed Station, but of those who were familiar, a majority of non-Indigenous respondents expressed comfort with the proposed location, citing its proximity to another existing Compressor Station (the Transco Station, owned by Williams) and appreciated Mountain Valley's use of existing corridors and already-impacted landscapes. A majority of Indigenous respondents, who were focused on landscape-scale issues, expressed no opinion on the proposed Station, but expressed significant discomfort with the proposed pipeline, citing concerns about the risk of further degradation of community health, as well as ecosystem and water quality associated with this Project as part of the larger Mountain Valley Pipeline system.

Relating to Mountain Valley

All respondents expressed some level of discomfort, distrust or skepticism about the Mountain Valley Pipeline or its parent companies. Level of distrust varied, with responses varying from expressing oppositional distrust (i.e. "I will never work with Mountain Valley Pipeline; all they care about is money,") to pragmatic skepticism (i.e. "They're an oil & gas company, and I think they might make some mistakes while they're trying to do their jobs.") Distrust was especially high among respondents with more years of experience in either energy & environmental planning/advocacy, or in historical/archaeological preservation. Distrust was also high among Indigenous respondents. Distrust was lower among both Indigenous and non-Indigenous respondents who currently worked in fields related to construction, engineering, or transportation.

Parameters of Community Impact -- Non-Indigenous

Community members interviewed within the 10 mile radius of the proposed Station anticipated highly localized impacts as a result of the construction and operation of the Station.

The focus of these comments was on perceived potential indirect impacts related to traffic and real estate values, and on physical operation of networked community providers such as churches and other faith institutions, childcare providers, food banks and community gardens, fire & emergency services, libraries and other free education support providers, and community support non-profits such as the Boys & Girls Club, Lions Club, and fraternity/sorority service groups.

Broadly, non-Indigenous respondent comments split into three domains:

Domain 1 – Critical Service Provision

This domain included concerns about impacts on critical service provision, including the operation of food banks and childcare facilities that might be disrupted, either permanently or temporarily due to construction or operation activities (as listed above).
Respondents also cited investments that Mountain Valley had already made into the community surrounding the proposed Station as reasons to anticipate future benefits ("I think they are good stewards of the community. They have always been very receptive to help fire and rescue. Always been open about issues.")

Impacted Provider	Anticipated Impact
Child Care & Senior Facilities	***Direct:*** Facilities could be forced to move as a result of land use changes, noise, or reduced air quality that impeded their ability to operate.
	Indirect: Facilities could be impacted by disruptions in already-weak internet capacity as a result of reduced bandwidth due to additional Mountain Valley burdens or use.
	Cumulative: This could result in economic consequences (lost wages due to needing to stay home, additional costs of differing child care, additional transportation costs) for households with children or elderly adults requiring care.
Churches	***Direct:*** Could be forced to move as a result of land use changes, noise, or reduced air quality that impeded their ability to operate.
	Indirect: Movement or shifting of churches could result in loss of social cohesion and community identity, as well as reduced community wellbeing. Churches could be impacted by disruptions in already-weak internet capacity as a result of reduced bandwidth due to additional Mountain Valley burdens or use.
Food Banks & Community Gardens	***Direct:*** Could be forced to move as a result of reduced water or soil quality as a result of land use changes, or catastrophic failures in the Compressor Station or pipeline.

	Could be forced to move as a result of land use changes, noise, or reduced air quality that impeded their ability to operate. - Large spaces at low cost are often a necessary part of food bank storage + management; this can orient toward cheap real estate in marginal locations relative to town centers, which is also the type of real estate sought by large infrastructure projects - Food banks experience costs related to the distribution of food to communities in need; these costs can be increased as a result of local traffic or infrastructure changes
	Indirect: Negative impacts on food banks and community gardens could result in loss of social cohesion and community identity, as well as reduced community wellbeing
	Cumulative: Could experience secondary impacts due to loss of capacity by churches or community service groups (*see above*)
Fire & Emergency Services	***Direct:*** Additional burden, cost, or risk incurred as a result of temporary increases in traffic, local population, and/or potential protests or Mountain Valley conflicts with protestors. Additional risk and cost incurred as a result of a catastrophic failure of Compressor Station Additional risk and cost incurred as a result of catastrophic failure of pipeline leading to/from Compressor Station
Community Service Groups	***Direct:*** Could be forced to reduce or change activities (e.g. outdoor recreation activities, gatherings) as a result of land use changes, noise, or reduced air quality that impeded their ability to operate
	Indirect: Could be impacted by disruptions in already-weak internet capacity as a result of reduced bandwidth due to additional Mountain Valley burdens or use

Domain 2 – Safety & Policing

Respondents – particularly respondents of color – expressed concerns about over-policing in relation to the proposed Project, and several respondents cited specific examples of

harassment by security forces presumed to be working for Mountain Valley, including incidents where they were followed, surveilled, or verbally harassed after getting too close to a construction site (the respondent expressed that this had been an act purely of curiosity, and had not been part of any protest action); surveying regions near the pipeline site for uncovered Indigenous artifacts as part of a group interested in archaeology; or attending a protest at a construction site.

Respondents also expressed concerns about immediate safety and emergency response, should a catastrophic failure of the Station or pipeline occur.

Impacted Domain	Anticipated Impact
Policing	***Direct:*** Overzealous policing on part of private security of Mountain Valley, or by local police on behalf of Mountain Valley could pose physical or legal dangers to community members* through abusive and unnecessary arrests/detention ***Particularly acute dangers could be posed to African-American community members, due to nationwide, systemic biases in policing & justice that disproportionately impact Black, Indigenous, and People of Color (BIPOC) community members
Emergency Services, Health & Safety	***Direct:*** Catastrophic failure of the Station could create immediate physical risk to residents (e.g. of fire, explosion), as well as chronic physical risks (e.g. contaminated air, water, or soil).
	Indirect: Stress of risk could create psychological anxieties for residents living within the fenceline.

Domain 3 – Recreation, Landscape & Way of Life Preservation

Respondents expressed a desire to limit or avoid negative impacts to the rural landscape or way of life as a key point of concern about energy infrastructure construction, in general ("[Where I live], it's very rural, very calm. A good, healthy place to live.").

However, respondents also noted that there are minimal recreation opportunities in the immediate Station area, and expressed concern that pipeline construction might further reduce those opportunities by making some areas previously used for recreation (either formal or informal) unsafe or unavailable for use.

Impacted Domain	Anticipated Impact

Outdoor Recreation Sites or Opportunities	***Direct:*** Access to outdoor recreation could be reduced as a result of land use changes, noise, or reduced air quality
Landscape & Way of Life	***Direct:*** Could experience ruined views/landscapes, reduced access to hunting + fishing opportunities, or other diminishments of rural way of life as a result of land use changes, noise, or reduced soil or air quality Could experience sick animals/impacts on local agriculture as a result of land use changes, noise, or reduced soil or air quality

Parameters of Community Impact – Indigenous

First and foremost, Indigenous community members consistently expressed disappointment and frustration that Mountain Valley had not previously conducted appropriate or authentic outreach to their communities, and cited multiple failures and missed opportunities for in-depth communication.

Overall, Indigenous community members expressed broader landscape-level concerns about the well-being of the natural environment related to the proposed pipeline than did non-Indigenous community members. Indigenous communities living across the United States and within interior Indigenous Sovereign Territories ("Indian Country"[52]) retain uniquely enduring, multivariate, intensive, and well-documented relationships to the broad land bases which they have historically stewarded, used, or occupied.[53] [54] [55] [56] [57] For this reason, interviews with Indigenous community members often included information, assessments of concern, or references to regions outside of our 10-mile maximum analytical radius. We nevertheless included this information in our reported findings, with parenthetical notes to suggest where the interviewer had marked such information as being related to issues within the 10-mile radius (notation: "Station") or outside of it (notation: "Project").

[57] National Museum of the American Indian. "IndiVisible: Native-African Lives in the Americas." (Accessed September 3, 2020) https://americanindian.si.edu/exhibitions/indivisible/land.html

Indigenous community members identified concerns relating to the preservation of cultural artifacts in the face of soil disruption; their opportunity to connect with ancestral and sacred places, potential negative impacts on the continuity of cultural and linguistic practices including visiting sites of importance in the region, and potential negative impacts on intertribal interactions, including increased antagonism due to differential compensatory schemes for impacts felt by federal and nonfederal tribes.

Broadly, Indigenous respondent comments split into the following four domains:

Domain 1 – Landscape, Artifacts, & Sense of Place

All Indigenous respondents identified or referred to a strong sense of place that extended beyond the immediate region of the Station, across the full breadth of the ancestral homelands or historic territory of their individual tribe and related tribal communities ("Looking out on the land, across the creeks and woods, you feel connected to that. The more disruption, that definitely affects your perception of your surroundings and yourself. It's like losing a part of yourself.").

All respondents identified specific risks to the ecological landscape from the pipeline rather than the station – in particular, to water quality and to water access for both utilitarian and ceremonial purposes (e.g. "the women need the [river] water for their ceremonies"). Concerns were raised about both construction and to operation, and in particular about potential catastrophic leakage ("Inevitably, these pipelines seem to leak. It's just a matter of time." "If there's a leak, it's going to impact the water…"), and a perceived lack of accountability ("If there's a leak, who's going to pay for it?").

All respondents also identified specific and severe risks to the archaeological-historical landscape ("There are untouched archaeological sites here…thousands of years of culture."), and the risk that the loss of critical archaeological artifacts might pose to a better understanding of their own cultural history ("Each site is a page in a book, a chapter of our history, and each time one is disturbed, a great deal of information is lost.") Some respondents cited specific failures of Mountain Valley to appropriately identify, transport, or protect artifacts previously uncovered ("I've seen them rotting away in bags in some basement."), as well as a failure to inform private landowners of the option/opportunity to turn found artifacts over to tribal preservation officers or designated safekeepers.

Impacted Domain	Anticipated Impact
Landscape (**Station**)	***Direct:*** Could experience ruined views/landscapes, reduced access to hunting + fishing opportunities, or other diminishments of rural way of life as a result of land use changes, noise, or reduced soil or air quality Could jeopardize continuation of cultural practices made meaningful by being contextualized in landscape (e.g. ceremony reliant on an unimpeded view of specific valleys and sacred places along ridgetops)
Ecological Integrity (*Project*)	***Indirect:*** Could experience water or soil contamination that prohibits direct human use for ceremonial or practical purposes; due to the cultural connection between water and women's ceremonies, this particularly impacts Indigenous women
	Cumulative: Could experience reduction in ecological functioning due to air, water or soil contamination that leads to loss of plant or animal species of practical (e.g. as food, medicine, or for physical elements in art or craftwork), spiritual (e.g. for ceremony), or cultural importance Could experience a reduction in ecological functioning due to water or soil contamination that violates ability of Indigenous communities to engage in traditional land use practices or stewardship
Archaeological Artifacts (**Station** & *Project*)	Artifacts could be unearthed on privately-owned or MVP-owned land during the construction phase and lost, broken, or mishandled in ways that violate cultural norms and spiritual ceremonial practices (esp. regarding reburial) Human remains could be unearthed on privately-owned or MVP-owned land during the construction phase and lost, broken, or mishandled in ways that violate cultural norms and spiritual ceremonial practices (esp. regarding reburial) Artifacts of unusual or delicate construction could be overlooked or inadvertently harmed by land disturbance processes

	Indirect: Language restoration efforts could be harmed by artifact destruction or losses Efforts toward federal acknowledgement for nonfederal tribes, or historical community acknowledgement of tribal continuity in place, could be harmed by artifact destruction or losses

Domain 2 – Identity, Livelihood & Sense of Community

Approximately a third of our seven Indigenous respondents expressed concerns about direct impacts on the livelihood of Indigenous community members in the impacted regions, particularly for those engaged in work related to construction or farming. For the former, anticipated impacts included potentially beneficial, but ultimately short-lived and dangerous employment; for the latter, concerns related to negative impacts on water quality and soil quality as a result of potential chemical contamination.

One respondent also expressed a general concern about negative impacts on identity as a result of physical-psychological division created by the pipeline ("We cross over these pipelines to get to one another"), which could exacerbate intertribal separation and harm to Indigenous communities.

Other respondents, particularly female respondents, expressed concern about the use of non-local workers for the construction and operation of the pipeline, citing increased violence against Indigenous women that had tracked with oil & gas construction projects in the western United States, and pointing out that the Southeastern Indigenous women face unique additional risks, due to endemic biases that fail to accurately record or investigate cases of missing and murdered Indigenous women.[58]

Impacted Domain	Anticipated Impact
Safety (**Station**)	***Direct:*** Indigenous women's safety could be put at risk due to influx of out-of-state or nonlocal workers, similar to the 'man camp' phenomenon; this is particularly acute because Indigenous women in the southeast already experience reduced reporting and investigation of violent crimes

[58] "Murdered And Missing Indigenous Women: Advocates Say NC Law Enforcement Ignores The Problem." (May 8, 2020). https://www.wunc.org/post/murdered-and-missing-Indigenous-women-advocates-say-nc-law-enforcement-ignores-problem

	Over-policing could put community members at risk, particularly community members who are of mixed African-American and Indigenous heritage
Livelihood (*Project*)	***Direct:*** Job opportunities arriving with the pipeline could be insecure and short-lived, and could weaken economic security for tribal members working in construction, transportation, etc.
	Indirect: Farmers could experience sick animals/impacts on local agriculture as a result of land use changes, noise, or reduced soil or air quality
Identity (**Station** & *Project*)	***Direct:*** Potential interruption of continuity of cultural practices or seasonal ceremonies as a result of impeded or impaired water bodies or local ecosystems
	Indirect: Potential loss of sense of self because of loss of familiar landscapes
	Cumulative: Potential reduction in intertribal unity as a result of new impediments to travel, contact, or psychological continuity of people in the landscapes

Domain 3 – Language & Governance

All Indigenous respondents identified potential risks to governance and language related to the proposed Project, which split into two subcategories of concern.

The first set of concerns were about language preservation, expressed as an urgent concern based on the fact that the Yesàh community is in the midst of a grassroots language revival effort (i.e. the Haliwa-Saponi Historic Legacy Project, and others), and that the delicate, critical process of relearning and contextualizing words in Yesànechi might be inhibited by drastic changes to the landscape. This had two components: (a) that the Station or the larger MVP construction might negatively impact archaeological sites which might hold evidence of material artifacts of communication (particularly any artifacts that might be of fragile construction but could hold critical communicative information or record-keeping); and (b) that the project might result in the permanent loss of landscape features critical to understanding past records of the language (e.g. a word meaning “the color of X fish when it’s swimming in Y river” ceases to have meaning if that fish disappears and that river is diverted).

One respondent also expressed a general concern (which relates to Domains 1 and 2 as well) about physical-psychological division as a result of the pipeline (“We cross over these pipelines to get to one another.”), which could exacerbate intertribal separation and harm to Indigenous communities.

Impacted Domain	Anticipated Impact
Language (**Station** & *Project*)	***Indirect:*** Language restoration efforts could be slowed or stopped by losses of artifacts; particularly any artifacts that might be of fragile construction but could hold critical communicative information Language restoration efforts could be slowed or stopped by changes in the contextual environment that made deciphering past texts more difficult (i.e. linguistic meaning that relies on relative landscape markers)
Intertribal Relations (**Station** & *Project*)	***Direct:*** Introduction of cash subsidies or cash payments could trigger intertribal conflict, particularly if these are unevenly received

Domain 4 – Spirituality, Ceremony & Traditional Knowledge

All of our Indigenous respondents identified specific impacts on spirituality, ceremony, and traditional knowledge that would be related to the Station. These included the loss or destruction of plant or animal species critical to traditional medicine; the disturbance of ancestral burial sites or remains without opportunity for ceremony or reburial; and the loss of access to clean water for ceremonial purposes ("When you want to connect, go down and touch the water. The water runs through all these areas and connects all things.")

Impacted Domain	Anticipated Impact
Ceremonial Practices (*Project*)	***Direct:*** Potential inability to use the water for essential ceremonies because of contamination and dangers to human health Potential inability to use sacred plant medicines for essential ceremonies because of contamination and dangers to human health
Traditional Knowledge (*Project)*	Potential inability to collect traditional medicine plants because of soil contamination Potential inability to hunt and fish in traditional ways, either because of environmental degradation or species loss

	Potential inability to use traditional animal medicines because of contamination due to air pollution, soil or water contamination

Distributive Expectations – Non-Indigenous

The following distributive expectations solely reflect discussions had during the interviews, and do not represent any existing agreement between Mountain Valley and any community member or entity. Non-Indigenous respondents generally identified mitigation or remediation that was highly localized, and supported existing community services or structures.

Recommendations for each domain included:

Domain 1 – Critical Service Provision

a) Additional donations to support critical service providers in the immediate Station area and nearest towns, including Chatham, throughout the period of construction and after initial operation begins
b) Willingness to avoid construction in or around areas currently used for critical service provision
c) Maintaining current investment practices to support local civic needs & organizations, including community colleges, fire & rescue services, community service groups, etc.

Domain 2 – Safety & Policing Provision

d) Intentional training of security forces to reduce conflict with local community members and avoid contributing to the over-policing of low-income, African-American, and Native American community members
e) Employment of mediators or Community Liaisons with authority to speak on behalf of Mountain Valley to de-escalate conflicts between security forces, employees, and local community members

Domain 3 – Recreation, Landscape & Way of Life Preservation

f) Donations to support the establishment or formalization of localized recreation opportunities, including low-cost options and green/open space recreation such as sports fields
g) Willingness to avoid construction in or around areas currently used for recreation
h) Thoughtful avoidance of impactful activities that could create negative impacts on the rural landscape and way of life; hiring practices that support local benefit via jobs and job training opportunities

Special Note -- African American Freedmen Descendants

In addition, although our community survey identified an extensive and continuous African-American community composed of Freedmen descendants, we were unable to interview any members of that community for this report. We strongly recommend that outreach continue until the needs and concerns of that community are explicitly understood.

In the meantime, we were made aware of an opportunity for Mountain Valley to initiate outreach to members of the community by:

i) Making a donation in support of the proposed African-American Leaders Memorial, to be sited in downtown Chatham.[59]

Distributive Expectations – Indigenous

Similar to the discussion of impacts, Indigenous respondents' discussion of distributive expectations focused broadly on the larger Project, and were not restricted to the proposed Station. The primary concern for almost all Indigenous respondents was that Mountain Valley be willing to divert its pipeline route in response to the discovery of sensitive artifacts or remains, as well as in response to notification from tribal leadership of sensitive cultural or historical sites – and that Mountain Valley be willing to act in good faith to assist tribes in acquiring uncovered artifacts or human remains (even if these were held by private landowners) so that such artifacts or remains could be protected, appropriately honored, and if appropriate, reburied in alignment with cultural beliefs around land, ancestors, and sanctity.

The second pressing concern for almost all Indigenous respondents was acting to ensure the continued wellbeing and functioning of the ecological systems essential for economic and cultural survival in the domains of livelihoods, traditional knowledge practices around food and medicine, spirituality and ceremony, and craft.

Indigenous respondents generally did not believe that any financial act could compensate for the harm caused to landscapes by major infrastructure projects conducted without appropriate consultation with local Indigenous communities – and all felt strongly that Mountain Valley Pipeline had not completed sufficient outreach to Indigenous communities before pipeline construction began. However, in light of the fact that Mountain Valley had already completed a significant portion of construction and impacts had already been felt by communities, respondents suggested mitigation or remediation that impacted the immediate Station, as well as the broader Project.

In addition, concerns related to intertribal relations and governance were particularly acute for the nonfederal tribal members surveyed. In this case, respondents expressed a worry that Mountain Valley might propose cash settlements with only some tribes of the region, exacerbating tribal divisions and augmenting inequality across differential statuses (i.e. federal

[59] "Fundraising begins for monument in Chatham to honor African American leaders." August 10, 2020. ABC13 News. Available online: https://wset.com/news/local/fundraising-begins-for-monument-in-chatham-to-honor-african-american-leaders

tribes might receive funds while nonfederal tribes would not). In doing so, respondents expressed that Mountain Valley would be exploiting community vulnerabilities first created by the federal government's unequal treatment of Indigenous peoples east of the Mississippi River, and doing significant harm to intertribal unity and the overall well-being of Indigenous peoples in the region ("Money triggers fighting." "There's a groundswell in reconnecting & healing past divisions…we are at the precipice of making some big progress [in intertribal unity].").

Further, respondents stated that compensation for past or ongoing harms should come in forms directly related to the harm done (e.g. land preservation to compensate for land damage and loss) and should last as long as the pipeline continued to operate and Mountain Valley continued to benefit. The suggestions included a Yesàh Land Trust and Legal Support Fund and funding for historical markers (Domain 1), and a Yesànechi Language Research and Reformation Program (Domain 2). These proposed suggestions, which refer more closely to the impacts created by the larger pipeline construction and operation Project, are explored further in a separate document (the larger, more detailed *Mountain Valley Pipeline Community Impact Assessment & Proposed Mitigation Draft Report*). Summarized here are some suggested forms of mitigation for potential impacts resulting from the proposed Station.

Domain 1: Landscape, Artifacts & Sense of Place

j) Provide direct financial support to existing tribally-led efforts toward the preservation of historical artifacts and material culture (e.g. the Monacan Museum; the Haliwa-Saponi History Legacy Project)
k) Establish an endowment for a Yesàh Archaeological Preservation, Crafts & Language Revitalization Program at a major university (chosen collectively by a communal body comprising representatives of each impacted tribe or community identified in this report) with the space and capabilities to archive materials under the best available preservation measures, while ensuring dedicated space for study + continued access by tribal preservation officers, spiritual leaders, or designated tribal safekeepers.
l) Establish a process to work with private landowners to encourage/incentivize the donation of artifacts uncovered during Project or pipeline construction to tribal preservation officers or designated safekeepers; or to the above-described Preservation Program to prevent artifact loss or destruction.
m) Provide direct financial support to forefronting Indigenous narratives in existing historic areas and public history markers, including around Bear Mountain; Amherst, VA; Occaneechi State Park; Fort Christanna Historic Site, and others.

Domain 4: Employment & Education

In this domain, the suggested activity included:

n) Support local economies and employment in all hiring practices and processes; prioritize local employees over out-of-state or nonlocal hires, and create training programs to move local employees into management positions.

o) Provide supportive funds to Indigenous students enrolled in local engineering, environmental science, geosciences, law, or other related programs

Discussion & Interpretation

Geospatial Baseline Data

3 Mile Fenceline Buffer

Based on the broad definitions of the Virginia Environmental Justice act, all census tracts within a 3-mile fenceline buffer are considered environmental justice communities. The vulnerability of these communities to disproportionate negative impacts will require special consideration in the planning and siting process that is sensitive to the needs and concerns of the communities. We recommend that Mountain Valley identify and plan to avoid or mitigate any disproportionate impacts resulting from compressor station construction and operation to domains of culture and lifeways, as well as to community health, food access, and critical service provision.

5 Mile Buffer

Our results at the 5-mile buffer did not differ from our results at the 3-mile buffer. All census tracts within a 5-mile radius are considered as environmental justice communities, and therefore require consideration in the planning and siting process.

10 Mile Buffer

All census tracts within a 10-mile buffer also met the criteria to be considered as environmental justice communities. Again, our recommendations are consistent across all radii.

Qualitative Interview Data

Non-Indigenous Communities

The impacted communities within the 10-mile buffer of the proposed Project were generally positive in orientation toward the proposed Project, but clearly identified key concerns and needs in specific domains, and had clear ideas of their distributive expectations and potentially valuable mitigations.

African-American Communities

As stated above, although we identified a present and thriving African-American community, many of whom are descendants of the original Freedmen families who labored as enslaved persons in Pittsylvania county prior to Emancipation (and are connected to the current Blairs, Virginia community), our outreach did not result in any interviews specifically with members of that community for this report.

Indigenous Communities

Because of their unique tie to land and place, Indigenous communities were considered separately and over a broader geographic region than non-Indigenous communities, and a single impacted diasporic community (Yesàh) was identified, which included two (2) federal and

five (5) nonfederal tribes; nonfederal tribes included a mix of three (3) state-recognized tribes and two (2) tribal communities acknowledged or identified by members of the federal and state recognized tribes as holding legitimate Indigenous identities through kinship ties and cultural practices.

Indigenous community members similarly identified key concerns and needs in specific domains, and also clearly identified distributive expectations and potentially valuable mitigations.

Conclusion & Recommendations

We have identified multiple communities throughout Pittsylvania County who meet the criteria for designation as Environmental Justice communities, and whose members report or anticipate perceived potential negative impacts as a result of the proposed Project. We have further identified multiple Indigenous communities, connected in a single cultural-linguistic diaspora (the Yesàh), whose ancestral and current homelands are impacted by the pipeline portion of the Project. These Indigenous communities not only meet the criteria for designation as environmental justice communities, but further possess a unique relationship to the land, and require additional, intentional, and thoughtful engagement and distributive compensation as a result of that unique relationship.

A distributive justice framework demands that communities bearing the greatest environmental or social costs should also receive greatest compensation for those costs. By choosing to engage with us and our work within this framework, Mountain Valley has a unique opportunity to set new industry precedents for community investment and outreach, and to establish best practices of corporate social responsibility that will contribute to, rather than diminish, the agency and well-being of communities – particularly vulnerable communities – throughout the regions in which it operates.

The new best practices would include ecological restoration and minimization of impact, and would also include specific culturally protective/preventative actions within regions of operation. Some of these actions include:

- Early, intentional, and respectful consultation with Indigenous communities tied to the language-territory (*amainechi)* in which any project takes place, including consultation with communities holding varying statuses of acknowledgement (i.e. both federal and nonfederal);
- Specific outreach to and consultation with African-American communities, who have been disproportionately affected by past exploitative energy and manufacturing projects, and who have historically been at the forefront of efforts pushing for greater environmental justice & fairer outcomes for all people;
- Coordination with local health services to ensure health care is made available to communities suffering potential health impacts, as well as to communities with pre-existing vulnerabilities.
- Ongoing consultation with communities and community researchers to identify any emergent points of concern and address them quickly, and with a distributive justice framework in mind.
- Sponsored education opportunities for impacted communities, with additional investments placed in communities made vulnerable by economic status, rurality, or ethnic identity; and
- Hiring practices that support local economic development and broader opportunities.

Informed Consent

INFORMED CONSENT
Lambert Compressor Station Community Impact Assessment

PURPOSE: You are being asked to participate in an interview for a Community Impact Assessment of the Mountain Valley Pipeline's proposed Lambert Compressor Station project. The purpose of this project is to elevate marginalized voices from the frontlines of environmental shifts, and to identify the ways in which energy infrastructure is directly impacting black, indigenous, and POC communities. We especially focused on indigenous communities as these voices are often missing in the energy infrastructure conversation.

MVP is currently planning to submit a request for additional permits to Virginia DEQ, and I intend to submit this report as part of a package describing where they have caused harm or may potentially cause harm, and what they need to do to correct it.

PROCEDURES: If you choose to participate in this interview, Alexa Lawrence will schedule a one-hour interview with you. Interviews may be conducted by phone or by Skype/Google Hangouts/Zoom. In the interview, you will be invited to talk about the ways in which you think about and experience the place where you live, and whether you have any concerns or expectations about ways - positive or negative — in which the MVP might impact yourself or your community. The interview is guided by eight key questions, but you should feel free to share anything you'd like in our conversation. We expect that the interview will take approximately 45-55 minutes to complete.

RISKS: The risks associated with this engagement are minimal and are not greater than risks ordinarily encountered in daily life. Storytelling can be deeply personal and can result in your story being published in the public sphere. For that reason, I will work closely with you to ensure that your words are accurately represented and are not manipulated or used to cause harm to you or any member of your community.

BENEFITS: No economic benefit can be promised to you from your participation in this project; however, your words will be used to shape suggested actions in support of remediation, mitigation, or compensation to communities impacted by the proposed Lambert Compressor Station or the Mountain Valley Pipeline project.

ALTERNATIVES: Participation in this interview is voluntary. You are free to choose not to participate. You may also choose to retract your consent to participate in this interview at any time. Your desire not to participate in this interview or your request to withdraw will have no adverse effects on you or your relationship with Alexa or Land & Heritage. Participants are also free to remove approval of proceeding with the story at any time.

COSTS/COMPENSATION: There are no costs, nor is there any compensation offered for participation in this project.

CONFIDENTIALITY: This interview is confidential, although not anonymous (both the interviewee and the interviewer are aware of each other's identities). However, no information

about you, nor any statement you make, will be made public in any way, or presented in a way that is personally identifiable. Anonymized quotations illustrating broad themes retrieved from interviews may be used in the final report, but you will be contacted for your consent prior to the submission of a final report to VA DEQ.

RECORDING: The interview will only be recorded at the written or verbal request of the interview participant. Audio recordings, if made, would be used for the sole purpose of transcribing interviews for analysis, and would not be published or made public in any way. Interviewees have access to the recording at any point if desired. Any recordings are stored on a password-secured hard-drive, and will be made accessible only to the interviewer/interviewee pair (and a translator, if one was needed).

RIGHT TO WITHDRAW: Your participation is voluntary; you have the right to withdraw or to skip any questions at any time.

OTHER PERTINENT INFORMATION: The interviewer will answer any questions you may have about the project. You may feel free to keep a copy of this consent form. If you have any questions after completing the interview, please contact Alexa Lawrence at alexa@landandheritageconsulting.com.

PARTICIPATION: Please be sure you have read and understood the above information. If you would like to participate in this project, please either state your agreement, or send your signed agreement by email.

Recruitment Email

Hello!

I'm Alexa Lawrence, a Community Relations Advisor at Land & Heritage Consulting, and I'm reaching out to inquire about your perspective and opinion on the planned Lambert Compressor Station, which would be a portion of the Mountain Valley Pipeline's Southgate Extension.

I'm writing with a brief request -- would you be available for a 30-minute Skype or phone interview with me to talk about the proposed Lambert Compressor Station project, which is planned to take place in your area?

As proposed, the Lambert Compressor Station would be part of the MVP Southgate project, a natural gas pipeline system that would span approximately 72 miles from southern Virginia to central North Carolina. The Lambert Compressor Station would be located approximately five to ten miles east of Chatham, in Pittsylvania County, Virginia.

My colleagues and I at Land & Heritage have been asked by EquiTrans Midstream to conduct a Community Impact Assessment. We are not employed by Mountain Valley Pipeline, nor any of its subsidiaries. Our outreach is intended to uncover any potential concerns or risks, or threats to communities located near the proposed project, as well as any potential benefits or opportunities these local communities might anticipate receiving.

As Mountain Valley Pipeline continues to move forward in the planning process for the Lambert Compressor Station, my staff and I are working quickly to complete our assessment of how local communities — including yours — might be impacted by the project.

The information you share with us will be kept confidential and will not be made public although the accumulated findings of our report (with any individual responses made anonymous) will be made public and will be shared with Mountain Valley Pipeline, appropriate regulatory agencies such as the Federal Energy Regulatory Commission and the Virginia Department of Environmental Quality.

In order to better understand the potential impact of this project, we are collecting individual and organizational interviews that ask:

1. How do you think about the landscape in which you currently live? How do you use the places around you, and what meaning does your home place hold for you?
2. Are there any thoughts, questions, or concerns that you (or members of your community) have about energy development, or its associated construction in your area?
3. Are there any thoughts, questions, or concerns that you (or members of your community) have *specifically* about the proposed Lambert Compressor Station? How much do you know about the project?
4. Are there any conflicts or negative impacts you are concerned might impact you or your community as a result of the proposed Lambert Compressor Station or the Mountain Valley Pipeline?
5. Are there any needs in your community that you are hoping that the proposed Lambert Compressor Station, or the parent companies of the Mountain Valley Pipeline could address?

If you are willing to share your thoughts, **we'd like to schedule a 30-minute phone call with you anytime before August 31, 2020.** We'll be conducting phone calls M - F, from 9 am to 6 pm, so if you'd be willing to speak with us, simply reply to this email with a time best suited to your needs. I totally understand if this is a busy time of year for you — please know that we are eager to hear your thoughts, but respectful of your time.

Land & Heritage Consulting is committed to identifying ways in which we can advocate for corporate entities to be better neighbors and to protect local communities, local justice, and the growth of local economies. By agreeing to share your thoughts with us, you'll be helping us to drive creative solutions to the challenges of compressor station construction — and speaking up for the safety and well-being of the people and places that you love.

If you are not able to speak with us, but know someone else in your community who can -- please feel free to forward this email to them; we'd be happy for them to get in touch.

Best,
Alexa

Interview Protocol – Lambert Community Members

INFORMED CONSENT

PURPOSE: You are being asked to participate in an interview for a Community Impact Assessment of the proposed Lambert Compressor Station, part of the Mountain Valley Pipeline Southgate Extension project. The purpose of this project is to elevate community voices from the frontlines of environmental shifts, and to identify the ways in which this energy infrastructure project may directly impact local communities.

MVP is currently planning to submit a request for additional permits to Virginia DEQ, and I intend to submit this report as part of a package describing where they have caused harm or may potentially cause harm, and what they need to do to correct it.

PROCEDURES: If you choose to participate in this interview, one of the members of the Land & Heritage team will schedule an interview with you. Interviews may be conducted by phone or by Skype/Google Hangouts/Zoom/Facebook Messenger. In the interview, you will be invited to talk about the ways in which you think about and experience the place where you live, and whether you have any concerns or expectations about ways - positive or negative — in which the MVP might impact yourself or your community.

The interview is guided by three key topics, but you should feel free to share anything you'd like to in our conversation. We expect that the interview will take approximately 30 minutes to complete.

RISKS: The risks associated with this engagement are minimal and are not greater than risks ordinarily encountered in daily life. Storytelling can be deeply personal and can result in your story being published in the public sphere. For that reason, I will work closely with you to ensure that your words are accurately represented and are not manipulated or used to cause harm to you or any member of your community.

BENEFITS: No economic benefit can be promised to you from your participation in this project; however, your words will be used to shape plans for remediation, mitigation, or compensation to indigenous communities from MVP.

ALTERNATIVES: Participation in this interview is voluntary. You are free to choose not to participate. You may also choose to retract your consent to participate in this interview at any time. Your desire not to participate in this interview or your request to withdraw will have no adverse effects on you or your relationship with Land & Heritage, Alexa Sutton Lawrence, or MVP. Participants are also free to remove approval of proceeding with the interview at any time.

COSTS/COMPENSATION: There are no costs, nor is there any compensation offered for participation in this project. Neither Land & Heritage nor MVP will be benefiting monetarily from your interview. This means your story or parts of your story would not be used for the purpose of fundraising, donation seeking, or grant proposals to benefit Land & Heritage or MVP.

CONFIDENTIALITY: This interview is not anonymous, but will be confidential: no identifying information relating to this interview will be published without the prior consent and approval of the participant.

RECORDING: Land & Heritage asks your permission to record the interview for future reference. The interview will only be recorded with the written on verbal consent of the interview participant. Audio recording would be used for the sole purpose of transcribing interview questions and would not be published. You will also have access to the recording at any point if desired.

RIGHT TO WITHDRAW: Your participation is voluntary; you have the right to withdraw or to skip any questions at any time.

OTHER PERTINENT INFORMATION: The interviewer will answer any questions you may have about the project. You may feel free to keep a copy of this consent form. If you have any questions after completing the interview, please contact PERSON WHO HOLDS THE RELATIONSHIP] at [INSERT CONTACT INFO HERE].

PARTICIPATION: Please be sure you have read and understood the above information. If you would like to participate in this project, please either state your agreement, or send your agreement by email to your primary Land & Heritage contacts, [PERSON WHO HOLDS THE RELATIONSHIP].

Self Introduction

- Who you are, what our goal is, etc. (***Same information from the recruitment email***)

Some Facts About MVP

- Venture of Mountain Valley Pipeline, LLC
- Jointly owned by EquiTrans and NextEra Energy
- Trees felled along 303.6 miles (99.9% complete)
- Pipe Strung along 266.7 miles (87.8% complete)
- Maps can be viewed at mountainvalley.info and mvpsouthgate.com

About the Interview Process

Who Is Being Interviewed – In Case Asked

Community members residing (or, for non-profits, working) within 5 to 10 miles of the Lambert Compressor Station.

First Question Set: General – What are your thoughts on energy development projects?

- Relating to Energy Infrastructuring, Overall
- Relating to the Proposed Compressor Station
- General Opinions on the Proposed Project
- Relating to MVP as a company

Second Question Set: Specific – What are the impacts you anticipate on these domains of Indigenous people's lives?

Are there any project-related activities that you believe may result in a markedly disruptive effect on the ability of communities within 5 to 10 miles of the proposed Lambert Compressor Station to continue in the course of ordinary cultural life due to:

1. The loss of primary features of the landscape
2. The loss or destruction of historical artifacts of cultural importance
3. Other losses or disruptions with respect to the following domains:
    - identity: the sense of belonging to a unique collective;
    - sense of place: the experience of attachment to particular places, based on shared sensory experiences, memories and stories;
    - sense of community: social networks, shared values, roles, norms of reciprocity and participation in collective events and activities;
    - spirituality and ceremony: the sense of connection to a wider force which may provide individuals with special powers and responsibilities;
    - governance: the ability to engage in decision-making for collective welfare;
    - stewardship: rules regarding resource management;
    - language: legends, stories, place names and instruction used to encode and transmit culture;
    - traditional knowledge: knowledge about the land and skills passed through generations;
    - livelihood: means of sustenance and economy; and
    - cultural continuity: the ability to engage in the same activities in the same places as ancestors did and to pass those skills and knowledges down to future generations.

Third Question Set: Justice & Fairness/Distributive Expectations

Main Question: What would justice look like for the impacts listed/mentioned above? Given that 85% of the pipeline is already built, what could or should MVP do next to start to make things right with your community?

- Conceptual Beliefs about Justice & Fairness
- Economic Benefit/Loss
- Cultural Benefit/Loss
- Infrastructural Benefit/Loss

- Other Benefit/Loss

Recruitment Messages - Lambert

Hello, [Community Member's Name]!

I'm writing with a brief request -- would you be interested in taking a short survey or conducting a phone interview with me about a proposed energy project in your area?

I'm Alexa Lawrence, a Community Relations Advisor at Land & Heritage Consulting, and I'm reaching out to inquire about your perspective and opinion on the planned Lambert Compressor Station, which would be a portion of the Mountain Valley Pipeline's Southgate Extension.

As proposed, the Lambert Compressor Station would be part of the MVP Southgate project, a natural gas pipeline system that would span approximately 72 miles from southern Virginia to central North Carolina, and would be regulated by the Federal Energy Regulatory Commission (FERC). The Lambert Station would be located approximately five to ten miles east of Chatham, in Pittsylvania County, Virginia.

Land & Heritage has been invited by EquiTrans Midstream to conduct a Community Impact Assessment. However, we are not employed by Mountain Valley Pipeline, nor any of its subsidiaries. Our assessment is intended to uncover any potential concerns or risks to communities located near the proposed project – as well as to identify any potential benefits or opportunities these local communities anticipate or enjoy.

The information you share with us will be kept confidential and will not be individually identifiable, although the accumulated findings of our report (with any individual responses made anonymous) will be made public and will be shared with Mountain Valley Pipeline, appropriate regulatory agencies such as the Federal Energy Regulatory Commission and the Virginia Department of Environmental Quality.

As Mountain Valley Pipeline continues to move forward in the planning process for the Lambert Compressor Station, my staff and I are working quickly to complete our assessment of how local communities – including yours – might be impacted by the project.

If you are willing to share your thoughts, we'd like to schedule a 30-minute phone call with you anytime before September 30, 2020. We'll be conducting phone calls M - F, from 9 am to 6 pm, so if you'd be willing to speak with us, simply reach out by phone or email with a time best suited to your needs. Alternatively, you can share your thoughts by returning the enclosed form. I totally understand if this is a busy time of year for you — please know that we are eager to hear your thoughts, but respectful of your time.

Land & Heritage Consulting is committed to identifying ways in which our clients can work with communities to be better neighbors and stronger advocate for local needs, local justice, and the growth of local economies. By agreeing to share your thoughts with us, you'll be helping us to find creative solutions to the challenges of compressor station construction — and advocating for the safety and well-being of the places that you love.

Best,
Alexa

Virginia Department of Transportation

Environmental Justice Guidelines

ENVIRONMENTAL JUSTICE GUIDELINES

VDOT Virginia Department of Transportation

Civil Rights

TABLE OF CONTENTS

I. INTRODUCTION

President Clinton issued Executive Order 12898 on February 11, 1994, which reinforces the importance of fundamental rights and legal requirements contained in Title VI of the Civil Rights Act of 1964 and the National Environmental Policy Act (NEPA). The Executive Order directs that "each Federal agency and State Highway Administration/Department of Transportation make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations". Other documents which have been issued to further clarify the Executive Order are: the US Department of Transportation's (DOT) Order on Environmental Justice, whose latest order (USDOT Order 5610.2(a) was issued May 2012; the Council on Environmental Quality's (CEQ) "Environmental Justice: Guidance Under the National Environmental Policy Act", dated December 10, 1997; and the Federal Highway Administration's (FHWA) Order on Environmental Justice, whose latest order (FHWA Order 6640.23A) was issued June 2012.

VDOT is committed to the principles of environmental justice (EJ) and is assessing and documenting the impacts of transportation projects on minority and low-income populations as a normal part of our environmental analysis efforts. A key aspect of an EJ analysis is to ensure the involvement of affected communities in the project development process. These guidelines are meant to provide Environmental, Planning, Right of Way, Location and Design, Civil Rights and any other applicable divisions (from this point forward referred to as “the project team”) with a consistent framework for both preparing an EJ analysis and developing an effective public involvement strategy. They contain only principles and general procedures, which means that the specific approach must be tailored to the unique circumstances of each project and those communities affected by it. If the procedures do not seem appropriate for a particular project, then the team should develop a more suitable approach.

The guidelines apply to projects requiring all types of NEPA documentation (Environmental Impact Statements, Environmental Assessments, Categorical Exclusions or environmental reevaluations). The identification of minority or low-income populations actually begins during systems planning by the Metropolitan Planning Organization (MPO) or VDOT's Transportation and Mobility Planning Division but is also carried out by Environmental, Location and Design and Right of Way. This information will be used and supplemented during the environmental inventory and alternatives development phases of the project development process as additional data, analysis and public input are refined. Decision-makers will be better informed about the important issues and concerns of low income and minority populations to be considered along with other factors in determining project location, design and mitigation. The EJ analysis during project development will be conducted concurrently with other technical environmental analyses during the Stage One Reporting stage.

An EJ analysis must be completed for each build alternative. Additionally, the No-Build alternative must be carefully considered as well. For example, it's possible that not building transportation improvements could impact minority or low-income populations (i.e., increased noise or air pollution, limited access to employment, etc.). A clearly written description of all EJ findings must be included in the environmental document.

II. ENVIRONMENTAL JUSTICE AND TITLE VI

The EJ Executive Order supplements the existing requirements of Title VI of the Civil Rights Act. Title VI says that each Federal agency is required to ensure that no person on grounds of race, color, or national origin is excluded from participation in, denied the benefits of, or in any other way subjected to discrimination under any program or activity receiving Federal assistance. Supplemental legislation provides these same protections from discrimination based on sex, age, and disability.

The concept of environmental justice is intended to ensure that procedures are in place to further protect groups which have been traditionally underserved. The fundamental principles of environmental justice are:

- To avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations.
- To ensure the full and fair participation by all potentially affected communities in the transportation decision-making process.
- To prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations.

The major similarities and differences between the EJ Executive Order and Title VI are described below:

SIMILARITIES	DIFFERENCES
Both address nondiscrimination. Both capture minority populations. Both are rooted in the constitutional guarantee (14th Amendment) that all citizens are created equal and are entitled to equal protection. Both address involvement of impacted citizens in the decision-making process through meaningful involvement and participation.	EJ covers minority and low-income, while Title VI and supplemental legislation cover race, color, national origin, sex, age, disability, limited English proficiency and low income. EJ is an executive order (an order of the President of the United States), while Title VI is a law (an act of Congress). EJ mandates a process, while Title VI prohibits discrimination.

A listing of existing laws and regulations addressing environmental justice and Title VI is included at the end of these guidelines.

III. DEFINITIONS

For your information, the following definitions are provided. They have been taken directly from the US DOT Order on Environmental Justice:

Low-Income
A person whose median household income is at or below the Department of Health and Human Services poverty guidelines.

Minority
A person who is:

- Black (a person having origins in any of the black racial groups of Africa);
- Hispanic (a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race);
- Asian American (a person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands); or
- American Indian and Alaskan Native (a person having origins in any of the original people of North America and who maintains cultural identification through tribal affiliation or community recognition)

Low-Income-Population
Any readily identifiable group of low-income persons who live in geographic proximity and, if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by a proposed DOT program, policy or activity.

Minority-Population
Any readily identifiable groups of minority persons who live in geographic proximity and, if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by a proposed DOT program, policy or activity.

Adverse Effects

The totality of significant individual or cumulative human health or environmental effects, including interrelated social and economic effects, which may include, but are not limited to:

- Bodily impairment, infirmity, illness or death
- Air, noise, and water pollution and soil contamination
- Destruction or disruption of man-made or natural resources
- Destruction or diminution of aesthetic values
- Destruction or disruption of community cohesion or a community's economic vitality
- Destruction or disruption of the availability of public and private facilities and services
- Vibration
- Adverse employment effects
- Displacement of persons, businesses, farms, or nonprofit organizations

- Increased traffic congestion, isolation, exclusion or separation of minority or low-income individuals within a given community or from the broader community
- Denial of, reduction in, or significant delay in the receipt of benefits of DOT programs, policies, or activities

Disproportionately High and Adverse Effects on Minority and Low-Income Populations

An adverse effect:

1. Is predominately borne by a minority population and/or a low-income population, or
2. Will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population.

IV. PUBLIC OUTREACH

Public involvement is the foundation to effectively integrating environmental justice concerns into transportation decision-making. It is not a separate task, but must be fully integrated within the full range of VDOT's processes. Outreach to the public is already a critical component of VDOT's project development process (as outlined in the Public Involvement Guide); environmental justice simply requires us to ensure that minority and low-income populations are included in this public outreach.

The public can provide valuable input and assist in validating information obtained from secondary sources such as census data. They can play an integral role in identifying issues and concerns of their communities, cataloging community resources and past actions affecting their quality of life, suggesting project alternatives, and negotiating avoidance, minimization, mitigation, and enhancements.

A primary goal of environmental justice is to engage those groups traditionally underrepresented in the project development process. For each project, the team should proactively reach out to the minority or low-income communities identified during systems planning and the environmental inventory and alternatives development stages. It doesn't matter whether the study area is predominantly minority or low-income, or if there is only a small EJ community. Outreach is still required to get them involved in the project development process. This outreach effort begins early in the project (i.e., in the same time frame as focus group formation) and continues throughout the process. In order to be effective, your public involvement strategy should be tailored to use adaptive or innovative approaches that overcome linguistic, institutional, cultural, economic, historical, or other potential barriers to effective participation in the decision-making process.

Each project team will need to develop its own outreach strategy thoughtfully, based on the characteristics of the particular study area. There is no 'cookie-cutter' approach, so each project may need to be treated somewhat differently.

Your goal should be to identify minority and low-income populations, bring them into the project development process, and ensure that reasonable efforts are made to address their concerns and provide them meaningful opportunities to influence transportation decisions. It is essential that VDOT visits minority and low income communities prior to the project development stage in order build and establish a relationship so that people in the community will begin to trust VDOT and be willing to share their concerns and their needs. This doesn't mean that your project outreach is directed only toward EJ communities to the exclusion of other communities. The outreach strategies listed below can be applied to all communities, not strictly to EJ communities.

Listed below is a menu of possible tools and strategies which may be useful in identifying, contacting, and engaging the public in the project development process. Remember, you don't have to use all of these strategies; you should use only those which are appropriate for your project and study area:

- For the following agencies, organizations and businesses, consider posting fliers and notices on bulletin boards; including information in church bulletins, homeowner association newsletters, etc.; offering to make project presentations; etc.:
  - Homeowner/community associations
  - Community action agencies
  - Religious organizations (churches, mosques, synagogues, etc.)
  - Civil rights organizations
  - Minority business associations
  - Chambers of Commerce
  - Business and trade organizations (e.g., Washington Board of Trade)
  - Environmental and environmental justice organizations
  - Rural/agricultural organizations
  - Ethnic stores/shops
  - Universities, colleges, vocational and local schools
  - Fraternities/sororities
  - Senior citizen groups (e.g., senior centers, county Office of Aging)
  - Community/recreational centers

- Publish ads and notices in newspapers, radio and other media, particularly media targeted to minority and low-income populations
- In addition to ads and notices, actively pursue having articles about the project published in local newspapers
- Publish ads not just in the legal section of the newspapers, but also in more 'popular' sections
- Include minority or low-income people on project focus groups
- Depending on the make-up of the particular project area, consider translating documents, notices and hearings for limited English-speaking populations
- For public meetings and brochures:
  - Include a slide asking for input from minority and low-income communities
  - Include wording in brochures soliciting input and information

- If at all possible, hold public meetings in locations that are accessible to transit

- Hold meetings at times and locations that are convenient for the attendees
- If appropriate, consider using an independent facilitator at community meetings, task force meetings, etc.
- Consider providing a minute-taker at key community meetings and providing copies of the minutes to attendees and other interested people
- Hold neighborhood open-houses or small informal group meetings
- In any notices for EJ community meetings, ask if there are unique needs/concerns (i.e., interpreter, etc.)
- Consider adding wording in project Initiation Ads and/or project mail-back cards to solicit input on, and active involvement from, minority/low-income/other populations - wording would have to be sensitive to any perception of discrimination
- Use the internet and other electronic media (e.g., VDOT web-site, some colleges and local schools have web-sites with bulletin boards, local governments)
- Place public meeting/workshop brochures, fliers and newsletters in the management offices of apartment buildings occupied by minority or low-income people
- Provide public meeting/workshop brochures, fliers and newsletters at local festivals and fairs
- Post signs in buses
- Distribute public meeting notices at bus/Metro stops
- Post notices in local libraries
- Contact school PTAs - they may be willing to have a presentation at one of their regular meetings
- Conduct in-street interviews to identify local issues/concerns
- Set up informational kiosks in malls, libraries, etc.

Possible innovative/unique ideas for atypical projects:

- Open a project field office in a minority or low-income area
- Hold workshops with affected populations by focusing more on the alternative(s) having the most impact on them.
- Use questionnaires to identify concerns of affected populations (issues, impacts, benefits, etc.) Any questionnaire would have to be developed and distributed early, so that ample time would be available to compile, analyze and use the data.
- Put out fliers and do a "road show" in communities, parks, festivals, malls, etc.
- To keep impacted communities involved and informed during final design and construction, consider having a community representative attend certain team meetings, developing flyers/brochures, etc.

V. IDENTIFICATION OF MINORITY POPULATIONS AND LOW-INCOME POPULATIONS

The identification of minority or low-income populations will begin during systems planning by the Metropolitan Planning Organization (MPO) or Planning District Commissions and VDOT's pre-construction divisions which include the Transportation and Mobility Planning Division, Location and Design, Environmental and Right of Way. This

information developed during planning will be used and supplemented during the project development process as additional data, analysis and public input are refined to be included in the NEPA and other environmental assessment documents. As more information becomes available and the alternatives are developed, the locations of populations will continue to be refined.

You need to be sensitive to the fact that you are identifying both minority and low-income populations, so don't just concentrate on minority communities. Also, remember that there are many wealthy minority communities and many poor non-minority communities.

A. Environmental Inventory

For environmental inventory purposes, the main sources of information regarding locations of minority or low-income populations are census data.

B. Census Data

Because census data is so readily available and easy to use, it is typically the first information gathered when trying to determine if there are minority or low-income populations in the project study area. However, census data is just the starting point used to "flag" census areas that potentially contain minority or low-income populations. You have to keep in mind that even census areas with a small minority or low-income percentage may contain a protected population in your study area - in some cases; a group of a few homes could be considered a population. "Disproportionately high and adverse effects", not size, are the basis for environmental justice. A small minority or low-income population in the project area does not eliminate the possibility of a disproportionately high and adverse effect on that population. That's why it is critical to continue gathering additional information from various sources in order to successfully locate and refine the geographic locations of the populations.

- Determine whether you will use census "tracts" or "blocks". Generally, data based on census tracts should be used for larger project areas. For smaller project areas (like intersection improvements), data based on the smaller census blocks would probably be more appropriate. (* It is the recommendation of FHWA that community profiles be created for each district because it is communities that are being affected.)
- Once the project study area is determined, identify all census tracts/blocks which overlap with it.
- Determine the minority or low-income percentage for each census tract/block.

  1) Minority Percentage

  If there is more than one minority group in your study area, the minority percentage should be based on the aggregate of all minority people. For example, if the percentage of Black persons in the identified census tract/block is 20% and the percentage of Hispanic persons is 20%, then the total of 40% should be used for the minority percentage.

  2) Low-Income Percentage

Census data provides the percentage of people below the poverty level (but does not actually provide the dollar amount of that poverty level). The dollar amount is defined by the Department of Health and Human Services. The data is revised annually and can be accessed at www.aspe.hhs.gov or www.census.gov. In order to be sensitive to low-income communities, do not include the poverty level dollar amount in the environmental document; you should simply keep the information in your project files. Be sure to identify the poverty level associated with the year of the census data being used (e.g., if you are using 1990 census data, use the corresponding 1990 poverty level).

Keep in mind that local jurisdictions may define their own 'poverty level'; however, you are to use the poverty level defined by the Department of Health and Human Services in order to maintain consistency between various jurisdictions.

- Calculate the average minority percentage and average low-income percentage for your entire study area by averaging the individual tract/block percentages.
- Determine which census tracts/blocks should be "flagged" because they could contain minority or low-income populations by comparing the minority or low-income percentage of each individual census tract/block to the average percentage for the study area. If this individual percentage is "meaningfully greater" than the average percentage, then a minority or low-income population is potentially located within that census tract/block.

  On a project-by-project basis, the project team should define "meaningfully greater" and document the rationale. For example, if the minority percentage for a census tract is 10% and the study area average is 5%, this 5% difference could be "meaningfully greater" because it represents a doubling of the average. However, if the minority percentage for a census tract is 75% and the study area average is 70%, this 5% difference is probably not "meaningfully greater" since it represents only a small increase over the average.

- VDOT and Other Agencies

  The project team should use a common sense approach when determining what further level of effort is appropriate for identifying EJ populations. For example, if the census data tells you that your project is in a mostly minority area, you may not need to use the other sources discussed below to identify minority populations - in essence, your entire project area would be a minority population. However, you would still need to go beyond just the census data to identify low-income populations.

  Even if a census tract/block has a small percentage of minority or low-income persons - and is therefore not identified during Step 1 above - it is possible that a population(s) may still be located in that census tract/block. For example, a 5% Asian American population may be entirely located in one particular community, thus qualifying as a minority population. Therefore, you cannot rely on census data alone to identify populations. A site visit is an essential step to identifying populations.

  At a minimum, you should also contact the following sources, via phone conversations, meetings (including project team meetings) or correspondence:

- Local planning and transportation staff, including MPOs
- VDOT Divisions
  1) Environmental
  2) Transportation and Mobility Planning
  3) Right-of-Way and Utilities
  4) Location & Design
  5) Civil Rights

  In any conversations with or letters to the above sources, you must be careful to include the following information so they understand why you are collecting EJ information. Information regarding the locations of EJ communities may raise sensitive issues, so you shouldn't just request locations of EJ communities without explaining why you need the information and what you will be doing with it.

- Provide the purpose/background of environmental justice (reference the Executive Order)
- Emphasize that you are looking for information on both minority and low-income populations - and that they are not the same thing.
- Explain what the four minority groups are and what the poverty level is.
- Request information on the location of minority or low-income populations, based on their knowledge of the project study area.

C. Alternatives Development

After the environmental inventory stage, as preliminary/conceptual alternatives are developed, other sources of information must be used to confirm and further refine the locations of minority and low-income populations. As described earlier, public involvement is a critical component to this effort. The project team will need to determine, based on each particular project, which sources are appropriate to contact.

This contact can be made via formal written correspondence (letters, flyers, etc.), meetings/presentations, phone calls and/or e-mails - the team needs to determine which method is most appropriate for a particular source. Some sources, such as religious groups and schools, in addition to providing race and national origin information about the people attending their services or classes, may also be able to provide information about any low-income communities they may assist. Keep in mind that it's very important to maintain a record of all sources you contact, as well as the input each source provides to you.

Possible additional information sources include, but are not limited to:

- Homeowner/community associations
- Community action agencies
- Religious organizations (churches, etc.)
- Civil rights organizations
- Transportation and Mobility Planning Division (GIS and other data)
- Right of Way and Utilities Division
- Environmental
- State and local tax and financing agencies

- Minority business associations
- Chambers of Commerce
- Business and trade organizations (e.g., Washington Board of Trade)
- Environmental and environmental justice organizations
- Rural/agricultural organizations
- Economic and job development agencies (e.g., Welfare to Work)
- Ethnic stores/shops
- Universities, colleges, vocational and local schools
- Fraternities/sororities
- Senior citizen groups (e.g., senior centers, county Office of Aging)
- Community/recreational centers

NOTE: For purposes of a secondary and cumulative effects analysis (SCEA), census data only will be used to identify minority or low-income populations since this data is existing and readily available. Each census tract which overlaps with the SCEA geographic boundary should be identified. Then the individual minority and low-income percentages for each tract are to be compared to the average study area percentages as determined in FHWA's Environmental Regulations - 23 CFR 771 (you do not need to calculate the average percentages for the entire SCEA boundary). Those individual tracts with percentages meaningfully greater than the study area average percentage will be considered to have minority or low-income populations.

D. Documentation

In the "Affected Environment" section of the environmental document, you will need to carefully discuss your findings regarding minority and low-income populations. While the project files should include all details of your efforts to identify minority or low-income populations in the study area (letters written to agencies/organizations, phone memos, responses or non-responses, etc.), the environmental document should only provide a summary.

- Clearly state whether minority or low-income populations have been identified in the project study area.
- Describe how you concluded whether or not there are minority or low-income populations.
- Describe the results of the census data assessment.
- List all of the agencies, organizations and/or other groups which were contacted and describe how they were contacted (letter, phone call, meeting, etc.).
- Summarize the responses received and/or issues identified.
  The most effective way to display this information is in a matrix format.
- If minority or low-income populations are identified, characterize them by describing their make-up, size, general location, age, etc. It's recommended that study area mapping showing all locations of EJ populations not be included in the environmental document.

VI. ASSESSMENT OF DISPROPORTIONATELY HIGH AND ADVERSE IMPACTS

The definition of adverse effects (see Section II) encompasses a wide variety of potential impacts, including those to human health, the natural and social environment, the economy, community function, etc. It also includes the denial, reduction or delay in receiving benefits, which should be addressed like any other impact. For an EJ analysis, you'll need to consider all of these.

There is no magic formula for determining if a minority or low-income community will experience disproportionately high and adverse impacts due to your project. Since each project - and each minority or low-income community - is different, the team will have to carefully consider many factors in making its determination. You will need to use an approach that combines both qualitative and quantitative information to support your conclusion.

Keep in mind that the EJ analysis must be done for each alternative, including the No-Build. The No-Build alternative is defined as no other improvements being done except maintenance to the existing road. Even under the No-Build, minority or low-income populations may be affected. Impacts such as increased noise, air pollution, congestion, travel times, etc. must be considered and documented appropriately.

One of the most important factors to consider is whether and how the community itself believes it will be impacted. What one community perceives as an impact, another may perceive as a benefit. It is also possible that, within the same community, the same action may be perceived by various segments as both an impact and a benefit. Therefore, it is imperative that you work with the EJ community to see how they feel about the project.

A. Analysis of Disproportionately High and Adverse Effects

Since a one-size-fits-all approach will not work, the Environmental Division and other pre-construction divisions will need to address a variety of questions and considerations in order to conclude if the project will have disproportionately high and adverse impacts (including denial, reduction or delay in receiving benefits) on an EJ population. You will, in essence, be assessing the context and intensity of effects on EJ populations as compared to non-EJ populations.

- You will need to carefully consider all of the items below, since no single item will lead to a supportable conclusion:
- **Is the adverse effect predominantly borne by the EJ population? For example, are more** minority or low-income people impacted than non- minority or non-low-income people? Is the percentage of minority or low-income people impacted greater than the percentage of minority or low-income people in the study area? Be very cautious when using numbers like this, since numbers alone can be misleading (*It is important to actually do a site visit of communities and neighborhoods).

- Will the adverse effect on the EJ population be appreciably more severe or greater in magnitude than the adverse effect on the non-minority or low-income population? In

other words, will the EJ population carry an unfair portion of the impact? For example, if there are ten EJ residences and ten non-EJ residences will each experience noise levels above the federal standard, but noise at the EJ residences will increase by twenty decibels and noise at the non-EJ residences will increase by ten decibels, there may be a disproportionate impact.

- Does the project impact a resource that is especially important to EJ populations? Does it serve an especially important social, religious or cultural function for the EJ community? For example, is a park which is used regularly for cultural festivals being impacted by the project?
- Are there mitigations, enhancement measures or offsetting project benefits (see Section VI) to the affected EJ population? These should be taken into account when assessing if there are disproportionately high and adverse effects.
- Have you assessed the type and severity of adverse effects on non-EJ populations? In order to determine if there are disproportionately high and adverse effects on EJ populations, you will have to take into consideration the comparative impacts in non-EJ areas.

Keep in mind that, while the identification of a disproportionately high and adverse effect on a low-income or minority population does not preclude the project from going forward, it should heighten our attention to alternatives (including alternative sites), mitigation strategies, monitoring needs and preferences expressed by the affected community or population.

Note: In the secondary and cumulative effects analysis (SCEA), you will need to consider the same questions and considerations listed above in order to determine if there are disproportionately high and adverse effects on EJ populations within the SCEA boundary.

B. Documentation

Your conclusions regarding impacts on minority or low-income populations must be thoroughly explained in the "Environmental Consequences" section of the environmental document.

- The final environmental document should clearly conclude whether or not a disproportionately high and adverse impact on any minority or low-income population is likely to result. This conclusion must be reached for each alternative, including the No-Build. Remember to take into account mitigations, enhancement measures or offsetting project benefits (see Section VI) to the affected EJ population.
- Whether or not you choose an alternative in disproportionately high and adverse impacts on minority or low-income populations, you need to supply supporting information to document how you reached that conclusion for each alternative - you have to "make your case".
- Present the analysis you completed and the issues you considered in order to reach your conclusions as concisely as possible. Include a description of impacts (type and severity), any offsetting benefits and mitigations/enhancements, comparison of impacts on EJ and non-EJ populations, etc.

- Document the efforts made to interact with the affected communities, the issues/concerns identified, results of the interaction, etc. Examples of interaction could include meetings to determine whether a community considers a project's effects to be impacts or benefits, correspondence discussing potential mitigation or enhancement measures, etc. A helpful way to present this information would be in a matrix format, which should be included in the appendix of the environmental document. The information in the matrix could include meeting dates, correspondence dates, responses received, issues/concerns identified by the community, etc. You may also want to include copies of important minutes in the appendix.
- When mapping is necessary in order to clearly illustrate the effect of a project on an EJ population, mapping may be included in the environmental document; otherwise, document the impacts textually. Remember to be sensitive to the concerns of the affected communities when determining what type of mapping, if any, will be provided.

VII. AVOIDANCE, MINIMIZATION, MITIGATION AND ENHANCEMENT

If you determine that your project appears to have a disproportionately high and adverse impact on a minority or low-income population, you will then need to consider how the magnitude and severity of the impact can be prevented or reduced. The approach is first to avoid impacts if possible, then minimize impacts, then mitigate unavoidable impacts. Enhancements should also be considered. The definitions of these terms and examples (from the Federal Highway Administration's "Community Impact Assessment" booklet) are provided below:

A. Definitions

- Avoid - to alter a project so an impact does not occur (i.e., shift an alignment to avoid displacements, redesign a road segment as an underpass to avoid cutting off access to a community facility, etc.)
- Minimize - to modify the project to reduce the severity of an impact (i.e., shift an alignment to reduce displacements, alter an alignment to increase the distance between the facility and residences to decrease noise impacts, phase the project to minimize impedance to business access during peak shopping periods, limit interchanges to minimize incompatible land use development, etc.)
- Mitigate - to take an action to alleviate or offset an impact or to replace an appropriated resource (i.e., set aside land for a park or add to public recreation areas to replace lost facilities, erect sound barriers to mitigate noise impacts, provide a bicycle/pedestrian overpass or underpass to provide access to public facilities, etc.)
- Enhance - to add a desirable or attractive feature to the project to make it fit more harmoniously into the community; this will not replace lost resources or alleviate project impacts (i.e., provide signing to recognize specific cultural or historic resources, develop bicycle trails or pathways adjacent to roadways, plant trees and add park benches, add public artwork or a façade to a transportation facility to match the aesthetic design goals of the community, etc.)

B. Considerations in Determining Appropriate Avoidance, Minimization, Mitigation and Enhancement Measures:

- Remember to take mitigation, enhancements and project benefits into account when you are assessing if there will ultimately be a disproportionately high and adverse impact on an EJ population.
- Another important consideration is the fairness in distribution of avoidance, minimization, mitigation and enhancement measures between EJ and non-EJ communities. When considering these measures for an EJ community vs. the entire project area, keep in mind that the measures should be proportional to the level of impact on each.
- A disproportionately high and adverse effect on an EJ population can only be carried out if further avoidance, minimization and mitigation measures are not practicable. In determining whether a measure is 'practicable', the social, economic (including costs) and environmental effects of avoiding, minimizing or mitigating the adverse effects can be taken into account.

You can use experience on other projects to determine what measures may be considered practicable. You should also take into account the nature and severity of the disproportionate impacts when determining what is practicable. For example, it may be appropriate to go beyond 'the norm' depending on how disproportionate the impact is.

Throughout this effort, keep in mind that you may be able to eliminate, reduce or mitigate the initial disproportionate impacts to such a degree that the impacts to the EJ population are now proportional.

C. Coordination with the Impacted EJ Community

The most important consideration in developing avoidance, minimization, mitigation and enhancement measures is how the impacted EJ community feels about them. Throughout the process, you must consult with and elicit the views of the affected populations. Otherwise, you might unknowingly propose a mitigation measure which impacts the community in a different way. Also, if the same community is composed of various minority groups or income levels, each component may have separate (and possibly conflicting) issues or concerns to be considered by the project team.

You should be encouraging the members of the EJ communities that may suffer a disproportionately high and adverse impact to help develop and comment on possible avoidance/minimization alternatives as early as possible in the process.

In addition to community meetings and correspondence, you may want to consider using community questionnaires to solicit input on proposed mitigation and enhancement strategies and to suggest their own strategies, based on the EJ community's perception of impacts. Any questionnaire would have to be developed and distributed early, so that ample time would be available to compile, analyze and use the data.

Once you have worked with the affected EJ communities to determine the appropriate avoidance, minimization, mitigation and enhancement measures, you should continue to keep them informed about the project status and progress throughout the design and construction phases.

Possible Mitigation Strategies (to be coordinated with the affected community):

- Keep the impacted minority or low-income population informed (status, progress, design changes, etc.) during final design and construction of the project; this could be accomplished by posting/mailing notices, meeting with the community, having a community representative serve a liaison role and attend construction partnering meetings, etc.
- Provide noise walls (appropriateness to be discussed with Noise Committee)
- Provide landscaping/visual screening
- Provide lighting
- Provide sidewalk improvements
- Provide multi-modal improvements (i.e., bus shelters, bicycle/pedestrian facilities)
- Build or rehabilitate community parks or recreation centers

- If relocations are required, attempt to relocate to the same area if possible to preserve community cohesiveness
- Documentation - For each alternative, you will need to clearly explain in the "Environmental Consequences" section of the environmental document any avoidance, minimization, mitigation and enhancement measures which have been adopted.
- Document the strategies taken to reduce, avoid or mitigate impacts to EJ communities. The discussion of these strategies should be clearly 'linked' to the associated community impacts. If appropriate, include a discussion of how these strategies helped turn a disproportionate adverse impact into a proportionate adverse impact.
- Include a summary of the public interaction used to develop and/or review the various strategies.
- If necessary in order to clearly illustrate the strategies and results, mapping may be included in the environmental document; otherwise, document the information textually.

Note: Even when VDOT has no responsibility to mitigate impacts not caused by the project, we may encourage other public/private groups to partner together to improve the quality of life in EJ communities.

Once the mitigation commitments have been made in the final environmental document, they are to be recorded in the Environmental Compliance and Considerations Checklists and discussed at the project transition meeting between the planning and design divisions. Planning staff will continue to be involved in the project during final design to ensure that the commitments are incorporated into the construction documents.

VIII. EXISTING LAWS AND REGULATIONS

- Environmental Justice Executive Order 12898
- US DOT EJ Order, April 1997
- FHWA EJ Order, December 1998
- Title VI Act of 1964
- 23 USC 109(h)
- US DOT Title VI Regulations [49 CFR 21.5 (b)(2)(3)] - addresses contracts and site selections
- Civil Rights Restoration Act of 1987
- National Environmental Policy Act of 1969
- Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970
- 23 USC 324 - addresses discrimination on the basis of sex
- Section 504 of the Rehabilitation Act of 1973 (29 USC 790) - addresses discrimination of the basis of disability
- Age Discrimination Act of 1975 (42 USC 6101) - addresses discrimination on the basis of age
- Fair Housing Act of 1988 - addresses discrimination on the basis of religion
- Religious Freedom Restoration Act of 1993 - addresses discrimination on the basis of religion
- 23 CFR 450 - FHWA Planning Regulations
- 23 CFR 771 - FHWA Environmental Regulations

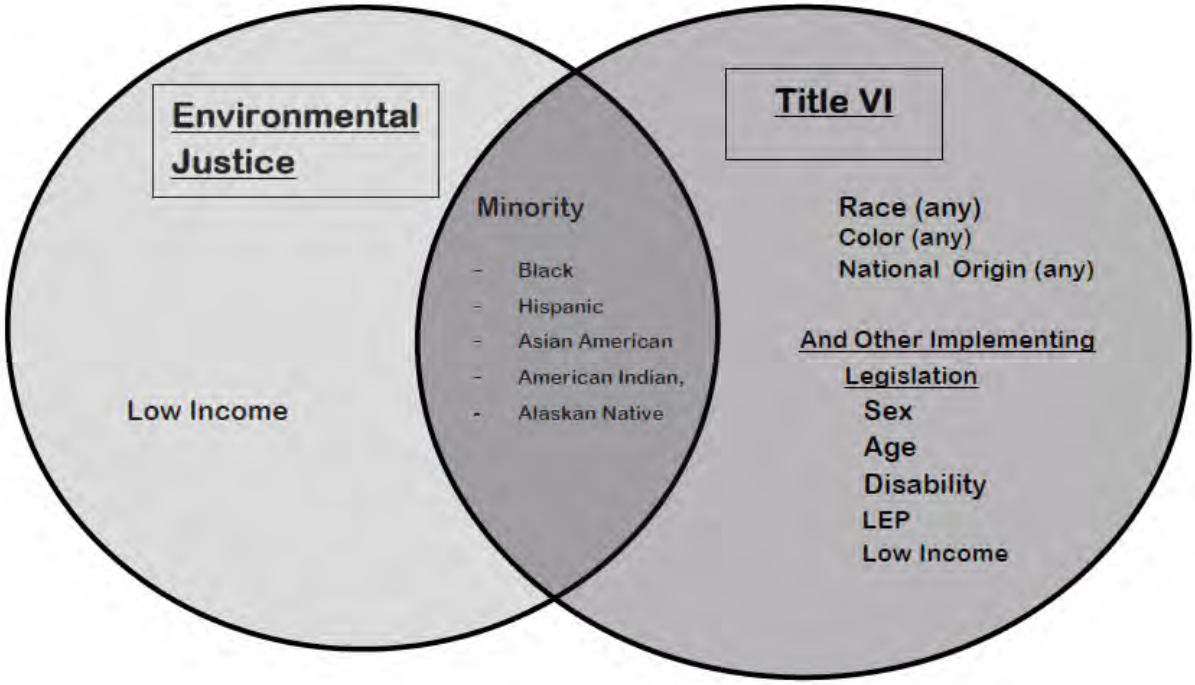
X. INTEGRATION OF ENVIRONMENTAL JUSTICE AND TITLE VI COVERAGE



XI. APPENDIX –A

FEDERAL-AID POLICY GUIDE 23 CFR 771
October 14, 1997

OPI: HEP-31

PART 771 - ENVIRONMENTAL IMPACT AND RELATED PROCEDURES

Sec.

Authority: 42 U.S.C. 4321 et seq.; 23 U.S.C. 109, 110 128, 138 and 315; 49 U.S.C. 303(c), 5301(e), 5323, and 5324; 40 CFR part 1500 et seq.; 49 CFR 1.48(b) and 1.51.

Source: 52 FR 32660, Aug. 28, 1987, unless otherwise noted.

Sec. 771.101 Purpose.

This regulation prescribes the policies and procedures of the Federal Highway Administration (FHWA) and the Urban Mass Transportation Administration (UMTA) for implementing the National Environmental Policy Act of 1969 as amended (NEPA), and the regulation of the Council on Environmental Quality (CEQ), 40 CFR 1500-1508. This regulation sets forth all FHWA, UMTA, and Department of Transportation (DOT) requirements under NEPA for the processing of highway and urban mass transportation projects. This regulation also sets forth procedures to comply with 23 U.S.C. 109(h), 128, 138, and 49 U.S.C. 303, 1602(d), 1604(h), 1604(i), 1607a, 1607a-1 and 1610.

Sec. 771.103 [Reserved]

Sec. 771.105 Policy.

It is the policy of the Administration that:

(a) To the fullest extent possible, all environmental investigations, reviews, and consultations be coordinated as a single process, and compliance with all applicable environmental requirements be reflected in the environmental document required by this regulation. [] FHWA and UMTA have supplementary guidance on the format and content of NEPA documents for their programs. This includes a list of various environmental laws, regulations, and Executive Orders which may be applicable to projects. The FHWA Technical Advisory T6640.8A, October 30, 1987, and the UMTA supplementary guidance are available from the respective FHWA and UMTA headquarters and field offices as prescribed in 49 CFR Part 7, Appendices D and G.

(b) Alternative courses of action be evaluated and decisions be made in the best overall public interest based upon a balanced consideration of the need for safe and efficient transportation; of the social, economic, and environmental impacts of the proposed transportation improvement; and of national, State, and local environmental protection goals.

(c) Public involvement and a systematic interdisciplinary approach be essential parts of the development process for proposed actions.

(d) Measures necessary to mitigate adverse impacts be incorporated into the action. Measures necessary to mitigate adverse impacts are eligible for Federal funding when the Administration determines that:

(1) The impacts for which the mitigation is proposed actually result from the Administration action; and

(2) The proposed mitigation represents a reasonable public expenditure after considering the impacts of the action and the benefits of the proposed mitigation measures. In making this determination, the Administration will consider, among other factors, the extent to which the proposed measures would assist in complying with a Federal statute, Executive Order, or Administration regulation or policy.

(e) Costs incurred by the applicant for the preparation of environmental documents requested by the Administration be eligible for Federal assistance.

(f) No person, because of handicap, age, race, color, sex, or national origin, be excluded from participating in, or denied benefits of, or be subject to discrimination under any Administration program or procedural activity required by or developed pursuant to this regulation.

[52 FR 32660, Aug. 28, 1987; 53 FR 11065, Apr. 5, 1988.

Sec. 771.107 Definitions.

The definitions contained in the CEQ regulation and in Titles 23 and 49 of the United States Code are applicable. In addition, the following definitions apply.

(a) Environmental studies--The investigations of potential environmental impacts to determine the environmental process to be followed and to assist in the preparation of the environmental document.

(b) Action--A highway or transit project proposed for FHWA or UMTA funding. It also includes activities such as joint and multiple use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds.

(c) Administration action--The approval by FHWA or UMTA of the applicant's request for Federal funds for construction. It also includes approval of activities such as joint and multiple use permits, changes in access control, etc., which may or may not involve a commitment of Federal funds.

(d) Administration--FHWA or UMTA, whichever is the designated lead agency for the proposed action.

(e) Section 4(f) -- Refers to 49 U.S.C. 303 and 23 U.S.C. 138. [] Section 4(f), which protected certain public lands and all historic sites, technically was repealed in 1983 when it was codified, without substantive change, as 49 U.S.C. 303. This regulation continues to refer to Section 4(f) because it would create needless confusion to do otherwise; the policies Section 4(f) engendered are widely referred to as "Section 4(f)" matters. A provision with the same meaning is found at 23 U.S.C. 138 and applies only to FHWA actions.

Sec. 771.109 Applicability and Responsibilities.

(a) (1) The provisions of this regulation and the CEQ regulation apply to actions where the Administration exercises sufficient control to condition the permit or project approval. Actions taken by the applicant which do not require Federal approvals, such as preparation of a regional transportation plan are not subject to this regulation.

(2) This regulation does not apply to, or alter approvals by the Administration made prior to the effective date of this regulation.

(3) Environmental documents accepted or prepared by the Administration after the effective date of this regulation shall be developed in accordance with this regulation.

(b) It shall be the responsibility of the applicant, in cooperation with the Administration, to implement those mitigation measures stated as commitments in the environmental documents prepared pursuant to this regulation. The FHWA will assure that this is accomplished as a part of its program management responsibilities that include reviews

of designs, plans, specifications, and estimates (PS&E), and construction inspections. The UMTA will assure implementation of committed mitigation measures through incorporation by reference in the grant agreement, followed by reviews of designs and construction inspections.

(c) The Administration, in cooperation with the applicant, has the responsibility to manage the preparation of the appropriate environmental document. The role of the applicant will be determined by the Administration in accordance with the CEQ regulation:

> (1) Statewide agency. If the applicant is a public agency that has statewide jurisdiction (for example, a State highway agency or a State department of transportation) or is a local unit of government acting through a statewide agency, and meets the requirements of section 102(2)(D) of NEPA, the applicant may prepare the environmental impact statement (EIS) and other environmental documents with the Administration furnishing guidance, participating in the preparation, and independently evaluating the document. All FHWA applicants qualify under this paragraph.
>
> (2) Joint lead agency. If the applicant is a public agency and is subject to State or local requirements comparable to NEPA, then the Administration and the applicant may prepare the EIS and other environmental documents as joint lead agencies. The applicant shall initially develop substantive portions of the environmental document, although the Administration will be responsible for its scope and content.
>
> (3) Cooperating Agency. Local public agencies with special expertise in the proposed action may be cooperating agencies in the preparation of an environmental document. An applicant for capital assistance under the Urban Mass Transportation Act of 1964, as amended (UMT Act), is presumed to be a cooperating agency if the conditions in paragraph (c) (1) or (2) of this section do not apply. During the environmental process, the Administration will determine the scope and content of the environmental document and will direct the applicant, acting as a cooperating agency, to develop information and prepare those portions of the document concerning which it has special expertise.
>
> (4) Other. In all other cases, the role of the applicant is limited to providing environmental studies and commenting on environmental documents. All private institutions or firms are limited to this role.

(d) When entering into Federal-aid project agreements pursuant to 23 U.S.C. 110, it shall be the responsibility of the State highway agency to ensure that the project is constructed in accordance with and incorporates all committed environmental impact mitigation measures listed in approved environmental documents unless the State requests and receives written Federal Highway Administration approval to modify or delete such mitigation features.

Sec. 771.111 Early coordination, public involvement, and project development.

(a) Early coordination with appropriate agencies and the public aids in determining the type of environmental document an action requires, the scope of the document, the level of analysis, and related environmental requirements. This involves the exchange of information from the inception of a proposal for action to preparation of the environmental document. Applicants intending to apply for funds should notify the Administration at the time that a project concept is identified. When requested, the Administration will advise the applicant, insofar as possible, of the probable class of action and related environmental laws and requirements and of the need for specific studies and findings which would normally be developed concurrently with the environmental document.

(b) The Administration will identify the probable class of action as soon as sufficient information is available to identify the probable impacts of the action. For UMTA, this is normally no later than the review of the transportation improvement program (TIP) and for FHWA, the approval of the 105 program (23 U.S.C. 105).

(c) When FHWA and UMTA are involved in the development of joint projects, or when FHWA or UMTA acts as a joint lead agency with another Federal agency, a mutually acceptable process will be established on a case-by-case basis.

(d) During the early coordination process, the Administration, in cooperation with the applicant, may request other agencies having special interest or expertise to become cooperating agencies. Agencies with jurisdiction by law must be requested to become cooperating agencies.

(e) Other States, and Federal land management entities, that may be significantly affected by the action or by any of the alternatives shall be notified early and their views solicited by the applicant in cooperation with the Administration. The Administration will prepare a written evaluation of any significant unresolved issues and furnish it to the applicant for incorporation into the environmental assessment (EA) or draft EIS.

(f) In order to ensure meaningful evaluation of alternatives and to avoid commitments to transportation improvements before they are fully evaluated, the action evaluated in each EIS or finding of no significant impact (FONSI) shall:

(1) Connect logical termini and be of sufficient length to address environmental matters on a broad scope;

(2) Have independent utility or independent significance, i.e., be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made; and

(3) Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.

(g) For major transportation actions, the tiering of EISs as discussed in the CEQ regulation (40 CFR 1502.20) may be appropriate. The first tier EIS would focus on broad issues such as general location, mode choice, and area wide air quality and land use implications of the major alternatives. The second tier would address site specific details on project impacts, costs, and mitigation measures.

(h) For the Federal-aid highway program:

(1) Each State must have procedures approved by the FHWA to carry out a public involvement/public hearing program pursuant to 23 U.S.C. 128 and 40 CFR parts 1500 through 1508.

(2) State public involvement/public hearing procedures must provide for:

(i) Coordination of public involvement activities and public hearings with the entire NEPA process.

(ii) Early and continuing opportunities during project development for the public to be involved in the identification of social, economic, and environmental impacts, as well as impacts associated with relocation of individuals, groups, or institutions.

(iii) One or more public hearings or the opportunity for hearing(s) to be held by the State highway agency at a convenient time and place for any Federal-aid project which requires significant amounts of right-of-way, substantially changes the layout or functions of connecting roadways or of the facility being improved, has a substantial adverse impact on abutting property, otherwise has a significant social, economic, environmental or other effect, or for which the FHWA determines that a public hearing is in the public interest.

(iv) Reasonable notice to the public of either a public hearing or the opportunity for a public hearing. Such notice will indicate the availability of explanatory information. The notice shall also provide information required to comply with public involvement requirements of other laws, Executive Orders, and regulations.

(v) Explanation at the public hearing of the following information, as appropriate:

(A) The project's purpose, need, and consistency with the goals and objectives of any local urban planning,

(B) The project's alternatives, and major design features,

(C) The social, economic, environmental, and other impacts of the project,

(D) The relocation assistance program and the right-of-way acquisition process.

(E) The State highway agency's procedures for receiving both oral and written statements from the public.

(vi) Submission to the FHWA of a transcript of each public hearing and a certification that a required hearing or hearing opportunity was offered. The transcript will be accompanied by copies of all written statements from the public, both submitted at the public hearing or during an announced period after the public hearing.

(3) Based on the reevaluation of project environmental documents required by Sec. 771.129, the FHWA and the State highway agency will determine whether changes in the project or new information warrant additional public involvement.

(4) Approvals or acceptances of public involvement/public hearing procedures prior to the publication date of this regulation remain valid.

(i) Applicants for capital assistance in the UMTA program achieve public participation on proposed projects by holding public hearings and seeking input from the public through the scoping process for environmental documents. For projects requiring EISs, a public hearing will be held during the circulation period of the draft EIS. For all other projects, an opportunity for public hearings will be afforded with adequate prior notice pursuant to 49 U.S.C. 1602(d), 1604(i), 1607a(f) and 1607a-1(d), and such hearings will be held when anyone with a significant social, economic, or environmental interest in the matter requests it. Any hearing on the action must be coordinated with the NEPA process to the fullest extent possible.

(j) Information on the UMTA environmental process may be obtained from: Director, Office of Planning Assistance, Urban Mass Transportation Administration, Washington, DC 20590. Information on the FHWA environmental process may be obtained from: Director, Office of Environmental Policy, Federal Highway Administration, Washington, DC 20590.

Sec. 771.113 Timing of Administration activities.

(a) The Administration in cooperation with the applicant will perform the work necessary to complete a FONSI or an EIS and comply with other related environmental laws and regulations to the maximum extent possible during the NEPA process. This work includes environmental studies, related engineering studies, agency coordination and public involvement. However, final design activities, property acquisition (with the exception of hardship and protective buying, as defined in Sec. 771.117(d)), purchase of construction materials or rolling stock, or project construction shall not proceed until the following have been completed:

(1) (i) The action has been classified as a categorical exclusion (CE), or

(ii) A FONSI has been approved, or

(iii) A final EIS has been approved and available for the prescribed period of time and a record of decision has been signed;

(2) For actions proposed for FHWA funding, the FHWA Division Administrator has received and accepted the certifications and any required public hearing transcripts required by 23 U.S.C. 128;

(3) For activities proposed for FHWA funding, the programming requirements of 23 CFR part 450, Subpart B, and 23 CFR part 630, Subpart A, have been met.

(b) For FHWA, the completion of the requirements set forth in paragraphs (a)(1) and (a)(2) of this section is considered acceptance of the general project location and concepts described in the environmental document unless otherwise specified by the approving official. However, such approval does not commit the Administration to approve any future grant request to fund the preferred alternative.

(c) Letters of Intent issued under the authority of Section 3(a)(4) of the UMT Act are used by UMTA to indicate an intention to obligate future funds for multi-year capital transit projects. Letters of Intent will not be issued by UMTA until the NEPA process is completed.

[52 FR 32660, Aug. 28, 1987; 53 FR 11066, Apr. 5, 1988]

Sec. 771.115 Classes of actions.

There are three classes of actions which prescribe the level of documentation required in the NEPA process.

(a) Class I (EISs). Actions that significantly affect the environment require an EIS (40 CFR 1508.27). The following are examples of actions that normally required an EIS:

(1) A new controlled access freeway.

(2) A highway project of four or more lanes on a new location.

(3) New construction or extension of fixed rail transit facilities (e.g., rapid rail, light rail, commuter rail, automated guide-way transit).

(4) New construction or extension of a separate roadway for buses or high occupancy vehicles not located within an existing highway facility.

(b) Class II (CEs). Actions that do not individually or cumulatively have a significant environmental effect are excluded from the requirement to prepare an EA or EIS. A

specific list of CEs normally not requiring NEPA documentation is set forth in Sec. 771.117(c). When appropriately documented, additional projects may also qualify as CEs pursuant to Sec. 771.117(d).

(c) Class III (EAs). Actions in which the significance of the environmental impacts is not clearly established. All actions that are not Class I or II are Class III. All actions in this class require the preparation of an EA to determine the appropriate environmental document required.

Sec. 771.117 Categorical exclusions.

(a) Categorical exclusions (CEs) are actions which meet the definition contained in 40 CFR 1508.4, and, based on past experience with similar actions, do not involve significant environmental impacts. They are actions which: do not induce significant impacts to planned growth or land use for the area, do not require the relocation of significant numbers of people; do not have a significant impact on any natural, cultural, recreational, historic or other resource; do not involve significant air, noise, or water quality impacts; do not have significant impacts on travel patterns; and do not otherwise, either individually or cumulatively, have any significant environmental impacts.

(b) Any action which normally would be classified as a CE but could involve unusual circumstances will require the Administration, in cooperation with the applicant, to conduct appropriate environmental studies to determine if the CE classification is proper. Such unusual circumstances include:

(1) Significant environmental impacts;

(2) Substantial controversy on environmental grounds;

(3) Significant impact on properties protected by Section 4(f) of the DOT Act or section 106 of the National Historic Preservation Act; or

(4) Inconsistencies with any Federal, State, or local law, requirement or administrative determination relating to the environmental aspects of the action.

(c) The following actions meet the criteria for CEs in the CEQ regulation (Section 1508.4) and Sec. 771.117(a) of this regulation and normally do not require any further NEPA approvals by the Administration:

(1) Activities which do not involve or lead directly to construction, such as planning and technical studies; grants for training and research programs; research activities as defined in 23 U.S.C. 307; approval of a unified work program and any findings required in the planning process pursuant to 23 U.S.C. 134; approval of statewide programs under 23 CFR part 630; approval of project concepts under 23 CFR part 476; engineering to define the elements of a proposed action or alternatives so that social, economic, and environmental effects can be assessed; and Federal-aid system revisions which establish classes of highways on the

Federal-aid highway system.

(2) Approval of utility installations along or across a transportation facility.

(3) Construction of bicycle and pedestrian lanes, paths, and facilities.

(4) Activities included in the State's "highway safety plan" under 23 U.S.C. 402.

(5) Transfer of Federal lands pursuant to 23 U.S.C. 317 when the subsequent action is not an FHWA action.

(6) The installation of noise barriers or alterations to existing publicly owned buildings to provide for noise reduction.

(7) Landscaping.

(8) Installation of fencing, signs, pavement markings, small passenger shelters, traffic signals, and railroad warning devices where no substantial land acquisition or traffic disruption will occur.

(9) Emergency repairs under 23 U.S.C. 125.

(10) Acquisition of scenic easements.

(11) Determination of payback under 23 CFR part 480 for property previously acquired with Federal-aid participation.

(12) Improvements to existing rest areas and truck weigh stations.

(13) Ridesharing activities.

(14) Bus and rail car rehabilitation.

(15) Alterations to facilities or vehicles in order to make them accessible for elderly and handicapped persons.

(16) Program administration, technical assistance activities, and operating assistance to transit authorities to continue existing service or increase service to meet routine changes in demand.

(17) The purchase of vehicles by the applicant where the use of these vehicles can be accommodated by existing facilities or by new facilities which themselves are within a CE.

(18) Track and rail bed maintenance and improvements when carried out within the existing right-of-way.

(19) Purchase and installation of operating or maintenance equipment to be located within the transit facility and with no significant impacts off the site.

(20) Promulgation of rules, regulations, and directives.

(d) Additional actions which meet the criteria for a CE in the CEQ regulations (40 CFR 1508.4) and paragraph (a) of this section may be designated as CEs only after Administration approval. The applicant shall submit documentation which demonstrates that the specific conditions or criteria for these CEs are satisfied and that significant environmental effects will not result. Examples of such actions include but are not limited to:

(1) Modernization of a highway by resurfacing, restoration, rehabilitation, reconstruction, adding shoulders, or adding auxiliary lanes (e.g., parking, weaving, turning, climbing).

(2) Highway safety or traffic operations improvement projects including the installation of ramp metering control devices and lighting.

(3) Bridge rehabilitation, reconstruction or replacement or the construction of grade separation to replace existing at-grade railroad crossings.

(4) Transportation corridor fringe parking facilities.

(5) Construction of new truck weigh stations or rest areas.

(6) Approvals for disposal of excess right-of-way or for joint or limited use of right-of-way, where the proposed use does not have significant adverse impacts.

(7) Approvals for changes in access control.

(8) Construction of new bus storage and maintenance facilities in areas used predominantly for industrial or transportation purposes where such construction is not inconsistent with existing zoning and located on or near a street with adequate capacity to handle anticipated bus and support vehicle traffic.

(9) Rehabilitation or reconstruction of existing rail and bus buildings and ancillary facilities where only minor amounts of additional land are required and there is not a substantial increase in the number of users.

(10) Construction of bus transfer facilities (an open area consisting of passenger shelters, boarding areas, kiosks and related street improvements) when located in a commercial area or other high activity center in which there is adequate street capacity for projected bus traffic.

(11) Construction of rail storage and maintenance facilities in areas used predominantly for industrial or transportation purposes where such construction is

not inconsistent with existing zoning and where there is no significant noise impact on the surrounding community.

(12) Acquisition of land for hardship or protective purposes; advance land acquisition loans under section 3(b) of the UMT Act. Hardship acquisition is early acquisition of property by the applicant at the property owner's request to alleviate particular hardship to the owner, in contrast to others, because of an inability to sell his property. This is justified when the property owner can document on the basis of health, safety or financial reasons that remaining in the property poses an undue hardship compared to others. Hardship and protective buying will be permitted only for a particular parcel or a limited number of parcels. These types of land acquisition qualify for a CE only where the acquisition will not limit the evaluation of alternatives, including shifts in alignment for planned construction projects, which may be required in the NEPA process. No project development on such land may proceed until the NEPA process has been completed.

(e) Where a pattern emerges of granting CE status for a particular type of action, the Administration will initiate rulemaking proposing to add this type of action to the list of categorical exclusions in paragraph (c) or (d) of this section, as appropriate.

[52 FR 32660, Aug. 28, 1987; 53 FR 11066, Apr. 5, 1988]

Sec. 771.119 Environmental assessments.

(a) An EA shall be prepared by the applicant in consultation with the Administration for each action that is not a CE and does not clearly require the preparation of an EIS, or where the Administration believes an EA would assist in determining the need for an EIS.

(b) For actions that require an EA, the applicant, in consultation with the Administration, shall, at the earliest appropriate time, begin consultation with interested agencies and others to advise them of the scope of the project and to achieve the following objectives: determine which aspects of the proposed action have potential for social, economic, or environmental impact; identify alternatives and measures which might mitigate adverse environmental impacts; and identify other environmental review and consultation requirements which should be performed concurrently with the EA. The applicant shall accomplish this through an early coordination process (i.e., procedures under Sec. 771.111) or through a scoping process. Public involvement shall be summarized and the results of agency coordination shall be included in the EA.

(c) The EA is subject to Administration approval before it is made available to the public as an Administration document. The UMTA applicants may circulate the EA prior to Administration approval provided that the document is clearly labeled as the applicant's document.

(d) The EA need not be circulated for comment but the document must be made available for public inspection at the applicant's office and at the appropriate Administration field

offices in accordance with paragraphs (e) and (f) of this section. Notice of availability of the EA, briefly describing the action and its impacts, shall be sent by the applicant to the affected units of Federal, State and local government. Notice shall also be sent to the State intergovernmental review contacts established under Executive Order 12372.

(e) When a public hearing is held as part of the application for Federal funds, the EA shall be available at the public hearing and for a minimum of 15 days in advance of the public hearing. The notice of the public hearing in local newspapers shall announce the availability of the EA and where it may be obtained or reviewed. Comments shall be submitted in writing to the applicant or the Administration within 30 days of the availability of the EA unless the Administration determines, for good cause, that a different period is warranted. Public hearing requirements are as described in Sec. 771.111.

(f) When a public hearing is not held, the applicant shall place a notice in a newspaper(s) similar to a public hearing notice and at a similar stage of development of the action, advising the public of the availability of the EA and where information concerning the action may be obtained. The notice shall invite comments from all interested parties. Comments shall be submitted in writing to the applicant or the Administration within 30 days of the publication of the notice unless the Administration determines, for good cause, that a different period is warranted.

(g) If no significant impacts are identified, the applicant shall furnish the Administration a copy of the revised EA, as appropriate; the public hearing transcript, where applicable; copies of any comments received and responses thereto; and recommend a FONSI. The EA should also document compliance, to the extent possible, with all applicable environmental laws and Executive orders, or provide reasonable assurance that their requirements can be met.

(h) When the Administration expects to issue a FONSI for an action described in Sec. 771.115(a), copies of the EA shall be made available for public review (including the affected units of government) for a minimum of 30 days before the Administration makes its final decision (See 40 CFR 1501.4(e)(2).) This public availability shall be announced by a notice similar to a public hearing notice.

(i) If, at any point in the EA process, the Administration determines that the action is likely to have a significant impact on the environment, the preparation of an EIS will be required.

Sec. 771.121 Findings of no significant impact.

(a) The Administration will review the EA and any public hearing comments and other comments received regarding the EA. If the Administration agrees with the applicant's recommendations pursuant to Sec. 771.119(g), it will make a separate written FONSI incorporating by reference the EA and any other appropriate environmental documents.

(b) After a FONSI has been made by the Administration, a notice of availability of the

FONSI shall be sent by the applicant to the affected units of Federal, State and local government and the document shall be available from the applicant and the Administration upon request by the public. Notice shall also be sent to the State intergovernmental review contacts established under Executive Order 12372.

(c) If another Federal agency has issued a FONSI on an action which includes an element proposed for Administration funding, the Administration will evaluate the other agency's FONSI. If the Administration determines that this element of the project and its environmental impacts have been adequately identified and assessed, and concurs in the decision to issue a FONSI, the Administration will issue its own FONSI incorporating the other agency's FONSI. If environmental issues have not been adequately identified and assessed, the Administration will require appropriate environmental studies.

Sec. 771.123 Draft environmental impact statements.

(a) A draft EIS shall be prepared when the Administration determines that the action is likely to cause significant impacts on the environment. When the decision has been made by the Administration to prepare an EIS, the Administration will issue a Notice of Intent (40 CFR 1508.22) for publication in the Federal Register. Applicants are encouraged to announce the intent to prepare an EIS by appropriate means at the local level.

(b) After publication of the Notice of Intent, the Administration, in cooperation with the applicant, will begin a scoping process. The scoping process will be used to identify the range of alternatives and impacts and the significant issues to be addressed in the EIS and to achieve the other objectives of 40 CFR 1501.7. For FHWA, scoping is normally achieved through public and agency involvement procedures required by Sec. 771.111. For UMTA, scoping is achieved by soliciting agency and public responses to the action by letter or by holding scoping meetings. If a scoping meeting is to be held, it should be announced in the Administration's Notice of Intent and by appropriate means at the local level.

(c) The draft EIS shall be prepared by the Administration in cooperation with the applicant or, where permitted by law, by the applicant with appropriate guidance and participation by the Administration. The draft EIS shall evaluate all reasonable alternatives to the action and discuss the reasons why other alternatives, which may have been considered, were eliminated from detailed study. The draft EIS shall also summarize the studies, reviews, consultations, and coordination required by environmental laws or Executive Orders to the extent appropriate at this stage in the environmental process.

(d) An applicant which is a "statewide agency" may select a consultant to assist in the preparation of an EIS in accordance with applicable contracting procedures. Where the applicant is a "joint lead" or "cooperating" agency, the applicant may select a consultant, after coordination with the Administration to assure compliance with 40 CFR 1506.5(c). The Administration will select any such consultant for "other" applicants. (See Sec. 771.109(c) for definitions of these terms.)

(e) The Administration, when satisfied that the draft EIS complies with NEPA

requirements, will approve the draft EIS for circulation by signing and dating the cover sheet.

(f) A lead, joint lead, or a cooperating agency shall be responsible for printing the EIS. The initial printing of the draft EIS shall be in sufficient quantity to meet requirements for copies which can reasonably be expected from agencies, organizations, and individuals. Normally, copies will be furnished free of charge. However, with Administration concurrence, the party requesting the draft EIS may be charged a fee which is not more than the actual cost of reproducing the copy or may be directed to the nearest location where the statement may be reviewed.

(g) The draft EIS shall be circulated for comment by the applicant on behalf of the Administration. The draft EIS shall be made available to the public and transmitted to agencies for comment no later than the time the document is filed with the Environmental Protection Agency in accordance with 40 CFR 1506.9. The draft EIS shall be transmitted to:

> (1) Public officials, interest groups, and members of the public known to have an interest in the proposed action or the draft EIS;
>
> (2) Federal, State and local government agencies expected to have jurisdiction or responsibility over, or interest or expertise in, the action. Copies shall be provided directly to appropriate State and local agencies, and to the State intergovernmental review contacts established under Executive Order 12372; and
>
> (3) States and Federal land management entities which may be significantly affected by the proposed action or any of the alternatives. These copies shall be accompanied by a request that such State or entity advise the Administration in writing of any disagreement with the evaluation of impacts in the statement. The Administration will furnish the comments received to the applicant along with a written assessment of any disagreements for incorporation into the final EIS.

(h) The UMTA requires a public hearing during the circulation period of all draft EISs. FHWA public hearing requirements are as described in Sec. 771.111(h). Whenever a public hearing is held, the draft EIS shall be available at the public hearing and for a minimum of 15 days in advance of the public hearing. The availability of the draft EIS shall be mentioned, and public comments requested, in any public hearing notice and at any public hearing presentation. If a public hearing on an action proposed for FHWA funding is not held, a notice shall be placed in a newspaper similar to a public hearing notice advising where the draft EIS is available for review, how copies may be obtained, and where the comments should be sent.

(i) The Federal Register public availability notice (40 CFR 1506.10) shall establish a period of not less than 45 days for the return of comments on the draft EIS. The notice and the draft EIS transmittal letter shall identify where comments are to be sent.

(j) For UMTA funded major urban mass transportation investments, the applicant shall

prepare a report identifying a locally preferred alternative at the conclusion of the Draft EIS circulation period. Approval may be given to begin preliminary engineering on the principal alternative(s) under consideration. During the course of such preliminary engineering, the applicant will refine project costs, effectiveness, and impact information with particular attention to alternative designs, operations, detailed location decisions and appropriate mitigation measures.

These studies will be used to prepare the final EIS or, where appropriate, a supplemental draft EIS.

Sec. 771.125 Final environmental impact statements.

(a) (1) After circulation of a draft EIS and consideration of comments received, a final EIS shall be prepared by the Administration in cooperation with the applicant or, where permitted by law, by the applicant with appropriate guidance and participation by the Administration. The final EIS shall identify the preferred alternative and evaluate all reasonable alternatives considered. It shall also discuss substantive comments received on the draft EIS and responses thereto, summarize public involvement, and describe the mitigation measures that are to be incorporated into the proposed action. Mitigation measures presented as commitments in the final EIS will be incorporated into the project as specified in Sec. 771.109(b). The final EIS should also document compliance, to the extent possible, with all applicable environmental laws and Executive Orders, or provide reasonable assurance that their requirements can be met.

(2) Every reasonable effort shall be made to resolve interagency disagreements on actions before processing the final EIS. If significant issues remain unresolved, the final EIS shall identify those issues and the consultations and other efforts made to resolve them.

(b) The final EIS will be reviewed for legal sufficiency prior to Administration approval.

(c) The Administration will indicate approval of the EIS for an action by signing and dating the cover page. Final EISs prepared for actions in the following categories will be submitted to the Administration's Headquarters for prior concurrence:

(1) Any action for which the Administration determines that the final EIS should be reviewed at the Headquarters office. This would typically occur when the Headquarters office determines that (i) additional coordination with other Federal, State or local governmental agencies is needed; (ii) the social, economic, or environmental impacts of the action may need to be more fully explored; (iii) the impacts of the proposed action are unusually great; (iv) major issues remain unresolved; or (v) the action involves national policy issues.

(2) Any action to which a Federal, State or local government agency has indicated opposition on environmental grounds (which has not been resolved to the written satisfaction of the objecting agency).

(3) Major urban mass transportation investments as defined by UMTA's policy on major investments (49 FR 21284; May 18, 1984).

(d) The signature of the UMTA approving official on the cover sheet also indicates compliance with section 14 of the UMT Act and fulfillment of the grant application requirements of Sections 3(d)(1) and (2), 5(h), and 5(i) of the UMT Act.

(e) Approval of the final EIS is not an Administration Action (as defined in Sec. 771.107(c)) and does not commit the Administration to approve any future grant request to fund the preferred alternative.

(f) The initial printing of the final EIS shall be in sufficient quantity to meet the request for copies which can be reasonably expected from agencies, organizations, and individuals. Normally, copies will be furnished free of charge. However, with Administration concurrence, the party requesting the final EIS may be charged a fee which is not more than the actual cost of reproducing the copy or may be directed to the nearest location where the statement may be reviewed.

(g) The final EIS shall be transmitted to any persons, organizations, or agencies that made substantive comments on the draft EIS or requested a copy, no later than the time the document is filed with EPA. In the case of lengthy documents, the agency may provide alternative circulation processes in accordance with 40 CFR 1502.19. The applicant shall also publish a notice of availability in local newspapers and make the final EIS available through the mechanism established pursuant to DOT Order 4600.13 which implements Executive Order 12372. When filed with EPA, the final EIS shall be available for public review at the applicant's offices and at appropriate Administration offices. A copy should also be made available for public review at institutions such as local government offices, libraries, and schools, as appropriate.

Sec. 771.127 Record of decision.

(a) The Administration will complete and sign a record of decision (ROD) no sooner than 30 days after publication of the final EIS notice in the Federal Register or 90 days after publication of a notice for the draft EIS, whichever is later. The ROD will present the basis for the decision as specified in 40 CFR 1505.2, summarize any mitigation measures that will be incorporated in the project and document any required section 4(f) approval in accordance with Sec. 771.135(l). Until any required ROD has been signed, no further approvals may be given except for administrative activities taken to secure further project funding and other activities consistent with 40 CFR 1506.1.

(b) If the Administration subsequently wishes to approve an alternative which was not identified as the preferred alternative but was fully evaluated in the final EIS, or proposes to make substantial changes to the mitigation measures or findings discussed in the ROD, a revised ROD shall be subject to review by those Administration offices which reviewed the final EIS under Sec. 771.125(c). To the extent practicable the approved revised ROD shall be provided to all persons, organizations, and agencies that received a copy of the final EIS pursuant to Sec. 771.125(g).

Sec. 771.129 Re-evaluations.

(a) A written evaluation of the draft EIS shall be prepared by the applicant in cooperation with the Administration if an acceptable final EIS is not submitted to the Administration within 3 years from the date of the draft EIS circulation. The purpose of this evaluation is to determine whether a supplement to the draft EIS or a new draft EIS is needed.

(b) A written evaluation of the final EIS will be required before further approvals may be granted if major steps to advance the action (e.g., authority to undertake final design, authority to acquire a significant portion of the right-of-way, or approval of the plans, specifications and estimates) have not occurred within three years after the approval of the final EIS, final EIS supplement, or the last major Administration approval or grant.

(c) After approval of the EIS, FONSI, or CE designation, the applicant shall consult with the Administration prior to requesting any major approvals or grants to establish whether or not the approved environmental document or CE designation remains valid for the requested Administration action. These consultations will be documented when determined necessary by the Administration.

[52 FR 32660, Aug. 28, 1987; 53 FR 11066, Apr. 5, 1988]

Sec. 771.130 Supplemental environmental impact statements.

(a) A draft EIS, final EIS, or supplemental EIS may be supplemented at any time. An EIS shall be supplemented whenever the Administration determines that:

(1) Changes to the proposed action would result in significant environmental impacts that were not evaluated in the EIS; or

(2) New information or circumstances relevant to environmental concerns and bearing on the proposed action or its impacts would result in significant environmental impacts not evaluated in the EIS.

(b) However, a supplemental EIS will not be necessary where:

(1) The changes to the proposed action, new information, or new circumstances result in a lessening of adverse environmental impacts evaluated in the EIS without causing other environmental impacts that are significant and were not evaluated in the EIS; or

(2) The Administration decides to approve an alternative fully evaluated in an approved final EIS but not identified as the preferred alternative. In such a case, a revised ROD shall be prepared and circulated in accordance with Sec. 771.127(b).

(c) Where the Administration is uncertain of the significance of the new impacts, the applicant will develop appropriate environmental studies or, if the Administration deems appropriate, an EA to assess the impacts of the changes, new information, or new

circumstances. If, based upon the studies, the Administration determines that a supplemental EIS is not necessary, the Administration shall so indicate in the project file.

(d) A supplement is to be developed using the same process and format (i.e., draft EIS, final EIS, and ROD) as an original EIS, except that scoping is not required.

(e) A supplemental draft EIS may be necessary for UMTA major urban mass transportation investments if there is a substantial change in the level of detail on project impacts during project planning and development. The supplement will address site-specific impacts and refined cost estimates that have been developed since the original draft EIS.

(f) In some cases, a supplemental EIS may be required to address issues of limited scope, such as the extent of proposed mitigation or the evaluation of location or design variations for a limited portion of the overall project. Where this is the case, the preparation of a supplemental EIS shall not necessarily:

(i) Prevent the granting of new approvals;

(ii) Require the withdrawal of previous approvals; or

(iii) Require the suspension of project activities; for any activity not directly affected by the supplement. If the changes in question are of such magnitude to require a reassessment of the entire action, or more than a limited portion of the overall action, the Administration shall suspend any activities which would have an adverse environmental impact or limit the choice of reasonable alternatives, until the supplemental EIS is completed.

Sec. 771.131 Emergency action procedures.

Requests for deviations from the procedures in this regulation because of emergency circumstances (40 CFR 1506.11) shall be referred to the Administration's headquarters for evaluation and decision after consultation with CEQ.

Sec. 771.133 Compliance with other requirements.

The final EIS or FONSI should document compliance with requirements of all applicable environmental laws, Executive orders, and other related requirements. If full compliance is not possible by the time the final EIS or FONSI is prepared, the final EIS or FONSI should reflect consultation with the appropriate agencies and provide reasonable assurance that the requirements will be met. Approval of the environmental document constitutes adoption of any Administration findings and determinations that are contained therein. The FHWA approval of the appropriate NEPA document will constitute its finding of compliance with the report requirements of 23 U.S.C. 128.

Sec. 771.135 Section 4(f) (49 U.S.C. 303).

(a) (1) The Administration may not approve the use of land from a significant publicly owned public park, recreation area, or wildlife and waterfowl refuge, or any significant historic site unless a determination is made that:

(i) There is no feasible and prudent alternative to the use of land from the property; and

(ii) The action includes all possible planning to minimize harm to the property resulting from such use.

(2) Supporting information must demonstrate that there are unique problems or unusual factors involved in the use of alternatives that avoid these properties or that the cost, social, economic, and environmental impacts, or community disruption resulting from such alternatives reach extraordinary magnitudes.

(b) The Administration will determine the application of section 4(f). Any use of lands from a section 4(f) property shall be evaluated early in the development of the action when alternatives to the proposed action are under study.

(c) Consideration under section 4(f) is not required when the Federal, State, or local officials having jurisdiction over a park, recreation area or refuge determine that the entire site is not significant. In the absence of such a determination, the section 4(f) land will be presumed to be significant. The Administration will review the significance determination to assure its reasonableness.

(d) Where Federal lands or other public land holdings (e.g., State forests) are administered under statutes permitting management for multiple uses, and, in fact, are managed for multiple uses, section 4(f) applies only to those portions of such lands which function for, or are designated in the plans of the administering agency as being for, significant park, recreation, or wildlife and waterfowl purposes. The determination as to which lands so function or are so designated, and the significance of those lands, shall be made by the officials having jurisdiction over the lands. The Administration will review this determination to assure its reasonableness. The determination of significance shall apply to the entire area of such park, recreation, or wildlife and waterfowl refuge sites.

(e) In determining the application of section 4(f) to historic sites, the Administration, in cooperation with the applicant, will consult with the State Historic Preservation Officer (SHPO) and appropriate local officials to identify all properties on or eligible for the National Register of Historic Places (National Register). The section 4(f) requirements apply only to sites on or eligible for the National Register unless the Administration determines that the application of section 4(f) is otherwise appropriate.

(f) The Administration may determine that section 4(f) requirements do not apply to restoration, rehabilitation, or maintenance of transportation facilities that are on or eligible for the National Register when:

(1) Such work will not adversely affect the historic qualities of the facility that

caused it to be on or eligible for the National Register, and

(2) The SHPO and the Advisory Council on Historic Preservation (ACHP) have been consulted and have not objected to the Administration finding in paragraph (f)(1) of this section.

(g) (1) Section 4(f) applies to all archeological sites on or eligible for inclusion on the National Register, including those discovered during construction except as set forth in paragraph (g)(2) of this section. Where section 4(f) applies to archeological sites discovered during construction, the section 4(f) process will be expedited. In such cases, the evaluation of feasible and prudent alternatives will take account of the level of investment already made. The review process, including the consultation with other agencies, will be shortened as appropriate.

(2) Section 4(f) does not apply to archeological sites where the Administration, after consultation with the SHPO and the ACHP, determines that the archeological resource is important chiefly because of what can be learned by data recovery and has minimal value for preservation in place. This exception applies both to situations where data recovery is undertaken or where the Administration decides, with agreement of the SHPO and, where applicable, the ACHP not to recover the resource.

(h) Designations of park and recreation lands, wildlife and waterfowl refuges, and historic sites are sometimes made and determinations of significance changed late in the development of a proposed action. With the exception of the treatment of archeological resources in paragraph (g) of this section, the Administration may permit a project to proceed without consideration under section 4(f) if the property interest in the section 4(f) lands was acquired for transportation purposes prior to the designation or change in the determination of significance and if an adequate effort was made to identify properties protected by section 4(f) prior to acquisition.

(i) The evaluations of alternatives to avoid the use of section 4(f) land and of possible measures to minimize harm to such lands shall be developed by the applicant in cooperation with the Administration. This information should be presented in the draft EIS, EA, or, for a project classified as a CE in a separate document. The section 4(f) evaluation shall be provided for coordination and comment to the officials having jurisdiction over the section 4(f) property and to the Department of the Interior, and as appropriate to the Department of Agriculture and the Department of Housing and Urban Development. A minimum of 45 days shall be established by the Administration for receipt of comments. Uses of section 4(f) land covered by a programmatic section 4(f) evaluation shall be documented and coordinated as specified in the programmatic section 4(f) evaluation.

(j) When adequate support exists for a section 4(f) determination, the discussion in the final EIS, FONSI, or separate section 4(f) evaluation shall specifically address:

(1) The reasons why the alternatives to avoid a section 4(f) property are not

feasible and prudent; and

(2) All measures which will be taken to minimize harm to the Section 4(f) property.

(k) The final Section 4(f) evaluation will be reviewed for legal sufficiency.

(l) For actions processed with EISs, the Administration will make the section 4(f) approval either in its approval of the final EIS or in the ROD. Where the section 4(f) approval is documented in the final EIS, the Administration will summarize the basis for its section 4(f) approval in the ROD. Actions requiring the use of section 4(f) property, and proposed to be processed with a FONSI or classified as a CE, shall not proceed until notified by the Administration of section 4(f) approval. For these actions, any required section 4(f) approval will be documented separately.

(m) Circulation of a separate Section 4(f) evaluation will be required when:

(1) A proposed modification of the alignment or design would require the use of section 4(f) property after the CE, FONSI, draft EIS, or final EIS has been processed;

(2) The Administration determines, after processing the CE, FONSI, draft EIS, or final EIS that section 4(f) applies to a property;

(3) A proposed modification of the alignment, design, or measures to minimize harm (after the original section 4(f) approval) would result in a substantial increase in the amount of section 4(f) land used, a substantial increase in the adverse impacts to section 4(f) land, or a substantial reduction in mitigation measures; or

(4) Another agency is the lead agency for the NEPA process, unless another DOT element is preparing the section 4(f) evaluation.

(n) If the Administration determines under Sec. 771.135(m) or otherwise, that section 4(f) is applicable after the CE, FONSI, or final EIS has been processed, the decision to prepare and circulate a section 4(f) evaluation will not necessarily require the preparation of a new or supplemental environmental document. Where a separately circulated section 4(f) evaluation is prepared, such evaluation does not necessarily:

(i) Prevent the granting of new approvals;

(ii) Require the withdrawal of previous approvals; or

(iii) Require the suspension of project activities; for any activity not affected by the section 4(f) evaluation.

(o) An analysis required by section 4(f) may involve different levels of detail where the

section 4(f) involvement is addressed in a tiered EIS.

(1) When the first-tier, broad-scale EIS is prepared, the detailed information necessary to complete the section 4(f) evaluation may not be available at that stage in the development of the action. In such cases, an evaluation should be made on the potential impacts that a proposed action will have on section 4(f) land and whether those impacts could have a bearing on the decision to be made. A preliminary determination may be made at this time as to whether there are feasible and prudent locations or alternatives for the action to avoid the use of section 4(f) land. This preliminary determination shall consider all possible planning to minimize harm to the extent that the level of detail available at the first-tier EIS stage allows. It is recognized that such planning at this stage will normally be limited to ensuring that opportunities to minimize harm at subsequent stages in the development process have not been precluded by decisions made at the first-tier stage. This preliminary determination is then incorporated into the first-tier EIS.

(2) A section 4(f) approval made when additional design details are available will include a determination that:

(i) The preliminary section 4(f) determination made pursuant to paragraph (o)(1) of this section is still valid; and

(ii) The criteria of paragraph (a) of this section have been met.

(p) Use. (1) Except as set forth in paragraphs (f), (g)(2), and (h) of this section, "use" (in paragraph (a)(1) of this section) occurs:

(i) When land is permanently incorporated into a transport-ation facility.

(ii) When there is a temporary occupancy of land that is adverse in terms of the statute's preservationist purposes as determined by the criteria in paragraph (p)(7) of this section; or

(iii) When there is a constructive use of land.

(2) Constructive use occurs when the transportation project does not incorporate land from a section 4(f) resource, but the project's proximity impacts are so severe that the protected activities, features, or attributes that qualify a resource for protection under section 4(f) are substantially impaired. Substantial impairment occurs only when the protected activities, features or attributes of the resource are substantially diminished.

(3) The Administration is not required to determine that there is no constructive use. However, such a determination could be made at the discretion of the Administration.

(4) The Administration has reviewed the following situations and determined that a constructive use occurs when:

(i) The projected noise level increase attributable to the project substantially interferes with the use and enjoyment of a noise-sensitive facility of a resource protected by section 4(f), such as hearing the performances at an outdoor amphitheater, sleeping in the sleeping area of a campground, enjoyment of a historic site where a quiet setting is a generally recognized feature or attribute of the site's significance, or enjoyment of an urban park where serenity and quiet are significant attributes;

(ii) The proximity of the proposed project substantially impairs esthetic features or attributes of a resource protected by section 4(f), where such features or attributes are considered important contributing elements to the value of the resource. Examples of substantial impairment to visual or esthetic qualities would be location of a proposed transportation facility in such proximity that it obstructs or eliminates the primary views of an architecturally significant historical building, or substantially detracts from the setting of a park or historic site which derives its value in substantial part due to its setting.

(iii) The project results in a restriction on access which substantially diminishes the utility of a significant publicly owned park, recreation area, or a historic site;

(iv) The vibration impact from operation of the project substantially impairs the use of a section 4(f) resource, such as projected vibration levels from a rail transit project that are great enough to affect the structural integrity of a historic building or substantially diminish the utility of the building; or

(v) The ecological intrusion of the project substantially diminishes the value of wildlife habitat in a wildlife or waterfowl refuge adjacent to the project or substantially interferes with the access to a wildlife or waterfowl refuge, when such access is necessary for established wildlife migration or critical life cycle processes.

(5) The Administration has reviewed the following situations and determined that a constructive use does not occur when:

(i) Compliance with the requirements of section 106 of the National Historic Preservation Act and 36 CFR part 800 for proximity impacts of the proposed action, on a site listed on or eligible for the National Register of Historic Places, results in an agreement of "no effect" or "no adverse effect";

(ii) The projected traffic noise levels of the proposed highway project do not exceed the FHWA noise abatement criteria as contained in Table 1, 23 CFR part 772, or the projected operational noise levels of the proposed transit project do not exceed the noise impact criteria in the UMTA guidelines;

(iii) The projected traffic noise levels exceed the relevant threshold in paragraph (p)(5)(ii) of this section because of high existing noise, but the increase in the projected noise levels if the proposed project is constructed, when compared with the projected noise levels if the project is not built, is barely perceptible (3 dBA or less);

(iv) There are proximity impacts to a section 4(f) resource, but a governmental agency's right-of-way acquisition, an applicant's adoption of project location, or the Administration approval of a final environmental document, established the location for a proposed transportation project before the designation, establishment, or change in the significance of the resource. However, if the age of an historic site is close to, but less than, 50 years at the time of the governmental agency's acquisition, adoption, or approval, and except for its age would be eligible for the National Register, and construction would begin after the site was eligible, then the site is considered a historic site eligible for the National Register;

(v) There are impacts to a proposed public park, recreation area, or wildlife refuge, but the proposed transportation project and the resource are concurrently planned or developed. Examples of such concurrent planning or development include, but are not limited to:

> (A) Designation or donation of property for the specific purpose of such concurrent development by the entity with jurisdiction or ownership of the property for both the potential transportation project and the section 4(f) resource, or
>
> (B) Designation, donation, planning or development of property by two or more governmental agencies, with jurisdiction for the potential transportation project and the section 4(f) resource, in consultation with each other;

(vi) Overall (combined) proximity impacts caused by a proposed project do not substantially impair the activities, features, or attributes that qualify a resource for protection under section 4(f);

(vii) Proximity impacts will be mitigated to a condition equivalent to, or better than that which would occur under a no-build scenario;

(viii) Change in accessibility will not substantially diminish the utilization of the section 4(f) resource; or

(ix) Vibration levels from project construction activities are mitigated, through advance planning and monitoring of the activities, to levels that do not cause a substantial impairment of the section 4(f) resource.

(6) When a constructive use determination is made, it will be based, to the extent it reasonably can, upon the following:

(i) Identification of the current activities, features, or attributes of a resource qualified for protection under section 4(f) and which may be sensitive to proximity impacts;

(ii) An analysis of the proximity impacts of the proposed project on the section 4(f) resource. If any of the proximity impacts will be mitigated, only the net impact need be considered in this analysis. The analysis should also describe and consider the impacts which could reasonably be expected if the proposed project were not implemented, since such impacts should not be attributed to the proposed project;

(iii) Consultation, on the above identification and analysis, with the federal, State, or local officials having jurisdiction over the park, recreation area, refuge, or historic site.

(7) A temporary occupancy of land is so minimal that it does not constitute a use within the meaning of section 4(f) when the following conditions are satisfied:

(i) Duration must be temporary, i.e., less than the time needed for construction of the project, and there should be no change in ownership of the land;

(ii) Scope of the work must be minor, i.e., both the nature and the magnitude of the changes to the section 4(f) resource are minimal;

(iii) There are no anticipated permanent adverse physical impacts, nor will there be interference with the activities or purpose of the resource, on either a temporary or permanent basis;

(iv) The land being used must be fully restored, i.e., the resource must be returned to a condition which is at least as good as that which exited prior to the project; and

(v) There must be documented agreement of the appropriate Federal, State, or local officials having jurisdiction over the resource regarding the above conditions.

[52 FR 32660, Aug. 28, 1987; 53 FR 11066, Apr. 5, 1988, as amended at 56 FR 13279, Apr. 1, 1991]

Sec. 771.137 International-actions.

(a) The requirements of this part apply to:

(1) Administration actions significantly affecting the environment of a foreign nation not participating in the action or not otherwise involved in the action.

(2) Administration actions outside the U.S., its territories, and possessions which significantly affect natural resources of global importance designated for protection by the President or by international agreement.

(b) If communication with a foreign government concerning environmental studies or documentation is anticipated, the Administration shall coordinate such communication with the Department of State through the Office of the Secretary of Transportation.

APPENDIX XII. TECHNICAL ASSISTANCE TOOLS

VDOT EJ TECHNICAL ASSISTANCE TOOL
SOCIAL ELEMENTS

Project Name: _____Project Code:_____

Contact Name: _____

Date Received: _____ Date Reviewed: _____ Reviewer: _____

SAT=Satisfactory; INC = Incomplete; MIS = Missing; N/A = Not Applicable)

Answers are required for questions that have no N/A box.

The following checklist is guidance. Discipline report writers should adjust contents according to complexity and type of project. Reviewers should use the checklist adjusting its use where appropriate. However, all users should be aware of requirements that are driven by regulations and address those areas accordingly.

I. Studies and Coordination

(Applicable laws: 42 USC 2000d-d4. Title VI of the Civil Rights Act of 1964.40CFR. 1500-1508 (CEQ), 23 CFR 771 (FHWA)

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Describe studies performed and coordination with local agencies. Identify agencies and programs administered.

II. Public Involvement/Interaction

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Description of public involvement/interaction plan. 1. Include any tribal contact and determine if government-to-government consultation is needed. 2. Include any targeted outreach to minority, disable. 3. Include any specific efforts to address limited English proficiency, if applicable.

III. Affected Environment

Report should include a description of each Section 4 (f) resource:

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Community Cohesion. Describe neighborhood population characteristics (e.g., minority, elderly, disabled, transit-dependent, larger family, income, Level, owner/tenant status). Access and linkages With community facilities/services (churches, schools, community centers, gathering places etc.). (If a low-income and/or minority population is Identified, see Environmental Justice.)
☐	☐	☐	☐	B.	Recreation. Describe and show maps of the type and location of parks, recreation areas, recreation areas, recreation trails, and natural landmarks. Include information on:
☐	☐	☐	☐		1. Available activities and facilities.
☐	☐	☐	☐		2. Use and number of users per activity.
☐	☐	☐	☐		3. Unique qualities.
☐	☐	☐	☐		4. Statement of national, state, or local significance as determined by official with jurisdiction.
☐	☐	☐	☐		5. Access.
☐	☐	☐	☐		6. Ownership.
☐	☐	☐	☐		7. Section 4(f) and/or 6(f) applicability.
				C.	Regional and Community Growth. Consider:
☐	☐	☐	☐		1. Local and regional population-breakdown by towns and communities.
☐	☐	☐			2. Population projected changes
☐	☐	☐			a. Ethnic/racial composition.
☐	☐	☐			b. Age/family composition.
☐	☐	☐			c. Income levels/major employment.
☐	☐	☐			d. Limited English composition.
☐	☐	☐			e. Disabled composition.
☐	☐	☐			f. Status of community, if in transition.
				D.	Services. Discuss:
☐	☐	☐			1. Educational facilities and attendance boundaries.
☐	☐	☐	☐		2. Religious institutions.
☐	☐	☐	☐		3. Social institutions (community centers, fraternal organizations, children's homes, etc.).
☐	☐	☐	☐		4. Medical services (hospitals, nursing homes, medical and dental clinics, etc.)
☐	☐	☐			5. Fire and police protection.
☐	☐	☐			6. Public services and utilities (energy, telephone, cable, water, sewer, solid waste, storm water, and other appropriate).

SAT	INC	MIS	N/A		
☐	☐	☐	☐		7. cemeteries.

☐	☐	☐	☐	8.	Government institutions and national defense installations.
☐	☐	☐	☐	9.	Other governmental services. Particularly social service/aid programs and locations as relates to proposed action.
				E.	Pedestrian, Bicyclist, and Transit Facilities.
☐	☐	☐	☐	1.	Describe location and type of existing facilities, including discussion of local plan.
☐	☐	☐	☐	2.	State whether local and land use/recreation plans include bike/pedestrian/transit facilities. Include paratransit where appropriate.
☐	☐	☐	☐	3.	Consider travel times (if available), capacity, circulation, and congestion on other facilities in the region.
☐	☐	☐	☐	4.	Discuss whether new facilities are proposed, include sufficient information to explain the basis for providing them (e.g., proposed bicycle facility is a link in the local plan, a new bus stop is needed, or sidewalks will reduce project access impact).
☐	☐	☐	☐	5.	Discuss safety issues as they relate to pedestrians and bicyclists.
☐	☐	☐	☐	6.	Discuss whether the project has potential to connect existing bike/pedestrian/transit facilities.
				F.	Environmental Justice.
☐	☐	☐	☐	1.	Document the presence of low-income or minority communities.

IV. Impacts

SAT	INC	MIS	N/A		
				A.	Community Cohesion. Consider project effects on the community such as:
☐	☐	☐		1.	Impacts on community life.
☐	☐	☐		2.	Effects on persons and groups.
☐	☐	☐		3.	Changes in social relationships/patterns.
☐	☐	☐	☐	4.	Isolation-community divided or set apart by project.
☐	☐	☐		5.	Redistribution, influx or loss of population.
SAT	**INC**	**MIS**	**N/A**		
☐	☐	☐	☐	6.	Cutting off streets.
☐	☐	☐	☐	7.	Separating residences from community facilities.
☐	☐	☐	☐	8.	Separating adjoining residential areas.
☐	☐	☐	☐	9.	Isolating areas.

10. Increasing automobile dependency.
11. Impact to and availability of affordable and accessible housing supply within the study area.

B. Recreation. Consider direct and indirect (growth induced, etc.) impacts on:
1. Facilities/capacity.
2. Access.
3. Aesthetics.
4. Air quality.
5. Noise.
6. Water.
7. Land use in the vicinity.

C. Cultural Resources
1. Describe any impacts to tribal areas i.e.: Usual and customary

D. Recreational and Community Growth. Consider:
1. Population changes caused by the proposed project. Include estimates on the effects such changes will have on the resource base in his study area. (Where a project induces significant growth, discuss the impacts of such growth under the appropriate headings in this outline. See also E.)
2. Effect on characteristics of population in the study area.
   a. Ethnic/racial composition.
   b. Age/family composition.
   c. Income levels/major employment.
3. Effect on population growth patterns.

E. Services. Consider the following impacts on each of the services listed in II.D., above.
1. Changes in service travel times.
2. Circuitry of access.
3. Changes in services area.
4. Potential new or additional public facilities And services needed.

F. Pedestrian, Transit and Bicyclist Facilities. Consider:

SAT	INC	MIS	N/A	
☐	☐	☐	☐	1. Use projects/capacity – design year data.
☐	☐	☐	☐	2. Safety/travel time.
☐	☐	☐	☐	3. Circulation changes.
☐	☐	☐	☐	4. How changes in accessibility will affect facility users.
				5. Describe provisions included in the project for a reasonable alternative route, or

Demonstrate that such a route exists.

☐ ☐ ☐ ☐
☐ ☐ ☐ ☐
☐ ☐ ☐ ☐

V. Mitigation

Consider:

SAT	INC	MIS	N/A		
				A.	Community Cohesion. Describe:
☐	☐	☐	☐	1.	Mitigation measurers and commitments.
				2.	Mitigation measures considered or available but not included, with reasons why.
				B.	Recreation. Describe:
☐	☐	☐	☐	1.	Mitigation measures and commitments.
☐	☐	☐	☐	2.	Mitigation measures considered or available but not included, with reasons why.
☐	☐	☐	☐	C.	Regional and Community Growth. Mitigation is normally not applicable.
				D.	Services. Describe:
☐	☐	☐	☐	1.	Mitigation measures and commitments.
☐	☐	☐	☐	2.	Mitigation measures considered or available but not included, with reasons why.
☐	☐	☐	☐	E.	Pedestrian, Transit and Bicyclist Facilities. Discuss any proposed measure to avoid or reduce adverse impacts on the facility and its users.
☐	☐	☐	☐	F.	Describe efforts to mitigate impacts on any potentially impacted low-income and/or minority communities in the environmental process. (This can be done in separate EJ report)

VI. Summary

Summarize the analysis done and conclusions reached. The summary should include enough detail so that it can be included in the environmental document with only minor modification. This summary should include:

SAT	INC	MIS	N/A		
☐	☐	☐		A.	The objectives of the project.
				B.	Current land use patterns.
☐	☐	☐		C.	Impacts of all alternatives including the no-build alternative.
☐	☐	☐		D.	Recommended mitigation.

☐ ☐ ☐ E. Comparison of alternatives based on impacts and cost effectiveness of mitigation.

☐ ☐ ☐ F. Describe public involvement/interaction plan, types of public involvement, timing.

VDOT EJ TECHNICAL ASSISTANCE TOOL
ECONOMIC ELEMENTS

Project Name: _____ Project Code: _____

Contact Name: _____

Date Received: _____ Date Reviewed: _____ Reviewer: _____

SAT=Satisfactory; INC = Incomplete; MIS = Missing; N/A = Not Applicable)
Answers are required for questions that have no N/A box.

The following checklist is guidance. Discipline report writers should adjust contents according to complexity and type of project. Reviewers should use the checklist adjusting its use where appropriate. However, all users should be aware of requirements that are driven by regulations and address those areas accordingly.

I. Studies and Coordination

(Refer to National Cooperative Highway Research Report-I22, Summary and Evaluation of Economic Consequences of Highway Improvements.)

SAT	INC	MIS	N/A		
				A.	Field interviews with employers in impacted area. Include small, large, minority owned and any unique businesses.
☐	☐	☐	☐	1.	Discuss what kind of adverse impact any relocations could have on employees as Well as local economy; i.e.; where do employees live? How do they get to work?
☐	☐	☐	☐	B.	Residents.
☐	☐	☐	☐	C.	County and city government officials.
☐	☐	☐	☐	D.	Local business and economic leaders.
☐	☐	☐	☐	E.	Studies of existing conditions.
☐	☐	☐	☐	F.	New industrial and commercial development in various planning or construction phases.
☐	☐	☐	☐	G.	Market feasibility studies.
☐	☐	☐	☐	H.	Real estate transactions.
☐	☐	☐	☐	I.	Property assessment valuations.
☐	☐	☐	☐	J.	County tax rolls.

II. Affected Environment

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Describe general economic climate of the area.
☐	☐	☐	☐	B.	Include established business districts and Transportation facility related business.

III. Impacts

SAT	INC	MIS	N/A		
				A.	Describe effects on overall business activity of:
☐	☐	☐	☐	1.	Loss of productive business or farm property through induced development.
☐	☐	☐		2.	Increases or decreases in travel time for shipment of goods.
☐	☐	☐	☐	3.	Changes in business and shopping patterns as a result of changes in accessibility; e.,g., effects on highway related businesses.
☐	☐	☐	☐	4.	Loss of business due to construction of alternative on new alignment including any businesses important to low-income and/or minority populations.
				B.	Describe increase, decrease, or change in location In permanent jobs after completion, due to:
☐	☐	☐	☐	1.	Basic industry or commercial location and relocation.
☐	☐	☐	☐	2.	Bypass diversions.
☐	☐	☐	☐	3.	Barrier effects.
☐	☐	☐	☐	4.	Induced growth or development.
☐	☐	☐	☐	5.	Facility relocation.
				C.	Describe effects on property value trends and the Local economy of:
☐	☐	☐	☐	1.	Traffic volumes.
☐	☐	☐	☐	2.	Competing enterprises and centers.
☐	☐	☐	☐	3.	Visibility.
☐	☐	☐	☐	4.	Physical access to facility or property.
☐	☐	☐	☐	5.	Altered commercial sales potential.
☐	☐	☐	☐	6.	Reduced revenue from loss of taxable property to highway right of way.
☐	☐	☐	☐	7.	Changed revenue from in-migration or out-migration of high tax-producing land users.
				D.	Describe these effects on the region:
☐	☐	☐	☐	1.	Effects on bypassed communities and/or businesses.

SAT	INC	MIS	N/A		
☐	☐	☐	☐	2.	Effects on areas in proximity to the facility.
☐	☐	☐	☐	3.	Effects on areas near interchanges or transit stops.

IV. Mitigation

SAT	INC	MIS	N/A		
☐	☐	☐	☐	A.	Mitigation measurers and commitments e.,g., control, commitments to minority/low-income affected community.
☐	☐	☐	☐	B.	Mitigation measurers considered or available but not included, with reasons why.

V. Construction Activity Impacts

(All impacts associated with construction of the project are to be addressed in a "Construction Activity Impacts: section of the environmental document. Provide the following information, as appropriate, for inclusion in that section.)

SAT	INC	MIS	N/A		
				A.	Under **Impacts,** consider temporary construction effects, such as:
☐	☐	☐	☐	1.	Construction expenditures.
☐	☐	☐	☐	2.	Temporary construction revisions to business or farm access.
☐	☐	☐	☐	3.	Temporary jobs created during construction.
☐	☐	☐	☐	4.	Impact of construction expenditures on sales tax revenues (consider multiplier effect).
☐	☐	☐	☐	B.	Under **Mitigation:**
☐	☐	☐	☐	1.	Mitigation measures and commitments; e.g. access provisions, public information program from construction activities.
☐	☐	☐	☐	2.	Mitigation measures considered or available but not included, with reasons why.

VI. Summary

Summarize the analysis done and conclusions reached. The summary should include enough detail so that it can be included in the environmental document with only minor modifications.

SAT	INC	MIS	N/A		
☐	☐	☐		A.	The objectives of the project.
☐	☐	☐		1.	Current economic activity and patterns.

SAT	INC	MIS	N/A		
☐	☐	☐			2. Impacts of all alternative including the no build.
☐	☐	☐			3. Recommended mitigation.
☐	☐	☐		B.	Alignment with any local comprehensive and/or neighborhood plans.
☐	☐	☐		C.	Comparison of alternatives based on impacts and cost effectiveness of mitigation.

VDOT EJ TECHNICAL ASSISTANCE TOOL
RELOCATION

Project Name: _____ Project Code: _____

Contact Name: _____

Date Received: _____ Date Reviewed: _____ Reviewer: _____

SAT=Satisfactory; INC = Incomplete; MIS = Missing; N/A = Not Applicable)
Answers are required for questions that have no N/A box.

Use this form if project displaces homes and/or businesses.

The following checklist is guidance. Discipline report writers should adjust contents according to complexity and type of project. Reviewers should use the checklist adjusting its use where appropriate. However, all users should be aware of requirements that are driven by regulations and address those areas accordingly.

I. Studies and Coordination

(Refer to Uniform Relocation Assistance and Real Property Acquisition Policy Act of 1970 as amended in 1987.)
Consider:

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Census data.
☐	☐	☐	☐	B.	Social/economic reports.
☐	☐	☐	☐	C.	Contact with community leaders and local officials
☐	☐	☐		D.	Field Surveys.

II. Affected Environment

Discuss (if necessary)

SAT	INC	MIS	N/A		
☐	☐	☐	☐	A.	Characteristics of the affected area, such as minority and ethnic, disabled, elderly, family size, income level, owner/tenant status, and long-term stability of the area (e.g., is the area in transition?)
☐	☐	☐	☐	B.	Numbers, descriptions, types of occupancy, and sizes (number of employees) of business and farms within the area. Describe business or farm products or services, particular requirements, specific availability of replacement sites/buildings.

III. Impacts

SAT	INC	MIS	N/A		
☐	☐	☐	☐	A.	Residential impacts. Include an estimate of the number of households to be displaced and any anticipated relocation problems to the extent such information is available.
					Describe:
☐	☐	☐	☐	1.	Dwelling types(s) i.e., single-family, multi-family, Section 8 or other subsidized housing, etc.
☐	☐	☐	☐	2.	Occupancy type (owner/tenant).
☐	☐	☐	☐	3.	Resident characteristics.
☐	☐	☐	☐		a. Elderly.
☐	☐	☐	☐		b. Disabled.
☐	☐	☐	☐		c. Minorities (racial, ethnics, or religious groups).
☐	☐	☐	☐		d. Income level (low, middle, high).
☐	☐	☐	☐		e. Large or small families.
☐	☐	☐	☐		f. Length of occupancy.
☐	☐	☐	☐		g. Transit dependency.
☐	☐	☐	☐		h. Limited English speaking.
☐	☐	☐	☐	B.	Summarize how many minority and/or low-income Households are impacted.
☐	☐	☐	☐	C.	Business, farm, and nonprofit organization impacts.
☐	☐	☐	☐	1.	Estimate of the number, types, and sizes of business, farms, and nonprofit organizations to be displaced. How many of these are minority owned or operated?
☐	☐	☐	☐	2.	The approximate number of employees for each business, farm, and nonprofit organization.

IV. Mitigation

Discuss relocation assistance. (Preparers should consult regional Real Estate Services personnel as early as possible for assistance in preparing relocation information.)

SAT	INC	MIS	N/A		
				A.	Residential.
☐	☐	☐	☐	1.	Describe available housing in the area and the ability to provide suitable relocation housing for residents being displaced, including moving existing structures to a

						new location.
☐	☐	☐	☐		2.	Describe any special advisory or other services that will be necessary for special relocation problems.
☐	☐	☐	☐		3.	Include a statement of commitment to last resort housing when sufficient comparable replacement housing may not be available.
				B.		Business, farm, and nonprofit organizations.
☐	☐	☐	☐		1.	Discuss probable availability of replacement facilities for business and nonprofit organizations, including moving existing structures to a new location.
☐	☐	☐	☐		2.	Discuss potential relocation of farm operations.
☐	☐	☐	☐	C.		Include a statement that the acquisition and relocation program will be conducted in accordance with the Uniform Relocation assistance and Real Property Acquisition Policies Act of 1970, as amended, and that resources are available to all residential and business relocates without discrimination.
☐	☐	☐	☐	D.		Describe specific measures or coordination discuss With local governments, organizations, etc., to Reduce general or specific impacts. Special Financial and incentive programs or opportunities (beyond those provided by the Uniform Relocation Assistance Act) available throughout other agencies or organizations for residential and Business relocates may be unidentified.
☐	☐	☐	☐	E.		Describe any additional mitigation measures and commitments.

V. Construction Activity Impacts

All impacts associated with construction of the project are to be addressed in a "Construction Activity Impacts" section of the environmental document. Provide the following information, as appropriate, for inclusion in that section.

SAT	INC	MIS	N/A			
☐	☐	☐	☐	A.	**Impacts**	Normally not applicable.
☐	☐	☐	☐	B.	**Mitigation**	Normally not applicable.

VI. SUMMARY

Summarize the analysis done and conclusions reached. The summary should include enough

detail so that it can be included in the environmental document with only minor modification. The summary should include.

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Objectives of the project.
☐	☐	☐		B.	Current housing availability and vacancy rates.
☐	☐	☐		C.	Impacts of all alternatives including the no-build.
☐	☐	☐		D.	Recommend mitigation and reference to the Uniform Relocation Act.
☐	☐	☐		E.	Comparison of alternatives based on impacts and cost effectiveness of mitigation. Total relocations/ displacements including number or percentage of minority/low-income households/business impacted. Separate into households impacted and business impacted.

VDOT EJ TECHNICAL ASSISTANCE TOOL
ENVIRONMENTAL JUSTICE

Project Name: _____ Project Code: _____

Contact Name: _____

Date Received: _____ Date Reviewed: _____ Reviewer: _____

SAT=Satisfactory; INC = Incomplete; MIS = Missing; N/A = Not Applicable)
Answers are required for questions that have no N/A box. The following checklist is guidance. Discipline report writers should adjust contents according to complexity and type of project. Reviewers should use the checklist adjusting its use where appropriate. However, all users should be aware of requirements that are driven by regulations and address those areas accordingly.

I. Studies and Coordination

Refer to Social and Economic Technical Assistance Tools and the EJ Guidelines. Also refer to 42 USC 2000d-d4, 23 CFR Part 771, Title VI of the Civil Rights Act of 1964, and Presidential Executive Orders 12898 and 13166.

There are three (3) types of environmental documents that require FHWA concurrence and adoption. However, CEs for activities specified under 23 CFR 771.117 (c), normally DO NOT require formal FHWA approval.

Class I: Environmental Impact Statement (EIS)
An EIS is prepared when it is determined through environmental studies, public involvement, and coordination with other Federal, State and local agencies that the project will have a significant impact on the environment. The EIS process requires the preparation of a Notice of Intent (NOI), a Draft Environmental Impact Statement (DEIS), a Final Environmental Impact Statement (FEIS), and a Record of Decision (ROD).

Class II: Categorical Exclusion (CE)
The CE is the most commonly used environmental processing option. The CE is not an environmental document, but a determination that a project will have no significant individual or cumulative SEE impacts. In other words, the project would not have significant impacts on planned growth or land use for the area; does not require the relocation of significant numbers of people; does not have a significant impact on any natural, cultural recreational, historic or other resource; do not involve significant air, noise, or water quality impacts; do not have significant environmental impacts.

Class III: Environmental Assessment (EA)
The EA is prepared for projects when the significance for the impacts is not known or clearly established. Projects that are not categorical exclusions and do not obviously require an EIS will require the preparation of an EA to determine the significance of the impacts and whether an EIS should be prepared. The amount of information and degree of analysis that should be performed

and included in an EA will depend on the size, type, location, number o reasonable alternatives, potential for significant impacts and other factors of the project.

II. Introduction

To be completed as a sub-set of the Socio-Economic Analysis if demographic analysis has identified low-income and/or minority residents in the project area. These are specific to an EJ analysis, but are to be used in conjunction with the overall Social-Economic-Relocation analysis. It is helpful to include maps highlighting the location of alternatives overlaid with any minority and/or low-income populations residing within the primary study area.

SAT	INC	MIS	N/A		
☐	☐	☐		A.	A definition of populations, which are the subject of EJ analysis; Percentage of low-income and minority populations present within impacted census blocks, block groups, or tracts.
☐	☐	☐		B.	Statement of two-pronged approach; enhanced public involvement (describing outreach to EJ populations), and analysis of impact/avoidance of disproportionate impact.

III. Affected Populations

SAT	INC	MIS	N/A	Definition of area of potential impact	
☐	☐	☐		A.	Documentation of data sources and methods for determination. Census data alone is generally not adequate. Data from public involvement, local comprehensive plans and "windshield surveys" are some examples of where supplemental data can be obtained.
☐	☐	☐		B.	Document the presence of low-income or minority populations. (Identification, description, and location of EJ population.)

IV. Enhanced Public Involvement

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Describe special efforts to address literacy, language, transportation, schedule, childcare, other barriers to involvement.
SAT	**INC**	**MIS**	**N/A**		
☐	☐	☐		B.	Description of target outreach efforts to involve low income/minority population. Describe methods Used to overcome potential barriers.
				C.	Documentation of strategy and results (attendance, responses, etc.).

V. Assessment of Impacts

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Definitions of adverse and disproportionate impacts (as per USDOT order.).
☐	☐	☐		B.	Analysis of impacts of each alternative, including No-Build, on EJ population. (Types of impacts as listed in Social-Economic-Relocation checklists)
☐	☐	☐		C.	Documentation of community perception of impacts, positive and negative and severity.
☐	☐	☐		D.	Description of any disproportionately high and adverse impacts on low-income or minority population.
☐	☐	☐		E.	Description of any offsetting benefits should be described.
☐	☐	☐		F.	Conclusion of impacts on EJ population. Are adverse impacts appreciably more severe or greater in magnitude that the adverse impacts that will be suffered by the non-minority/low-income population?

VI. Avoidance, Minimization, Mitigation and Enhancement

SAT	INC	MIS	N/A		
☐	☐	☐		A.	Discussion of any alternatives that avoid such impacts as they pertain to the EJ population. Include discussion of practicability.
☐	☐	☐		B.	Description of efforts to avoid, minimize, mitigate, enhance, or offset project as they pertain to the EJ population.
☐	☐	☐		C.	Description of social, economic, and environmental effects of mitigation measurers as they pertain to the EJ population
☐	☐	☐		D.	Mitigation commitments.
☐	☐	☐		E.	Documentation of community perception of suitability of mitigation proposed.

VII. Summary

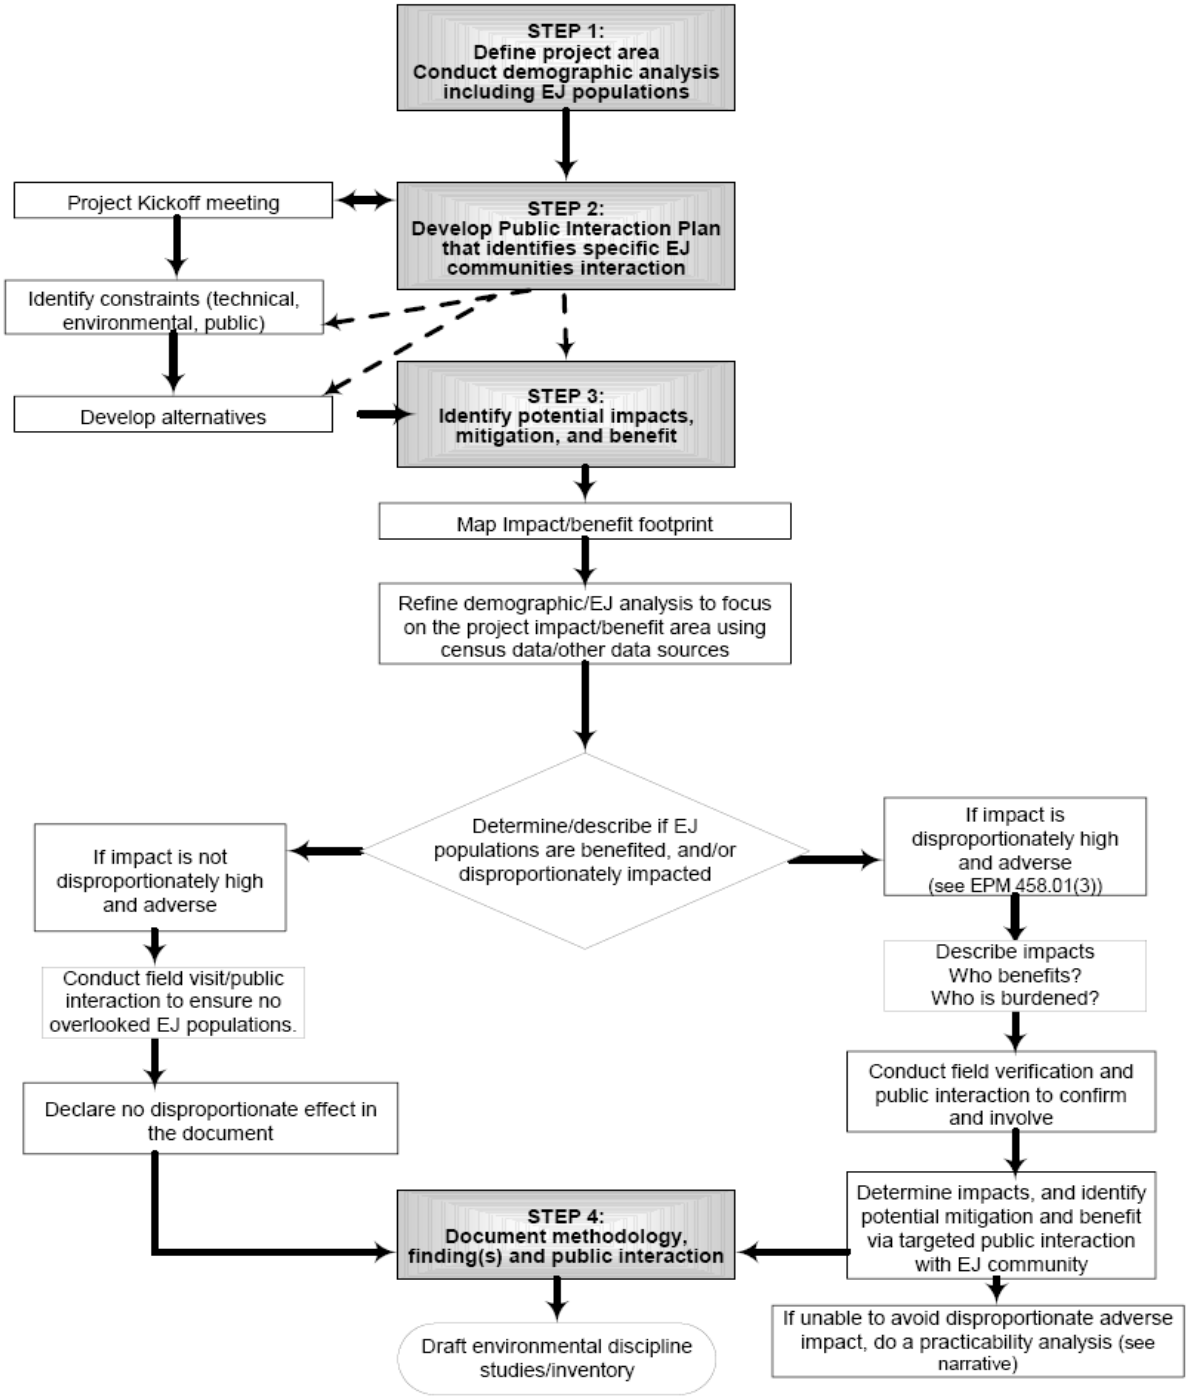
Summarize the analysis done and conclusions reached. The summary should include enough detail so that it can be included in the final environmental document with only minor

modification.

The summary should include:

SAT	INC	MIS	N/A		
☐	☐	☐		A.	The objectives of the project.
☐	☐	☐		B.	Environmental Justice populations and issues involved.
☐	☐	☐		C.	Impacts of all alternative including the no-build alternative.
☐	☐	☐		D.	Recommended mitigation.
☐	☐	☐		E.	Comparison of alternatives based on impacts and reasonableness of mitigation.
☐	☐	☐		F.	Summarize practicability determination if disproportionately high and adverse effects on minority populations or low-income populations cannot be avoided, minimized or mitigated.

Environmental Justice Analysis – Step-by-Step Flowchart



APPENDIX XIII. CONDUCTING AN ENVIRONMENTAL JUSTICE ANALYSIS STEP-BY-STEP OVERVIEW

Purpose and Requirements

This step-by-step overview provides directions on how to analyze transportation planning and project development effects on minority and low income communities. This condensed guide was developed in accordance with Title VI of the Civil Rights Act of 1964, National Environmental Policy Act (NEPA), Intermodal Surface Transportation Efficiency Act (ISTEA), and the Presidential Executive Order 12898 of 1994 as applicable throughout all stages of project development and construction. This guide acts a general framework for any environmental justice analysis.

VDOT intends this guidance to:

- Provide a consistent approach to conducting an environmental justice analysis.
- Ensure transportation planning and project development are done in a manner that does not have the effect of excluding persons from participation in or receiving program benefits.
- Promote the exchange of lessons learned.
- The step-by-step is a general process to refine an environmental justice (EJ) analysis throughout project development through the planning, environmental, project development, construction, and maintenance process.

Environmental Justice Analysis Overview

The EJ analysis process is composed of four basic steps:

1. Conduct a demographic analysis of the Study Area.
2. Develop a Public Interaction/Involvement Plan (PIP).
3. Determine impact(s), appropriate mitigation, and benefits(s) with regard to EJ populations via public interaction with the potentially affected communities.
4. Document the EJ analysis process.

Step 1 - Demographics

Prior to the project kick off meeting, but after the project is defined, conduct a demographic analysis of the project area, map the results, and develop a PIP based on this analysis. The analysis must identify any environmental justice (EJ) populations, and should include other data elements relevant to the PIP – e.g., age, disability, limited English proficiency, income level.

An EJ community includes individuals and minority populations, i.e., Asians, Blacks, Hispanics, Native Americans, and Pacific Islanders, as well as, low-income populations as defined by Presidential Executive Order 12898.

Step 2 – PIP Development

The PIP will be developed and modified to meet specific public and project needs as the project proceeds through the planning, environmental, project development, construction, and maintenance process.

The project team, assisted by this step-by-step overview, needs to decide how and where public interaction will occur in addition to circulating the usual reports for review and comment – as required or appropriate for project scoping; constraint identification; alternative development; and impact, mitigation, and benefit identification.

The PIP should:

1. Set public interaction goals and objectives.
2. Identify people and organizations to be reached based on demographics and relevant information.
3. Develop a strategy based on the goals/objectives and characteristics of the target audiences.
4. Incorporate strategies and techniques to aid decision-making.
5. Be evaluated and modified as more information is obtained from the impacted community.
6. Document the public interaction process and its results.

Step 3 - Impact/Mitigation/Benefits

When alternatives are developed, potential impacts, mitigation, and benefits should be identified and mapped prior to producing a draft document. Map the affected geographic areas, and refine the demographic analysis to determine if EJ communities are affected. A disproportionately high and adverse effect on minority and low-income populations means an adverse effect that:

1. Is predominately borne by a minority population and/or a low-income population; or
2. Will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non low-income population.

Disproportionately high and adverse effects on minority populations or low-income populations will only be carried out if further mitigation measures of alternatives that would avoid or reduce the disproportionately high and adverse effects are not "practicable." To determine the practicability of a mitigation measurer or an alternative, take into account the social, economic (including costs) and environmental effects of avoiding or mitigating the adverse effects. This process should be documented.

The analysis also needs to ensure that any potential for disproportionately high and adverse effects on populations protected by Title VI and EJ ("protected populations") will only be carried out if:

1. A substantial need for the program, policy or activity exists, based on the overall public interest; and
2. Alternatives that would have less adverse effects on protected populations have either:
    a) Adverse social, economic, environmental, or human health impacts that are more severe; or
    b) Would involve increased costs of an extraordinary magnitude.

A PIP is implemented within these affect EJ communities to obtain feedback on the alternatives, impacts, mitigation and benefits. A correlation should be made between the results of the public interaction, particularly with an adversely impacted EJ community, and the proposed mitigation and benefits.

Step 4 - Document the Process

The EJ analysis process is documented as follows:

- Summarize related laws, regulations and guidance,
- Define "adverse" and "disproportionate" impacts (per USDOT order.)
- Document data sources and methods for determination.
- Describe the study area and its demographics using narrative and maps,
- Summarize public interaction strategy,
- Describe and map impacts, mitigation and benefits and those populations affected,
- Describe specific interactions with the affected communities and results,
- Make an EJ determination(s),
- If the determination result is high and disproportionately adverse, another determination should be made taking into consideration the effect that mitigation and benefits will have.
- If disproportionately high and adverse effects on minority populations or low-income populations cannot be avoided, minimized or mitigated, a practicability determination should be made.

Draft the environmental discipline studies/inventories, and produce a draft environmental/planning document. The EJ determination is done concurrently with preparation of other environmental documents to allow for the inclusion of any related impacts such as noise, air, etc.

APPENDIX L
Data Collection Guidelines

The diversity of Virginia's population reflects the diversity of the population of the entire nation. It is critically important that VDOT and its sub-recipients be innovative in engaging historically under represented populations and businesses in the planning, project development and maintenance processes. According to the census bureau 2010 data, Virginia's total population estimate for 2013 was 8,260,405; females made up 50.1% of the population; people 65 years and older made up 13.4% of the population; Whites (not Hispanic or Latino) made up 63.6% of the population; Blacks or African Americans made up 19.7% of the population; Asians made up 6.1% of the population; Hispanic or Latinos made up 8.6% of the population, Native Hawaiian and Other Pacific Islanders made up 0.1 % of the population and American Indians and Alaska Native made up 0.5% of the population.

Purpose of Collecting Data:

23 U.S.C, 200.9(b)(4) requires the state "develop procedures for the collection of statistical data of participants in and beneficiaries of State highway programs, i.e., relocatees, impacted citizens (race, color, disability, sex, age and national origin) and affected communities." In addition, data collection provides measurable evidence of the Department's performance as it relates to Title VI for annual reports to the FHWA and the Department's efforts to ensure compliance with Title VI.

Objective data is necessary to identify:

1. Transportation needs of all persons within boundaries and plans or projects.
2. Impacts and persons impacted.
3. Persons to include in the decision making process.
4. "Champion(s) for various modes and transportation options.
5. Strategies to address impacts.
6. Alternatives to modes and locations and types of facilities (transit, light rail, van and carpooling, HOV lanes, etc.).
7. Priorities for investments.
8. Sources for financing investments.
9. Strategies to disseminate information.

Based on Title VI implementing regulations, each division/district is required to:

1. Provide for the collection of data and information to permit effective enforcement of Title VI.
2. Collect data about beneficiaries.
3. Analyze the data and information collected.
4. Eliminate discrimination when it is found.
5. Take affirmative measures to ensure nondiscrimination.

Types of data and analysis:

Each division develops a process to collect data with regard to race, color, national origin, sex, disability and age. Data that will be helpful in determining compliance with Title VI:

DATA	ANALYSIS
Population	District and statewide population and growth rates
	District and statewide ethnic composition
	Sex and age distribution
	Number of households by income group
	Median household by income
	Percent of persons below poverty level
	Percent of persons with mobility limitations
	Percent of mobility limitations
	Percent of elderly persons
	Language(s) spoken
	Percent of disabled by types of disability
Mode Choice	Number of trips per capita
	Percent of households with no automobiles
	Percent of households by income groups using various modes of transportation (e.g., bus, carpool, commuter rail, automobile)
	Percent of persons by ethnic, gender and disability group using various modes of transportation (e.g., bus, carpool, commuter rail, automobile)
Transportation System	Transportation system congested
	Delay as a percentage of travel time
	Travel time
	Exposure to transportation hazards (environmental, safety, crime)
	Access to jobs, churches, synagogues, mosques, medical care, schools, emergency services, grocery stores, family
Employment	Present and future location of jobs
	Present and future location of housing
	Present and future location of low-income communities
Other	Public investment per capita (Federal, State and Local)
These are recommendations; data should not be limited to these categories.	

Types of analysis to address compliance with Title VI:

1. Percent of benefits allocated to persons below poverty line vs. persons above poverty line.
2. Distribution of benefits (dollars, facilities, systems, projects) by groups and communities.
3. Impact of investments on income, race, gender, disability and age groups.
4. Allocation of funds by mode (highway, bus, commuter rail, etc.)
5. Projected population increases versus planned facilities and types of facilities.
6. Language needs assessment.

Types of performance indicators:

1. Mobility – ease of movement of people and goods.
2. Accessibility – access to opportunities (jobs, medical care, emergency services, family, shopping, entertainment).
3. Environment – sustainable development and preservation of the existing system and the environment.
4. Cost-effectiveness – maximized return on investment, direct as well as indirect costs associated with air pollution, congestion delay for individuals/businesses.
5. Reliability – system reliability (probability of arriving at destination or even making the trip).
6. Safety – physical design and operation of system (measured in accidents per person a mile) also includes security related to criminal activities on highways as well as on transit systems.
7. Equity – transportation investments and benefits are invested in a manner that meets the needs of all persons.
8. Customer Satisfaction – increased ability to make trips, improved travel time, safety and security, improved access to system.
9. Livable Communities – enhancement of living conditions for communities through transportation policies that provide multi-modal options including non-motorized modes.

Resources for collecting data:

1. Census Data
2. School Districts
3. Transit Ridership Surveys
4. Management Systems (Pavement and Congestion)
5. Land Use Plans
6. Geographic Information Systems
7. Transportation Models
8. Metropolitan Planning Organization Committees (e.g., Citizen Advisory Committees)

How to collect data:

Each division develops a process to collect data for the following basis:

Race	White/Caucasian
	Black/African American
	American Indian/Alaskan Native
	Asian
	Hawaiian/Pacific Islander
	Hispanic/Latino
National Origin	Born in United States, Puerto Rico, Guan, The U.S. Virgin Islands, Northern Marianas or
	Born Abroad of American parent(s)
	Born outside U.S., Puerto Rico, Guam, the U.S. Virgin Islands or Northern Marianas
Does the Person Speak a Language other than English at home?	If yes, what is the language? _____
	No
Sex	Male
	Female
Disability	Yes
	No
Age	_____

How to present/allocate multiple race responses is addressed in Office Management and Budget Bulletin No. 00-02. 1

All of the data collection considerations above apply directly to VDOT programs and when administering new or renewal contracts or applications for grants, permits or loans, an oversight perspective of your sub-recipients must be recognized and applied.

In addition, the U.S. Department of Justice regulations offer the examples below for determining compliance with Title VI:

1. The manner in which services are or will be provided and the related data necessary for determining whether any persons are or will be denied such services on the basis of prohibited discrimination.
2. The population eligible to be served by race, color, national origin, sex, disability

1 Office of Management and Budget Bulletin No. 00-02 establishes multiple race response is acceptable.

and age.

3. Data regarding, covered employment, including use of planned use of bilingual public contact employees servicing beneficiaries of the program where necessary to permit effective participation by beneficiaries unable to speak or understand English.
4. The location of existing or proposed facilities connected with the program and related information adequate for determining whether the location has or will have the effect of unnecessarily denying access to any persons on the basis of prohibited discrimination.
5. The present or proposed membership, by race, color, national origin, sex, disability and age, in any planning or advisory body which is an integral part of the program.
6. Where location is involved, the requirements and steps used or proposed to guard against unnecessary impact on persons on the basis of race, color, national origin, sex, disability or age.

Additional data, such as demographic maps, the racial composition of affected neighborhoods or census data, may be necessary or appropriate for understanding information requirements listed above. This type of data is required to the extent that the data is available.

The Title VI Specialist or the Division Administrator of Civil Rights must be promptly notified of any complaint filed against any program and its sub-recipients alleging discrimination on the basis of race, color, national origin, sex, disability or age.

MVP Southgate Project

Docket No. CP19-XX-000

Resource Report 5 – Socioeconomics

November 2018

MVP Southgate Project
Resource Report 5 – Socioeconomics

Resource Report 5 – Filing Requirements	
Information	**Location in Resource Report**
Minimum Filing Requirements	
1. Describe socioeconomic conditions within the Project area. (§ 380.12(g)(1))	Section 5.3
2. Evaluate impact of any substantial immigration of people on governmental facilities and services and describe plans to reduce the impact on the local infrastructure. (§ 380.12(g)(2))	Section 5.4
3. Describe on-site manpower requirements and payroll during construction and operation including number of construction personnel who currently reside within the impact area, would commute daily to the site from outside the impact area, or would relocate temporarily within the impact area. (§ 380.12(g)(3))	Section 5.4.1, 5.4.2, 5.4.5
4. Determine whether existing housing within the impact area is sufficient to meet the needs of the additional population. (§ 380.12(g)(4))	Section 5.4.3
5. Describe number and types of residences and businesses that would be displaced by the Project, procedures to be used to acquire these properties, and types and amounts of relocation assistance payments. (§ 380.12(g)(5))	Section 5.4.3
6. Conduct a fiscal impact analysis evaluating incremental local government expenditures in relation to incremental local government revenues that would result from construction of the Project. Incremental expenditures include, but are not limited to, school operating costs, road maintenance and repair, public safety, and public utility costs. (§ 380.12(g)(6))	Section 5.4.2 Appendix 5-A
Additional Information Often Missing and Resulting in Data Requests	
7. Estimate total worker payroll and material purchases during construction and operation.	Section 5.4.2 Table 5.4-1 Appendix 5-A
8. Estimate project-related ad valorem and local tax revenues.	Section 5.4.2 Table 5.4-2 Appendix 5-A
9. Describe impacts on local traffic due to construction- and operation-related traffic and worker commuting. Address impacts on marine traffic where applicable (e.g., LNG import/export facilities).	Section 5.4.5
10. Evaluate the effects of the project on minority and low income populations in consideration of Executive Order 12898. (59 Fed. Reg. 7629 (Feb. 16, 1994)).	Section 5.3.8, 5.4.8

RESOURCE REPORT 5
SOCIOECONOMICS

5.1 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission ("FERC" or "Commission") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Southgate Project" or "Project"). The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina. See Resource Report 1 (General Project Description) for additional Project information.

5.1.1 Environmental Resource Report Organization

Resource Report 5 is prepared and organized according to the FERC *Guidance Manual for Environmental Report Preparation* (February 2017). Section 5.2 describes the analysis area for the socioeconomic assessment. Section 5.3 describes existing socioeconomic conditions, including population, economic conditions, housing, community services, transportation, tax revenues, and environmental justice. Section 5.4 describes how the existing socioeconomic conditions could be affected during construction and operation of the Project. References used in the development of Resource Report 5 are listed in Section 5.5.

5.2 ANALYSIS AREA

The socioeconomic analysis area (Project area) for the Southgate Project focuses on the counties where the Project facilities will be constructed and operated. The Project is in Pittsylvania County, Virginia, and Rockingham and Alamance counties, North Carolina. Approximately two-thirds of the pipeline (47 miles) will be located in North Carolina (Table 5.2-1). Aboveground facilities include the construction of one new compressor station, four new meter (interconnect) stations, pig launchers and receivers, and mainline valves that will be installed at various locations along the pipeline route.

The Project counties are located in urbanized areas that are defined by the U.S. Census Bureau as areas of 50,000 or more people (U.S. Census Bureau, 2010a). The Project counties include one combined statistical area ("CSA[1]"), two metropolitan statistical areas ("MSA[2]"), and one micropolitan statistical area[3] that provide large labor pools consisting of highly skilled and well-educated workers, access to a wide range of equipment, materials, services, and sufficient temporary housing to accommodate the Project workforce. These populated areas are within the direct impact areas, and therefore, construction and operation impacts from the Project to surrounding communities and municipalities are not anticipated.

[1] CSAs consist of two or more adjacent metropolitan and micropolitan statistical areas that have substantial employment interchange. The MSA that combine to create a CSA retain separate identities within the larger CSA (U.S. Census Glossary, 2018).

[2] MSAs are Core Based Statistical Areas ("CBSAs") associated with at least one urbanized area that has a population of at least 50,000. The MSA comprises the central county or counties or equivalent entities containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county or counties as measured through commuting (U.S. Census Glossary, 2018).

[3] Micropolitan statistical areas are CBSAs associated with at least one urban cluster that has a population of at least 10,000 but less than 50,000. The micropolitan statistical area comprises the central county or counties or equivalent entities containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county or counties as measured through commuting (U.S. Census Glossary, 2018).

N/A = Not Applicable				

Pittsylvania County, Virginia

Approximately 26 miles of the pipeline, one compressor station and one interconnect will be in Pittsylvania County. Total land area in Pittsylvania County is 978.18 square miles and includes 9.23 square miles of water (U.S. Census, 2010b). The county is home to three towns and several other unincorporated communities with several major highways that cross through it (Pittsylvania County, 2018). Pittsylvania County is also included in the Danville micropolitan statistical area. For the purposes of this analysis, the City of Danville is not included as part of Pittsylvania County because it is an independent city bounded by Pittsylvania County and the North Carolina border and is located approximately 2.5 miles at its closest point to the Southgate Project. With respect to Environmental Justice ("EJ") areas, Pittsylvania County contains 16 census tracts, 9 of which are crossed by the Project and of that amount one census tract is a potential EJ communities (less than 1 percent). See Section 5.3.8 for more details on EJ.

Rockingham County, North Carolina

Approximately 26 miles of the pipeline and two interconnects will be in Rockingham County. Total land area in Rockingham County is 572.71 square miles and includes 7.15 square miles of water (U.S. Census, 2010b). There is one public-use airport and several major highways that cross through the county. Rockingham County is included in the Greensboro-High Point MSA which is part of the Greensboro-Winston-Salem-High Point CSA. The county is home to two cities, four towns, and 10 townships (Rockingham County, 2018). With respect to EJ communities, Rockingham County contains 21 census

tracts, 10 of which are crossed by the Project and of that amount four census tracts are potential EJ communities (less than 1 percent). See Section 5.3.8 for more details on EJ.

Alamance County, North Carolina

Approximately 21.1 miles of the pipeline and one interconnect will be in Alamance County. Total land area in Alamance County is 434.74 square miles and includes 10.79 square miles of water (U.S. Census, 2010b). Alamance County is centrally located in North Carolina, linking the Research Triangle and the Piedmont Triad metropolitan regions. The county is home to three cities, six towns, and many other smaller unincorporated communities and villages (Alamance County, 2018). Alamance County is included in the Burlington MSA which is part of the Greensboro-Winston-Salem-High Point CSA. With respect to EJ communities, Alamance County contains 36 census tracts, nine of which are crossed by the Project and of that amount two census tracts are potential EJ communities (less than 1 percent). See Section 5.3.8 for more details on EJ.

5.3 EXISTING SOCIOECONOMIC CONDITIONS

The socioeconomic data used in this evaluation were obtained from the most recent U.S. Department of Commerce, Bureau of the Census, and Bureau of Labor Statistics online databases. Additional information on community public services and available housing, hotel lodging, and rental units was obtained from publicly available online sources.

5.3.1 Population

Population data and trends including population density for the Project area are provided in Table 5.3-1. The three counties in the Project area had a total combined population of 314,598 in 2017, with 80 percent of this total located in the North Carolina counties. Population by county ranged from 162,391 in Alamance County to 61,258 in Pittsylvania County.

Population densities by county in 2017 ranged from 63.21 persons per square mile (persons/square mile) in Pittsylvania County to 383.00 persons/square mile in Alamance County. The corresponding statewide densities were approximately the same averaging around 212 persons/square mile.

Table 5.3-1
Population by State and County for the MVP Southgate Project

State/County	2017 Population	2017 Population Density (persons/square mile)	Population Change (Percent)	
			2000 to 2010	2010 to 2017
Virginia	**8,470,020**	**214.5**	**13.0**	**5.9**
Pittsylvania	61,258	63.21	2.9	-3.5
North Carolina	**10,273,419**	**211.31**	**18.5**	**7.7**
Rockingham	90,949	160.68	1.9	-2.9
Alamance	162,391	383.00	15.5	7.5

Source: U.S. Census Bureau, 2000, 2010, 2017 Census.

Population increased in all three counties in the Project area between 2000 and 2010. Alamance County experienced the greatest population increase, 15.5 percent. Pittsylvania and Rockingham counties had population increases of 2.9 and 1.9 percent, respectively. Alamance County continued to experience a

population growth of 7.5 percent between 2010 and 2017 while Pittsylvania and Rockingham counties experienced declines.

5.3.2 Employment and the Economy

Table 5.3-2 provides information on the economy and employment in the Project area. Per capita annual income was approximately equivalent among the Project counties with only an approximate $1,300 difference between the highest and lowest. The unemployment rates for the Pittsylvania and Rockingham counties were slightly above their respective state rates while Alamance County was equal at 4.3 percent. The civilian workforce estimates for 2017 for the Project counties include: 29,542 workers in Pittsylvania County; 41,106 workers in Rockingham County; and 79,767 workers in Alamance County. The total civilian workforce for all of the Project counties is 150,415 workers. Within the Project area, the major occupations are in the fields of educational, health and social services", "manufacturing", and "retail trade" (U.S. Census, 2016). Other top industries in the Project area include professional, scientific, and technical services, arts and entertainment, and construction.

Table 5.3-2
Existing Socioeconomic Conditions in the MVP Southgate Project Area

State/County	Per Capita Income (U.S. Dollars) a/	Civilian Labor Force (persons) b/, c/	Unemployment Rate b/, c/	Top Five Major Industries a/
Virginia	**$34,967**	**4,338,619**	**3.2**	**A, E, P, Pu, R**
Pittsylvania County	$22,650	29,542	4.5	C, E, M, P, R
North Carolina	**$26,779**	**4,987,865**	**4.3**	**A, E, M, P, R**
Rockingham County	$21,298	41,106	5.2	A, E, M, P, R
Alamance County	$23,989	79,767	4.3	C, E, M, P, R

Sources:

b/ Bureau of Labor Statistics, Table 1. Civilian Labor Force (May 2018 preliminary) for states.
c/ Bureau of Labor Statistics, Labor Force Data by County, 2017 Annual Averages for counties (number of unemployed people as a percentage of the labor force).

Industries:
A = Arts, entertainment, and recreation, and accommodation and food services.
Ag = Agriculture, forestry, fishing and hunting, and mining.
C = Construction.
E = Educational, health and social services.
F = Finance and insurance, and real estate and rental and leasing.
M = Manufacturing.
O = Other services, except public administration.
P = Professional, scientific, management, administrative and waste management services.
Pu = Public administration.
R = Retail trade.
T = Transportation and warehousing, and utilities.

5.3.3 Housing

Table 5.3-3 provides select housing data from the Project counties. Data on housing units are estimates for 2016 prepared by the U.S. Census Bureau, 2012-2016 American Community Survey 5 – year estimates (U.S. Census Bureau, 2012-2016). The number of total housing units varies across the impact area, largely based on the county population and the presence of the MSA, CSA, or micropolitan statistical area. In 2016, Pittsylvania County (with the lowest population) had the fewest housing units (31,334 units) while Alamance County, with the highest population, had the most housing units (68,211 units). Rockingham County possessed the highest rental vacancy rate of 8.9 percent while Pittsylvania County possessed the lowest rate of 3.6 percent. Each of the three counties had over 5,000 vacant housing units available (17,253 total). Based on available online resources, there are approximately 44 hotels and motels within the Project counties, as well as 12 campgrounds and recreational vehicle ("RV") parks providing hundreds of rental units.

Table 5.3-3
Housing by State and County for the MVP Southgate Project

State/County	Housing Units 2016 a/			Hotels and Motels b/	Campgrounds & RV Parks c/

5.3.3.1 Existing RV and Campground Facilities

Table 5.3-4 lists existing RV and campground facilities that would be located within commuting distance of the Southgate Project.

Table 5.3-4
Existing RV and Campground Facilities in the MVP Southgate Project Counties

Existing RV And Campground Facilities	Description / Amenities
Virginia	
Pittsylvania County	
Elkhorn Lake Campground and ATV Trails 2500 Elkhorn Road, Java	• 560+ acre recreation area with private 110-acre lake and family campground • Opened year round, gated • 60 RV sites onsite • Full hookups for electric service • 8.7 miles away from closest point of pipeline centerline at MP 0.5 • Rustic cabins, picnic pavilions, fishing and boat ramp, swimming pool and water slide • Band events and entertainment • 31 miles of ATV trails and motorcycle Enduro track
Leesville Lake Campground 3129 Gallows Road, Gretna	• 40-acre campground site • Opened year round, pet friendly • 9.0 miles away from closest point of pipeline centerline at MP 0.0 • 12 spacious full hookup campsites • Swimming pool • Large wooded areas • Old road-bed trails • Access to a 17-mile long lake providing fishing, boating, kayaking, canoeing, and other water sports and activities • Access to boat ramps, floating docks, and paved parking areas with boat trailer spaces
Paradise Lake and Campground 593 Keeling Drive, Keeling	• Opened year round, pet friendly • 17 large and 40 small RV sites with full hookups • 7 miles away from closest point of pipeline centerline at MP 11.0 • Rustic cabins and tent sites • Bath and laundry facilities • Swimming pool • Snack bar • Outdoor activities • Access to Paradise Lake providing fishing, paddle and jon boating
Smith Mountain Campground 155 Liberty Road, Penhook	• Opened year round, pet friendly • Located adjacent to pond and 4 miles from Smith Mountain Lake with public boat landing • 20 large wooded and level RV sites with four pull through sites; all with electric service • 17 miles away from closest point of pipeline centerline at MP 0.0 • 10 tent sites available • Bath house and pavilion • Walking trails, outdoor activities
Running Cedar RV Resort 3129 Gallows Road Post Office Box 556, Gretna	• Located steps from the 17-mile long Leesville Lake • 23 large wooded and level campsites with water and electric service • 18 miles away from closest point of pipeline centerline at MP 0.0 • Access to public lake front picnic area with public boat ramp, fishing • Clubhouse with lounge area and game room, private outdoor pool, walking trails

Table 5.3-4 Existing RV and Campground Facilities in the MVP Southgate Project Counties	
Existing RV And Campground Facilities	**Description / Amenities**
North Carolina	
Rockingham County	
Lake Reidsville 630 Water Works Road, Reidsville	• Multipurpose recreation facility with a campground located on a 750-acre lake and park providing outdoor activities • Opened year round, every day • 46 wooded sites with water and electricity with 28 having full hookups • 5 miles away from closest point of pipeline centerline at MP 46.5 • Swimming is not allowed since Lake Reidsville is a municipal water source
Dan River Campground 724 Webster Road, Stoneville	• Small family owned and operated tent and RV campground site • Located on the Dan River about 20 miles from the Martinsville Speedway • Opened April 1 through October 31, pet friendly • 53 RV sites (20 that have water, electric and sewer hookup; 13 that have water and electric hookup that are available for RV camping) • 4 tent sites have electric and water and 5 sites are tent only with no hookups • 12.4 miles away from closest point of pipeline centerline at MP 36.0 • River activities include more than 30 canoes and kayaks and over 100 float tubes available
	• Swimming, outdoor activities, walking trails
Humphrey's Ridge Marine and Campground, Belews Lake 548 Shelton Road, Stokesdale	• Located on Belews Lake which is a 3,864 acre lake with an 88-mile shoreline • Opened early April through early September • 36 RV sites • 22 miles away from closest point of pipeline centerline at MP 41.0
Lisa's RV Landing 3440 US 311, Madison	• Opened year round • 12 RV sites • 22 miles away from closest point of pipeline centerline at MP 40.0 • Can accommodate all types of campers from the smallest tent to the biggest 5th wheel and motorhomes with slide-outs • Electric hook ups
Alamance County	
Jones Station RV Park 2710 Jones Drive, Mebane	• 25-acre privately owned RV park and campground park • 56 deluxe camp sites • Opened year round • Full hookups on all sites as well as RV Storage • Bathhouse and several other modern day amenities • Park can accommodate large pull-throughs • 4.4 miles away from closest point of pipeline centerline at MP 73.11
Hidden Lake Park 4460 South NC Highway 54, Hidden Lake Road, Graham	• Opened year-round for camping (RV hookups and tent) • 12 RV sites • Swimming and water slide • Concessions with picnic area • Two bath houses • 5.0 miles away from closest point of pipeline centerline at MP 73.11

Table 5.3-4 Existing RV and Campground Facilities in the MVP Southgate Project Counties	
Existing RV And Campground Facilities	**Description / Amenities**
Crane Creek Campground & RV Park 1256 Longest Acre Road, Snow Camp	• 80 wooded acres sitting on the Cane Creek mountain range • Opened year round • 20 hookups (water and electric) and additional sites with no hookups • Can accommodate all types of campers from the smallest tent to the biggest 5th wheel and motorhomes with slide-outs • 22 miles away from closest point of pipeline centerline at MP 40.0
Sources: Experience Danville Pittsylvania County, 2018; Visit Rockingham County, 2018; Visit Alamance County, 2018.	

5.3.4 Travel and Tourism

Table 5.3-5 provides domestic travel-related economic impacts for the Project area in 2016. The Southgate Project counties each account for less than 1 percent in travel-related expenditures compared to their state totals (VATC, 2016; VisitNC, 2016). However, preliminary data for year 2017 for both states indicate increases in all areas of domestic travel-related economics ranging from a low of 1.1 percent to a high of 7.1 percent (U.S. Travel Association, 2018).

Virginia

The Southgate Project area is located in the southern region of Virginia known for its six speedways, history and heritage, rolling countryside, and outdoor activities (Virginia, 2018). Domestic and international travelers to Virginia spent nearly $25 billion in 2016 that supported 234,670 jobs and provided $3.4 billion in state and local taxes and the travel industry was the fourth largest private employer in the state (U.S. Travel Association, 2016).

Among the 95 counties in Virginia, Pittsylvania County ranked 55th with respect to economic impacts resulting from domestic travel in 2016 (VATC, 2016). Domestic travelers spent approximately $73 million in Pittsylvania County in 2016, which represents less than 1 percent of the states total. The travel and tourism industry generated $14 million in payroll in Pittsylvania County and resulted in approximately $4 million in state tax revenue and $2 million in local tax revenue in 2016 (Table 5.3-5).

North Carolina

The Southgate Project area is located in the Greensboro and Winston-Salem region known for having the nation's largest natural-habitat zoo, being the furniture capital of the world, and the nation's largest pottery community (VisitNC, 2018). Domestic and international travelers to North Carolina spent nearly $24 billion in 2016 that supported 229,530 jobs and provided $3.7 billion in state and local taxes and the travel industry was the sixth largest private employer in the state (U.S. Travel Association, 2016).

In 2016, domestic traveler expenditures in Rockingham County were approximately $71 million, representing less than 1 percent of the state total (VisitNC, 2016). The travel and tourism industry generated $12 million in payroll in Rockingham County and resulted in approximately $3.8 million in state tax revenue and $1.7 million in local tax revenue in 2016 (Table 5.3-5).

Domestic traveler expenditures in Alamance County were more than double that of Rockingham County at $180 million, but still only representing less than 1 percent of the state total (VisitNC, 2016). The travel

and tourism industry generated $29 million in payroll in Alamance County and resulted in approximately $11 million in state tax revenue and $3 million in local tax revenue in 2016 (Table 5.3-5).

Table 5.3-5
Domestic Travel-Related Economic Impacts in the MVP Southgate Project Counties, 2016

State/County	Travel-Related Expenditures $(millions)	Travel-Related Payroll $(millions)	Travel-Related Employment (thousands)	Travel-Related State Tax Receipts $(millions)	Travel-Related Local Tax Receipts $(millions)
Virginia	**$23,699.81**	**$5,624.41**	**229.26**	**$1,014.41**	**$663.39**

2016 Impact of Travel on North Carolina (VisitNC, 2016).

5.3.5 Public Services

Public services and facilities are available in the Southgate Project area, including full-service law enforcement, hospitals, career and volunteer fire departments, and public schools. Select public service information is provided in Table 5.3-6.

5.3.5.1 Education

The total number of public schools are summarized by county in Table 5.3-6. There are 80 public schools in the Project counties consisting of elementary, middle, and high schools. The parking lot of one public school will be crossed by the Southgate Project pipeline at approximately milepost ("MP") 71.3. Refer to Resource Report 8 for further details.

5.3.5.2 Police and Fire Services

Summary data for law enforcement and fire departments are presented by county in Table 5.3-6. These data provide a general overview of resources available in each county. In general, the number of police and fire departments is directly related to the overall size and population of the county, as well as the number of communities. Multiple law enforcement agencies and providers exist in the potentially affected counties of the Project, including state patrol, county sheriffs, and local police departments. In many cases, mutual aid agreements allow agencies to support one another in emergency situations.

The Southgate Project counties have full service law enforcement agencies that are each staffed by one sheriff's office that employs, on average, 140 full and part-time deputies and officers who provide services in the areas of corrections, operations, investigations, and administration (Table 5.3-6). In addition, there are hundreds of state troopers in the corresponding states (approximately 675 in Virginia and over 1,600 in North Carolina) that provide similar services as the counties (VSP, 2015; NCDPS, 2015).

Multiple fire departments provide fire protection, rescue, and suppression services in the Southgate Project counties. Many of these fire departments are at least staffed with a few full-time paid fire-fighter and several part-time volunteers. Several of the fire stations in the Southgate Project counties also provide

combined medical services. For instance, Pittsylvania County has 21 fire stations, four of which have combined emergency medical services (Pittsylvania County, 2018).

5.3.5.3 Medical Facilities

Medical facility summaries are presented by county in Table 5.3-6. There are only four hospitals in the Southgate Project counties with over 600 beds; however, the area has numerous outpatient clinics providing emergency services, general care, eye and dental, onsite pharmaceuticals, and other specialty services (Open Door Clinic, 2018; Piedmont Health, 2018). Pittsylvania County also has approximately 12 emergency transport agencies that provide emergency ambulance services to surrounding communities (Pittsylvania County, 2018).

Table 5.3-6
Public Services in the MVP Southgate Project Area

County/State	Number of Public Schools a/	Number of Police Departments b/	Number of Fire and Rescue Departments c/	Number of Hospitals d/	Number of Hospital Beds d/

5.3.6 Transportation

The Southgate Project area will mainly be accessed by use of existing highways. Major routes crossed by the pipeline alignment in Pittsylvania County, Virginia include U.S. Route 29 and U.S. Route 58. U.S. Route 29 extends north/south for approximately 1,036 miles from Pensacola, Florida to the western suburbs of Baltimore, Maryland. It will be crossed twice by the pipeline, near MP 4.5 in Pittsylvania County, Virginia and again near MP 41.7 in Rockingham County, North Carolina. U.S. Route 29 bisects Virginia, entering the state at Danville and passing through several towns before leaving the state in Arlington County and entering the District of Columbia (AARoads, 2018). U.S. Route 58 is an east/west highway that extends for approximately 508 miles from just northwest of Harrogate, Tennessee to U.S. Route 60 in Virginia Beach, Virginia and will be crossed by the Southgate Project pipeline near MP 20.0. Major routes and that will be crossed by the Project are identified in Table 5.3-7.

Other major routes that will be crossed by the pipeline alignment include State Route 87 ("SR 87"), Interstate 40 ("I-40"), Interstate 85 ("I-85"), and U.S. 70. SR 87 is a primary state highway in Virginia that extends approximately 4 miles from the North Carolina state line north to U.S. Route 220 in Henry County, Virginia. It parallels the majority of the pipeline route through Alamance and Rockingham counties in North Carolina and will also cross the pipeline near MPs 49.2 and 55.8 in Alamance County. I-40 and I-85 ("I-40/85") are major east-west interstate highways traversing through the southcentral/southeastern portions of the U.S. I-40 travels through North Carolina for approximately 421 miles and intersects (shares)

with I-85 east of downtown Greensboro. In Alamance County, the pipeline will cross the shared I-40/85 near MP 70.9. U.S. 70 (Haw River Bypass) is a primary corridor that extends east/west through North Carolina connecting Raleigh, Smithfield, Goldsboro, Kinston, Havelock and the Port of Morehead City that is a major hurricane evacuation route. The pipeline alignment will cross U.S. 70 at MP 68.5.

Table 5.3-7
Major Interstates and Highways Crossed by the MVP Southgate Project

Approximate Milepost	Highway	County	State
4.5	U.S. Route 29	Pittsylvania	Virginia
20.0	U.S. Route 58 (Martinsville Highway)	Pittsylvania	Virginia
41.7	U.S. Route 29	Rockingham	North Carolina
42.2	U.S. 158 West	Rockingham	North Carolina
49.2	SR 87	Alamance	North Carolina
55.8	SR 87	Alamance	North Carolina
68.5	Highway 70 (Haw River Bypass)	Alamance	North Carolina
70.9	Interstate 40/85	Alamance	North Carolina

Optional transportation available in the region include train and airline resources. North Carolina has more than 3,200 miles of railroad track serving 22 states in the eastern half of the country. North Carolina also has four international airports, 11 regional airports and two major deep-water seaports (EDPNC, 2018). The Amtrak National provides daily round-trip service throughout the majority of the Project area (Amtrak, 2018). The Burlington-Alamance and Danville Regional Airports provide regional air service to many major cities, internal and external to Virginia and North Carolina. The Piedmont Triad International Airport in Greensboro, North Carolina is approximately 25 miles away from the closest point of the pipeline at MP 54 (WPPDC, 2018).

5.3.7 Tax Revenues

5.3.7.1 Sales and Use Taxes

The general sales and use tax rate for Virginia is 5.3 percent (4.3 percent state tax and 1 percent local tax), Table 5.3-8. Additional state tax is imposed in the Northern Virginia and Hampton Roads regions, neither of which is crossed by the Project (Virginia State Tax Division, 2017).

The general sales and use tax rate for North Carolina is 6.75 or 7.00 percent (4.75 percent state tax plus applicable local rates at 2.00 or 2.25 percent tax), (North Carolina Department of Revenue, 2017)).

Table 5.3-8
Sales and Use Tax Rates by Location

State/County	County Tax Rate (%)	State Tax Rate (%)	Total Tax Rate (%)
Virginia			
Pittsylvania	1.00	4.3	5.3
North Carolina			
Rockingham	2.00	4.75	6.75
Alamance	2.00	4.75	6.75

5.3.8 Environmental Justice

Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (1994) was issued to focus federal attention on the environmental and human health effects of federal actions on minority and low-income populations with the goal of achieving environmental protection for all communities. The order requires each federal agency to identify and address as appropriate the disproportionately high and adverse effects of its programs, policies and activities on minority populations and low-income populations. It also provides minority and low-income communities access to public information and public participation.

5.3.8.1 Federal Environmental Screening

To determine potential impacts on minority and low-income populations, the Southgate Project used the Environmental Protection Agency's ("EPA") Environmental Justice Screening and Mapping Tool ("EJSCREEN") demographic index (EPA, 2017a), in accordance with FERC *Guidance Manual for Environmental Report Preparation*. EJSCREEN's demographic index is a block group which exceeds 50 percent minority population and/or exceeds 50 percent population whose household income is below twice the federally defined poverty threshold (EPA, 2017b). Block groups and census tracts of potential EJ communities where the Project facilities cross or are in are included in Tables 5.3-9 and 5.3.10 and displayed on Figure 5.3-1. Data in Table 5.3-9 was taken from the U.S. Census Bureau, 2012-2016 American Community Survey 5-Year Estimates which is what the EJSCREEN uses. Discussions on the results are provided in the following sections.

EPA's Environmental Justice Showcase Communities

The Southgate Project also conducted a review of EPA's Environmental Justice Showcase Communities for Regions 3 and 4 and determined that none of the Project facilities are located in these communities (EPA, 2017c).

Tribal Consultation

On July 24, 2014, the EPA issued its Policy on Environmental Justice for Working with Federally Recognized Tribes and Indigenous Peoples. The Policy focuses on EPA's work with federally recognized tribes, state recognized tribes, tribal members, indigenous community-based/grassroots organizations, Native Hawaiians, individual Native Americans, and others living in Indian country. The Policy also discusses EPA's work with other federal agencies, state agencies, and other interested groups (EPA, 2014).

The Southgate Project is actively coordinating with federal tribes that are cooperating agencies in the FERC process (see Resource Report 4 for more details). In addition, the Project has conducted outreach with state tribes and has been actively coordinating with interested tribal representatives.

In addition to federal guidance, the Southgate Project also assessed state level EJ policies, as applicable, which are further discussed in the following sections (see Section 5.3.8.2 below).

Table 5.3-9

Opportunity Zones

Opportunity Zones[1] are a new community development program established by Congress in the Tax Cuts and Jobs Act of 2017 to encourage long-term investments in low-income urban and rural communities nationwide. The Opportunity Zones program provides a tax incentive for investors to re-invest their unrealized capital gains into Opportunity Funds that are dedicated to investing into Opportunity Zones designated by the chief executives of every U.S. state and territory (EIG, 2018).

North Carolina Opportunity Zones will offer qualified investors certain tax benefits when they invest unrealized capital gains into these areas. Investments made by qualified entities known as Opportunity Funds into certified Opportunity Zones will receive three key federal tax incentives to encourage investment in low-income communities.

The federal law allows each state to designate up to 25 percent of its total low-income census tracts as Opportunity Zones candidates. North Carolina has just over 1,000 of these tracts, so only 252 census tracts could be selected as Opportunity Zones (NC Commerce, 2018). Opportunity Zones for the Project counties are displayed on Figure 5.3-1. Many of these zones correspond to the block groups and census tracks of potential EJ communities where the Project facilities are located or cross.

Minority and Low-Income

A total of seven block groups out of 28 crossed by the Southgate Project exceeded the national averages of minority populations and/or low income populations where the Project facilities cross or are in (Table 5.3-9 and Figure 5.3-1). These seven block groups of potential EJ communities represent approximately 17.12 miles of the total Project route (23 percent), (Table 5.3-10 and Figure 5.3-1). While the Southgate Project pipeline route crosses EJ communities, it is collocated with existing infrastructure for approximately 34 percent (6.44 miles) of the alignment within the EJ census tracts. These existing facilities have been in operation for decades within these communities. With respect to demographic indexes, one block group in Pittsylvania County exceeded the 50 percent threshold of the minority population of the national average by approximately 1 percent and one block group in Rockingham County exceeded the threshold by approximately 2 percent and one block group was equal to the threshold. Low income populations for five block groups (three in Rockingham County and two in Alamance) were reported to be above the national averages by approximately 4 and 5 percent, and one at 17 percent. One block group in Rockingham County exceeded the 50 percent threshold of both demographic indexes.

Racial/Ethnic Composition

Table 5.3-9 provides the percentages of the general racial/ethnic compositions for the Project counties and block groups crossed by the Project. Racial/ethnic compositions for the Southgate Project area is predominantly white with six block groups over 90 percent, 10 block groups at or over 80 percent, two counties and six block groups over 70 percent, once county and five block groups approximately 51 to 70 percent and one block group at 49 percent followed by the African American racial/ethnic composition with two block groups averaging approximately 46 percent, two block groups approximately 30 to 40 percent,

[1] An Opportunity Zone is an economically-distressed community where new investments, under certain conditions, may be eligible for preferential tax treatment. Localities qualify as Opportunity Zones if they have been nominated for that designation by the state and that nomination has been certified by the Secretary of the U.S. Treasury via his delegation authority to the Internal Revenue Service (IRS, 2018).

14 block groups between 10 and 25 percent and the remaining block groups under 10 percent while the Project counties averaged approximately 20 percent.

Non-English Speaking Groups

Data was taken from the U.S. Census Bureau, 2012-2016 American Community Survey 5-Year Estimates for language spoken at home (S1601), (U.S. Census Bureau, 2012-2016). According to the Census, language spoken at home is defined as the language currently used by respondents at home that is either "English only" or a non-English language used in addition to English or in place of English.

Alamance County was approximately 1.3 percent higher than North Carolina's estimate for percentages of non-English speaking populations age 5 and over in the Project area, while Pittsylvania and Rockingham counties each were less than their respective state estimates by 12 and 6 percent (Table 5.3-9). Of the seven block groups of potential EJ communities, only two had percentages of non-English speaking populations age 5 and over that averaged 3 percent.

Children and Elderly

According to the U.S. Census Bureau, 2012-2016 American Community Survey 5-Year Estimates, two of the Project counties have less people age 5 and under living in the Project area compared to their respective state estimates by more than 1 percent (and one was equal), and average 5.2 percent of the state population. However, for the elderly living in the Project area, each of the Project counties exceed their respective state estimates by more than 3 percent, and average approximately 18 percent of the state population (Table 5.3-9). With respect to the block groups, the highest and lowest percent of people age 5 and under and people age 65 and over living in the Project area are located in Rockingham County. Section 5.4.8 provides a discussion on human health and protective standards including children and the elderly.

Public Outreach

To facilitate public involvement and outreach, the Southgate Project has developed a Public, Stakeholder, and Agency Participation Plan (see Resource Report 1, Appendix 1-L). This plan outlines a commitment to engage actively with stakeholders throughout the life cycle of the Project and provides the steps the Southgate Project has identified to ensure successful ongoing communication with stakeholders, including establishing a Project website (www.mvpsouthgate.com), a toll-free phone line (833-MV-SOUTH), and e-mail mail@mvpsouthgate.com. The Southgate Project will continue to meet with stakeholders to discuss the ongoing efforts associated with the Project.

5.3.8.2 State Environmental Screening

The states of Virginia and North Carolina have recently established EJ councils and / or policies that appear to be under development, as described further below; however, neither state currently has data or policies available for the counties in the Southgate Project area.

Virginia

Virginia's Executive Order 73 (effective October 31, 2017) established the Advisory Council on Environmental Justice ("ACEJ"). The ACEJ provides independent advice and recommendations to the Executive Branch on integrating environmental justice considerations throughout Virginia's programs, regulations, policies, and procedures, among other goals. The ACEJ focuses on strategic, scientific, technological, regulatory, community engagement, and economic issues related to environmental justice

throughout Virginia and interacts with several groups (Virginia Natural Resources, 2018). The Southgate Project will continue to coordinate with the ACEJ as it develops state polices and guidelines to address EJ.

North Carolina

North Carolina's Department of Environmental Quality ("NCDEQ") recently formed the Secretary's Environmental Justice and Equity Advisory Board ("EJ Board"). The scope of the EJ Board is to assist the NCDEQ in achieving and maintaining the fair and equal treatment and meaningful involvement of North Carolinians regardless of where they live, their race, religion or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Board members will work directly with NCDEQ staff to help elevate the voices of the underserved and underrepresented as the NCDEQ work to protect the public's health and natural resources (NCDEQ, 2018).

The NCDEQ also committed to new policies to ensure compliance with federal civil rights laws, including a language access program and the development of an EJ tool to examine demographic, health, and environmental characteristics of communities impacted by NCDEQ policies (NCEJN, 2018). The Southgate Project will continue to coordinate with the NCDEQ as it develops state polices and guidelines to address EJ.

5.4 ECONOMIC EFFECTS AND MITIGATION

Construction impacts from the Project will be short-term and localized, due primarily to the short construction period and small composition of the labor force. Potential effects associated with construction of the Project could result in minor temporary increases in the local population, demand for temporary housing, and use of temporary public services such as police, fire, and medical services. However, sufficient public services exist within the Project area to support the needs of the construction crew and personnel associated with construction of the Project. In addition, construction activities will be in large CSA/MSA areas that have sufficient capability and capacity to manage the temporary influx of personnel without affecting the level of service provided to the current population. Revenues from construction employment, local expenditures by the construction companies for construction materials, and non-local construction workers for temporary housing, food, and entertainment will temporarily benefit the local economy.

5.4.1 Population and Employment

Overall construction of the pipeline and associated facilities of the Project is expected to take 10-12 months, with a proposed construction start date in the first quarter of 2020. Based on current discussions with qualified construction contractors, the Southgate Project estimates that local workers will account for approximately 55 percent of construction jobs for each spread for the duration of the Project. The remaining 45 percent of the construction workforce will consist of non-local workers. Local workers are defined here as those who normally reside within daily commuting distance of the work sites.

Non-local workers will temporarily relocate to the Project vicinity for the duration of their employment; some workers will possibly commute home on weekends, depending on the location of their primary residence. Individual non-local workers may also relocate along the length of the Southgate Project and between segments depending on their assignment. Very few of the non-local workers employed during the construction phase of each spread are expected to be accompanied by family members or permanently relocate to the affected areas. If a larger than anticipated percentage of non-local construction personnel is

required to meet peak workforce requirements, sufficient workers should be available in the labor pool in the surrounding areas since the Project is located within large CSA/MSA areas.

Table 1.4-1 compares the projected average and peak numbers of non-local workers with existing population by construction spread. These estimates illustrate the numbers of non-local workers expected to be present during construction. Non-local workers seeking temporary accommodation would reside in daily commuting distance of their work sites. Some non-local workers would likely reside in the counties within which they are working; others may locate in larger communities in adjacent or nearby communities. This is discussed further in Section 5.4.3.

The Southgate Project expects approximately four new jobs will also be required for operations and maintenance of the Project facilities.

Impacts to the local population in the Southgate Project area from non-local construction activities would be temporary and minimal. Non-local construction personnel will typically disperse following completion of specialized construction activities. Therefore, no long-term population impacts will result from construction of the Project.

5.4.2 Economy and Tax Revenue

5.4.2.1 Construction-Related Tax Revenues

The Southgate Project has conducted an economic analysis of the Project and is evaluating the results. A report and summary of the conclusions for Project construction and operation in Virginia and North Carolina will be provided upon completion.

The Southgate Project estimates that it will spend approximately $464 million on labor, equipment, materials, acquisition, and other services to develop and construct the project facilities, of which $68 million is expected to be spent directly in Virginia and $113 million is expected to be spent directly in North Carolina. These expenditures will generate economic activity and support employment and income elsewhere in the economy through the multiplier effect, as initial changes in demand "ripple" through the local economy and support indirect and induced impacts. During peak construction in 2020, the Southgate Project estimates that the Project would generate and support an estimated 570 total (direct, indirect, and induced) jobs in Virginia during Project construction, and an estimated 1,130 total jobs in North Carolina. A detailed economic report for the Project is included in Appendix 5-A. *[Note: Appendix 5-A to be provided in a supplemental filing expected to be filed in early 2019.]*

Table 5.4-1 below shows the tax revenue that the Southgate Project will generate over the pre-construction and construction periods from 2018 to 2020. The Southgate Project estimates that it will generate $4.1 million and $6.3 million in tax revenue in Virginia and North Carolina, respectively, with the largest impact from property taxes. The property tax value is conservative in that it excludes estimated property taxes for materials that are on-site but not yet installed.

Table 5.4-1
Estimated State and Local Tax Revenues Generated During Construction for the MVP Southgate Project

Type of Tax	Virginia ($ million) a/, b/	North Carolina ($ million) a/, b/
Sales and Use Tax	$1.2	$2.3
Income Tax	$0.9	$1.5
Property Tax c/	$1.5	$1.6
Other Personal	$0.1	$0.4
Other Business	$0.4	$0.5
Total	**$4.1**	**$6.3**

a/ Estimated tax revenues are presented in millions of dollars.
b/ These estimates are aggregate totals for the entire construction period.
c/ Taxes generated by induced economic activity during construction; numbers conservatively do not include property taxes paid directly by the Southgate Project during construction.

Sources: FTI Consulting 2018.

5.4.2.2 Ad Valorem Tax Revenues

Estimated ad valorem taxes that will be paid once the pipeline is in service are presented by county and state in Table 5.4-2 (FTI Consulting 2018). Estimated ad valorem tax revenues as a share of general fund total revenues in the Project counties will range from 0.4 percent (Alamance County) to 1.8 percent (Pittsylvania County).

The Project will also generate an additional $1.7 million for municipalities in North Carolina. Table 5.4-2 below does not include this figure, however, as neither Rockingham nor Alamance counties receive these funds.

Table 5.4-2
Estimated Annual Ad Valorem Tax Revenues During Operation by County for the MVP Southgate Project

County/State	General Fund Total Revenues (dollars) a/	Annual Ad Valorem Taxes (dollars) a/	Percent of General Fund Total Revenues
Pittsylvania	$67,227,000	$1,212,000	1.8%
Virginia Subtotal	**$67,227,000**	**$1,212,000**	1.8%
Rockingham	$90,031,000	$1,038,000	1.2%
Alamance	$152,280,000	$681,000	0.4%
North Carolina Subtotal	$242,311,000	**$1,719,000**	0.7%
Total	**$309,538,000**	**$2,931,000**	

a/ Numbers are presented in 1,000s.
Sources: FTI Consulting 2018.

5.4.3 Housing

During construction of the Project, the presence of construction workers immigrating to the Southgate Project area will increase the demand for temporary short-term housing. The majority of construction workers will likely temporarily relocate to the vicinity of the Project area for the duration of their employment, possibly commuting home on weekends, depending on the location of their primary residence.

Non-local construction workers are most likely to use available temporary housing such as area campgrounds/RV parks and hotel/motels in the Southgate Project area and possibly adjacent towns or counties that are within a reasonable daily commuting distance of the Project. Non-local construction workers are also most likely to provide their own housing units (e.g. travel trailers or RV campers). The Southgate Project estimates approximately 45 percent of the construction workers would be non-local and of that amount approximately 25 percent would bring their own travel trailers or RV campers. At peak construction, approximately 290 non-local workers that would utilize existing RV camping facilities for temporary housing. As listed in Section 5.3.3.1, there are 12 RV and campground facilities located in the Project counties providing over 400 individual RV sites; the majority of which are open year round.

Given the large number of available vacant housing units (over 5,000 in each Project county, totaling 17,253), the number of potential hotel rooms available in each Project county (totaling over 2,000, Table 5.3-3), plus the 400 individual RV sites, the Southgate Project does not expect a conflict with hotels, RV parks, or other temporary housing in the Project counties during the tourism season. The anticipated migration of non-local construction workers to the Project area represents less than 1 percent of the total temporary housing (rental housing, hotel and motel rooms, and RV hookups) and therefore, the temporary demand for these facilities is unlikely to displace permanent residents or adversely affect housing prices or cause any conflicts with tourism.

5.4.3.1 Travel and Tourism

The Southgate Project counties provide mainly outdoor recreation tourist attractions, but also provide arts, music, historical structures and districts, dining, museums, sporting events, and shopping opportunities. The high tourist season in the Project area typically peaks during summer vacation season between May and October and in October for viewing fall foliage. Travel-related expenditures for the Project counties each accounted for less than 1 percent in 2016 compared to their state totals (VATC, 2016) and are only expected to increase by small percentages annually; therefore, construction of the Project is not anticipated to adversely impact the tourist season in the region. However, short-term impacts, including temporary increases in dust, noise, and traffic from construction is expected but are not anticipated to adversely impact tourism in the region. If any potential conflicts are identified with tourism, mitigation measures will be evaluated, which may include timing of construction to avoid peak use periods, maintaining access to businesses at all times, and expediting construction through the areas frequented by tourists. The Project will coordinate directly with affected stakeholders on an individual basis to further reduce potential adverse effects. Potential impacts to recreational resources, and visual impacts on recreation and other sensitive resources are addressed in Resource Report 8.

5.4.3.2 Displacement of Residences and Businesses

The Southgate Project has no plans to displace or relocate any businesses as a result of construction or operation of the Project.

5.4.4 Property Values

Several studies have examined the effects of gas pipelines on sales and property values. A study on "The Effect of Natural Gas Pipeline on Residential Value" performed by Diskin et al. (2011) could "not identify a systematic relationship between proximity to [a] pipeline and sale price or value." A study conducted by Integra Realty Resources for the Interstate Natural Gas Association of America ("INGAA") Foundation in 2016 found that "There is no measurable impact on the sales price of properties located along or in

proximity to a natural gas pipeline versus properties which are not located along or in proximity to the same pipeline." (INGAA, 2016)

The 2016 INGAA Foundation study reviewed underground FERC-regulated natural gas transmission pipelines in residential areas in the Midwest, Northeast, Mid-Atlantic and Southeast. In addition, a study by Gnarus Advisors LLC (2012) examined whether proximity to pipelines, with a focus on natural gas pipelines, has an effect on residential property values. The study contains a literature review specific to pipelines and property values, with a focus on actual sales data. The authors conclude that there is "no credible evidence based on actual sales data that proximity to pipelines reduces property values." Further, they found that "hypothetical surveys of actual or potential market participants should not be used as a substitute for the systematic analysis of market data, as they may overstate the effects, if any, of proximity to disamenities, including pipelines, on property values."

In addition, FERC, the lead federal agency on the construction of pipelines, researched pipelines' effect on property values and reported the results in an Environmental Impact Statement and Environmental Assessments issued 2018, 2012 and 2013. The Environmental Impact Statement and Environmental Assessments found that there was no pipeline-related impact on property value. Further, with respect to compressor stations, the Commission Staff has found that various nuisance effects are prominent, such as noise, aesthetics or air emissions could potentially affect property values in the same way as homes near major roads might be devalued. However, when noise and visual impacts are sufficiently mitigated, a compressor station will not significantly impact property values.[2]

Additionally, the compressor station will meet emission standards (see Resource Report 9 for more details). Therefore, it is unlikely that the compressor station will significantly reduce property values or resale values.

5.4.5 Community Infrastructure

The Southgate Project counties have numerous medical facilities and emergency response services to temporarily accommodate the construction workforce (Table 5.3-6). The temporary immigration of construction workers to local communities will be short term and is not expected to affect the levels of service provided by existing law and fire protection personnel or burden medical facilities. Local police assistance will likely be required to facilitate traffic flows during construction at some road crossings and permits will be required for vehicle load and width limits for some of the vehicles delivering Project materials and supplies. The Project will work directly with local law enforcement, fire departments, and emergency medical services to coordinate for effective emergency response. Furthermore, in accordance with 49 Code of Federal Regulations ("CFR") 192.615, The Project is currently preparing an Emergency Response Plan for construction and operation of the pipeline and associated facilities (see Resource Report 11).

[2] Environmental Impacts Statement for Midship Pipeline Company, LLC, Midcontinent Supply Header Interstate Pipeline Project at pp. 4-118 & 4-119, Docket No. CP17-458-000 (June 2018). Environmental Assessment for Millennium Pipeline Co, LLC's Hancock Compressor Project at pp. 42-43, Docket No. CP13-14-000 (Feb. 28, 2013). Environmental Assessment for Millennium Pipeline Co, LLC's Minisink Compressor Project at pp. 22-23, Docket No. CP11-515-000 (Feb. 29, 2012).

Very few, if any, of the non-local workers employed during the construction phase of each spread are expected to be accompanied by family members. As a result, the number of school age of children expected to relocate is very limited and unlikely to noticeably affect school enrollment in the Project area.

5.4.6 Transportation and Traffic

Resource Report 8 (Table 8.2-4) provides a complete list of public road crossings for the Southgate Project. Major state and federal transportation routes and highways that will be crossed by the pipeline are also identified in Table 5.3-7. To the extent feasible, existing public and private roads in the Project area will be used to access the Project facilities.

Construction of the Southgate Project will result in minor, short-term effects on the transportation system in the Project area. Construction will be scheduled for work within roadways and specific crossings so as to avoid commuter traffic and schedules for school buses and local city transit buses to the greatest extent practical.

The Southgate Project will incorporate measures to maintain safety, minimize traffic disruption, and ensure that construction activities will not prevent the passage of emergency vehicles. Measures may include the creation of temporary travel lanes during construction or the placement of steel plate bridges to allow continued traffic flow during open trenching. Traffic lanes and residential access will be maintained, except for the temporary periods essential for pipeline installation. Provisions will be made to allow passage of emergency vehicles at all times. In areas where traffic volumes are high or other circumstances (e.g., congested areas) exist, the Project will employ a police detail to ensure traffic flow and the safety of pedestrians and vehicles. All necessary permits for public road crossings or work within public road rights-of-way, including from the Virginia Department of Transportation and the North Carolina Department of Transportation will be obtained. The Project will also require its construction contractors to ensure enforcement of local vehicle weight restrictions and limitations by its vehicles and to remove any soil that is left on the road surface by the crossing of construction equipment. When necessary for equipment to cross roads, mats or other appropriate measures, such as sweeping, will be used to reduce deposition of mud. In the event that construction traffic causes damage to any roads, the Project will immediately repair the road in accordance with the requirements set forth by the landowner or agency having jurisdiction over the road.

In addition to the traffic impacts caused by road crossings, the temporary movement of construction equipment and materials and the daily commuting of employees to and from the construction work areas will add to existing traffic volumes on local roads. Construction activities will be spaced over two construction spreads, with each spread responsible for all construction activities within a specific milepost range along the pipeline (Table 5.2-1). These activities will include grading, trenching, pipe stringing, welding, lowering-in, backfilling, regrading, and restoration described more fully in Resource Report 1. Construction activities at each spread will proceed in sequence in an assembly-line fashion along the right-of-way, with one crew following the next from clearing until final clean-up. As a result, construction workers and equipment will not only be divided between two spreads, but will also be distributed at different locations within each spread.

Equipment and materials will be transported from various laydown areas and storage yards within the vicinity of the pipeline. Most construction equipment will remain on site during construction. Several construction-related trips will be made each day (to and from the job site) on each of the construction

spreads. This level of traffic will remain consistent throughout the construction period and will typically occur during the early morning hours (from 5:00 to 6:00 a.m.) and evening hours (after 6:00 p.m.). Typically, the pipeline construction work week is 6 days, sometimes extending to 7 days as required by the workload and construction schedule. However, some work, such as stream crossings may be conducted on a 24-hour basis until that particular task is complete.

Construction crews would commute to the Southgate Project work areas in their personal or company vehicles. Workers will be deployed in various locations along each spread, thereby reducing the potential for congestion in any one area. Pipeline construction work is typically scheduled to take advantage of daylight hours and involves long work days (at least 10 hours). With typical start and finish times of 7:00 a.m. and 7:00 p.m., most workers will commute to and from the construction right-of-way during off-peak hours. Some discrete activities (e.g. hydrostatic testing, HDD, tie-ins, stream crossings, purge and packing the pipeline facilities) may occur beyond these timeframes. Because construction is expected to move sequentially along the pipeline route, traffic flow impacts that do arise will be temporary on any given section of roadway. Refer to Appendix 5-B – MVP Southgate Project Traffic Management Plan for more details.

Construction vehicles can pose concern when school buses are traveling their established routes. Communities expect for their children to have safe and timely travel to and from school. The Southgate Project will work with the governing School Districts or the School Transportation Departments in the Project area to identify school bus routes and times. The Project will avoid school bus routes to the extent practicable.

The Southgate Project does not anticipate substantive impacts on transportation infrastructure and traffic patterns along the pipeline route during construction or operation of the Project facilities.

5.4.7 Agriculture

In Virginia, agriculture is the largest private industry, contributing $70 billion annually and providing more than 334,000 jobs in Virginia (VDACS, 2017a). According to a 2017 economic impact study, production agriculture employs nearly 54,000 farmers and workers in Virginia and generates approximately $3.8 billion in total output (VDACS, 2017b). Land in farms accounted for 30.3 percent of the total land area in Virginia in 2012 (Table 5.4-3). However, the number of farms in Pittsylvania County accounted for approximately 2.9 percent (1,354 farms) of the total number of farms in Virginia, which is 46,030 farms.

In North Carolina, agriculture is expected to see modest declines between 2014 and 2024 and agricultural employment is likely to follow the national projected trend and drop 5.3 percent during the same period. This decrease will most likely be driven by employment declines in crop production and animal production (LEAD, 2016). Land in farms accounted for 26 percent of the total land area in North Carolina in 2012. The Project counties in North Carolina accounted for an average of 3.2 percent (1,634 farms) of the total farms in North Carolina (50,218) and represented approximately 0.1 percent of agricultural market value compared to that of the state (Table 5.4-3).

Table 5.4-3
Summary of Agriculture by County and State, 2012 for the MVP Southgate Project

County/State	Number of Farms	Land in Farms (acres)	% of Total Land Area	Average Farm Size (acres)	Market Value of Agriculture Products Sold	Total Market Value of Agriculture Products Sold	
						Crops (%)	Livestock, Poultry, and Products (%)
Virginia	**46,030**	**8,302,444**	**30.3**	**180**	**$3,753,287,000**	**36**	**64**
Pittsylvania	1,354	287,262	46.3	212	$86,942,000	42	58
North Carolina	**50,218**	**8,414,756**	**26.0**	**168**	**$12,588,142,000**	**34**	**66**
Rockingham	902	112,166	30.9	124	$32,804,000	74	26
Alamance	732	83,551	30.7	114	$32,930,000	47	53

Source: USDA, 2012.

Agricultural land accounted for approximately 14 percent of total land area where the Southgate Project facilities will be located. Of that amount, 266.3 acres will be impacted during construction and operation of the Project (200 temporary, 66.2 permanent). Therefore, the Project is unlikely to noticeably affect overall agricultural production and employment in any of the Project counties. Refer to Resource Report 8 for further discussions.

5.4.8 Environmental Justice

5.4.8.1 Disproportionate High and Adverse Effects on Minority or Low Income Populations

As discussed in Section 5.3.8, assessing the potential for disproportionately high and adverse impacts on minority and/or low income populations typically involves two steps: first, identifying whether minority and/or low-income communities are present, and, then, if these types of communities are present, evaluating whether high and adverse human health or environmental effects will disproportionately affect the identified community or communities. As indicated in the above discussion, review of census data suggests the presence of low income, and, to a much lesser extent, minority communities. As indicated in Table 5.3-9, the six block groups total population is 7,297 (2.3 percent) of the total population in EJ compared to that of the Southgate Project counties total population of 308,280. However, construction of the Southgate Project is not expected to result in adverse and disproportionate human health or environmental effects to these communities, as discussed below.

The Southgate Project facilities will be designed in compliance with the national ambient air quality standards, which are protective of human health, including children, the elderly, and sensitive populations. Construction of the Project is not expected to have high and adverse human health or environmental effects on any nearby communities. Adverse construction-related impacts will likely include increases in local traffic and noise, as well as fugitive dust, and could result in temporary delays at some highway crossings. These impacts will be temporary, localized, and are not expected to be significant. The Project will implement a variety of measures that will minimize potential impacts on nearby communities, including environmental justice communities. For instance, the Project will employ proven construction-related practices to control fugitive dust, such as application of water or other commercially approved dust control

applications on unpaved areas subject to frequent vehicle traffic. Similarly, noise control measures will be implemented during project construction. See Resource Report 9 for more detail and discussions on noise and air quality impacts.

The presence of existing infrastructure must be considered when evaluating relevant Project impacts, including environmental justice and opportunity zones. When collocated with existing infrastructure or utility corridors, the incremental impacts of an additional pipeline are significantly less compared to routing through a greenfield area. Collocation minimizes potential impacts on the general population and environmental justice communities alike. Mountain Valley developed the Southgate Project pipeline route to collocate to the maximum extent practicable and avoid unnecessary greenfield impacts. Within environment justice communities, the Project pipeline route is collocated for 7.4 miles, resulting in 7.4 fewer miles of greenfield impacts, including greenfield impacts on environmental justice communities. Many of these environmental justice communities are also located within opportunity zones along the route (See Figure 5.3-1).

Construction could also increase demand for health care and municipal services, as well as potentially increase demand for police and fire protection services. However, these impacts are expected to be temporary and are not expected to measurably affect the quality of services currently received by local communities and residents.

The Southgate Project facilities will also be designed, constructed, operated, and maintained in accordance with or to exceed the U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration minimum federal safety standards in 49 CFR 192 (see Resource Report 11 for more details). These regulations, which are intended to protect the public and to prevent natural gas facility accidents and failures, apply to all areas along the pipeline routes regardless of the presence or absence of minority or low income populations.

The Southgate Project will continue to update its stand alone, interactive Project web site to provide the public with the most recent information, including a Project overview, map of the facilities, list of frequently asked questions, list of the Project contacts and announcements of public meetings on the Project. The Project intends to continue its efforts to keep landowners, public officials, and the relevant permitting agencies fully informed of developments on the Project.

Revenues from construction employment, local expenditures by the construction companies for construction materials, and non-local construction workers for temporary housing, food, and entertainment will temporarily benefit the local economy. The increased property tax base during Project operation will be beneficial in the long-term. Local communities will benefit from ad valorem taxes paid annually by the Southgate Project over the life of the Project. Refer to Resource Reports 1.1.2 and 10 for further discussions on the "Purpose and Need" of the Project and additional benefits the Project is expected to provide.

In conclusion, the construction and operation of the Southgate Project would not cause a disproportionate share of adverse environmental or socioeconomic impacts on any racial, ethnic, or socioeconomic group, or on block groups that meet the environmental justice criteria.

Appendix 5-B

MVP Southgate Project
Traffic Management Plan

MVP Southgate Project

Traffic and Transportation Management Plan

November 2018

TABLE OF CONTENTS

1.0 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") has developed this Traffic and Transportation Management Plan to describe the measures the MVP Southgate Project ("Project" or "Southgate Project") and their Contractors will take to minimize potential impacts on state and local roadways during the construction of the Project. This plan outlines traffic impact minimization measures, noxious weed control measures, and dust control methods that will be used on the Project to reduce impacts during construction.

Operations and maintenance activities will be conducted with light vehicles at very few occasions that should have no impact to roadways and traffic once the project is in-service.

1.1 Traffic Impacts

Prior to construction, the Southgate Project will obtain applicable Federal, State/Commonwealth, and local road use and crossing permits, as required. The Project personnel will comply with all permit requirements and conditions to provide for public safety and minimize impacts on public roads. Copies of this *Traffic and Transportation Management Plan* and applicable road use and crossing permits will be provided to the appropriate personnel and maintained at each Contractors' field office.

The Southgate Project's Traffic Coordinator will consult with State and local agencies regarding detour routes, speed/load limits, and other use limitations, conditions, or restrictions on the roads that will be utilized during construction. Before the start of construction, the Project will work with these agencies to obtain the most up-to-date traffic information for the roadways in the Project area as well as ongoing road reconstruction or improvement projects in the vicinity of the pipeline route and facilities area. Where local, private roadways will be affected, the Project will coordinate with landowners and lessees of properties to mitigate potential impacts on those roads. Similarly, where roads on public lands will be affected, the Project will coordinate with the appropriate managing agency to mitigate potential impacts on roads or implement required traffic and transportation procedures. As discussed further in the following sections, the Project will place and maintain traffic control measures, such as flag persons, warning signs, lights, and/or barriers, as appropriate, to ensure the safety of construction workers and the public and to minimize traffic congestion. The Project will maintain traffic flow and emergency vehicle access on roadways with traffic control personnel or detour signs, where necessary. The Project's Traffic Coordinator will work with local law enforcement, fire departments, and emergency medical services to coordinate access for effective emergency response during construction. Contractors will be directed to comply with local weight limitations and restrictions on area roadways.

The Southgate Project strives to mitigate the increase in construction-related truck traffic on local roads shared with community and school buses in suburban and more densely populated rural areas. Key components to a successful community partnership include:

- Central point of command for construction traffic route plan. The Project will have a Traffic Coordinator reporting to the Safety Program Manager or Construction Manager responsible for maintaining traffic related plans, procedures, records, and documents.
- School bus curfews. Often times construction vehicles can pose concern when school buses are traveling their established routes. The community expects for their children to have safe and timely travel to and from school. The Project will work with the governing School Districts or the School Transportation Department in the project area to identify the bus routes and times. To the extent practicable, construction traffic will be limited or refrained during the bus route times with a published school bus route curfew time period.
- Speed enforcement. In more rural areas, law enforcement is often not staffed to handle a sudden increase in traffic. Establishing a third-party contractor to assist in monitoring the speed of the route not only keeps contractor and the public safe but lends accountability to the Project. Inevitably, contractors will end up off of bonded routes. The Traffic Coordinator will be able to actively monitor these issues and reduce unbonded travel that can become costly if damage occurs. The Coordinator can also be useful in diffusing potential hostile situations with neighbors and landowners.

All impacts shall be within the guidelines of all applicable agencies, as well as approval from landowners. A list of state and county contacts is provided in the table below. Once construction is complete, the Project will restore all roads back to their original level of service or better, unless the Project is directed otherwise in writing by the landowner or regulatory agency. Pre-construction video will be used to document the roadway condition prior to Project usage.

2.0 PIPELINE ROAD CROSSINGS

The Southgate Project will construct road and highway crossings in accordance with the permit requirements and the construction drawings for the crossing. No work on any such crossing shall be started before obtaining all applicable permits from the regulatory agencies. At a minimum, the Project will maintain single lane traffic on all roads and shall provide flagmen, road signs and all other signaling required by the governing authority to supervise the flow of traffic. The Project will provide barricades, warning signs, flares, lanterns, flagmen and such other protective measures required to maintain traffic and to safeguard the public at all times.

Any damage to paved or blacktop roads shall be repaired per specifications provided by the regulatory agencies. Road surfaces other than hard surface roads (e.g., paved, blacktop, or concrete) shall be backfilled in well-tamped 6-inch layers and shall be finished with a well-tamped surface matching the existing road. If flowable fill is used, it will be in accordance with the appropriate mix per agency specifications. For all types of crossings, additional or other limitations may be provided by the governing municipality and must prevail.

At the end of each workday, the Southgate Project will make passable any open-cut driveways for ingress and egress. This may be accomplished by using steel plates. Any and all steel plates used for such purposes shall be properly pinned (i.e., secured in place) and ramped on each end to allow traffic flow. The backfilling road crossings shall be performed immediately after the pipe is installed and in accordance with requirements established by the applicable permit.

3.0 CONSTRUCTION TRAFFIC

An increase in traffic to local and state roads will be expected throughout the day between the hours of 6:00 a.m. and 7:00 p.m. or sunset, whichever is later. Emergencies or other designated construction activities may necessitate nighttime work. The temporary traffic will include transportation for construction workers in light and heavy duty trucks, as well as tractor trailers hauling machinery and materials. Impacts are expected to be minor and short term because construction spreads and personnel will be geographically dispersed and personnel will commute to and from work areas in early morning and late evening during nonpeak traffic hours. Traffic will be entering and leaving off-site locations such as laydown yards, right-of-way and additional temporary workspace for the purpose of pipeline construction, hauling material and roadway maintenance. Once the material and heavy equipment are placed on the right-of-way, construction equipment will move in a linear manner along the right-of-way as work progresses, minimizing traffic on local roads. The amount of equipment moved by hauling from site to site will be reduced due to the accessibility created by the construction right-of-way.

The Southgate Project may make road improvements at areas that are not conducive to heavy hauling and large traffic volume, in addition to maintaining all bonded roads during construction, and finally returning the roads back to their original or better level of service, meaning their original width and length, unless the Project is directed otherwise in writing by the landowner or state agency.

4.0 NOXIOUS WEEDS

To prevent noxious weeds from transporting along roadways, the Southgate Project developed the following measures:

- The prompt seeding and revegetation of areas of disturbed soils with certified weed-free seed.
- Encourage the cleaning of equipment and vehicles prior to entering or leaving each management area. (Pressure wash in a designated area only.)
- Minimize soil disturbance, where possible.
- Use certified weed-free mulch/straw for erosion control.

5.0 FUGITIVE DUST CONTROL

Dirt and gravel during construction periods in dry weather can create an inhospitable environment for neighbors and workers. The Southgate Project developed the following fugitive dust control measures to address this issue.

Implementation of construction and restoration best management practices and operational controls will be used to mitigate fugitive dust emissions. The project earth disturbance permit will outline specific practices that control fugitive dust, including a construction sequence; use of rock construction entrances; and temporary soil stabilization methods. Operational controls are also implemented, including the use of a reduced speed limit on unpaved access roads as well as sweeping/vacuuming paved roadways when Project-related soils are tracked out onto paved surfaces.

Wet suppression, using water, is the predominate method of suppressing fugitive dust on unpaved roads and gravel pads as it causes finer materials to adhere into larger particles. Increasing the moisture content of the finer materials may be accomplished either naturally or mechanically. Moisture content of unpaved road surfaces can be naturally increased through rainfall. Moisture content can also be increased mechanically through the application of water. The amount of water required to sufficiently control fugitive dust emissions is dependent on the characteristics of materials (e.g., surface moisture content), ambient conditions (e.g., rainfall, humidity, temperature), activities occurring in the area (e.g., vehicle traffic, vehicle weight, speeds).

The following measures will be taken to reduce fugitive dust from operations:

- Fugitive dust emissions from vegetation removal, clearing and grading, cutting and filling, topsoil removal, trenching, backfilling and stockpile storage will be controlled to a great extent by following the construction sequencing and disturbing limited areas at a time;

- Fugitive dust emissions generated by motorized equipment and miscellaneous vehicle traffic will be controlled by wet suppression as necessary;
- Fugitive dust emissions from paved roads will be controlled with a combination of water trucks, power washers, sweeping and/or vacuuming. If necessary, additional potential sources of water for dust control may include other municipal systems, groundwater supply wells, and/or approved surface waters;
- Track out of loose materials will be controlled using rock construction entrances on access roads that begin at a junction with paved roads; and
- When environmental conditions are dry, inspection of dust control measures will be conducted daily.

6.0 INSPECTION, MONITORING, AND RECORD KEEPING

The construction contractor will implement the dust control measures specified in this plan. All construction personnel will be informed of the measures in this plan. Environmental inspectors will have primary responsibility for monitoring and enforcing the implementation of dust control measures by the construction contractor. The inspectors will also be responsible for ensuring that these measures are effective and proper documentation is maintained. When environmental conditions are dry, inspection of dust control measures will be conducted daily, and the environmental inspectors will be responsible for recording the following information on a daily basis:

- weather conditions, including temperature, wind speed and wind direction;
- number of water trucks in use;
- incidents where dust concentration is such that special abatement measures must be implemented;
- condition of soils (e.g., damp, crusted, unstable) on the right-of-way and other construction sites;
- condition of soils (e.g., damp, crusted, unstable) on access roads;
- condition of track-out pads;
- overall status of dust control compliance.

This information will be incorporated into the environmental inspector's daily report, and significant instances of non-compliance with the plan will be reported to the Construction Manager as soon as they are discovered.

Southgate Project

Final Environmental Impact Statement

Mountain Valley Pipeline, LLC
FERC Docket No.: CP19-14-000

Cooperating Agencies:

U.S. Army Corps of Engineers

U.S. Fish & Wildlife Service

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

OFFICE OF ENERGY PROJECTS

In Reply Refer To:
OEP/DG2E/Gas 3
Mountain Valley Pipeline, LLC.
Southgate Project
Docket No. CP19-14-000

TO THE INTERESTED PARTIES:

The staff of the Federal Energy Regulatory Commission (FERC or Commission), with the participation of the cooperating agencies listed below, has prepared a final environmental impact statement (EIS) for the Southgate Project (Project) proposed by Mountain Valley Pipeline, LLC (Mountain Valley). Mountain Valley requests authorization to construct and operate about 75.1 miles of natural gas transmission pipeline, one new compressor station, and accompanying facilities that would provide 375 million cubic feet of gas per day of available capacity for transport from the City of Chatham, in Pittsylvania County, Virginia to a delivery point with Dominion Energy North Carolina (DENC), formerly PSNC[1], near the City of Graham in Alamance County, North Carolina.

The final EIS assesses the potential environmental effects of the construction and operation of the Project in accordance with the requirements of the National Environmental Policy Act (NEPA). As described in the final EIS, the FERC staff concludes that approval of the Project would result in some adverse environmental impacts; however, these impacts would be reduced to less-than-significant levels because of the impact avoidance, minimization, and mitigation measures proposed by Mountain Valley and those recommended by staff in the EIS.

The United States Army Corps of Engineers (COE) and the U.S. Department of the Interior Fish and Wildlife Service (FWS) participated as cooperating agencies in preparation of this EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposal and participate in the NEPA analysis. The cooperating agencies provided input into the analyses, conclusions, and recommendations presented in the EIS. Following issuance of the final EIS, the cooperating agencies will issue subsequent decisions, determinations, permits, or authorizations for the Project in accordance with each individual agency's regulatory requirements. The COE would use this EIS in their regulatory process, and to satisfy

[1] Following a January 2, 2019 merger, Dominion Energy, Inc. acquired PSNC and changed the company name to Dominion Energy North Carolina.

compliance with NEPA and other related federal environmental laws (e.g., the National Historic Preservation Act).

The EIS addresses the potential environmental effects of the construction and operation of the following Project facilities:

- about 75.1 miles of new 24-inch and 16-inch diameter natural gas pipeline located in Pittsylvania County, Virginia, and Rockingham and Alamance Counties, North Carolina;
- one new 28,915 horsepower compressor station (Lambert Compressor Station) in Pittsylvania County, Virginia;
- four interconnects or tie-ins with facilities operated by Mountain Valley, East Tennessee Gas, and DENC; and
- ancillary facilities including pig launchers and receivers, mainline block valves (MLV), and cathodic protection beds.

The Commission mailed a copy of the *Notice of Availability* of the final EIS to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Indian Tribes; potentially affected landowners and other interested individuals and groups; and newspapers and libraries in the area of the Project. The final EIS is available in hard copy at libraries in the area of the Project and in electronic format. It may be viewed and downloaded from the FERC's website (www.ferc.gov), on the Environmental Documents page (https://www.ferc.gov/industries/gas/enviro/eis.asp). In addition, the final EIS may be accessed by using the eLibrary link on the FERC's website. Click on the eLibrary link (https://www.ferc.gov/docs-filing/elibrary.asp), click on General Search, and enter the docket number in the "Docket Number" field, excluding the last three digits (i.e., CP19-14). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FercOnlineSupport@ferc.gov or toll free at (866) 208-3676, or for TTY, contact (202) 502-8659.

Questions?

Additional information about the Project is available from the Commission's Office of External Affairs, at **(866) 208-FERC**, or on the FERC website (www.ferc.gov) using the eLibrary link. The eLibrary link also provides access to the texts of all formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription that allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to www.ferc.gov/docs-filing/esubscription.asp.

EXECUTIVE SUMMARY

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared this final Environmental Impact Statement (EIS) to fulfill the requirements of the National Environmental Policy Act (NEPA), under Title 40 Code of Federal Regulations (CFR) Parts 1500-1508, and the Commission's regulations at 18 CFR Part 380. On November 6, 2018, Mountain Valley Pipeline, LLC (Mountain Valley[1]), filed an application with the FERC, under Section 7(c) of the Natural Gas Act (NGA) and Part 157 of the Commission's regulations, requesting authorization to construct and operate certain interstate natural gas facilities in Virginia and North Carolina.

The FERC is the federal agency responsible for authorizing interstate natural gas transmission facilities under the NGA, and is the lead federal agency for preparation of this EIS in compliance with the requirements of NEPA.[2] The United States (U.S.) Army Corps of Engineers (COE) Norfolk and Wilmington Districts, and the U.S. Department of the Interior Fish and Wildlife Service (FWS) Virginia and North Carolina Field Offices participated as cooperating agencies in preparation of the EIS. A cooperating agency has jurisdiction by law or has special expertise with respect to environmental resource issues associated with a project.[3]

PROPOSED ACTION

The Southgate Project (Southgate Project or Project) would involve the construction and operation of 75.1 miles of underground natural gas transmission pipeline system in Virginia and North Carolina. Mountain Valley also proposes to construct and operate a new compressor station (Lambert Compressor Station) in Virginia; four new meter stations (referred to as interconnects); four pig launchers and receivers at three locations; eight main line valves; and four cathodic protection beds. Associated with construction of the proposed facilities would be contractor yards, staging areas, temporary extra workspaces, and access roads.

In general, as described by Mountain Valley, the purpose and need for the Southgate Project is to meet the specific requests for natural gas transportation service of its anchor shipper, Dominion Energy North Carolina (DENC), formerly PSNC[4], a local natural gas distribution company. Mountain Valley states that the Project will provide additional firm natural gas transportation services for DENC to meet its growing supply needs via interconnections with the under construction Mountain Valley Pipeline Project in southern Virginia and the interstate pipeline of East Tennessee Natural Gas Transmission, LLC (East Tennessee) in North Carolina to two new delivery points on the DENC distribution system in Rockingham and Alamance Counties,

1 Mountain Valley is a joint venture among affiliates of EQM Midstream Partners, LP; NextEra Energy Inc; AltaGas Ltd. and RGC Resources, Inc. MVP Southgate Project facilities would be operated by an affiliate of EQM Midstream Partners, LP.

2 40 CFR Part 1501.5.

3 40 CFR Part 1501.6.

4 Following a January 2, 2019 merger, Dominion Energy, Inc. acquired PSNC and changed the company name to Dominion Energy North Carolina.

North Carolina. The Project would have the capacity to transport 375 million cubic feet of gas per day.

PUBLIC INVOLVEMENT

On May 3, 2018, Mountain Valley filed a request with the FERC to initiate the Commission's pre-filing environmental review process for the Project. On May 15, 2018, the FERC staff granted Mountain Valley's request and established a pre-filing docket number, PF18-4-000, to place information related to the Project into the public record. The intent of our[5] pre-filing process is to encourage the early involvement of interested stakeholders, facilitate interagency cooperation, and identify and resolve issues before an application is filed.

During pre-filing, Mountain Valley sponsored three open house meetings held at various locations throughout the Project areas to explain their Project to the public. Representatives of the FERC staff also attended those open house meetings to answer questions from the public about our environmental review process. A total of about 300 people attended the open houses.

On August 9, 2018, the Commission issued a Notice of Intent (NOI) to *Prepare an Environmental Impact Statement for the Planned Southgate Project, and Request for Comments on Environmental Issues, and Notice of Public Scoping Sessions*. The NOI was published in the *Federal Register* on August 15, 2018, and mailed to more than 1,100 interested parties on our environmental mailing list for the Project. The NOI briefly described the Project, summarized the FERC's environmental review process, provided a preliminary list of issues identified by us, invited comments on the environmental issues that should be addressed in the EIS, listed the dates, times, and locations of three public scoping sessions, and established a closing date for receipt of comments of September 10, 2018.

The scoping sessions were held in Reidsville and Haw River, North Carolina and Chatham, Virginia between August 20 and 23, 2018. About 100 people in total attended the sessions, with 68 people providing oral comments. During the scoping period, we received a total of 137 comments on the Project; all comments are in the Commission's public record. Transcripts of the scoping sessions were placed into the public record for this proceeding.[6]

The most common comments we received were on project need. The Commission's role in reviewing the details of any project is to make a determination of whether a proposed project is in the public convenience and necessity. The Commission bases its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project. The forthcoming Commission order for the Project will address the need for the Southgate Project when it makes a determination of whether the Project is in the public convenience and necessity. We also received numerous comments regarding impacts on water quality, socioeconomics, and health and safety. These resources are addressed in the EIS.

---

5 "We," "us," and "our" refer to the environmental staff of the FERC's Office of Energy Projects.

6 See FERC eLibrary Accession Numbers 20180921-4000, 20181004-4006, and 20181004-4007. These comments can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the numbers above in the "Numbers: Accession Number" field.

During the pre-filing period, Mountain Valley assessed numerous route alternatives. Mountain Valley adopted 101 route alternative segments and/or minor route variations into its proposed Project design for various reasons, including landowner requests, avoidance of sensitive environmental resources (such as archaeological sites or wetlands), avoidance of areas of steep terrain or side slopes, and engineering considerations.

We issued a *Notice of Availability of the Draft Environmental Impact Statement for the Proposed Southgate Project* on July 26, 2019. A formal notice was also published by the Environmental Protection Agency in the Federal Register on August 2, 2019, indicating that the draft EIS was available. The draft EIS was mailed to four local libraries. The notice of availability established a 45-day comment period on the draft EIS that ended on September 16, 2019 and announced the time, date, and location of public comment sessions to take comments on the draft EIS. We held three public comment sessions in Virginia and North Carolina between August 19 - 22, 2019.

At our comment sessions, a total of 65 people provided oral and written comments. Transcripts of the sessions were placed in the public record for this proceeding.[7] In response to our notice, 77 stakeholders submitted a total of 92 letters including letters from landowners, public officials, non-government organizations, and government agencies regarding the draft EIS. Multiple form letters and petitions were also submitted in response to the draft EIS. The most commonly received comments on the draft EIS related to need for the Project, impacts on water quality, issues associated with the mainline Mountain Valley Pipeline Project, and general comments regarding the content of the draft EIS. Our responses to relevant comments are provided in appendix I of this final EIS. A subject index is provided in appendix J showing the location of relevant terms in the EIS.

PROJECT IMPACTS AND MITIGATION

Construction and operation of the Project could result in impacts on environmental resources, including geology, soils, groundwater, surface water, wetlands, vegetation, wildlife, fisheries, special-status species, land use, visual resources, socioeconomics, cultural resources, air quality, noise, and safety. In section 3 of this final EIS, we include an evaluation of alternatives to the Project, including the No-Action Alternative, system alternatives, and route alternatives. In section 4.13, we assess the cumulative impacts of the Project added to other known actions within the same geographic area and in the same timeframe.

We evaluate the impacts of the Project, taking into consideration Mountain Valley's proposed avoidance, minimization, and mitigation measures. Our analysis of impacts on environmental resources is summarized below and is discussed in detail in section 4 of this final EIS. Where necessary, we recommend additional mitigation measures to reduce impacts on specific resources. Section 5.2 of this final EIS contains a compilation of our recommended mitigation measures.

[7] See FERC eLibrary Accession Numbers 20190923-4000, 20190923-4001, and 20190923-4002. These comments can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the numbers above in the "Numbers: Accession Number" field.

Geology and Soils

The overall effects of Project construction and operation on topography and existing geologic conditions would be minor. Primary impacts would be limited to construction activities and would include temporary disturbance resulting from grading and trenching operations. After completion of construction activities, topography and associated drainages in areas of temporary disturbance would be returned to pre-construction contours and elevations to the extent practicable.

The Project pipeline permanent easement would be within 28.5 feet of parcels owned by the East Alamance Quarry, a crushed stone aggregates operation, near milepost (MP) 66.8. Mountain Valley has adjusted the pipeline route at this location to reduce impacts on planned or future mining activities. The Project does not cross land owned by the East Alamance Quarry. Therefore, we conclude that the Project would not significantly impact or be impacted by the East Alamance Quarry.

We received comments regarding the presence of uranium deposits in the Project vicinity in Pittsylvania County. The nearest commercially viable uranium deposit is 3.5 miles north of the Lambert Compressor Station, and concentrations of uranium in sediment, soils, shallow bedrock, and groundwater near the Project workspace are comparable to concentrations in the conterminous U.S. Additional uranium deposits do occur in the vicinity of the Coles Hills deposit; however, those deposits are not economically viable due to the size and grade of the deposits present. Further, uranium is generally not highly mobile in the environment, and Mountain Valley would implement its *Erosion and Sediment Control Plan* (E&SC Plan) to address fugitive dust mitigation, stormwater control, and erosion and sediment control measures.

With the implementation of Mountain Valley's best management practices (BMPs), we conclude that impacts on geological resources would be adequately minimized.

During and following construction, the potential for soil erosion would be minimized through the use of erosion controls and revegetation measures as described in FERC's *Upland Erosion Control, Revegetation and Maintenance Plan* as modified by Mountain Valley (referred to as Mountain Valley's Plan). To further minimize soil erosion, the Project would follow BMPs included in Mountain Valley's E&SC Plan and *Winter Construction Plan*. To address inadvertent spills of hazardous materials or petroleum products during construction, or in the event of an unanticipated discovery of existing contaminated media, Mountain Valley would implement its *Spill, Prevention, Control, and Countermeasures Plan* and *Unanticipated Discovery of Contamination Plan.* We find that these plans would minimize potential impacts on soils.

Groundwater, Surface Waterbody Crossings, and Wetlands

The Project would not cross any sole source aquifers or principal source aquifer areas. No wellhead protection areas were identified within the Project area. Prior to construction, Mountain Valley would identify any private wells and springs near construction workspaces that are used for potable water on affected properties. As described in the Project's *Water Resources Identification and Testing Plan*, Mountain Valley would offer to conduct pre-construction and post-construction water quality testing for all water supply wells located within 150 feet of Project workspaces; with post-construction testing being conducted if a pre-construction water quality test was performed. We are recommending that prior to construction Mountain Valley provide additional information

on private water wells or springs, including the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs.

In general, the watersheds crossed by the Project contain development consistent with a rural environment. The water quality and biota within Project area streams are largely reflective of the degree of upstream development. The Project would require 223 crossings of waterbodies, 4 of which are major waterbodies. The Project crossings would follow the FERC *Wetland and Waterbody Construction and Mitigation Procedures* as modified by Mountain Valley (referred to as Mountain Valley's Procedures) and the E&SC Plan. Mountain Valley would use Horizontal Direction Drill (HDD) crossings at the Dan River and the Stony Creek Reservoir. Mountain Valley's *HDD Contingency Plan* would ensure that drill operations are monitored and adjusted to avoid potential inadvertent returns of drilling fluid to the ground surface, and if one should occur, that the release would be contained to the extent practicable and remediated. Conventional bore crossings are proposed at Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek due to the potential presence of federal or state listed aquatic species in these systems. All other crossing would be completed using dry-ditch methods (dam-and-pump or flume method) to minimize in-stream construction and surface water impacts.

The Project crosses the Dan River which is listed on the Nationwide Rivers Inventory by the National Park Service; the Banister River which is a potential Blueway river (a state-designated recreational water trail); and the Sandy River which is a potential Virginia Scenic River. The Dan River would be crossed by the HDD method to avoid impacts on the river. The Sandy River and Banister River would be crossed using a dry-ditch crossing method (e.g. dam-and-pump or flume) and would experience minor short-term impacts during construction. Mountain Valley would implement its Procedures to minimize impacts and work with state agencies regarding effects to recreational boaters.

Mountain Valley has indicated that water required for construction and hydrostatic testing would be obtained primarily from the Dan River, if approved by the FWS, at milepost 30.1. Municipal water sources would be used as a secondary source, if necessary. The hydrostatic test water would be discharged through sediment filters in vegetated uplands away from waterbodies and wetlands.

The Project is not expected to permanently affect surface or ground water resources. Though temporary impacts would result from the Project, with implementation of BMPs and mitigation proposed by Mountain Valley, as well as our recommendations, we conclude the Project would not significantly affect water resources.

Mountain Valley made numerous modifications to its proposed route to avoid and reduce wetland crossings and impacts; however, construction of the Project would impact 25.7 acres of wetlands. Most of these impacts would be temporary and short-term. The Project's operational right-of-way would affect 5.6 acres of wetlands, including the conversion of 0.2 acre of palustrine scrub-shrub (PSS) wetland to palustrine emergent (PEM) wetland, and 4.2 acres of palustrine forested (PFO) wetlands to PSS and PEM wetlands. While adverse and long-term impacts on wetlands would occur, the Project would not result in any loss of wetlands. With adherence to Mountain Valley's Procedures and the implementation of BMPs and mitigation proposed by Mountain Valley, we conclude the Project would not significantly affect wetlands. In addition,

the COE could require Mountain Valley to offset unavoidable impacts on wetlands through the creation, restoration, enhancement, or preservation of at least an equal amount of wetlands through implementation of an agency-approved *Compensatory Mitigation Plan*.

Vegetation, Wildlife, Fisheries, and Federally Listed Species

The Project is located wholly within the Piedmont Region and areas that have been heavily used as cropland; however, many of these areas have regrown into successional forests. Managed or developed land classes include agricultural land, commercial, industrial, and residential areas. These land classes represent about 21 percent of the proposed land that would be required for the Project. About 94 percent of the land within the Project footprint is vegetated, including agricultural land, upland forest, upland herbaceous/shrub-scrub, and wetlands. Of these vegetated areas, the majority (about 44 percent) consists of forested upland, followed by herbaceous/scrub-shrub upland (about 39 percent); less than 2 percent of the pipeline Project area is within wetland vegetation communities.

The primary effect of pipeline facility construction would be cutting, clearing, and/or removal of existing vegetation. The majority of vegetation affected by construction of the Project would be upland forested land, which would result in long-term impacts. To minimize forest fragmentation and edge effects, Mountain Valley has collocated about 49 percent (36.8 miles) of the pipeline route with existing linear corridors. Following construction, Mountain Valley would seed the construction workspace and allow natural succession to revegetate temporary workspaces disturbed by construction in accordance with Mountain Valley's Plan and Procedures. To control the spread of noxious weed species within the Project area, Mountain Valley developed an *Exotic and Invasive Plant Species Control Plan* in coordination with state agencies. Given the high level of collocation with existing, maintained rights-of-way through the majority of large forested areas crossed by the proposed pipeline route, and Mountain Valley's commitment to restore disturbed areas, we conclude that impacts on vegetation, including the spread of invasive species, would be adequately minimized.

The temporary and permanent loss and/or conversion of habitat and the general disturbance created by the use of construction equipment would impact wildlife. This impact would vary depending on the type and quantity of habitat affected and the ability of species to leave Project work areas and successfully utilize adjacent habitats. Constructing the Project may result in limited mortality of less mobile animals, such as small rodents, reptiles, amphibians, and invertebrates, which may not be able to relocate from the immediate construction area.

The Project would cross 21 perennial waterbodies containing fisheries of special concern. Constructing and operating the Project could temporarily impact fisheries and aquatic resources. Mountain Valley would adhere to all federal and state permit conditions, including those regarding the minimization of impacts on fisheries of special concern (adhering to recommended work windows for in-water construction). Based on our review of the potential impacts and mitigation measures, including our recommendations, we conclude that constructing and operating the Project would not significantly impact wildlife, terrestrial habitats, migratory birds, or fisheries and aquatic resources.

Federal agencies are required by the Endangered Species Act (ESA) Section 7(a)(2) to ensure that any action authorized, funded, or carried out by the agency would not jeopardize the

continued existence of a federally listed threatened or endangered species or species proposed for listing, or result in the destruction or adverse modification of designated critical habitat. There are five federally listed threatened or endangered species, two species of concern, and one species that is proposed as threatened that could potentially be affected by the Project. We have determined that the Project would not likely adversely affect these species. We are submitting this final EIS as our final Biological Assessment (BA) and requesting concurrence from the FWS for our determinations of effect for federally listed species potentially affected by the Project in accordance with Section 7 of the ESA. We have included a recommendation that restricts construction until our ESA consultation with the FWS is completed.

Land Use

The primary land uses affected by construction would be forested/woodland and open land. In addition, agricultural, silviculture, industrial/commercial, and residential land types would be affected during construction. As currently designed, 19.2 acres of residential land would be affected by construction of the pipeline and use of access roads. Mountain Valley prepared and would adhere to site-specific *Residential Construction Plans* for 24 residential structures currently identified as within 25 feet of construction work areas or where a plan was requested by a landowner or agency. No occupied residences would be removed to construct the pipeline.

The Project would cross the Mountains-to-Sea Trail, a North Carolina state trail, at MP 69.8. The trail/road would be crossed by conventional bore resulting in no direct impacts on the trail or its use. In general, recreation areas and special use areas crossed by the Project are expected to experience some temporary impacts during construction, such as clearing of trees, noise, dust, and limited access which may prevent or curtail recreational activities within construction areas.

Socioeconomics and Transportation

The Project may affect the socioeconomic character of communities near the proposed facilities. These potential impacts include temporary population increases, new employment opportunities, increased demand for housing and public services, impacts on tourism and local businesses, transportation impacts, impacts on environmental justice communities, and increased revenues associated with sales and payroll taxes. Mountain Valley would coordinate with local fire departments, police departments, and emergency first responders to address any Project needs, including traffic assistance and emergency response preparedness. The communities in the Project area have adequate public service infrastructure to meet the potential needs of non-local workers who relocate temporarily. Therefore, we conclude that the Project would not significantly impact public services.

Our review of available studies indicates that the Project is not likely to have a significant adverse impact on property values. There may be a potential benefit to the state and local economies by creating a short-term stimulus to the affected areas through payroll expenditures, local purchases of consumables Project-specific materials, room rentals, and sales tax. However, these benefits would generally be temporary and minor. Although low income and minority populations exist within the Project area, the Project would not have a disproportionately high and adverse environmental or human health impact on minority or low income populations.

Cultural Resources

As of the end of October 2019, Mountain Valley ~~had~~ conducted cultural resources inventories of a total of about 70.5 miles of pipeline route (94 percent); 30.3 acres at aboveground facilities (100 percent); 119.2 acres at yards (68 percent); 1.1 acres at cathodic protection beds (66 percent); and 29.9 miles of access roads (93 percent). During those inventories, Mountain Valley recorded 81 archaeological sites and 241 historic architectural sites in the direct area of potential effect (APE).

FERC staff consulted with the State Historic Preservation Offices (SHPO) of Virginia and North Carolina, and interested Indian tribes and other consulting parties, prior to making determinations of National Register of Historic Places (NRHP) eligibility and project effects. Of the archaeological sites, 55 were evaluated as not eligible for the NRHP, 23 were assessed as potentially eligible or unevaluated, and 3 were determined eligible. Of the historic architectural sites, 201 were evaluated as not eligible, 34 are potentially eligible or unevaluated, 2 should be treated as eligible, 1 is eligible, and 3 are listed in the NRHP. No further work was recommended for the sites not eligible for the NRHP.

We have not yet completed the process of complying with the National Historic Preservation Act (NHPA). Additional investigations and/or plans remain outstanding. About 5 miles of proposed pipeline route, and about 2.5 miles of access roads have still not yet been surveyed. Also, about 0.6 acres at cathodic protection beds, and 55.6 acres at proposed yards remain to be inventoried.

We recommend that prior to allowing construction to proceed, Mountain Valley must complete surveys, and file with the Commission evaluation reports, avoidance plans, or treatment plans for NRHP listed or eligible sites, as necessary, and file comments of the SHPOs, interested Indian tribes, and other consulting parties on those reports and plans. Commission staff has developed an agreement document that outlines the process that would be used to resolve adverse effects on historic properties.

Air Quality and Noise

Air quality impacts associated with construction of the Project would include emissions from construction equipment, fugitive dust, and open burning. Such air quality impacts would generally be temporary and localized, and are not expected to cause or contribute to a violation of applicable air quality standards. Operational emissions would be generated by the Lambert Compressor Station, as well as minimal emissions from maintenance blowdowns and incidental leaks from the pipeline and four interconnects. Mountain Valley would comply with all applicable federal requirements and associated air permits to minimize effects on air quality in the area. As a result, we conclude that the Project would not result in a significant impact on local or regional air quality.

Noise sensitive areas (NSA) near the construction areas may experience an increase in perceptible noise, but the effect would be temporary and localized. Operational noise impacts would be limited to areas near the aboveground facilities, primarily the Lambert Compressor Station. Noise impacts on NSAs due to operation of the pipeline, meter stations, and compressor station would be negligible to barely perceptible. However, we have included a recommendation

for Mountain Valley to verify the actual noise levels from operation of the compressor station at full load.

For construction of the Project's proposed aboveground facilities, nighttime work may be necessary for specific situations related to safety, permit compliance, or other non-typical circumstances. Noise levels due to 24-hour construction of the Lambert Compressor Station would be below the FERC criterion of 55 decibels on the A-weighted scale day-night noise level (dBA L_{dn}) at the nearest NSAs. However, noise levels due to 24-hour construction of three of the four interconnects would all be above the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. Mountain Valley would develop a *Nighttime Construction Noise Management Plan,* which would include specific noise mitigation, such as noise barriers, quieter equipment, or partial equipment enclosures. To ensure that residents and sensitive receptors near the aboveground facilities would not be significantly affected by the noise levels from nighttime construction, we have included a recommendation that Mountain Valley file its *Nighttime Construction Noise Management Plan* prior to construction. This plan would include site-specific mitigation measures and demonstrate that noise levels would be reduced below 48.6 dBA at night and 55 dBA L_{dn} overall at the nearest NSA, or would not exceed 10 dBA over the ambient at the nearest NSA where ambient noise levels are already above 55 dBA L_{dn}.

Based on our analyses, mitigation measures proposed, and our recommendation, we conclude that construction and operation of the Project would not result in significant noise impacts on residents and the surrounding communities.

Reliability and Safety

The Project would be designed, constructed, operated, and maintained to meet the U.S. Department of Transportation's (DOT) *Minimum Federal Safety Standards* in 49 CFR 192 and other applicable federal regulations. These regulations include specifications for material selection and qualification; minimum design requirements; and protection of the pipeline from internal, external, and atmospheric corrosion. Mountain Valley would also design, construct, operate, and maintain the Lambert Compressor Station in accordance with modern engineering practices that meet or exceed the DOT safety standards.

Mountain Valley would follow federal safety standards for pipeline class locations based on population density. The DOT regulations are designed to ensure adequate safety measures are implemented to protect all populations. We conclude that Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety.

Cumulative Impacts

We analyzed cumulative impacts of the Project, in addition to other projects that may occur within the same area of geographic scope and timeframe. The other projects we examined include FERC-jurisdictional natural gas transportation projects; non-jurisdictional project-related facilities; other energy projects; mining operations; transportation or road projects; and commercial/residential/industrial and other development projects.

Most of the impacts resulting from construction and operation of the Project would be temporary and localized, contained within the right-of-way and extra workspaces, and when added to the impacts of other projects are not expected to result in significant cumulative impacts. However, some long-term cumulative impacts would occur in forested wetlands and forested uplands regarding vegetative communities and associated wildlife habitats. Given the Project BMPs, design features, and mitigation measures that would be implemented; and the federal and state laws and regulations protecting resources, and permitting requirements, we conclude that when added to other past, present, and reasonably foreseeable future actions, cumulative impacts on environmental resources within the geographic scopes affected by the Project would not be significant.

Alternatives Considered

As required by NEPA and Commission policy, we identified and evaluated reasonable alternatives to the Project to determine whether the implementation of an alternative would be environmentally preferable to the proposed action. An alternative would be environmentally preferable if it offers a significant environmental advantage over the proposed action. We evaluated the No Action Alternative, system alternatives, three major and six minor route alternatives, and various minor route variations. Based on our findings that no other alternative would meet the purpose of the Project, be technically and economically feasible, and provide a significant environmental advantage, we conclude that the proposed Project is the preferred alternative than can meet the Project purpose.

MAJOR CONCLUSIONS

For most resources, the construction and operation of the Project would result in limited adverse environmental impacts. Most adverse environmental impacts would be temporary or short-term during construction, but some long-term and permanent environmental impacts would occur on forest and wetlands. This determination is based on our review of the information provided by Mountain Valley and further developed from environmental information requests; field reconnaissance; scoping; literature research; alternatives analyses; and contacts with federal, state, and local agencies, and other stakeholders. We conclude that approval of the Project would result in some adverse environmental impacts, but these impacts would be reduced to less-than-significant levels through implementation of our recommendations and Mountain Valley's proposed avoidance, minimization, and mitigation measures. The following factors were also considered in our conclusions:

- about 36.8 miles, or about 49 percent, of the 75.1-mile pipeline route would be constructed adjacent to existing rights-of-way;
- Mountain Valley would minimize impacts on natural and cultural resources during construction and operation of the Project by implementing Mountain Valley's Plan and Procedures, its E&SC Plan, and other Project-specific plans (e.g., *Unanticipated Discovery of Historic Properties and Human Remains Plan*, *HDD Contingency Plan, Spill Prevention Control and Countermeasures Plan*, *Exotic and Invasive Species Control Plan*, *Traffic Management Plan*, and *Landslide Mitigation Plan*);
- the FERC staff would complete the process of complying with section 7 of the ESA prior to construction;

- the FERC staff would complete the NHPA compliance process prior to construction;
- Mountain Valley would comply with all applicable federal requirements and associated air and noise regulatory requirements during construction and operation of the Project; and
- an environmental inspection program and a third-party monitoring oversight program would be implemented to ensure compliance with the mitigation measures that become conditions of the FERC authorization.

In addition, we recommend that should the Project be approved by the Commission, the Project-specific impact avoidance, minimization, and mitigation measures that we have developed (included in this EIS as recommendations) be attached as conditions to any Certificate of Public Convenience and Necessity issued by the Commission. These recommended mitigation measures are presented in section 5.2 of the EIS.

1.0 INTRODUCTION

In accordance with the Natural Gas Act (NGA, Title 15 United States Code [U.S.C.] § 717), the Federal Energy Regulatory Commission (FERC or Commission) is responsible for deciding whether to authorize the construction and operation of interstate natural gas transmission facilities. The National Environmental Policy Act (NEPA, 42 U.S.C. § 4321 et seq.) requires that the Commission consider the environmental impacts of a proposed project prior to making a decision. The Commission's natural gas program's environmental staff[1] has prepared this final Environmental Impact Statement (EIS) so that the FERC can comply with NEPA, and to assess the potential environmental impacts that could result from the construction and operation of the Southgate Project (Project), as proposed by Mountain Valley Pipeline, LLC (Mountain Valley)[2] in Docket No. CP19-14-000.

The vertical line in the margin identifies text that is new or modified in this final EIS and differs materially from the corresponding text in the draft EIS. Changes were made to address comments from cooperating agencies and other stakeholders on the draft EIS; incorporate modifications to the Project after publication of the draft EIS; update information included in the draft EIS; and incorporate supplemental information filed by Mountain Valley in response to recommendations in the draft EIS, and in response to our post-draft EIS environmental information requests.

On November 6, 2018, Mountain Valley filed an application with the FERC pursuant to Section 7(c) of the NGA, as amended. Mountain Valley is seeking a Certificate of Public Convenience and Necessity (Certificate) to construct, install, own, operate, and maintain a new interstate natural gas pipeline and ancillary facilities in Virginia and North Carolina. Mountain Valley's application was assigned Docket No. CP19-14-000.[3] The Commission issued a Notice of Application (NOA) for the Project on November 19, 2018, and the notice appeared in the *Federal Register* (FR) on November 26, 2018.

Mountain Valley's Southgate Project would involve the construction and operation in Virginia and North Carolina of the following:

- about 75.1 miles of new 24-inch and 16-inch-diameter natural gas pipeline in Pittsylvania County, Virginia, and Rockingham and Alamance Counties, North Carolina;

[1] Commission staff was assisted in the preparation of this EIS by a third-party environmental contractor, Cardno, Inc.

[2] MVP Southgate is a joint venture among affiliates of EQM Midstream Partners, LP; NextEra Energy Inc; AltaGas Ltd. and RGC Resources, Inc. MVP Southgate Project facilities would be operated by an affiliate of EQM Midstream Partners, LP.

[3] Previous to the filing of Mountain Valley's application, the Southgate Project was under pre-filing environmental review by the FERC staff in Docket No. PF18-4-000.

- one new compressor station (Lambert Compressor Station) totaling about 28,915 International Organization for Standardization (ISO) horsepower (hp) in Pittsylvania County, Virginia;
- four interconnects/meter stations or tie-ins with facilities operated by Mountain Valley, East Tennessee Natural Gas, LLC (East Tennessee), and Dominion Energy North Carolina (DENC), formerly PSNC[4]; and
- ancillary facilities including pig[5] launchers and receivers, mainline block valves (MLV), and cathodic protection beds.

The Project would be designed to transport 375 million cubic feet per day [MMcf/d]) of natural gas. The Project is described in more detail in section 2.0.

1.1 PURPOSE AND NEED

The Council on Environmental Quality's (CEQ) regulations for implementing NEPA at 40 CFR 1502.13 recommends that an EIS should briefly address the underlying purpose and need for a project. In general, as described by Mountain Valley, the purpose and need for the Southgate Project is to meet the specific requests for natural gas transportation service of its anchor shipper, DENC, a local natural gas distribution company. Mountain Valley states that the Project will provide additional firm natural gas transportation services for DENC to meet its growing supply needs via interconnections with the under construction Mountain Valley Pipeline project in southern Virginia and the interstate pipeline of East Tennessee in North Carolina to two new delivery points on the DENC distribution system in Rockingham and Alamance Counties, North Carolina.

The Commission's role in reviewing the details of any project is to make a determination of public convenience and necessity. The Commission bases its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project. The Commission has developed a "Certificate Policy Statement"[6] that established criteria for determining whether there is a need for a proposed project and whether the proposed project would serve the public interest. The Commission decision, in its Order, would review the need for the Project.

During the scoping comment period, the Commission received comments regarding the potential for Mountain Valley to further expand the Project and eventually export natural gas. We[7] do not have any information in the record to support this contention. Mountain Valley states in its application that it did not design its facilities to transport natural gas to a liquefied natural gas (LNG) export terminal. The nearest LNG export terminal to the terminus of the Project would be the existing Cove Point LNG terminal on the Chesapeake Bay in Calvert County, Maryland, about 190 miles away. There is no direct connection from the Project terminus in Alamance County,

4 Following a January 2, 2019 merger, Dominion Energy, Inc. acquired PSNC and changed the company name to Dominion Energy North Carolina.

5 A "pig" is a device used to clean or inspect the interior of a pipeline.

6 See *Certification of New Interstate Natural Gas Pipeline Facilities*, 88 FERC ¶ 61,227 (1999), clarified in 90 FERC ¶ 61,128, and further clarified in 92 ¶ 61,094 (2000).

7 "We," "us," or "our" refers to the environmental staff in FERC's Office of Energy Projects.

North Carolina to the Cove Point terminal. Mountain Valley stated that it does not intend to seek permission to export natural gas overseas as LNG from the U.S. Department of Energy.

1.2 PURPOSE AND SCOPE OF THIS EIS

Our principal purposes in preparing this EIS are to:

- identify and assess the potential direct, indirect, and cumulative impacts on the natural and human environment that would result from the construction and operation of the proposed Project;
- describe and evaluate reasonable alternatives to the proposed Project that would avoid or minimize adverse impacts on environmental resources;
- recommend mitigation measures, as necessary, that could be implemented by Mountain Valley to reduce impacts on specific environmental resources; and
- encourage and facilitate involvement by the public and interested agencies in the environmental review process.

This EIS addresses topics including Project alternatives; geology; soils; water resources; wetlands; vegetation; wildlife and aquatic resources; special status species; land use, recreation, special interest areas, and visual resources; socioeconomics; cultural resources; air quality and noise; reliability and safety; and cumulative impacts. This EIS describes the affected environment as it currently exists and analyzes the environmental consequences of the proposed Project. This EIS also presents our conclusions and recommended mitigation measures.

Our description of the affected environment is based on a combination of data sources, including desktop resources such as scientific literature and regulatory agency reports, information from resource and permitting agencies, scoping comments, field data collected by Mountain Valley and its consultants, and our own site visits. Our resource specialists independently fact-checked data submitted by the applicant. As of October 2019, Mountain Valley has field surveyed about 96 percent of all the proposed Project facility locations.

On October 26, 2018, we sent letters to various federal and state resource agencies that might have an interest in cooperating in the production of the EIS for the Project, as defined in 40 CFR 1501.6.[8] The U.S. Army Corps of Engineers (COE), Norfolk and Wilmington Districts, and the U.S. Fish and Wildlife Service (FWS) agreed to be cooperating agencies. See section 1.2.2 and 1.2.3 below for details on cooperating agency roles and responsibilities. A cooperating agency has jurisdiction by law over part of a project and/or has special expertise with respect to environmental issues. Cooperating agencies play a role in the environmental analyses of this project and assist in developing mitigation plans or other measures. They participate in the NEPA

[8] The FERC sent letters to the U.S. Army Corps of Engineers District Officers in Norfolk, Virginia and Wilmington, North Carolina; Region 4 of the U.S. Environmental Protection Agency in Atlanta, Georgia; the Virginia and North Carolina Field Offices of the U.S. Fish and Wildlife Service; the Virginia Department of Mines, Minerals, and Energy; the Virginia Department of Conservation and Recreation; the Virginia Department of Game and Inland Fisheries; the Virginia Department of Environmental Quality, the Virginia Marine Resources Commission; the North Carolina Wildlife Resources Commission; and the North Carolina Department of Environmental Quality; requesting their participation as cooperating agencies.

process by reviewing the application and related materials, and by reviewing administrative drafts of the overall EIS or the specific portions related to agency permitting or special expertise. The roles and the scope of the actions of FERC and the cooperating agencies in the Project review processes are described in the sections below.

1.2.1 Federal Energy Regulatory Commission

Originally known as the Federal Power Commission when first created by Congress in 1920, the agency was reorganized and renamed the FERC under the administration of President Jimmy Carter. The FERC is an independent federal regulatory agency[9] that regulates the interstate transportation of natural gas, among other industries, in accordance with the NGA of 1938 as amended.

Pursuant to the Energy Policy Act of 2005 (EPAct) Section 313(b)(1), the FERC is the lead federal agency for the coordination of all applicable federal authorizations. Thus, the FERC is the lead federal agency for preparation of this EIS to comply with NEPA, as described in the CEQ's regulations at 40 CFR 1501.5 and in keeping with the May 2002 Interagency Agreement with other federal agencies.[10]

As the lead federal agency, we prepared this EIS to assess the environmental impacts that could result from constructing and operating the Project. This document was prepared in compliance with the requirements of the CEQ's regulations at 40 CFR 1500-1508, and the FERC's regulations for implementing NEPA at 18 CFR 380. As applicable, this EIS is also intended to fulfill the cooperating federal agencies obligations under NEPA and to support subsequent conclusions and decisions made by the Commission and the cooperating agencies.

The Commission will consider the findings contained herein, as well as non-environmental issues, in its review of Mountain Valley's application. The identification of environmental impacts related to the construction and operation of the Project, and the mitigation of those impacts, as disclosed in this EIS, would be components of the Commission's decision-making process. The Commission would issue its decision in an Order. If the Project is approved, the Commission would issue a Certificate to Mountain Valley. The Commission may accept the application in whole or in part, and can attach conditions to the Order that would be enforceable actions to assure that the proper mitigation measures are implemented prior to a project going into service.

1.2.2 U.S. Army Corps of Engineers

Under Section 404 of the Federal Water Pollution Control Act Amendments of 1972 (later incorporated into the Clean Water Act [CWA] 33 U.S.C. § 1344) the COE was given authority

[9] The decision makers at the agency are five Commissioners (at full contingent) appointed by the President and confirmed by the Senate. The decisions of the Commission cannot be challenged by the President or Congress, but may be reviewed in federal court.

[10] May 2002 Interagency Agreement on Early Coordination of Required Environmental and Historic Preservation Reviews Conducted in Conjunction With the Issuance of Authorizations to Construct and Operate Interstate Natural Gas Pipelines Certificated by the Federal Energy Regulatory Commission, signed by the FERC, Advisory Council on Historic Preservation, CEQ, USDA, U.S. Department of the Army, U.S. Department of Commerce, U.S. Department of Energy, EPA, U.S. Department of Interior, and Department of Transportation.

over the discharge of dredged or fill materials into the Waters of the United States. The Project would cross two COE Districts, including the Norfolk District and Wilmington District.

The COE's regulations for permits under Section 10 of the Rivers and Harbors Act (RHA, 33 U.S.C. § 403) can be found at 33 CFR 322, while regulations for permits under Section 404 of the CWA are at 33 CFR 323, and processing of permits is at 33 CFR 325. The Norfolk and Wilmington Districts agreed to be a cooperating agencies in the production of this EIS. As a cooperating agency, the COE may adopt this EIS for the purposes of exercising its regulatory authorities. Mountain Valley filed its permit applications with the Norfolk and Wilmington Districts of the COE on November 30, 2018.

The District Engineer cannot make a decision on a permit application until the requirements of NEPA are fulfilled. After the publication of an EIS, the COE authorization can be issued under the Nationwide Permit Program. In communications with FERC staff, representatives of the COE indicated that individual COE Districts would not finalize their permit processes for the Project until after the FERC has documented completion of the National Historic Preservation Act (NHPA) Section 106 and Endangered Species Act (ESA) Section 7 consultations. We expect that the Project would be considered by the COE under its Nationwide Permit Program. However, if it is determined that an Individual Permit with the COE is required, and once the COE determines a permit application to be complete, it would issue a public notice. In accordance with EPAct Section 313(d), the COE would submit or summarize relevant information used in its permit decision, potentially including comments received on its notice, and file this information with the FERC, as the Commission is the keeper of the consolidated record for the proceedings. If an individual permit is required, as an element of its review, the COE must consider whether the proposed Project represent the least environmentally damaging practicable alternative pursuant to the CWA Section 404(b)(1) guidelines. The term practicable means available and capable of being done after taking into consideration cost, existing technology, and logistics in light of the overall purpose of the Project.

1.2.3 U.S. Fish and Wildlife Service

The mission of the FWS is to conserve, protect, and enhance, fish, wildlife, and plants and their habitats. Towards that goal, the FWS works to enforce federal wildlife laws, protect endangered species, manage migratory birds, conserve habitats including wetlands, and restore fisheries. The FWS cares for about 150 million acres in more than 500 National Wildlife Refuges.

The FERC, as the lead federal agency for the Project, is required to consult with the FWS to determine whether any federally listed or proposed endangered or threatened species or their designated critical habitats would be affected by the Project. If it is determined that the Project is likely to adversely affect federally listed species or their critical habitats, the FERC staff must prepare a biological assessment (BA) to identify the nature and extent of adverse impacts, and to recommend measures that would avoid, reduce, or mitigate impacts on habitats and/or species. At this time, we have not determined that the Project would adversely affect a listed species. Upon issuance of the draft EIS, we requested to initiate informal consultation under Section 7 of the ESA. In a letter dated August 16, 2019, we informed the FWS that our draft EIS serves as the BA for the Project; however, due to incomplete surveys for listed species at the time of the draft EIS, our final BA and request for concurrence would be provided with the final EIS. Therefore, with

this final EIS, we are requesting concurrence from the FWS on our determinations of effect for listed species potentially affected by the Project. The consultation process under Section 7 of the ESA is outlined in regulations at 50 CFR 402. The ESA is further discussed in sections 1.4.4 and 4.7 of this EIS.

In addition, the FWS has statutory authority and responsibilities for enforcing the Migratory Bird Treaty Act (MBTA), the Fish and Wildlife Improvement Act, and the Fish and Wildlife Act. The FWS may issue permits under the MBTA in accordance with 50 CFR 21. On March 30, 2011, the FERC and the FWS entered into a Memorandum of Understanding (MOU) regarding compliance with the MBTA. On December 22, 2017, the Department of the Interior (DOI) issued a memorandum (M-37050) analyzing whether the MBTA prohibits the accidental or incidental take of migratory birds. In M-37050, the DOI clarified their position stating that the MBTA does not prohibit incidental take. The MBTA is further discussed in sections 1.4.5 and 4.6 of this EIS. The FWS also has the authority to issue permits under the Bald and Golden Eagle Protection Act (BGEPA), in accordance with regulations at 50 CFR 22. The BGEPA is further discussed in sections 1.4.1 and 4.6 of this EIS.

1.3 PUBLIC REVIEW

On May 3, 2018, Mountain Valley filed a request to enter into the Commission's pre-filing (PF) environmental review process for the Project. The FERC granted Mountain Valley's request on May 15, 2018, and established pre-filing Docket No. PF18-4-000. Prior to and during the pre-filing process, Mountain Valley contacted federal, state, and local governmental agencies to inform them about the Project and discuss Project-specific issues. Mountain Valley also contacted affected landowners to inform them about the Project, and to obtain permission to perform environmental surveys. Mountain Valley developed a public participation plan (Public, Stakeholder, and Agency Participation Plan[11]) to facilitate stakeholder communications and make information available to the public and regulatory agencies.[12] This public participation plan established a single point of contact within Mountain Valley for the public or agencies to call or e-mail with questions or concerns; a publicly accessible website (http://www.mvpsouthgate.com/) with information about the Project (including maps) and Project status; and regular newsletter mailings for affected landowners and other interested parties.

Between June 25 and 28, 2018, after entering into PF, Mountain Valley hosted three informal open house meetings along the planned Southgate route. The purpose of the open houses was to provide affected landowners, elected and agency officials, and the general public with information about the Project and to give them an opportunity to ask questions and express their concerns. A total of about 300 people attended the open house meetings. We participated in the open houses to provide information regarding the Commission's environmental review process to interested stakeholders and to listen to stakeholder concerns.

[11] Mountain Valley's Public, Stakeholder, and Agency Participation Plan was included as appendix 1-L to Resource Report 1 in its November 06, 2018, application. The Public, Stakeholder, and Agency Participation Plan can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

[12] Mountain Valley's public participation plan was filed with its May 3, 2018, request to the FERC to initiate the pre-filing review process.

On August 9, 2018, the FERC issued a *Notice of Intent to Prepare an Environmental Impact Statement for the Planned MVP Southgate Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Sessions* (NOI). The NOI was published in the FR on August 15, 2018 (83 FR 40509) and sent to over 1100 parties on our environmental mailing list, which included federal and state resource agencies; elected officials; environmental groups; non-governmental organizations (NGO); Native Americans and Indian tribes; potentially affected landowners; local libraries and newspapers; and other stakeholders who had indicated an interest in the Project. The NOI also announced the date, time, and location of public scoping sessions sponsored by the FERC in the Project area. Issuance of the NOI opened a 30-day formal scoping period that ended September 10, 2018.

The FERC sponsored three public scoping sessions in the Project area during the formal scoping period to provide the public with the opportunity to comment verbally on the Project. The scoping sessions were held in Reidsville, North Carolina on August 20, 2018; Chatham, Virginia on August 21, 2018; and Haw River, North Carolina on August 23, 2018. A total of 68 attendees provided oral comments at the sessions. Transcripts of each scoping session were placed into the FERC's public record for the Project and are available for viewing electronically through the Internet.[13]

The issuance of our NOI for the Project on August 9, 2018, marked the start of the official scoping period. During the official scoping period, from August 9, 2018 to September 10, 2018, we received 137 comments. This includes: 4 letters from Indian tribes; 5 letters from state agencies; 1 letter from county governments; 14 letters from NGOs; 9 letters from affected landowners; 36 letters from the general public; and 68 oral comments transcribed at the public scoping meetings. We also received 65 form letters.

During the PF period, the FERC staff visited the Project area and inspected portions of the pipeline route. In addition, the FERC staff attended meetings with representatives of Mountain Valley, the North Carolina Wildlife Resources Commission (NCWRC) on June 25, 2018; the COE Wilmington District, FWS Raleigh Field Office, and North Carolina Department of Environmental Quality (NCDEQ) in separate meetings on June 27, 2018; a conference call with the Virginia State Historic Preservation Officers (SHPO) on August 7, 2018; a meeting with COE Norfolk District on August 8, 2018; and a meeting with Virginia Department of Environmental Quality (VADEQ), Virginia Marine Resources Commission, Virginia Department of Conservation and Recreation (VADCR), Virginia Department of Game and Inland Fisheries (VADGIF) on August 8, 2018. Notes summarizing these meetings were placed into the FERC's public record for the proceeding.[14]

During the PF period, FERC staff participated in conference calls on an approximately bi-weekly basis with representatives from Mountain Valley and federal and state governmental

[13] To access the public record for this proceeding, go to the FERC's Internet website (http://www.ferc.gov), click on "Documents & Filings" and select the "eLibrary" feature. Click on "General Search" from the eLibrary menu and enter the docket number excluding the last three digits in the field (i.e., PF18-4, or CP19-14). Select an appropriate data range.

[14] The notes for these meetings can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the following numbers in the "Numbers: Accession Number" field – 20180712-3035, 20180830-3014, 20180830-3052

agencies to discuss the progress of the Project and issues. Summaries of the telephone calls were placed in the FERC's public record.

Mountain Valley filed its formal application for the Project on November 6, 2018. On November 19, 2018, the FERC issued a NOA. Our notice stated there are two ways to become involved in the Commission's review of the Project. One way is to become an intervenor, or party to the proceeding. This is a legal position that carries certain rights and responsibilities, and gives parties legal standing to request a rehearing and challenge a Commission decision in court. The second way to participate is to file comments with the Secretary of the Commission (Secretary). The comment period to respond to the NOA closed on December 10, 2018. Between the filing of Mountain Valley's application, and December 31, 2018, 42 parties filed for intervenor status. However, five additional entities filed late motions to become intervenors after the comment period closed, including the Monacan Indian Nation and Sappony Tribe. The Commission has granted these requests for late intervention.

From the time we accepted Mountain Valley's request to start the PF process on May 3, 2018 up to the filing of the application on November 6, 2018, we received 181 comment letters on the record about the Project. Table 1.3-1 lists the environmental topics raised in comments received on the Project during the scoping period. The most common comments were on Project need, water quality, socioeconomics, and health and safety topics. Table 1.3-1 also includes comments received after the formal scoping period ended on September 10, 2018, including relevant environmental comments raised by individuals requesting to be intervenors in the Commission's Southgate proceeding.

a/ Percentages will not sum to 100 percent because most letters include more than one category

During the public scoping period, we received comments regarding if there is a need for the additional natural gas supplies in North Carolina. Others questioned the need for the Project on the grounds that it would not directly benefit the citizens of Virginia. Some stated that construction and operation of the Project would be a burden on affected landowners. In this EIS, we address these comments in either the Alternatives section (see section 3) or in the Socioeconomics section (see section 4.9).

The Commission issued a *Notice of Availability of the Draft Environmental Impact Statement for the Proposed Southgate Project* on July 26, 2019. A formal notice was also published by the Environmental Protection Agency (EPA) in the FR on August 2, 2019, indicating that the draft EIS was available. The draft EIS was mailed to four local libraries. The distribution list was included as appendix A of the draft EIS. The Notice of Availability established a 45-day comment period on the draft EIS that ended on September 16, 2019 and announced the time, date, and location of public comment sessions to take comments on the draft EIS. The notice described procedures for filing comments on the draft EIS and how information about the Project could be found on the FERC's website.

We held three public comment sessions during the draft EIS comment period. The comment sessions were held between August 19 - 22, 2019 in Wentworth and Haw River, North Carolina and Chatham, Virginia. The comment sessions provided interested parties with an opportunity to provide oral or written comments on our analysis of the environmental impacts of the Project as described in the draft EIS. A total of 65 individuals provided either written or oral comments at the sessions. A transcript of each comment session and copies of each written comment are part of the FERC's public record for the Project. In addition, 77 parties submitted a

total of 92 letters in response to the draft EIS. Multiple form letters and petitions were also submitted in response to the draft EIS. The most commonly received comments on the draft EIS related to need for the Project, impacts on water quality, issues associated with the mainline Mountain Valley Pipeline Project (MVP Project), and general comments regarding the content of the draft EIS. All substantive environmental comments on the draft EIS that were received through January 15, 2020 have been addressed in this final EIS. Our responses to relevant comments on the draft EIS are provided in appendix I of this EIS. A subject index is provided in appendix J showing the location of relevant terms in the EIS.

We received numerous comments regarding the MVP Project's failures in erosion and sediment control and concerns about how past performance should be considered in our environmental analysis of the Southgate Project. For the MVP Project in Virginia, Mountain Valley specified and designed its erosion control measures in accordance with the Virginia Erosion and Sediment Control Handbook. Measures employed included the use of clean water diversion berms, conveyance pipes and plunge pools for maintaining upland runoff from entering the right-of-way, use of water bars with sump filters in combination with perimeter erosion and sediment controls (ESC) (i.e., compost filter sock, silt fence, super silt fence, etc.) within the right-of-way to manage stormwater and sediment during construction. The approved ESC and stormwater management plans utilized rainfall data obtained for each county in Virginia in which Project earth-disturbing activities were undertaken. This information was used during the design to account for geographic variation in storm intensity. In West Virginia, erosion control measures were designed and deployed consistent with the West Virginia Erosion and Sediment Control Best Management Practice Manual. The Commission's third-party environmental compliance monitors conducted daily environmental inspections of the project right-of-way throughout construction and restoration phases of the project to document compliance with Mountain Valley's proposed mitigation and the conditions of the Commission's October 13, 2017 Order Issuing Certificates regarding the MVP Project.

Throughout the construction and restoration phases of the MVP Project, Mountain Valley has continually upgraded or revised ESC implementation to meet changing weather conditions and to address controls during severe storm events. Still, 2018 broke annual precipitation records. For Roanoke County, Virginia, 2018 was the wettest year on record, with data compiled since 1895. Rainfall during the year totaled about 63 inches, which represents a 51 percent increase over the annual median for the 124-year period. The year included intense rainfall events over short periods, such as those in September and October from Hurricanes Florence and Michael, and Subtropical Storm Alberto. All of this precipitation generated stormwater and flooding within each of the watersheds affected by the MVP Project.

Because 2018 was an unusual year yielding record breaking precipitation amounts and given the flatter terrain where the Southgate Project would be constructed, we do not anticipate the Southgate Project would experience the same issues with erosion and sediment control. For the Southgate Project, Mountain Valley proposes to use Virginia and North Carolina standards for erosion and sediment control, which mandate that control measures be designed to handle storm events that are reasonably expected to occur during the period of construction. Mountain Valley has also agreed to implement supplemental control measures, which exceed the minimum standards required by these states. As discussed in section 4.3, Mountain Valley would monitor weather conditions during construction and appropriately adjust erosion control measures as necessary to minimize the impacts from heavy precipitation events. To document the effectiveness

of erosion control devices and verify that they are properly maintained, FERC representatives would be on-site during construction to monitor compliance. Weekly reports would document Mountain Valley's compliance with erosion control requirements.

The Commission's *Notice of Availability* for this final EIS is being mailed to the agencies, tribes, individuals, and organizations on the distribution list provided in appendix A. The *Notice of Availability* includes information on how this final EIS may be viewed and downloaded from the FERC website. This final EIS was filed with the EPA for issuance of a formal public *Notice of Availability* in the FR. In accordance with CEQ's regulations implementing NEPA, no agency decision on a proposed action may be made until 30 days after the EPA publishes a *Notice of Availability* for this EIS. However, the CEQ regulations provide an exception to this rule when an agency decision is subject to a formal internal process. In such cases, the agency decision may be made at the same time the notice of the EIS is published, allowing both periods to run concurrently. Should the Commission issue an Order authorizing the Project, it would be subject to a 30-day rehearing period. Therefore, the Commission could issue its decision concurrently with the EPA's notice.

1.4 PERMITS, APPROVALS, AND REGULATORY REQUIREMENTS

The FERC and the other federal agencies that must make a decision on the Project are required to comply with numerous federal statutes in addition to NEPA, including the BGEPA, Clean Air Act (CAA), CWA, ESA, MBTA, NHPA, and RHA. Each of these statutes has been taken into account in the preparation of this final EIS, as discussed below.

Table 1.4-1 lists the major federal, state, and local permits, approvals, and consultations for construction and operation of the Project. The table also provides the dates, or anticipated dates, when Mountain Valley commenced, or anticipates commencing, formal permit and consultation procedures.

TABLE 1.4-1

Major Environmental Permits, Licenses, Approvals, and Consultations Applicable to the Southgate Project

a/ Mountain Valley's application was denied on procedural grounds until a preferred route was identified by the FERC, at which time Mountain Valley was instructed it could reapply for the Joint Permit Application under Section 401 of the CWA; Isolated/non-404 wetland and water permit.

1.4.1 Bald and Golden Eagle Protection Act

The BGEPA (16 U.S.C. § 668) was originally passed by Congress in 1940, and amended in 1962 to also protect golden eagles. The 1972 amendment increased penalties for violation of the Act. The 1978 amendment allowed taking of golden eagle nests that interfere with resource development, with permission from the Secretary of the Interior. The BGEPA prohibits taking without a permit, or taking with wanton disregard for the consequences of an activity, any bald or golden eagle or their body parts, nests, chicks, or eggs, which includes collection, molestation, disturbance, or killing. The BGEPA protections include provisions not included in the MBTA, such as the protection of unoccupied nests and a prohibition on disturbing eagles. The BGEPA includes limited exceptions to its prohibitions through a permitting process. This EIS discusses compliance with the BGEPA in section 4.5.

1.4.2 Clean Air Act

Congress originally passed the CAA (42 U.S.C. § 85) in 1963, and made major revisions to it in 1970, 1977, and 1990. The primary objective of the CAA, as amended, is to establish federal standards for various pollutants from both stationary and mobile sources, and to provide for the regulation of polluting emissions via state implementation plans. In addition, the CAA was established to prevent significant deterioration in certain areas where air pollutants exceed national

standards and to provide for improved air quality in areas that do not meet federal standards (nonattainment areas).

The EPA has regulatory authority under the CAA. Section 309 of the CAA directs the EPA to review and comment in writing on environmental impacts associated with all major federal actions. Section 4.11.1 of this EIS has a detailed discussion of air quality issues.

1.4.3 Clean Water Act

The CWA got its legislative start as the Federal Water Pollution Control Act of 1948, but the Act was amended and renamed in 1972. The CWA (33 U.S.C. § 1251 et seq.) establishes the basic structure for regulating discharges of pollutants into the Waters of the United States and regulating quality standards for surface waters. Section 404 of the CWA outlines procedures by which the COE can issue permits for the discharge of dredged or fill material into Waters of the United States, including wetlands. The EPA also independently reviews Section 404 CWA applications and has veto power for permits issued by the COE.

Mountain Valley submitted its original Section 404 CWA permit applications to the Norfolk and Wilmington Districts of the COE on November 30, 2018.

The EPA has also delegated Water Quality Certification (WQC) under CWA Section 401 and National Pollutant Discharge Elimination System (NPDES) permitting under CWA Section 402 to state agencies (i.e., the VADEQ and the NCDEQ) in states crossed by the Project. The CWA made it unlawful to discharge any pollutant from a point source into navigable waters, unless a permit was obtained. The NPDES permit program controls stormwater discharges.

Mountain Valley submitted its Section 401 applications to the VADEQ and the NCDEQ in November 30, 2018. On June 3, 2019, NCDEQ issued a letter of denial of the Section 401 Water Quality Certification for the Project based on procedural grounds. Mountain Valley re-filed its application with NCDEQ in August 2019. Section 4.3 of this EIS discusses impacts on water resources that may be applicable to compliance with the CWA.

1.4.4 Endangered Species Act

The Endangered Species Preservation Act of 1966 was amended in 1969, and evolved into the ESA (16 U.S.C. § 1531-1544) in 1973. Section 7 of the ESA states that any project authorized, funded, or conducted by any federal agency (in this case, the FERC) should not "…jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined…to be critical…." As previously stated, the FERC, as the lead federal agency for the Project, is required to consult with the FWS to determine whether any federally listed or proposed endangered or threatened species or their designated critical habitats would be affected by the Project. Additional information regarding compliance with the ESA can be found in section 4.7.

1.4.5 Migratory Bird Treaty Act

The MBTA (16 U.S.C. § 703-712) dates back to 1918, but has been amended many times. The MBTA implements various treaties and conventions between the United States (U.S.),

Mexico, Canada, Japan, and Russia for the protection of migratory birds. Birds protected under the MBTA include all common songbirds, waterfowl, shorebirds, hawks, owls, eagles, ravens, crows, native doves and pigeons, swifts, martins, swallows, and others, including their body parts (feathers, plumes, etc.), nests, and eggs. The MBTA makes it unlawful to pursue, hunt, take, capture, or kill; attempt to take, capture, or kill; possess, offer to or sell, barter, purchase, deliver, or cause to be shipped, exported, imported, transported, carried, or received any migratory bird, part, nest, egg, or product, manufactured or not. This EIS discusses compliance with the MBTA in section 4.6.

1.4.6 National Historic Preservation Act

Congress passed the NHPA in 1966 (54 U.S.C. § 3001 et seq.), which has been amended multiple times, most recently in 2014. The NHPA created the National Register of Historic Places (NRHP), established the Advisory Council on Historic Preservation (ACHP), and directed states to appoint SHPOs.

Section 101(d)(6) of the NHPA states that properties of religious and cultural importance to an Indian tribe may be determined to be eligible for the NRHP. In meeting our responsibilities under the NHPA, and our tribal trust obligations, the FERC consulted on a government-to-government basis with Indian tribes that may have an interest in the Project and its potential effects on traditional cultural properties. The current status of government-to-government consultations regarding the identification of historic properties in the area of potential effect (APE) that may have religious or cultural significance to Indian tribes is further discussed in section 4.10.

Section 106 of the NHPA requires the FERC to take into account the effects of its undertakings on historic properties, and afford the ACHP an opportunity to comment. Historic properties include prehistoric or historic sites, districts, buildings, structures, objects, or properties of traditional religious or cultural importance that are listed or eligible for listing on the NRHP. In accordance with the regulations for implementing Section 106 at 36 CFR 800, the FERC, as the lead agency, is required to consult with the appropriate SHPOs, interested Indian tribes, and other consulting parties; identify historic properties in the APE; assess project effects on historic properties; and resolve adverse effects. Mountain Valley, as a non-federal party, is assisting the FERC in meeting its obligations under Section 106 by preparing the necessary information and analyses as allowed under Part 800.2(a)(3). However, the FERC remains responsible for all final determinations. The status of our compliance with the NHPA is summarized in section 4.10 of this EIS.

1.4.7 Federal, State, and Local Permits, Licenses, Approvals, and Consultations

In some cases, Mountain Valley would obtain applicable state and local permits or authorizations, as required under specific state and county laws and regulations in order to allow the Project to move forward. The FERC encourages cooperation between applicants and state and local authorities; however, state and local agencies, through the application of state and local laws, may not prohibit or unreasonably delay the construction or operation of facilities approved by the

FERC. Any state or local permits issued with respect to jurisdictional facilities must be consistent with the conditions of any authorization issued by the FERC.[15]

A list of major federal and state environmental permits, approvals, and consultations for the Project is provided in table 1.4-1. Mountain Valley would be responsible for obtaining all permits and approvals required to construct and operate the Project, regardless of whether or not they appear in this table.

[15] *See* 15 U.S.C. § 717r(d) (2019) (state or federal agency's failure to act on a permit considered to be inconsistent with Federal law); *see also, Schneidewind v. ANR Pipeline Co.,* 485 U.S. 293, 310 (1988) (state regulation that interferes with FERC's regulatory authority over the transportation of natural gas is preempted) and *Dominion Transmission, Inc. v. Summers,* 723 F.3d 238, 243 (D.C. Cir. 2013) (noting that state and local regulation is preempted by the NGA to the extent it conflicts with federal regulation, or would delay the construction and operation of facilities approved by the Commission).

2.0 DESCRIPTION OF THE PROPOSED ACTION

2.1 PROPOSED FACILITIES

The Project would involve the construction and operation of a welded-steel underground natural gas transmission pipeline and associated aboveground facilities in Virginia and North Carolina. Figure 2.1-1 provides an overview map of the Project. Detailed maps showing the proposed pipeline and facility locations are provided in appendix B.1. The Project facilities would be installed using the methods described in section 2.4.

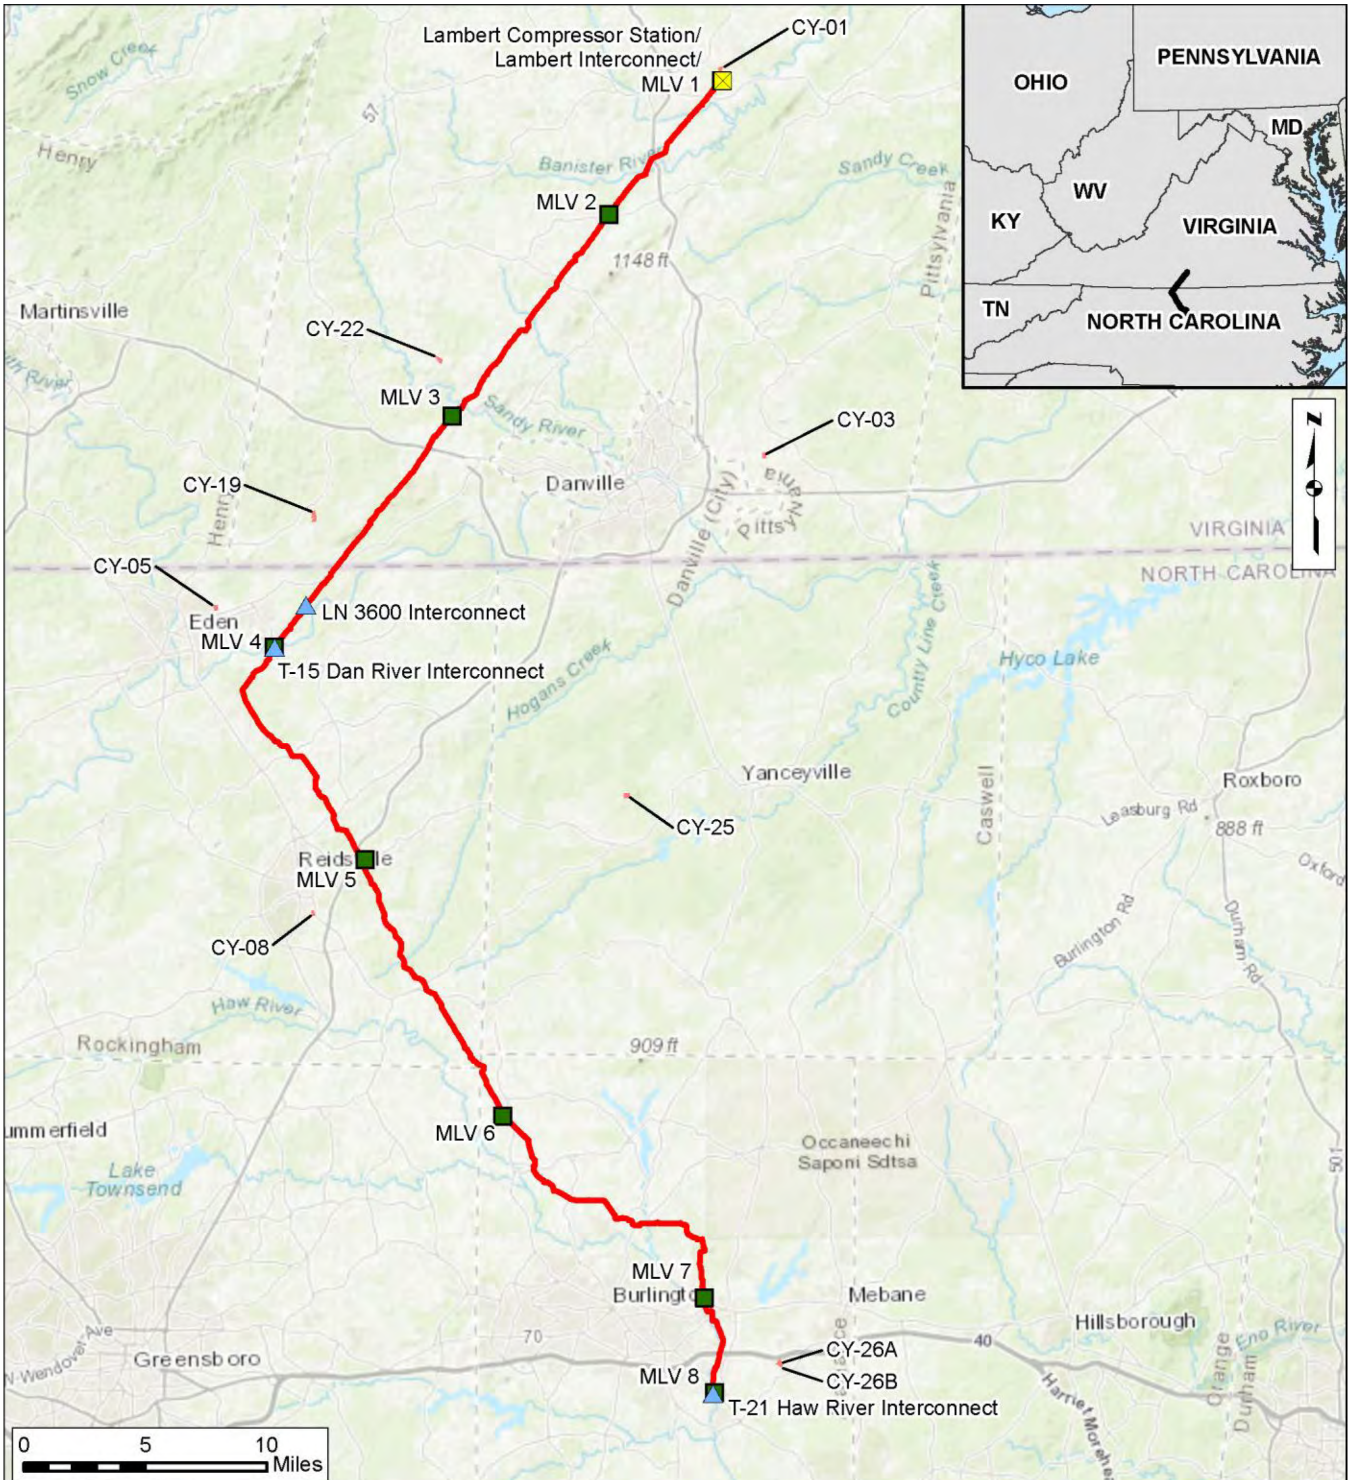
The Project would consist of 75.1 miles of 16-inch and 24-inch-diameter natural gas transmission pipeline. Aboveground facilities would consist of a new compressor station (Lambert Compressor Station) in Virginia; four new interconnects/meter stations; four pig launchers and receivers at three locations; eight MLVs; and four cathodic protection beds.

The pipeline would be constructed of steel and installed underground for the entire length using the methods described in sections 2.4.2 and 2.4.3. The basic functions of the various aboveground facilities are summarized in the following bullets, and additional details are provided below in sections 2.1.1 and 2.1.2.

2.1.1 Pipeline Facilities

The proposed Project includes 75.1 miles of new natural gas pipeline in Virginia and North Carolina. Locations of the pipeline facilities are described in table 2.1-1. Pipeline facilities include the following:

- installation of 0.5 mile of 24-inch-diameter natural gas transmission pipeline (H-605) located in Pittsylvania County, Virginia;
- installation of 30.7 miles of 24-inch-diameter natural gas transmission pipeline (H-650) located in Pittsylvania County, Virginia, and Rockingham County, North Carolina; and
- installation of 43.9 miles of 16-inch-diameter natural gas transmission pipeline (H-650) located in Rockingham and Alamance County, North Carolina.



Proposed Pipeline Route
Meter Station/Interconnect
Compressor Station
Mainline Valve
Yard

Figure 2.1-1

Southgate Project

Southgate Overview Map

TABLE 2.1-1

Southgate Project Pipeline Facilities

Milepost a/	Pipeline / Diameter	County, State	Approximate Length (miles) b/
0.0 – 0.5	H-605 Pipeline / 24-inch	Pittsylvania, VA	0.5
0.0RR – 26.1	H-650 Pipeline / 24-inch	Pittsylvania, VA	26.4
26.1 – 30.4	H-650 Pipeline / 24-inch	Rockingham, NC	4.3
30.4 – 52.6	H-650 Pipeline / 16-inch	Rockingham, NC	22.4
52.6 – 73.2RR	H-650 Pipeline / 16-inch	Alamance, NC	21.5
	Total (H-605 and H-650 pipelines)		**75.1**

a/ Mileposts with an "RR" indicate locations where a re-route was incorporated into the pipeline alignment.
b/ The milepost numbering does not directly correspond to actual pipeline length due to the incorporation of reroutes.

The pipeline route begins with a new 0.5-mile pipeline (H-605) that would interconnect the Mountain Valley Pipeline Project to the Lambert Compression Station. From the Lambert Compressor Station, the proposed Southgate pipeline (H-650) would proceed 74.6 miles through Pittsylvania County, Virginia, and Rockingham and Alamance Counties, North Carolina. The pipeline has been designed to transport 375 MMcf/d of natural gas. The maximum allowable operating pressure (MAOP) for the H-605 pipeline would be 1,480 pounds per square inch gauge (psig) and H-650 pipeline would be 1,440 psig. For 36.8 miles (49 percent) of the route, the Project would be collocated with existing utility corridors and rights-of-way (see table 2.1-2). The proposed route is considered collocated with an existing corridor if the new permanent right-of-way is located immediately adjacent to or overlaps the existing utility right-of-way.

TABLE 2.1-2

Summary of Pipeline Collocated with Existing Rights-of-Way for the Southgate Project

Collocation Type	Virginia (miles)	North Carolina (miles)	Total (miles)	Percent of Total Project Length
Overhead Power Lines/Electric Transmission Line Rights-of-Way	0	11.9	11.9	15.8
Pipeline Rights-of-Way	19.1	5.8	24.9	33.2
Total	**19.1**	**17.7**	**36.8**	**49.0**

2.1.2 Aboveground Facilities

Mountain Valley proposes to construct a new compressor station (Lambert Compressor Station) in Pittsylvania County, Virginia; four new meter stations; four interconnects; four pig launchers and receivers at three locations; and eight MLVs. The basic functions of the aboveground facilities are summarized below, and additional details regarding each facility is provided below in table 2.1-3.

- Compressor stations use engines to maintain pressure within the pipeline in order to deliver the contracted volumes of natural gas to specific points at specific pressures. Compressors are housed in buildings that are designed to attenuate noise and allow for operation and maintenance activities. Compressor stations also typically include administrative, maintenance, storage, and communications buildings, and can include metering and pig launcher/receiver facilities discussed below. Most stations consist of a developed, fenced area within a larger parcel of land that remains undeveloped. The location of the compressor station and amount of compression needed are determined primarily by hydraulic modeling.
- Interconnects (meter stations) measure the volume of gas removed from or added to a pipeline system. Most meter stations consist of above and below ground piping within a small graveled area with small building(s) that enclose the measurement equipment. Mountain Valley would construct and operate interconnects within the Lambert Compressor Station, at customer delivery points, and at interconnections with other interstate transmission systems.
- MLVs consist of a small system of aboveground and underground piping and valves that control the flow of gas within the pipeline and can also be used to vacate, or blow off, the gas within a pipeline segment, if necessary. Five of the MLVs would be installed within the operational rights-of-way of the pipeline right-of-way. Three of the MLVs would be installed within the limits of associated facilities.
- Launchers and receivers are facilities where internal pipeline cleaning and inspection tools, referred to as "pigs," can inserted or retrieved from the pipeline. Pig launchers/receivers consist of an aboveground group of piping within the pipeline right-of-way or other aboveground facility boundaries.
- Cathodic protection systems help prevent corrosion of underground facilities. These systems typically include a small, aboveground transformer-rectifier unit and an associated anode groundbed located on the surface or underground. Mountain Valley identified locations where groundbeds would extend off of the pipeline right-of-way for a short distance.

TABLE 2.1-3

Aboveground Facilities for the Southgate Project

Facility	County, State	MP	Description
Lambert Compressor Station (with Lambert Interconnect, MLV 1 and pig launcher)	Pittsylvania, VA	0.0RR	A proposed new 28,915-hp compressor station consisting of two natural gas turbine-driven compressors housed in one compressor building that would take natural gas from the proposed H-605 pipeline at the Lambert Interconnect and discharge into the H-650 pipeline. This location would include the Lambert Interconnect, MLV 1 and a 24-inch pig launcher.
Lambert Interconnect (within Lambert Compressor Station, with pig launcher)	Pittsylvania, VA	0.0RR	New interconnecting meter station at the Lambert Compressor Station to receive gas from the Mountain Valley Pipeline system via the H-605 pipeline and discharge into the Lambert Compressor Station.
LN 3600 Interconnect	Rockingham, NC	28.2	New interconnecting meter station to take gas from the existing East Tennessee LN 3600 and discharge into the Southgate pipeline.
T-15 Dan River Interconnect (with MLV 4 and pig launcher and receiver)	Rockingham, NC	30.4	New interconnecting meter station to take gas from the Southgate pipeline and discharge into the existing DENC T-15 Dan River facility. This location would include MLV 4 and a 16-inch pig launcher and 24-inch receiver
T-21 Haw River Interconnect (with MLV 8 and pig receiver)	Alamance, NC	73.2RR	New interconnecting meter station to take gas from the Southgate pipeline and discharge into the existing DENC T-21 Haw River facility. This location would include MLV 8 and a 16-inch pig receiver.
MLV 1 (within Lambert Compressor Station at Lambert Interconnect)	Pittsylvania, VA	0.0RR	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping at the Lambert Compressor Station connection to H-650 pipeline.
MLV 2	Pittsylvania, VA	7.4	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping within the permanent easement north of Dry Fork Road.
MLV 3	Pittsylvania, VA	18.3	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping within the permanent easement south of Pine Lake Road.
MLV 4 (within T-15 Dan River Interconnect)	Rockingham, NC	30.4	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping at the T-15 Dan River Interconnect.
MLV 5	Rockingham, NC	42.2	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping within the permanent easement south of Hwy 158.

TABLE 2.1-3

Aboveground Facilities for the Southgate Project

Facility	County, State	MP	Description
MLV 6	Alamance, NC	55.1	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping within the permanent easement south of Gilliam Church Road.
MLV 7	Alamance, NC	68.7	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping within the permanent easement south of Haw River Hopedale Road.
MLV 8 (within T-21 Haw River Interconnect)	Alamance, NC	73.2RR	Mainline valve with aboveground valve operators, risers, blowdown valves, and crossover piping at the T-21 Haw River Interconnect.

The local service provider would provide primary telecommunication services to aboveground facilities. Mountain Valley would install very small aperture terminal (VSAT) equipment at the Lambert Compressor Station, meter stations, and MLV sites for backup telecommunications service. Mountain Valley proposes to install an 80-foot communication tower at the Lambert Compressor Station.

Electrical services from the local distribution company would be installed at meter stations, MLVs, and cathodic protection locations. The primary power source at the Lambert Compressor Station would be natural gas generators; however, backup electrical service would be provided by the local distribution company.

2.1.3 Cathodic Protection

Cathodic protection units would include both aboveground and underground components. These units are installed to decrease or prevent corrosion of the pipe, by running a low electric current. Cathodic protection equipment could consist of underground negative connection cables, linear anode cable systems, aboveground junction boxes, and rectifiers. Mountain Valley is still evaluating locations to install cathodic protection at four locations along the Project; however, the preferred locations are provided in table 2.1-4.

TABLE 2.1-4

Cathodic Protection Units for the Southgate Project

MP	County, State	Cathodic Protection Type
9.4	Pittsylvania, VA	Conventional
20.0	Pittsylvania, VA	Conventional
44.9	Rockingham, NC	Conventional
60.2	Alamance, NC	Conventional

According to Mountain Valley, the permanent footprint of conventional anode and cable type cathodic surface groundbeds would require additional right-of-way with dimensions of about 50 feet wide and 500 feet long to be located perpendicular to the pipeline right-of-way. Surface groundbeds would not require a temporary workspace adjacent to the permanent footprint.

2.2 NON-JURISDICTIONAL FACILITIES

Under Section 7 of the NGA, the FERC is required to consider, as part of its decision to authorize interstate natural gas facilities, all factors bearing on the public convenience and necessity. Occasionally, proposed projects have associated facilities that do not come under the jurisdiction of the Commission. As such, FERC has no authority or jurisdiction over the siting, permitting, licensing, construction, or operation of these facilities. These "non-jurisdictional" facilities may be integral to the need for the proposed facilities (e.g., a power plant at the end of a FERC-jurisdictional pipeline) or they may be merely associated as minor, non-integral components of the jurisdictional facilities that would be constructed and operated as a result of the Certification of the proposed. These facilities are addressed below.

The non-jurisdictional facilities associated with the Project would include installation of aboveground and underground powerlines and telecommunications from existing nearby power poles to the meter stations, Lambert Compressor Station, MLVs, and cathodic protection groundbeds. These extensions would range from 50 feet to 1,684 feet in length. Telecommunications would be radio and/or cellular provided by the local telecommunications provider with VSAT service as a backup. Dominion Energy would make minor improvements to its Dan River and Haw River delivery points in conjunction with the Project. Impacts associated with these non-jurisdictional facilities are addressed in section 4.13.

2.3 LAND REQUIREMENTS

Construction of the Project would disturb 1,465.9 acres of land. This includes the pipeline construction right-of-way, permanent right-of-way, additional temporary workspaces (ATWS), aboveground facilities, contractor and storage yards (yards), cathodic protection areas, and new and improved access roads (see table 2.3-1). Operation of the Project would use about 450 acres, which includes the permanent pipeline easements, aboveground facilities, and permanent access roads.

TABLE 2.3-1

Land Requirements for the Southgate Project

Project Component/State	Land Affected During Construction (acres)	Land Affected During Operation (acres)
PIPELINE FACILITIES		
Virginia		
H-605 Pipeline Right-of-Way	7.8	2.6
H-650 Pipeline Right-of-Way	399.6	150.3
North Carolina		
H-650 Pipeline Right-of-Way	752.1	278.7

Note: Pig launchers and receivers will be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect), therefore, acreage calculations for the pig launchers and receivers are included with those facilities. MLVs 1, 4, and 8 will be located within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect), therefore, acreage calculations for MLVs 1, 4, and 8 are included with those facilities.

2.3.1 Pipelines

Mountain Valley would generally use a 100-foot-wide construction right-of-way to install the pipeline in uplands and a 75-foot-wide construction right-of-way through wetlands. Right-of-way configurations proposed by Mountain Valley for its pipeline are included in appendix B.2. Construction of the pipelines would affect a total of 1,159.5 acres, including ATWS, but excluding staging areas, yards, access roads, and cathodic protection beds. Pipeline construction would affect 407.4 acres of land in Virginia and 752.1 acres in North Carolina. The temporary work areas used during construction of the pipelines would be restored to their pre-construction condition and use after the facilities are built.

Following construction, Mountain Valley would retain a 50-foot-wide permanent right-of-way to operate the pipeline. The operational permanent easement for the pipelines would require about 431.6 acres. Operation of the pipelines would affect 152.9 acres in Virginia and 278.7 acres in North Carolina.

2.3.2 Aboveground Facilities

A total of 30.4 acres would be affected by construction of aboveground facilities. Operation of aboveground facilities would affect a total of 11.1 acres. The temporary work areas used during construction of the aboveground facilities would be restored to their pre-construction condition and use after the facilities are built.

Construction of the new Lambert Compressor Station, Lambert Interconnect, and MLV 1 would be within the same facility on land owned by Mountain Valley and would affect about 19 acres all in Pittsylvania County, Virginia. Operation of these facilities would require 8.6 acres in total.

Construction of the remaining interconnects and MLVs would affect a total of 11.1 acres. Construction and operation in Virginia would require about 0.04 acre for MLV 2 and MLV 3. In North Carolina, construction of these facilities would require about 11 acres, and operation would use a total of 2.3 acres.

2.3.3 Additional Temporary Workspaces

During construction of the pipeline facilities, Mountain Valley would require ATWS in areas such as the following:

- adjacent to crossings of railroads, waterbodies, wetlands, other utilities, and at some roadways;
- construction constraints that require special construction techniques, such as horizontal directional drill (HDD) entry and exit locations;
- HDD pullbacks;
- conventional bores;
- areas requiring extra trench depth;

- timber storage areas;
- installation of erosion and sediment controls, and stormwater management to meet state regulations;
- areas with steep side slopes and difficult terrain;
- pipeline interconnects;
- areas for extra spoil storage;
- areas for temporary storage of segregated topsoil;
- locations with soil stability concerns;
- truck turnarounds;
- equipment passing lanes; and
- staging and fabrication areas.

As proposed by Mountain Valley, the Project would require 94.8 acres of ATWS in Virginia and 198.1 acres in North Carolina, affecting a total of 292.9 acres combined. ATWS would be used only during construction of the Project. After pipeline installations, all of the ATWS would be restored to their pre-construction condition and use, to the extent possible. Appendix B.3 identifies where Mountain Valley has proposed ATWS within 50 feet of a wetland or waterbody.

2.3.4 Contractor Yards

Mountain Valley would need temporary yards during construction to store pipe, materials, and equipment; set up offices; and mobilize workers. Land requirements for contractor yards proposed for temporary use during construction of the Project are provided in table 2.3-1. Depending upon the conditions at each site, Mountain Valley would clear trees, grade, modify drainage, import gravel or crushed rock, install buildings (usually pre-fabricated mobile offices), and construct internal roadways as needed. After pipeline installation, Mountain Valley would allow yards to return to pre-construction use, unless the landowner requests otherwise.

During pipeline construction, Mountain Valley would use four yards in Virginia and five yards in North Carolina (see table 2.3-2). The yards would temporarily occupy about 175 acres. These yards are depicted on the maps in appendix B.1.

TABLE 2.3-2

Contractor Yards for the Southgate Project

Name	Approx. MP	County	State	Municipality	Parcel	Land Use a/	Acres
CY-01	0.0 (on H-605)	Pittsylvania	VA	Chatham	VA-PI-001.000	OL	22.2

						Total	**174.9**

a/ CI = Commercial / Industrial; FW = Upland Forest / Woodland; OL = Upland Open Land

2.3.5 Access Roads

Mountain Valley would mostly use existing public and private roads to gain access to its respective rights-of-way. However, many existing roads are not suitable for construction traffic.

In addition to the use of public roads, Mountain Valley would use 119 (totaling 30.5 miles) existing access roads and construct 41 new roads (totaling 1.8 miles). Use of these 160 access roads would affect about 99.5 acres. Almost all of the existing access roads (113) would require improvements for pipeline construction traffic. Mountain Valley would use 17 of the access roads for permanent access to the right-of-way and aboveground facilities, including 7 existing roads and 10 new roads. Permanent use of access roads would affect 5.7 acres. Appendix B.4 identifies

each road improvement proposed for the Project. Additional information regarding access roads can be found in appendix B.4 and section 4.8.1.

2.3.6 Cathodic Protection

After installation of the pipeline, Mountain Valley would install cathodic protection rectifiers and groundbeds at four sites. These facilities would affect about 1.8 acres for construction and operation.

2.4 CONSTRUCTION PROCEDURES

Mountain Valley would design, construct, operate, and maintain its respective pipelines and facilities in accordance with U.S. Department of Transportation (DOT) regulations under 49 CFR 192 (Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards) and other applicable federal and state regulations. DOT regulations specify pipeline material selection; minimum design requirements; protection from internal, external, and atmospheric corrosion; and qualification procedures for welders and operations personnel, in addition to other design standards. Mountain Valley would also comply with the siting and maintenance requirements under 18 CFR 380.15 and other applicable federal and state regulations, including the requirements of the U.S. Department of Labor, Occupational Safety and Health Administration. These safety regulations are intended to ensure adequate protection of the public, pipeline workers, contractors, and employees, and to prevent natural gas pipeline accidents and failures. Pipeline safety is discussed further in section 4.12 of this EIS.

Mountain Valley agreed to adopt the FERC's general construction, restoration, and operational mitigation measures outlined in our *Upland Erosion Control, Revegetation and Maintenance Plan* (FERC Plan) with modifications, herein referred to as Mountain Valley's Plan[1]. Mountain Valley also agreed to adopt our *Wetland and Waterbody Construction and Mitigation Procedures* (FERC Procedures)[2] with modifications; herein referred to as Mountain Valley's Procedures[3]. Mountain Valley requested modifications to certain requirements of the FERC Plan and Procedures and provided site-specific justifications which are further described below and in sections 4.3 and 4.4.

The requirements of the FERC Procedures that Mountain Valley requested modifications of are:

- unless expressly permitted or further restricted by the appropriate federal or state agency in writing on a site-specific basis, instream work, except that required to install or

[1] Mountain Valley's Plan was included in its October 23, 2019 application supplement. Mountain Valley's Plan can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191023-5022 in the "Numbers: Accession Number" field.

[2] FERC Plan and Procedures are available on the FERC Internet website at: http://www.ferc.gov/industries/gas/enviro/guidelines.asp.

[3] Mountain Valley's Procedures were included in its October 23, 2019 application supplement. Mountain Valley's Procedures can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191023-5022 in the "Numbers: Accession Number" field.

remove equipment bridges, must occur during the following time windows: b. coolwater and warmwater fisheries– June 1 through November 30 (Section V.B.1.b.);

- that prior to construction, site-specific justifications must be filed with the Secretary, for review and written approval, for extra work areas that would be closer than 50 feet from a waterbody or wetland (V.B.2.a and VI.B.1.a);
- where pipelines parallel a waterbody, at least 15 feet of undisturbed vegetation must be maintained between the construction right-of-way and the waterbody (and any adjacent wetland), except where maintaining this offset would result in greater environmental impact (Section V.B.3.c); and
- the width of the construction right-of-way should be limited to 75 feet or less in wetlands.

Mountain Valley has requested to locate extra work areas closer than 50 feet from a waterbody or waterbody in certain locations, and has requested modifications to the 15-foot buffer described above. Mountain Valley also requested a greater than 75-foot-wide construction corridor at four wetland locations due to utility lines, road crossing, and extensive HDD operations. The locations where these modifications would be located for the Project are identified in appendix B.3 and B.8. In addition, based on coordination with state agencies, Mountain Valley is requesting modified waterbody crossing windows. We have reviewed the requested modifications and have found them acceptable.

Mountain Valley is also requesting modification to the FERC Plan in order to provide enhanced inspection frequency per state requirements in watersheds with established total maximum daily loads (TMDL); and enhanced spacing of temporary slope breakers. In addition, Mountain Valley is requesting an adjustment to the mowing timing restrictions to protect migratory birds per agency consultation. We have reviewed the requested modifications and have found them acceptable

To further reduce construction impacts, Mountain Valley has indicated that it would implement a Project-specific *Erosion and Sediment Control Plan* (E&SC Plan)[4] that outlines best management practices (BMPs) and the placement of erosion control devices (ECDs) within Project work areas in accordance with Virginia and North Carolina regulations. The E&SC Plan has been submitted to the states for review and approval. The E&SC Plan would contain measures that are consistent with and/or would provide greater protection than those required in Mountain Valley's Plan and Procedures.

Mountain Valley has also agreed to implement supplemental control measures, which exceed the minimum standards required by these states. As discussed in section 4.3, Mountain Valley would monitor weather conditions during construction and appropriately adjust erosion

[4] Mountain Valley's Virginia and North Carolina draft narrative *Erosion and Sediment Control Plan* (E&SC Plan) was filed on June 21, 2019. The E&SC Plan can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190621-5150 in the "Numbers: Accession Number" field.

control measures as necessary to minimize the impacts from heavy precipitation events. In addition, Mountain Valley has developed a Project-specific *Spill, Prevention, Control, and Countermeasures Plan* (SPCC Plan)[5] and an *Unanticipated Discovery of Contamination Plan*[6] in order to contain hazardous materials stored or discovered during construction of the Project.

2.4.1 General Pipeline Construction Procedures

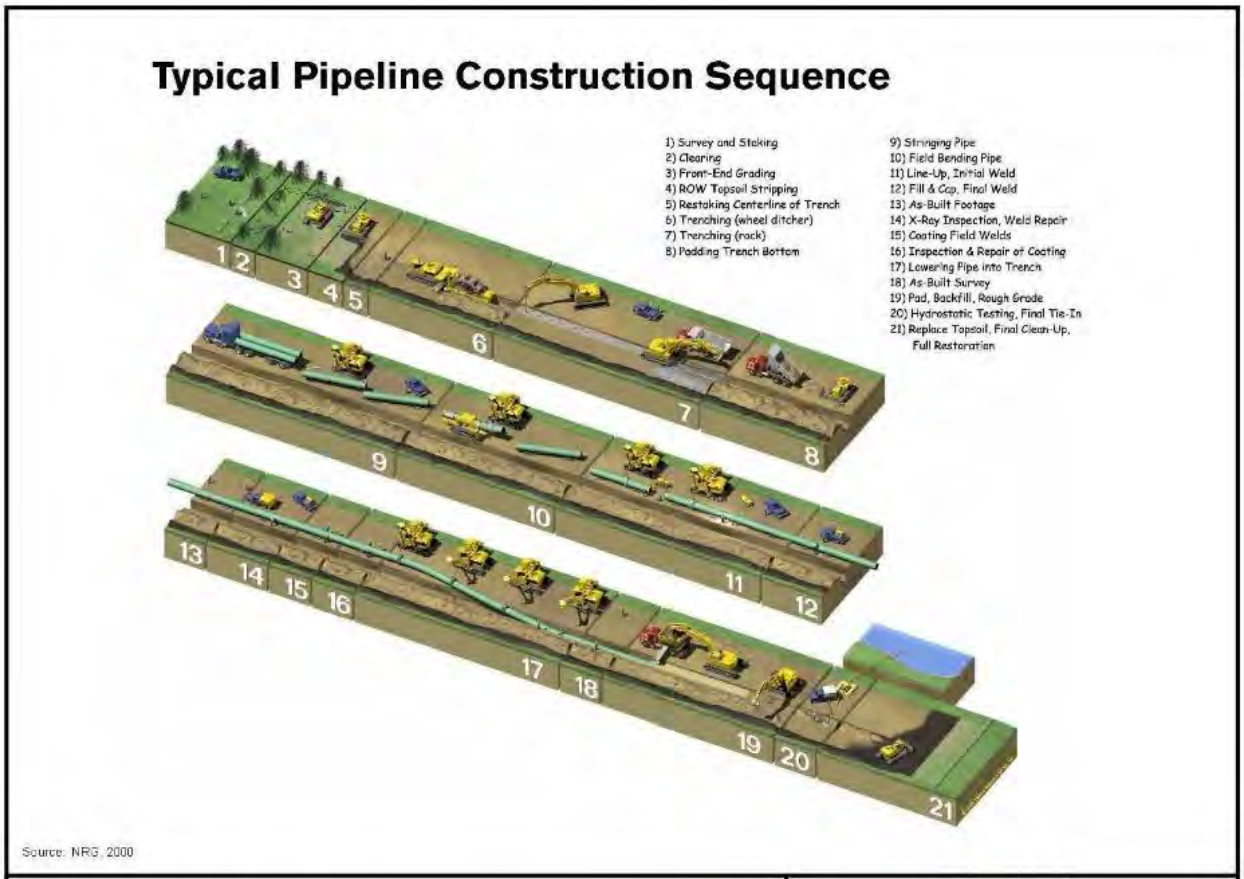
Constructing the Project would generally be completed using typical upland overland sequential pipeline construction techniques, which include survey and staking; clearing and grading; trenching; pipe stringing, bending, and welding; lowering-in and backfilling; hydrostatic testing; commissioning; and cleanup and restoration (see figure 2.4-1). These construction techniques would generally proceed in an assembly line fashion with construction crews moving down the construction right-of-way as work progresses. Mountain Valley would have two construction spreads that would each be simultaneously conducting construction activities at different locations along the route. Construction and restoration at any particular point along the pipeline route would take about 3 weeks to complete; although progress could be delayed by topography, weather, or other factors. Specialized construction methods such as side-slope construction, HDD, conventional bore, and special procedures for crossing waterbodies and wetlands would be used as needed and are described below. Construction at the Lambert Compressor Station would involve standard industrial site construction activities.

In response to a comment on the draft EIS by the VADEQ, Mountain Valley would implement measures to reuse and recycle Project materials, and prevent pollution, where appropriate, to minimize impacts on the environment. Reuse and recycling of Project waste streams would include, where feasible: mulching or reuse of brush following clearing to the extent practicable in accordance with landowner conditions/agreements; and reuse of hydrostatic test water from one test segment to the next test segment. Mountain Valley would also require all contractor employees, subcontractors, and agency representatives to attend the Project-specific Worker Environmental Awareness Program (WEAP) training prior to conducting any activities on the Project, which emphasizes the importance that Mountain Valley places on environmental compliance, identifies permit conditions and restrictions applicable to the Project, and identifies spill reporting procedures and emergency notification requirements. Mountain Valley would develop seed mixes in coordination with FWS, VADEQ, NCDEQ, and Mountain Valley's threatened and endangered species consultant to provide habitat for threatened and endangered species as well as to stabilize and revegetate the Project limits with pollinator-friendly species. Mountain Valley would encourage supply-chain partners to implement pollution prevention and would coordinate with VADEQ regarding additional guidance on pollution prevention techniques.

---

[5] Mountain Valley's SPCC Plan was included as appendix 1-G to Resource Report 1 in its November 06, 2018, application. The SPCC Plan can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

[6] Mountain Valley's *Unanticipated Discovery of Contamination Plan* was included as appendix 6-H to Resource Report 6 in its November 06, 2018, application. The *Unanticipated Discovery of Contamination Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.



Typical Pipeline Construction Sequence	**Figure 2.4-1** **Southgate Project**

2.4.1.1 Survey and Staking

The first step of construction involves engineering and land survey crews staking the limits of the construction right-of-way, the centerline of the proposed trench, ATWS, and other approved work areas. Mountain Valley would mark approved access roads using temporary signs or flagging, and the limits of approved disturbance on any access roads requiring widening. Mountain Valley would fence off environmentally sensitive areas (e.g., waterbodies and wetlands, special status species habitat, and historic properties) where the construction right-of-way may be constricted. Property markers and old survey monuments would be referenced and marked, and replaced during restoration. Mountain Valley would contact the One-Call system for each state and county to locate, identify, and flag existing underground utilities to prevent accidental damage during pipeline construction. Typically, land surveying is done using all-terrain vehicles (ATV) and pick-up trucks.

2.4.1.2 Clearing and Grading

Clearing and grading would remove trees, shrubs, brush, roots, and large rocks from the construction work area and would level the right-of-way surface to allow operation of construction

equipment. The specified construction right-of-way widths would be cleared, including ATWS. Existing fences may not be removed, but new gates may be cut, and fences reinforced.

Vegetation would generally be cut or scraped flush with the surface of the ground, leaving rootstock in place where possible. In the draft EIS, Mountain Valley proposed the following timber and brush disposal methods: 1) If requested by the landowner, merchantable timber would be cut to useable lengths and stacked on the edge of the right-of-way to a maximum height of 4 feet with openings every 200 feet to allow the safe passage of wildlife; 2) cut timber would be disposed in accordance with landowner wishes; unless Mountain Valley purchases the timber as part of its compensation agreements; and 3) brush cleared from the construction corridor would be open burned, windrowed, chipped/mulched and blown off of the right-of-way, or hauled off for disposal at an approved location. According to Mountain Valley, chipped brush would be blown off of the right-of-way with landowner approval. Chips would not be blown into environmentally sensitive areas (i.e., waterbodies, wetlands, and habitat for special status species).

Any open burning would be conducted on a site-specific basis, in accordance with applicable state and local regulations and Mountain Valley's *Fire Prevention and Suppression Plan*.[7] Burning of cleared slash would only take place in upland areas, away from residences, waterbodies, and wetlands. Impacts on air quality during burning are discussed in section 4.11.1. In response to landowner comments received on the draft EIS regarding the burning of brush, Mountain Valley clarified that no burning would occur where landowners have objected to the activity. Landowner preferences or requests would be the primary consideration when determining the appropriate disposal method.

In the draft EIS, we determined that Mountain Valley's proposed timber and brush disposal methods, specifically windrowing timber along on the right-of-way without being hauled off and used for beneficial reuse by the landowner as well as blowing chips off of the right-of-way, do not comply with the FERC Plan, section III.E. Therefore, we included a recommendation in section 4.5 requiring Mountain Valley to file revised disposal plans in accordance with the FERC Plan.

In response to our recommendation in the draft EIS, Mountain Valley provided the additional details on their brush and timber removal methods. Mountain Valley confirmed that they would blow chipped brush on the right-of-way only. Regarding the stacking of timber, at locations where the landowner requests to keep the timber and not have it removed from the right-of-way, Mountain Valley proposes to stack the timber in appropriate locations in order to allow construction to proceed. The duration of time the stacks of timber would remain on the right-of-way would be a landowner preference. If the landowner does not want to keep the timber, Mountain Valley would utilize disposal methods including removal from the Project to an approved disposal location, or chipping or burning on the right-of-way in a timely manner.

However, we do not accept this modification to the FERC Plan and in section 4.5 we have included a recommendation that requires Mountain Valley to conduct regular collection of timber

[7] Mountain Valley's *Fire Prevention and Suppression Plan* was included as appendix 1-H to Resource Report 1 in its November 06, 2018, application. The *Fire Prevention and Suppression Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

on the right-of-way, for either relocation to an alternate location on the landowners property or disposal, in accordance with the FERC Plan.

Grading would be conducted where necessary to provide a reasonably level work surface. More extensive grading, referred to as two-tone construction, would be required in uneven terrain and where the right-of-way traverses side slopes. Equipment used for clearing and grading activities could include grinding machines, motor-graders, bulldozers, track-hoes, and dump trucks.

Mountain Valley has indicated that it would separate topsoil from subsoil in residential, agricultural areas, and unsaturated wetlands. Mountain Valley would segregate at least the top 12 inches of topsoil where 12 or more inches of topsoil is present. In soils with less than 12 inches of topsoil, the entire topsoil layer would be segregated. See section 4.2 for additional information regarding topsoil segregation.

Temporary erosion controls would be installed along the construction right-of-way immediately after initial disturbance of the soil and would be maintained throughout construction. Temporary erosion control measures would remain in place until permanent erosion controls are installed or restoration is completed. Mountain Valley has committed to employing Environmental Inspectors (EIs) during construction to help determine the need for erosion controls and ensure that they are properly installed and maintained. Additional discussion of EI responsibilities is provided in section 2.4.4.

2.4.1.3 Trenching

Soil and bedrock would be removed to create a trench into which the pipeline would be placed. A track-mounted excavator/backhoe or similar equipment would be used to dig the pipeline trench. When rock is encountered, tractor-mounted mechanical rippers or rock trenchers would be used to fracture the rock prior to excavation. Blasting may be used in specific areas where hard bedrock is close to the surface. Blasting is more fully discussed in section 4.1 of this EIS.

Excavated soils would be stockpiled along the right-of-way on the side of the trench away from the construction traffic ("spoil side"). Subsoil would not be allowed to mix with the previously stockpiled topsoil. In response to comments from NCDEQ, Mountain Valley stated rock that is excavated from the right-of-way during construction activities would be utilized as backfill or would be removed from the site and taken to an approved disposal location. If necessary, rock would be appropriately sized via mechanical means to ensure it can be incorporated into the backfill. Rock would be incorporated in the backfill to a depth of 4 inches or more in locations where rock was present pre-construction such that it would not inhibit herbaceous growth. In section 4.1.4.6, we have recommended that Mountain Valley confirm it will not bury excess rock fragments generated during trenching or blasting in any location other than where the rock originated and all excess rock fragments not suitable for reburial at the point of origin would be considered construction debris and should be disposed of consistent with the FERC Plan. Specific locations for temporarily storing/staging excess rock are unknown as such locations where there may be excess rock would be identified during construction by the pipeline contractor and inspection staff. Rock would be stored/staged on the right-of-way as needed and

incorporated into the backfill as outlined above. If rock is encountered during construction in steep topographic areas, the rock would be relocated via truck to a stable area with more favorable slope conditions.

The trench would be dug at least 12 inches wider than the diameter of the pipeline and excavated to a depth of 5.5 feet to 9 feet in order to provide sufficient cover over the pipeline in accordance with DOT standards in 49 CFR 192.327 (see table 2.4-1). The depths provided in table 2.4-1 may deviate based on topography, soil composition, and pipe diameter; however, there would generally be 36 inches of cover over the top of the pipeline in deep soils and 18 inches of cover in areas of consolidated rock. At waterbody crossings, the pipe would be more deeply buried; with a minimum of 4 feet of cover at navigable waterways and a minimum of 2 feet of cover at waterbodies with consolidated rock. As discussed in section 4.3, the pipeline would be buried deeper than the DOT standards for several waterbodies in order to prevent exposure of the pipeline due to scour. Mountain Valley would install its uncased pipeline with a minimum of 10 feet of cover under railroads; and a minimum of 5.5 feet of cover for cased pipe under a railroad.

TABLE 2.4-1

Minimum DOT Specifications for Depth of Cover over Natural Gas Pipelines

Location a/	Normal Soil (cover depth in inches)	Consolidated Rock (cover depth in inches)
DOT PHMSA Class 1	36	18
DOT PHMSA Class 2, 3, and 4	36	24
Actively cultivated agriculture	48	24
Drainage ditches of public roads	36	24
Navigable river, stream, or harbor	48	24
Minor stream crossings	36	24

DOT PHMSA – U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration

a/ As defined in 49 CFR 192.5.

Class 1: offshore areas and areas within 220 yards of a pipeline with ≤10 buildings intended for human occupancy.

Class 2: areas within 220 yards of a pipeline with >10 but <46 buildings intended for human occupancy.

Class 3: areas within 220 yards of a pipeline with >46 buildings intended for human occupancy and areas within 100 yards of either a building or a small, well defined outside area (such as a playground, recreation area, outdoor theater, or other place of public assembly) that is occupied by 20 or more persons on at least 5 days a week for 10 weeks in any 12-month period.

Class 4: areas within 220 yards of a pipeline where buildings with four or more stories are prevalent.

2.4.1.4 Pipe Stringing, Bending, Welding, and Coating

After trenching, sections of pipe typically between 40 and 60 feet long (also referred to as "joints") would be transported to the right-of-way by truck, off-loaded by track-hoes or side-boom tractors, and strung beside the trench in a continuous line. The pipe would be delivered to the job site with a protective coating of fusion-bonded epoxy or other approved coating that would inhibit corrosion by preventing moisture from coming into direct contact with the steel.

Individual sections of pipe would be bent using a track-mounted, hydraulic pipe-bending machine to conform to the contours of the ground after the joints of pipe sections are strung alongside the trench. Where multiple or complex bends are required, bending may be conducted at the pipe fabrication factory, and the pipe would be shipped to areas pre-bent.

After the pipe joints are bent, they would be aligned, welded together into a long segment, and placed on temporary supports at the edge of the trench. Mountain Valley would use welders who are qualified according to applicable standards in 49 CFR 192 Subpart E, American Petroleum Standard 1104, and other requirements. Automated welding may be used by Mountain Valley in areas of flat terrain.

Every completed weld would be examined by a welding inspector to determine its quality using radiographic or other approved methods as outlined in 49 CFR 192. Radiographic examination is a non-destructive method of inspecting the inner structure of welds and determining the presence of defects. Welds that do not meet the regulatory standards would be repaired or removed.

After a weld is approved, a coating crew would coat the area around the weld before the pipeline is lowered into the trench. Prior to application, the coating crew would thoroughly clean the bare pipe with a power wire brush or sandblast machine to remove dirt, mill scale, and debris. The crew would then apply the coating and allow the coating to dry. The pipeline would be inspected electronically (also referred to as "jeeped" because of the sound of the alarm on the testing equipment) for faults or voids in the coating and would be visually inspected for scratches, and other defects. Mountain Valley would repair damage to the coating before the pipeline is lowered into the trench. The welded pipe would be placed on wooden skids next to the trench.

2.4.1.5 Lowering-in and Backfilling

The trench would be inspected to be sure it is free of rocks and other debris that could damage the pipe or protective coating before the pipe is lowered into the trench. Trench dewatering may be necessary to inspect the bottom of the trench in areas where water has accumulated. Trench water would be discharged through sediment removal devices in well-vegetated upland areas away from waterbodies and wetlands. The pipeline would then be lowered into the trench by side-boom tractors. Trench breakers (such as sand bags or foam) would then be installed in the trench on slopes at specified intervals to prevent subsurface water movement along the pipeline.

Sandbags may be placed on top of the pipe after it is in place at the bottom of the trench to protect it from rocks. The first 12 inches at the bottom of the trench above the pipe would be clean fill, absent of rocks. Limestone dust may be brought in and used as padding material only when other local suitable fill is unavailable. The trench would then be backfilled using the excavated material; first with subsoil, then with topsoil. If needed, certified clean fill material would be brought in that is free of contamination with oil, petroleum, hazardous material, or coal combustion residuals. Backfilling could be done by track-hoes, bulldozers, graders, or backfilling machines. A crown of soil may extend above the trench in agricultural, grasslands-rangelands, and open lands, to account for settling. Any excess soils would be spread evenly over the right-of-way.

2.4.1.6 Hydrostatic Testing

Mountain Valley would hydrostatically test the pipeline after backfilling to ensure the system is capable of withstanding the operating pressure for which it was designed. Hydrostatic testing involves filling the pipeline with water to a designated test pressure and maintaining that pressure for about 8 hours. Actual test pressures and durations would be consistent with the requirements of 49 CFR 192. Any leaks would be repaired and the section of pipe retested until the required specifications were met.

Mountain Valley has indicated that water for hydrostatic testing would be obtained primarily from the Dan River at milepost 30.1 and from municipal water sources if necessary. If chlorinated water is used, a dechlorination agent may be required prior to discharge, depending on the discharge location. No chemicals would be added to test water unless approved by FERC and applicable federal and state regulatory agencies. The test water would contact only new pipe. No desiccant or chemical additives would be used to dry the pipe after testing.

The pipeline would be tested in segments, and the water may be moved through each sequential segment along the route, or the water would be discharged. The hydrostatic test water would be discharged through sediment filters in vegetated uplands away from waterbodies and wetlands. Section 4.3.2 provides more information on hydrostatic testing.

2.4.1.7 Commissioning

Test manifolds would be removed and final pipeline tie-ins would be completed after hydrostatic testing. The pipeline then would be cleaned and dried using mechanical tools (pigs) that are moved through the pipeline with pressurized dry air. Pigs also would be used to internally inspect the pipeline to detect whether any abnormalities or damage exists. Any problems or concerns would be addressed as appropriate.

Pipeline commissioning would then commence. Commissioning involves verifying that equipment has been properly installed and is working, verifying that controls and communications systems are functioning, and confirming that the pipeline is ready for service. In the final step, the pipeline would be prepared for service by purging the pipeline of air and loading it with natural gas. Mountain Valley would not be authorized to place the pipeline facilities into service until after it has documented to the FERC that restoration activities are proceeding in a satisfactory manner, and the companies have received written permission from the Director of the Office of Energy Projects (OEP).

2.4.1.8 Cleanup and Restoration

Within 20 days of backfilling the trench (10 days in residential areas), all work areas would be graded and restored. If seasonal or other weather conditions prevent compliance with these timeframes, temporary erosion controls would be maintained until conditions allow completion of final cleanup. Surplus construction material and debris would be removed from the right-of-way unless that landowner or land-managing agency approves otherwise and it is used for beneficial reuse. As previously stated, rock excavated from the right-of-way during construction activities

may be utilized as backfill or would be removed from the Project site for disposal at an approved landfill.

After backfilling the trench, the topographic contours would be restored to their original pre-construction condition as close as possible, using graders and bulldozers; except where drainage patterns may cause erosion. Permanent erosion control features, such as slope breakers (water bars), would be installed on steep terrain. Fences and gates would be repaired. In addition, driveways and access roads would be restored to pre-construction conditions. Markers showing the location of the pipeline would be installed at fence and road crossings in order to identify the owner of the pipeline and convey emergency information in accordance with applicable governmental regulations, including DOT safety requirements. Mountain Valley would conduct restoration activities in accordance with landowner agreements, permit requirements, and recommended seeding mixes, rates, and dates in accordance with the Project's E&SC Plan.

The right-of-way would be seeded within 6 working days following final grading, weather and soil conditions permitting, although seeding would not be required in actively cultivated croplands unless requested by the landowner. Alternative seed mixes specifically requested by the landowner or required by agencies may be used. Any soil disturbance that takes place outside the permanent seeding season or any bare soil left unstabilized by vegetation would be mulched in accordance with the FERC Plan (see section 4.4).

2.4.2 Special Pipeline Construction Procedures

Special construction techniques are required when a pipeline is installed across waterbodies, wetlands, roads and railroads, foreign utilities, steep slopes, residences, agricultural lands, and other sensitive environmental resources. These procedures are further discussed as they apply to specific resources in section 4.0.

2.4.2.1 Waterbody Crossings

Waterbody crossings would be completed in accordance with Mountain Valley's Procedures and measures required in other federal or state issued permits. A total of 277 waterbodies would be either crossed by the pipeline or would be present within construction workspace. The pipeline would cross 223 waterbodies, 4 of which are major waterbodies. The waterbodies that would be crossed and the proposed crossing methods for each are listed in appendix B.5. Waterbody crossings are discussed in more detail in section 4.3.2.2 of this EIS.

ATWS necessary for waterbody crossings would be placed a minimum of 50 feet from the waterbody edge. The 50-foot setback would be maintained unless site-specific approval for a reduced setback is granted by the FERC and other jurisdictional agencies (see appendix B.3 and section 4.3.2).

To prevent sedimentation caused by equipment traffic crossing through waterbodies, temporary equipment bridges would be installed across waterbodies. Bridges may include clean rock fill over culverts, equipment pads, wooden mats, free-spanning bridges, and other types of spans. Equipment bridges would be maintained throughout construction. Each bridge would be designed to accommodate normal to high streamflow (storm events) and would be maintained to

prevent soil from entering the waterbody and to prevent restriction of flow during the period of time the bridge is in use.

Sediment barriers, such as silt fence and straw bales, would be installed immediately after initial disturbance of the waterbody or adjacent upland. Sediment barriers would be properly maintained throughout construction, until replaced by permanent erosion controls or restoration of adjacent upland areas is complete and revegetation has stabilized the disturbed areas. Trench plugs, consisting of compacted earth of similar low permeability material would be installed at the entry and exit points of wetlands and waterbodies to prevent water from the stream or wetland from moving along the trench. After backfilling, streambanks would be re-established to approximate pre-construction contours and stabilized.

The pipelines would be installed below scour depth (see section 4.3.2) for each waterbody crossed. In most cases, at least 4 feet of cover over the pipeline at waterbody crossings would be maintained; except in consolidated rock, where there would be a minimum of 2 feet of cover. Trench spoil would be placed on the banks above the high-water mark for use during backfilling. In some cases, the pipeline would be coated with concrete for negative buoyancy. Concrete would not be poured or cured along the right-of-way. Any staging areas used to cast concrete would be located away from any waterbodies and enclosed with perimeter erosion and sediment controls to ensure that materials are unable to enter a waterbody. Additionally, should concrete need to be mixed within the staging area, a wash-out pit would be implemented and materials disposed of properly.

The majority of waterbody crossings for the Project would be dry-ditch crossings (flume, dam-and-pump, or cofferdam). The Dan River and Stony Creek Reservoir are proposed to be crossed via an HDD; and three locations are proposed to be crossed via conventional bore including Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek. These crossing methods are briefly described below.

Flume Construction Method

The flume method is a type of dry-ditch crossing that involves diverting the flow of water across the construction work area through one or more flume pipes placed in the waterbody. The first step in the flume crossing method involves placing a sufficient number of adequately sized flume pipes in the waterbody to accommodate the highest anticipated flow during construction. After placing the pipe in the waterbody, sand bags or equivalent dam diversion structures are placed in the waterbody upstream and downstream of the trench area. These devices serve to dam the stream and divert the water flow through the flume pipes, thereby isolating the water flow from the construction area between the dams. Flume pipes are typically left in place during pipeline installation until trenching under the flumes, pipe installation, and final cleanup of the streambed is complete. Once the pipeline is installed, and the streambed and banks restored, the flume pipes are removed, allowing water flow to return to pre-construction conditions.

Dam-and-Pump Construction Method

The dam-and-pump method is similar to the flume crossing method except that pumps and hoses are used instead of flumes to move water across the construction work area. Temporary

dams are installed across the waterbody on both the upstream and downstream sides of the construction right-of-way, usually using sandbags or plastic sheeting. Pumps are then set up at the upstream dam with the discharge line (or hoses) routed through the construction area to discharge water immediately downstream of the downstream dam. An energy dissipation device is typically used to prevent scouring of the streambed at the discharge location. The pipeline is then installed and the trench backfilled, allowing water flow to be re-established to pre-construction conditions. After backfilling, the dams are removed and the banks restored and stabilized.

HDD Construction Method

An HDD involves drilling a hole under the waterbody (or other sensitive feature) and installing a pre-fabricated pipe segment through the hole. Mountain Valley is proposing to use the HDD method to cross the Dan River and Stony Creek Reservoir.

The first step in an HDD is to drill a small-diameter pilot hole from one side of the crossing to the other using a drill rig. As the pilot hole progresses, segments of drill pipe are inserted into the hole to extend the length of the drill. The drill bit is steered and monitored throughout the process until the desired pilot hole has been completed. The pilot hole is then enlarged using several passes of successively larger reaming tools. Once reamed to a sufficient size, a pre-fabricated segment of pipe is attached to the drill string on the exit side of the hole and pulled back through the drill hole towards the drill rig. Depending on the substrate and length, drilling and pullback can last anywhere from a few days to a few weeks. Additional information regarding the HDD method is presented in section 4.3.

Conventional Bore Method

Conventional boring consists of creating a tunnel-like shaft for a pipeline below roads, waterbodies, wetlands, or other sensitive resources without affecting the surface of the resource bore pits are excavated on both sides of the resource to the depth of the adjacent trench and graded to match the proposed slope of the pipeline. A boring machine is then used within the bore pit to tunnel under the resource by using a cutting head mounted on an auger. The auger rotates and advances forward as the hole is bored. Once the hole is bored, a pre-fabricated section of pipe is pushed through the borehole. At particularly long crossings, pipe sections may be welded onto the pipe string just before being pushed through. Due to the depth of the bore pit and proximity to water resources, this method may require use of sheet pile to maintain the integrity of the bore pits and use of well point dewatering systems to avoid flooding of the pits. Borings are usually conducted 24 hours per day and typically require between 2 and 10 days to complete from start to finish. Mountain Valley is proposing to use the conventional bore method at three locations to cross Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek.

2.4.2.2 Wetland Crossings

Wetland crossings would be completed in accordance with Mountain Valley's Procedures, and other federal and state permits. A total of 89 wetlands (144 individual crossings) would be crossed by the pipeline. An additional 80 wetlands (117 individual locations) would be within temporary workspaces associated with pipeline construction. A total of 10 wetlands would be temporarily affected within workspaces for access roads and the T-15 Dan River Interconnect.

This is an increase from what was reported in the draft EIS due to Project route changes and surveys on previously unavailable properties. The wetlands that would be crossed are listed in appendix B.6 and are discussed further in section 4.3.3.

Mountain Valley would use a 75-foot-wide construction right-of-way through wetlands unless site-specific approval for an increased right-of-way width is granted by the FERC and other jurisdictional agencies (see section 4.3.3). ATWS may be required on both sides of wetlands to stage construction equipment, fabricate the pipeline, and store materials. ATWS for wetland crossings would be located in upland areas a minimum of 50 feet from the wetland edge unless site-specific approval for a reduced setback is granted by the FERC and other jurisdictional agencies (see section 4.3). Mountain Valley proposes to use extra workspace within 50 feet of waterbodies and wetlands at specific locations as listed in appendix B.3.

Clearing of vegetation in wetlands would be limited to trees and shrubs, which would be cut flush with the surface of the ground and removed from the wetland. Stump removal, topsoil segregation, and excavation would be limited to the area immediately over the trenchline. A limited amount of stump removal and grading may be conducted in other areas to ensure a safe working environment. During clearing, sediment barriers, such as silt fence and staked straw bales, would be installed and maintained adjacent to wetlands and within temporary extra workspaces as necessary to minimize sediment runoff.

Construction equipment working in wetlands would be limited to that essential for right-of-way clearing, excavating the trench, fabricating and installing the pipeline, backfilling the trench, and restoring the right-of-way. The method of pipeline construction used in wetlands would depend largely on the stability of the soils at the time of construction. Wetlands would be crossed by wet or dry open trench lay, or open ditch push-pull methods.

Where wetland soils are saturated and/or inundated, the pipeline may be installed using the push-pull technique, which involves stringing and welding the pipeline outside of the wetland and excavating the trench through the wetland using a backhoe supported by equipment mats. The water that seeps into the trench is used to "float" the pipeline into place, aided by a winch and flotation devices attached to the pipe. After the pipeline is floated into place, the floats are removed, allowing the pipeline to sink into place. Pipe installed in saturated wetlands is typically coated with concrete or equipped with set-on weights to provide negative buoyancy. Mountain Valley has proposed to use aggregate-filled sacks to decrease buoyancy. After the pipeline sinks into position, trench breakers are installed where necessary to prevent the subsurface drainage of water out of the wetland. Then the wetland is backfilled and cleanup completed. Where topsoil has been segregated from subsoil, the subsoil is backfilled first followed by the topsoil. Topsoil is not segregated in saturated wetlands due to the unconsolidated nature of the soils. Equipment mats and timber riprap would be removed from wetlands following backfilling.

For the proposed Project, construction through unsaturated wetlands would be similar to dry upland methods, with one exception; only one travel lane would be used. Up to 1 foot of topsoil from the trench would be segregated where hydrologic conditions allow.

2.4.2.3 Road and Railroad Crossings

The Project would cross 74 roads and 4 railroads. The pipeline would be installed at least 3 feet beneath all roads, and at least 10 feet below all railroads for uncased pipe (about 5.5 feet deep for cased pipe).

Construction across roads and railroads would be conducted in accordance with the permits obtained by Mountain Valley and applicable laws and regulations, including DOT safety standards. Traffic control measures would be coordinated with appropriate state and county transportation and road agencies. Mountain Valley has developed a Project-specific *Traffic Mitigation Plan*, as more fully discussed in section 4.9 of this EIS.

Railroads would be crossed with a conventional bore. In general, crossings of paved roads would also be conventionally bored, so not to disrupt traffic. The process for constructing a conventional bore crossing under roads is the same as previously described for crossing waterbodies. If a paved road is open-cut, any asphalt removed during a road crossing would be disposed of at an approved facility. Mountain Valley would not recycle used asphalt.

Most gravel, dirt, and grass roads would be crossed by the open-cut method. Traffic on roads would be maintained during construction by the use of steel plates or detours. At least one lane of the road being crossed would be kept open to traffic except for brief periods when it would be essential to close the road to install the pipeline. Road users would be notified via signage and flagmen. Most open-cut road crossings require only 1 or 2 days to complete. After pipeline installation, all open-cut road crossings would be restored to pre-construction conditions.

2.4.2.4 Residential Areas

Construction work areas would be within 25 feet of 24 residential structures. (e.g., homes, mobile homes, and cabins). Mountain Valley filed site-specific plans, as discussed in section 4.8 and provided in appendix B.7. As described in section 4.8, we encouraged affected landowners to review the site-specific plans for their properties, and provide comments to the FERC during the draft EIS comment period.

Measures that would be implement to minimize impacts on residences located within 25 feet of the construction right-of-way, include, but are not limited to:

- installing temporary safety fencing for at least 100 feet on either side of the residence and maintaining it throughout active construction in the area;
- installing safety fence and temporary end caps on the pipeline at the end of each work day to prevent overnight access to the trench and pipeline;
- fencing the boundary of the construction work area to ensure that construction equipment and materials, including the spoil pile, remain within the construction work area;
- leaving mature trees and landscaping intact within the construction work area unless the trees and landscaping interfere with the installation techniques or present unsafe working conditions;

- reducing temporary workspaces where possible;
- backfilling the trench as soon as possible after the pipe is installed; and
- completing final cleanup, grading, and installation of permanent ECDs within 10 days after backfilling the trench, weather permitting.

2.4.2.5 Foreign Utilities

The Project route crosses about 121 locations with existing buried pipelines and other foreign utilities (including fiber optic lines, telephone lines, power lines, sewer lines, water lines, etc.) This is an increase from what was reported in the draft EIS due to Project route changes, continued surveys, and coordination with utility companies. Mountain Valley would install the pipelines below existing pipelines and other foreign utilities wherever feasible. Mountain Valley would install the pipeline with at least 12 inches of clearance from any other underground utilities as required by DOT standards at 49 CFR 192.325. Larger spoil piles resulting from greater depth of excavation at the crossing of foreign utilities would be stored within ATWS at each crossing. Construction of those crossings would be monitored by Mountain Valley, and sometimes by representatives of the owner/operator of the other pipeline or utility. Appropriate safety measures would be implemented that meet the standards of the Occupational Safety and Health Administration. To ensure that existing pipelines and other foreign utilities are properly identified, and crossed without damage, the following measures would be implemented:

- contact "One-Call" to locate existing known buried pipelines and other foreign utilities;
- locate existing buried pipelines using a hand-held magnetometer or by probing, as appropriate for the conditions encountered;
- scan the edges of the right-of-way with passive inductive locating equipment;
- provide advance notice to the owner/operators of the foreign pipelines prior to construction, and allowing representatives to be present during work around their pipelines;
- not use mechanized excavation equipment within 3 feet of another buried foreign pipeline, with the excavations completed by hand shoveling;
- keep construction equipment and spoil piles off the centerline of the foreign pipeline;
- support the foreign pipeline for the length of the span exposed;
- inspect the foreign pipeline before and after the pipeline are installed;
- maintain DOT minimum separation distances;
- follow the foreign pipeline operator's requirements; and
- keep a working combustible gas indicator on-site.

2.4.2.6 Agricultural Lands

The Project would cross about 199 acres of agricultural lands. Impacts and mitigation on prime farmland soils are discussed in section 4.2 of this EIS; while impacts and mitigation for agricultural land use are discussed in section 4.8.

Prior to construction, Mountain Valley would conduct surveys to identify and flag existing irrigation systems and drainage tiles. The pipeline would typically be installed below drain titles. During restoration, any irrigation systems or drain tiles damaged during construction would be repaired or replaced.

The pipelines would be buried deep enough to allow for 48 inches of cover in actively cultivated lands. A minimum of 12 inches of topsoil would be segregated from the full right-of-way in agricultural lands, in accordance with Mountain Valley's Plan. Where topsoil is less than 12 inches deep, the actual depth of the topsoil layer would be removed and segregated. If topsoil fill is necessary, it would be locally sourced to prevent invasive species. Other mitigation measures in agricultural lands would include relief from compaction and removal of rocks from topsoil.

2.4.2.7 Rugged Topography

The Project would cross about 1.8 miles of slopes greater than 30 percent. Mountain Valley has developed construction methods for rugged terrain, which include slopes that typically exceed 30 to 35 percent, to allow for the safe operation of equipment, and prevention of severe erosion.

In areas of steep slopes and any side slopes construction, Mountain Valley would employ temporary sediment barriers, such as reinforced silt fences and silt socks, to prevent movement of sediment.. To divert water to vegetated areas or reduce water runoff, Mountain Valley may install temporary slope breakers during grading activities per the Mountain Valley's Plan and the Project-specific E&SC Plan. Additionally, Mountain Valley would install post-construction stormwater controls and permanent slope breakers as needed. Mountain Valley has proposed to implement mitigation and stabilization control measures such as trench breaker daylight drains, cutoff drains, transverse trench drains, rock lined swales, riprap natural drains, riprap slope breakers, trench breaker pass-through drains, brow ditches, geogrid reinforcement, and highwall revetment, steep slope revetment and compact slope breakers.

In areas where the pipeline route crosses laterally along a slope, cut and fill grading, or "two-tone" construction techniques, may be used to create a relatively flat working surface. This would require expanded ATWS. Spoil piles, separated every 50 feet by temporary water bars, may be compacted by bulldozers, then covered by mulch.

2.4.2.8 Karst Terrain

The Project would cross minimal areas of karst geology within 0.25-mile of the Project route. Mountain Valley's karst specialist assessed areas of karst features along the proposed Project route and determined that no impacts on karst formations are anticipated during construction and operation of the Project. In the event that areas of karst are identified during construction, Mountain Valley would implement the measures outlined in section 4.1.4.5;

coordinate with the appropriate state agencies; and conduct monitoring during and post-construction for any subsidence or karst impacts.

2.4.2.9 Winter Construction

Mountain Valley developed a *Winter Construction Plan*[8] to address specialized methods and procedures to protect resources during the winter season. The key elements of this plan include:

- use of special snow plowing equipment within the Project workspaces to prevent mixing of snow and underlying soil;
- clearing of snow from roads without blocking driveways or other access points;
- use of safety fencing around open trenches in areas used for snowmobiling, hiking, and similar activities;
- suspension of backfill and topsoil replacement if unfeasible due to frozen conditions;
- use of mulch and ECDs to stabilize topsoil and subsoil piles; and
- delaying final cleanup activities until soils have thawed.

2.4.3 Aboveground Facility Construction

Construction activities at the proposed compressor station, meter stations, and interconnects would include access road construction; site clearing; grading; putting in foundations; erecting buildings; installing equipment such as compressors and metering facilities; restoration and laying gravel in the yards; and erecting security fencing. Initial work at the aboveground facilities would focus on excavations for reinforced concrete foundations. Subsurface friction piles may be required to support foundations. Forms would be set, rebar installed, and concrete poured and cured according to industry stations. Concrete batches would be tested. Backfill would be compacted.

Equipment and piping would be transported to the sites by truck and off-loaded by cranes and/or front-end loaders. The equipment and piping would then be placed on the foundations, leveled, and secured. Piping would be welded, and welds inspected using radiography, ultrasound, or other non-destructive examination methods. Aboveground piping would be painted. Piping would be hydrostatically tested prior to being put into service. Safety equipment and controls, including emergency shutdown, relief valves, gas and fire detection, and engine overspeed and vibration protection would be calibrated and tested. Pig launchers and receivers and MLVs would be installed.

[8] Mountain Valley's *Winter Construction Plan* was included as appendix 1-J to Resource Report 1 in its November 06, 2018, application. The *Winter Construction Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

2.5 CONSTRUCTION SCHEDULE AND WORKFORCE

Mountain Valley proposes to begin construction of the Project in 2020 and estimates that it would take up to 32 months to construct, restore, and complete revegetation of its entire Project. Construction of the H-605/H-650 pipeline would be completed using two construction spreads (see table 2.5-1), with an in-service target date of December 2020. The peak construction workforce would be 900 people for the pipeline and aboveground facilities.

TABLE 2.5-1

Construction Spreads for the Southgate Project

Spread Number/Component	Start MP	End MP	Spread Length (miles)	Peak Workforce
Spread 1 - H-605/H-650 pipelines	0	30.4	30.9 a/	300
Spread 2 - H-650 pipeline	30.4	73.2RR	42.8	385
Lambert Compressor Station	0	0	N/A	110

a/ Includes 0.5 mile of H-605 and 30.4 miles of H-605 pipelines.

Construction crews would typically work 10 hours per day, 6 days per week. Work would be conducted during daytime hours (on average, 7:00 a.m. to 7:00 p.m.), or sunrise to sunset whichever is longer, except where the pipe would be installed using the HDD and bore methods, which require around-the-clock operations and typically last a few days to a few weeks. In addition, certain construction activities may extend typical workhours, such as tie-ins, operation of pumps at waterbody crossings, and hydrostatic testing, as these activities require extended and continuous operation until the activity is complete. Construction activities for aboveground facilities would be primarily limited to daytime hours; however, specific situations related to safety, permit compliance, or other non-typical circumstances may necessitate nighttime work.

2.6 ENVIRONMENTAL COMPLIANCE AND MONITORING

2.6.1 Construction Monitoring and Quality Control

During construction, Mountain Valley would provide contractors with all Project design documents, including environmental alignment sheets, and copies of all applicable federal, state, and local permits. Construction would be supervised by a Chief Inspector (CI). Mountain Valley indicates that up to four EIs would be hired per spread who would report to the CI, and whose duties would be consistent with Section II.B of the FERC Plan, including:

- the EI would be a full-time position, separate from other activity inspectors;
- the EI would be responsible for ensuring that the company complies with its construction and environmental mitigation plans, complies with all environmental conditions of the Commission Order, and complies with the environmental conditions of other relevant federal and state permits;

- the EI would have immediate "stop-work" authority for all activities, and would be empowered to take corrective actions to remedy instances of non-compliance; and
- the EI would conduct environmental training for company employees, maintain records, and write reports.

Mountain Valley has agreed to fund a FERC third-party compliance monitoring program during the Project construction phase. Under this program, a contractor is selected by, managed by, and reports solely to the FERC staff to provide environmental compliance monitoring services. The FERC Compliance Monitor would report to the FERC Project Manager on compliance issues and make recommendations on how to deal with compliance issues and construction changes, should they arise. In addition to this program, FERC staff would also conduct periodic compliance inspections during all phases of construction and throughout restoration, as necessary.

2.7 OPERATION AND MAINTENANCE

Mountain Valley would maintain and operate the pipelines and aboveground facilities in accordance with the DOT/Pipeline and Hazardous Materials Safety Administration (PHMSA) regulations at 49 CFR 192, the FERC regulations at 18 CFR 380.15, and the maintenance provisions found in Mountain Valley's Plan, Mountain Valley's Procedures, and the Project-specific E&SC Plan. As required by 49 CFR 192.615, Mountain Valley would establish an Emergency Plan that includes procedures to minimize the hazards in a natural gas pipeline emergency. Pipeline safety measures are outlined in section 4.12 of this EIS.

2.7.1 Pipelines

Mountain Valley would maintain a 50-foot-wide permanent operational easement for the H-605 and H-650 pipelines. In accordance with Mountain Valley's Plan, vegetation removal within upland portions of the operational easement would not be done more frequently than every 3 years. In wetland areas, the full width of the permanent right-of-way would not be subject to periodic vegetation maintenance; however, trees that are located within 15 feet of the pipeline that have roots that could compromise the integrity of the pipeline coating may be cut and removed from the permanent right-of-way. To facilitate periodic corrosion and leak surveys in both upland and wetland portions of the permanent right-of-way, a corridor not exceeding 10 feet in width centered on the pipeline may be maintained as frequent as necessary to maintain an herbaceous state. As indicated in Mountain Valley's Plan, in no case would routine vegetation maintenance occur between April 1 and October 14 of any year. No vegetation maintenance activities would be conducted in riparian areas between HDD entry and exit points. Vegetation management is discussed further in section 4.4.

Besides vegetation maintenance, other operational activities on the pipeline right-of-way would include inspections and repairs. Periodic aerial and ground inspections may identify pipeline leaks, erosion or loss of vegetation cover on the right-of-way, and unauthorized encroachment. The cathodic protection system would also be inspected periodically to ensure that it is functioning properly. In addition, pigs are regularly sent through the pipeline to check for corrosion and irregularities in the pipe in accordance with DOT requirements.

2.7.2 Aboveground Facilities

Mountain Valley would perform routine inspections of and maintain all equipment at aboveground facilities, including the Lambert Compressor Station, meter stations, interconnects, MLVs, and pig launchers and receivers. Routine maintenance checks would include calibration of equipment and instrumentation. Safety equipment, such as pressure relief devices and fire and gas detection systems, would be tested for proper operation. Corrective actions would be taken if problems are noted.

The aboveground facilities would be unmanned, with start/stop capabilities controlled from Mountain Valley's Gas Control headquarters. A telemetry system would notify operational personal at local offices and the gas control headquarters of the activation of safety systems or alarms. Maintenance personnel would be dispatched to investigate and take corrective actions.

2.8 FUTURE PLANS AND ABANDONMENT

During public scoping, a comment was submitted regarding the potential for Mountain Valley to further expand the Project and eventually export natural gas. Mountain Valley stated that it has no plans at this time to either expand or abandon the proposed facilities, nor is the Project able or designed to export natural gas. If Mountain Valley proposes any expansion or abandonment of the Project facilities, it would have to seek specific authorization for that action from the FERC. An appropriate environmental review would be conducted, and the public would have the opportunity to comment on Mountain Valley's proposal. Likewise, any proposed abandonment of any facilities approved in these dockets would require additional environmental and regulatory review under section 7(b) of the NGA.

3.0 ALTERNATIVES

3.1 INTRODUCTION

As required by NEPA and Commission policy, we identified and evaluated reasonable alternatives to the Project to determine whether the implementation of an alternative would be environmentally preferable to the proposed action. A reasonable alternative would meet the Project's purpose and would be technically and economically feasible and practical. We evaluated the No Action Alternative, system alternatives, pipeline route alternatives, route variations, and compressor engine type alternatives. An alternative would be environmental preferable if it offers a significant environmental advantage over the proposed action.

To ensure a consistent environmental comparison and to normalize the comparison factors, we generally use desktop sources of information (e.g., publicly available data, geographic information system data, aerial imagery). Where appropriate, we also use site-specific information (e.g., field surveys or detailed designs). Our environmental evaluation considers quantitative data (e.g., acreage or mileage) and uses common comparative factors such as total length, amount of collocation, and land requirements. In recognition of the competing interests and the different nature of impacts that sometimes exist (i.e., impacts on the natural environment versus impacts on the human environment), we also consider other factors that are relevant to a particular alternative and discount or eliminate factors that are not relevant or may have less weight or significance.

We generally consider an alternative to be preferable to a proposed action using three evaluation criteria, as discussed in greater detail below. These criteria include:

1. the alternative meets the stated purpose of the project;

2. is technically and economically feasible and practical; and

3. offers a significant environmental advantage over a proposed action.

The alternatives were reviewed against the evaluation criteria in the sequence presented above. The first consideration for including an alternative in our analysis is whether or not it could satisfy the stated purpose of the Project. An alternative that cannot achieve the purpose for the Project cannot be considered as an acceptable replacement for the Project.

Many alternatives are technically and economically feasible but not practical. Technically practical alternatives, with exceptions, would generally require the use of common construction methods. An alternative that would require the use of a new, unique, or experimental construction method may not be technically practical because the required technology is not available or is unproven. Economically practical alternatives would result in an action that generally maintains the price competitive nature of the proposed action. Generally, we do not consider the cost of an alternative as a critical factor unless the added cost to design, permit, and construct the alternative would render a project economically impractical.

Alternatives that would not meet the Project's purpose or were not technically/economically feasible or practical were not brought forward to the next level of review.

Determining if an alternative provides a significant environmental advantage requires a comparison of the impacts on each resource as well as an analysis of impacts on resources that are not common to the alternatives being considered. The determination must then balance the overall impacts and all other relevant considerations. In comparing the impact between resources, we also considered the degree of impact anticipated on each resource. Ultimately, an alternative that results in equal or minor advantages in terms of environmental impact would not compel us to shift the impacts from the current set of landowners to a new set of landowners.

With regard to the first criterion, Mountain Valley's stated objective for the Project is documented in section 1.1 Purpose and Need. Our analysis of alternatives is based on Project-specific information provided by Mountain Valley, affected landowners, and other concerned parties; comments received during project scoping; publically available information; our consultations with federal and state agencies; and our own research regarding the siting, construction, and operation of natural gas transmission facilities and their impacts on the environment. Unless otherwise noted, we used the same desktop sources of information to standardize comparisons between the Project and each alternative that we evaluated. As a result, some of the information presented in this section relative to the Project may differ from information presented in section 4.0, which is based on data derived from field surveys and engineered drawings.

3.1.1 Public Comments

We received 32 comments during the scoping process and 5 comments following issuance of the draft EIS requesting that we evaluate alternatives for the Project. In response to these comments, we requested that Mountain Valley provide additional environmental information to enable us to compare alternatives to the proposed action. In some cases, in response to stakeholder, agency, and FERC staff comments, and their own assessments, Mountain Valley revised their proposal and incorporated approximately 122 route variations since the scoping process began in Spring of 2018.

Some commenters recommended that we evaluate the potential for energy efficiency, energy conservation programs, and renewable energy (e.g., wind, solar) to eliminate or meet the need for the Southgate Project. We recognize that energy conservation and efficiency programs help to reduce energy demand and that renewable energy is playing an increasing role in meeting the region's energy needs. However, because the purpose of the Project is to transport natural gas, and the generation of electricity from renewable energy sources or the gains realized from increased energy efficiency and conservation are not transportation alternatives, they cannot function as a substitute for the Project and are not considered further in this analysis.

3.2 NO ACTION ALTERNATIVE

The Commission has two courses of action in processing applications under Section 7 of the NGA: 1) deny the requested action (the No Action Alternative); or 2) grant the Certificate with or without conditions. If the No Action Alternative is selected by the Commission, the Project would not be constructed, and the short- and long-term environmental impacts of the Project would not occur. Additionally, if the No Action Alternative is selected, the stated objectives of the Project would not be met. If the Project is not constructed, shippers may seek other means to obtain an equivalent supply of natural gas from new or existing pipeline systems. Because any replacement

project capable of transporting similar volumes of natural gas may result in the expansion of existing natural gas transportation systems or the construction of new infrastructure; both of which are likely to result in impacts comparable to those described in section 4.0 of this EIS, we conclude that in addition to not meeting the Project objective, the No Action Alternative is also not likely to provide a significant environmental advantage. Therefore, we dismiss it from further consideration.

3.3 SYSTEM ALTERNATIVES

System alternatives to the proposed action would make use of existing natural gas transmission systems/facilities to meet the stated purpose of the Project. Implementing a system alternative would make it unnecessary to construct all or part of the Project, although some modifications or additions to an existing transmission system may be necessary. Existing pipeline systems and systems under construction are depicted on figure 3.3-1.

3.3.1 Existing and Approved Natural Gas Pipeline Systems

There are currently two existing FERC-jurisdictional natural gas pipeline transportation systems operating near the Project area: Transcontinental Gas Pipe Line Company LLC (Transco) and East Tennessee. There is also one approved FERC-jurisdictional natural gas pipeline system, the Atlantic Coast Pipeline (ACP) Project that is currently under construction. It consists of 604 miles of natural gas pipeline in West Virginia, Virginia, and North Carolina. The ACP Project is approximately 100 miles east of the proposed Project Dan River and Haw River interconnects. Additionally, one non-jurisdictional pipeline system owned by Cardinal Pipeline Company, LLC (Cardinal Pipeline) is operating near the Project. Without modifications, these pipeline systems currently do not have the available individual capacity, combined available capacity, nor direct physical connection to transport the required volumes of natural gas to the delivery points proposed for the Project. . Therefore, we do not consider use of existing pipeline systems as a technically feasible alternative to the Project.

3.3.2 Modifications of Existing and Approved Natural Gas Pipeline Systems

Since none of the existing or approved pipeline systems in the Project area have the capacity to meet the Project's purpose, each system would require modifications to meet the purpose of the Project. The modifications could include additional pipeline construction to connect to the natural gas supply, delivery area, or both; pipeline construction to create additional transportation capacity; additional compression; or some combination of these options.

3.3.2.1 Transco Pipeline System Alternative

The existing Transco system consists of various diameter pipelines totaling approximately 10,200 miles between Texas and New York. The system has a peak design capacity of almost 15 Bcf/d of natural gas to markets in the Northeast, Mid-Atlantic, and Southeast regions of the United States. The Southgate Project would be located adjacent to the Transco system in Virginia and North Carolina from mileposts (MPs) 0.4 to 32.9.

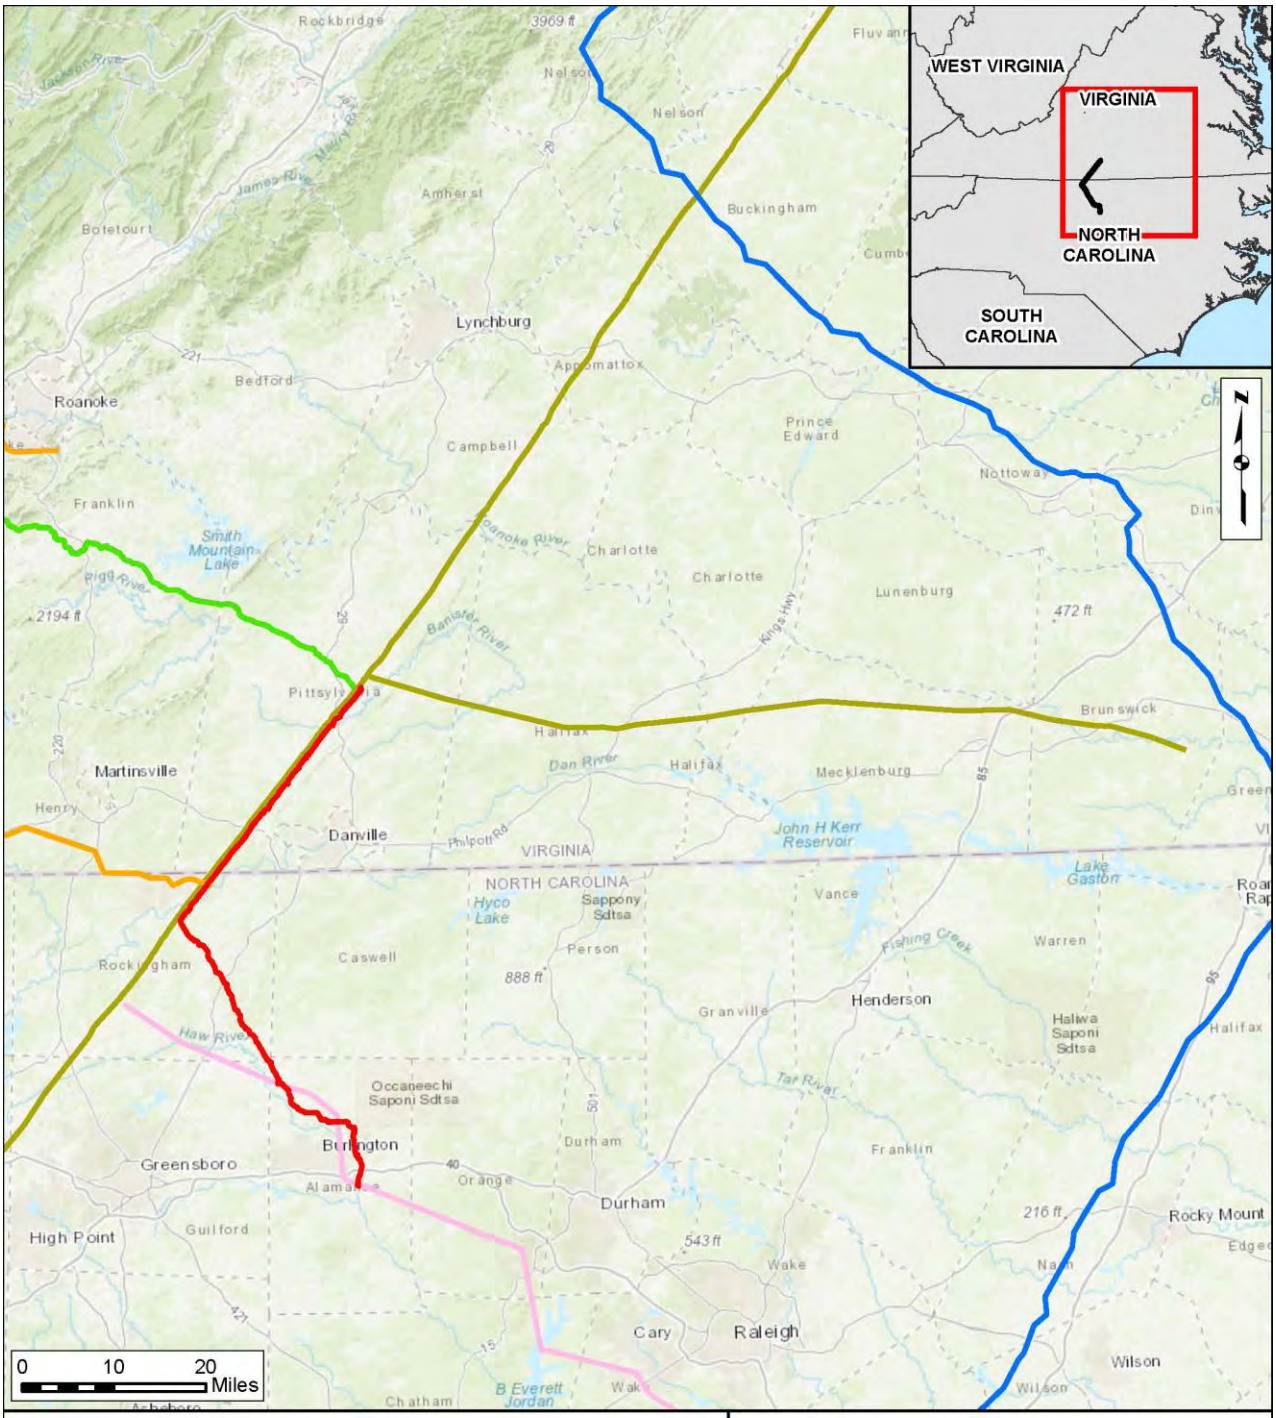


Figure 3.3-1

Southgate Project

System Alternatives

In comments on the draft EIS, Transco noted that although the firm transportation capacity of its system is currently fully subscribed, it could modify its existing system to provide the capacity sought by DENC by collocating a new 37.7-mile pipeline lateral along the existing right-of-way for the Cardinal Pipeline, and modifying an existing compressor station in Rockingham County, North Carolina. Additional system upgrades would likely be necessary before Transco would be able to provide the additional 375,000 dekatherms per day (Dth/d) of firm transportation service on its mainline from the Project's proposed receipt point with the MVP mainline to the interconnection between Transco and Cardinal Pipeline.

Mountain Valley responded to these comments stating that Transco's System Alternative would not meet several of the Southgate Project objectives that DENC considered prior to contracting for capacity on the Southgate Project, including increased competition and resiliency, risk diversification, and a direct physical connection to East Tennessee's interstate pipeline system. DENC agreed with Mountain Valley, stating that the Transco System Alternative would not meet the Southgate Project need with less environmental impact and at a lower cost, noting two reasons: 1) Transco failed to explain how its proposal would resolve Transco's lack of available firm capacity on its mainline; and 2) that its alternative would be unable to meet their timing needs for bringing the Southgate Project's proposed capacity online.

We conclude that undefined modifications would be required along Transco's mainline. Transco did not explain what upgrades would be needed to resolve its mainline system's lack of available firm capacity. The impacts of these upgrades may be less than, similar to, or greater than those that would occur as proposed by the Southgate Project. Therefore, we are unable to determine that this alternative would provide a significant environmental advantage.

Finally, as Mountain Valley and DENC pointed out, beginning the numerous permitting processes anew would cause delays that would be inconsistent with DENC's timing needs for bringing into service this additional capacity. While this last factor was not included as a Southgate Project objective, it is clearly a consideration that could affect the economic feasibility of the Southgate Project. Therefore, this alternative is not considered further in this analysis.

3.3.2.2 East Tennessee System Alternative

The East Tennessee pipeline system has the capacity to transport 1.9 billion cubic feet per day (bcf/d) of natural gas and extends from Nashville, Tennessee, through Virginia, to Eden, North Carolina where it interconnects with the Transco pipeline system. The East Tennessee pipeline system does not connect with the Southgate Project's proposed receipt point with the Mountain Valley Pipeline. The Southgate Project would interconnect with the East Tennessee pipeline system at the LN 3600 Interconnect taking gas to delivery points. To meet the purpose of the Project, modifications to the East Tennessee pipeline system would be required to supply 375 MMcf/d of natural gas to the DENC distribution system. The modifications would include upgrades similar to the Project including approximately 30 miles of pipeline collocated with the Transco pipeline system, 40 miles of new pipeline, and additional compression. These modifications would result in environmental impacts similar to those that would occur as proposed by the Project. Therefore, we conclude that this alternative would not provide a significant environmental advantage.

3.3.2.3 Atlantic Coast Pipeline System Alternative

The ACP Project, currently under construction, consists of 604 miles of natural gas pipeline in West Virginia, Virginia, and North Carolina. As noted above, the ACP Project is approximately 100 miles east of the T-15 Dan River and T-21 Haw River interconnects. In comments on the draft EIS, ACP states that rather than connecting to the western side of DENC's system as proposed by Mountain Valley, deliveries from ACP to DENC could occur on the eastern side of DENC's service territory. ACP contends that the ACP System Alternative could provide the additional gas through a combination of 140,000 Dth/d of available capacity on its system, ancillary facility enhancements, and upgrades to the existing Piedmont system, on which ACP has leased capacity.

As ACP acknowledged, the ACP System Alternative would not connect to the Project's proposed receipt points with the mainline Mountain Valley Pipeline or with East Tennessee's interstate pipeline system. Nor would the ACP System Alternative facilitate deliveries to the Southgate Project's proposed delivery points on DENC's distribution system in Rockingham and Alamance Counties, North Carolina. For these reasons, we find that the ACP System Alternative does not meet the stated purpose of the Southgate Project.

In order to connect the ACP Project with DENC's receipt points, a minimum of 100 miles of new pipeline (and associated compression) infrastructure would be required. Therefore, we conclude that the use of the ACP System Alternative would not provide a significant environmental advantage. For these reasons, the ACP Project is not considered further in this analysis.

3.3.2.4 Cardinal Pipeline System

The Cardinal Pipeline Company, co-owned by affiliates of Transco, Piedmont Natural Gas Company, and Dominion Energy, operates 105 miles of 24-inch-diameter intrastate pipeline in North Carolina originating in Rockingham County at an interconnect with the Transco pipeline system, extending southwest to Wake County. The Cardinal Pipeline Company transports natural gas from the Transco pipeline system to the Dominion Energy distribution system and Piedmont Natural Gas system. To meet the objective of the Southgate Project, modifications to the existing Cardinal Pipeline similar to those described above (i.e., a lateral and compression) would be necessary. Providing the gas to this lateral would either require the use of the Transco system, as described above, or additional pipeline construction. The impacts of these upgrades may be less than, similar to, or greater than those that would occur as proposed by the Project. Therefore, we cannot conclude that this alternative would provide a significant environmental advantage.

3.4 ROUTE ALTERNATIVES AND VARIATIONS

Early in the development of the Project, Mountain Valley considered a pipeline route that was largely collocated with existing utility rights-of-way. Upon more detailed route evaluation and after the determination of the presence of constraints such as residential areas, ponds, and side slopes, Mountain Valley subsequently incorporated minor deviations in the Project route. During the course of the pre-filing and environmental scoping process, Mountain Valley incorporated at least 46 of the 122 route variations into the Southgate route to avoid and/or minimize impacts on specific resources at the request of landowners and stakeholders.

Major route alternatives represent substantial deviations from a proposed route that may offer significant environmental advantages compared to the proposed route. Smaller route alternatives represent deviations to the proposed route between certain mileposts in a particularly sensitive area that may offer a significant environmental advantage to the proposed route. Minor route variations include minor deviations (or reroutes) over a short distance that might avoid a specific resource at that location.

We evaluated three major route alternatives including the Berry Hill Alternative, Lake Cammack East Alternative, and the North-South Alternative. The locations of the major route alternatives are shown on figure 3.4-1. We also evaluated six minor route alternatives including the Haw River Alternative, Haw River West Alternative, Green Level Alternative, Jimmie Kerr Road Alternative, Duke Energy Powerline Extension Alternative, and City of Burlington Alternative. The locations of the minor route alternatives are shown on figures 3.4-2 through 3.4-7. Finally, we evaluated eight minor route variations including the Nicholson Variation, Whitehead Variation, Robert Pollok-Hill View Farms Variation, Moore Variation, Strader Variation, Madren Variation, Taylor East Variation, and Taylor West Variation. The locations of the minor route variations are shown on figures 3.4-8 through 3.4-14.

Mountain Valley incorporated several route variations that we evaluated in the draft EIS into its proposed pipeline route filed with the Commission on October 23, 2019.[1] Therefore, these route variations are incorporated into the Proposed Action and are no longer evaluated in this section. These variations include the Bombardier Variation, Shambley Variation 1, Shambley Variation 2, Martin Marietta Variation, and Town of Haw River Variation.

On October 23, 2019, in response to alternatives considered in the draft EIS, Mountain Valley submitted impact analysis comparison tables for each alternative based on changes in the current proposed route and new information gathered on each alternative or route variation. The revised data represents refinements to the previous data that are derived largely from new 2016 U.S. Geological Survey (USGS) National Land Cover Dataset, revised 2019 pipeline and electrical utility data, and other updated sources. The revisions do not alter our conclusions.

Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field. Accession number 20191023-5022 contains supplemental project information filed on October 23, 2019. Accession number 20191220-5298 contains revised alignment sheets for the Project.

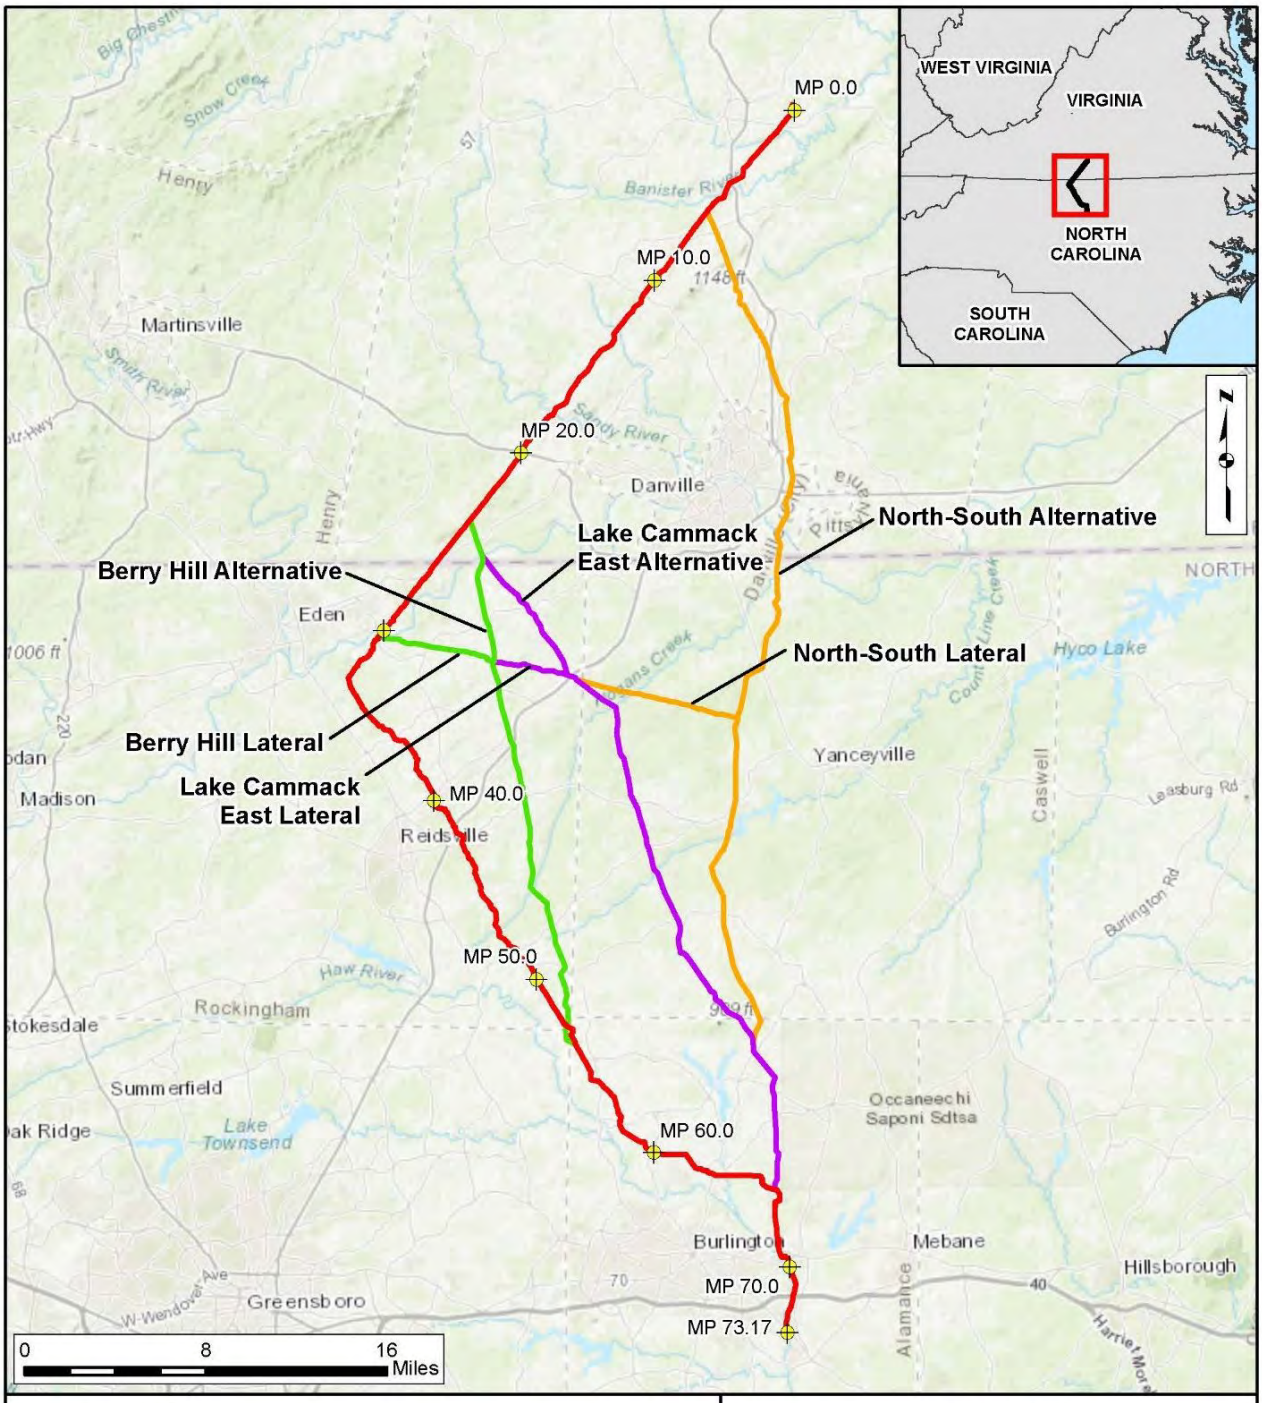

Figure 3.4-1

Southgate Project

Major Route Alternatives

3.4.1 Major Route Alternatives

3.4.1.1 Berry Hill Alternative

Based on stakeholder suggestions to route away from the Eden and Reidsville areas, we evaluated the Berry Hill Alternative. This alternative deviates from the proposed route at MP 23.7 in Pittsylvania County near Berry Hill, Virginia extending southeast 30.1 miles to rejoin the proposed route at MP 53.6 in Alamance County, North Carolina. The alternative includes a 5.4-mile lateral from the T-15 Dan River Interconnect with Dominion Energy, east of Eden, North Carolina to the alternative south of Guerrant Springs Road. Table 3.4-1 provides a comparison between the proposed route and the Berry Hill Alternative, and the location of the alternative is shown on figure 3.4-1.

The Berry Hill Alternative would cross two fewer perennial waterbodies, 0.8 acre less total wetland including 0.6 acre of forested wetland during construction, one less environmental justice area, one less potentially eligible historic property, and one less residence within 25 feet of workspace in comparison to the proposed route. However, the Berry Hill Alternative would be 0.2 mile longer; require a 5.4-mile lateral; and affect seven more residences within 50 feet of workspace. Within the range of the alternative route the proposed route would be collocated with existing rights-of-way for 15.2 miles, or about 50 percent of the total length compared to 4.6 miles or 15 percent of the total length of the Berry Hill Alternative. The Berry Hill Alternative would result in 365.0 acres of impacts during construction compared to the 363.1 acres of the proposed route. The Berry Hill Alternative would also impact about 30 more acres of forested land than would the proposed route. While the Berry Hill Alternative does offer some advantages, we conclude that the environmental advantages, when considered on the whole, are not significant.

TABLE 3.4-1

Comparison of the Berry Hill Alternative and the Southgate Proposed Route

Feature	Berry Hill Alternative	Proposed Route
Total length (miles) a/	30.1	29.9
Length adjacent to existing right-of-way (miles)	4.6	15.2
Land affected during construction (acres) a/	365	363.1
NRHP designated or eligible historic districts crossed (miles)	0	0
Unlisted/potential eligible historic properties (number)	0	1
Landowner parcels crossed (number)	159	159
Residences within 25 and 50 feet of the edge of the construction right-of-way (number)	0 /11	1 / 4
Environmental Justice Areas (number) b/	11	12
Agricultural Land crossed (miles) c/	9.5	10.5
Forested Land affected during construction (acres)	209.3	179.1
Wetlands affected by construction (acres) d/	1.4	2.2
Forested wetlands affected by construction (acres) d/	0.8	1.4
Perennial waterbody crossings (number)	14	16

TABLE 3.4-1

Comparison of the Berry Hill Alternative and the Southgate Proposed Route

Feature	Berry Hill Alternative	Proposed Route
Presence of critical habitat or federally endangered or threatened species (Yes/No). Number of species.	No/0	No/0
Shallow bedrock crossed (miles)	3.8	4.4

a/ Assuming 100-foot-wide construction right-of-way. Includes a 5.4-mile long lateral to T-15 Dan River Interconnect.

b/ U.S. Census Bureau 2017b, 2017c.

c/ Includes pasture/hay and cultivated crops.

d/ National Wetlands Inventory (NWI) and National Hydrography Dataset (NHD) data. Assuming 75-foot-wide construction right-of-way.

3.4.1.2 Lake Cammack East Alternative

This alternative also deviates from the proposed route at MP 23.7 in Pittsylvania County near Berry Hill, extending southeast 43.3 miles on the east side of Lake Cammack and rejoins the proposed route at MP 66.1 in Alamance County, North Carolina. The Lake Cammack East Alternative was considered based on stakeholder suggestions to route away from Eden and Reidsville. This alternative includes an 8.8-mile-long lateral from the T-15 Dan River Interconnect with Dominion Energy, east of Eden to the alternative north of U.S. Route 29. Table 3.4-2 provides a comparison between the proposed route and the Lake Cammack East Alternative, and the locations of the alternative is shown on figure 3.4-1.

The Lake Cammack East Alternative would cross 33 fewer parcels, one less potentially eligible historic property, and two less Environmental Justice Areas in comparison to the proposed route. However, the alternative would require an 8.8 mile lateral; affect one more residence within 25 feet and five more residences within 50 feet of workspace; and impact an additional 2.5 acres of total wetlands, 3.5 additional acres of forested wetlands, and 28.7 additional acres of forested land during construction. Within the range of the alternative route, the proposed route would be collocated with existing rights-of-way for 19.1 miles, or about 44 percent of the total length compared to 7.1 miles or 16 percent of the total length of the alternative. Given the consideration of these factors, we conclude that the Lake Cammack East Alternative does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-2

Comparison of the Lake Cammack East Alternative and the Southgate Proposed Route

Feature	Lake Cammack East Alternative	Proposed Route
Total length (miles) a/	43.3	43.3
Length adjacent to existing right-of-way (miles)	7.1	19.1
Land affected during construction (acres) a/	525.4	525.2
NRHP designated or eligible historic districts crossed (miles)	0	0
Unlisted/Potential Eligible Historic Properties (number)	0	1
Landowner parcels crossed (number)	200	233
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	2 /11	1 / 6
Environmental Justice Areas (Number) b/	16	14
Agricultural Land crossed (miles) c/	13.7	17.2

Shallow bedrock crossed (miles)	4.3	4.4

a/ Assuming 100-foot-wide construction right-of-way. Includes an 8.8-mile long lateral to T-15 Dan River Interconnect.

b/ U.S. Census Bureau 2017b, 2017c.

c/ Includes pasture/hay and cultivated crops.

d/ NWI and NHD data. Assuming 75-foot-wide construction right-of-way.

3.4.1.3 North-South Alternative

The North-South Alternative deviates from the proposed route at MP 6.1 in Pittsylvania County, extending south 63.4 miles to rejoin the proposed route at MP 66.1 in Alamance County. The alternative was developed from suggestions from stakeholders to develop a straight line alternative routed east of Danville, Virginia. This alternative includes a 16.6-mile-long lateral from the T-15 Dan River Interconnect with Dominion Energy, east of Eden, to the alternative route approximately 2.3 miles south of Foster Road. Table 3.4-3 provides a comparison between the proposed route and the North-South Alternative, and the location of the alternative is shown on figure 3.4-1.

The North-South Alternative would cross 9.9 miles less agricultural land and affect two less residences within 25 feet and two less potentially eligible historic properties in comparison to the proposed route. However, the alternative would be 2.3 miles longer; require a 16.6 mile lateral, cross 53 more parcels, affect 11 more residences within 50 feet of workspace; crosses three more streams; and impact 2.3 acres more acres of wetlands (1.4 more acres of forested wetlands), and 131.6 more acres of forested land during construction. Within the range of the alternative route, the proposed route would be collocated with existing rights-of-way for 31.0 miles, or about 50

percent of the total length compared to 25.5 miles or 40 percent of the total length of the alternative. The North-South Alternative would result in 768.7 acres of impacts during construction compared to the 740.4 acres of the proposed route. Given the consideration of these factors, we conclude that the North-South Alternative does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-3

Comparison of North-South Alternative and the Southgate Proposed Route

Feature	North-South Alternative	Proposed Route
Total length (miles) a/	63.4	61.1
Length adjacent to existing right-of-way (miles)	25.5	31.0
Land affected during construction (acres) a/	768.7	740.4
NRHP designated or eligible historic districts crossed (miles)	0	0
Unlisted/Potential Eligible Historic Properties (number)	0	2
Landowner parcels crossed (number)	376	323
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	2 / 23	4 / 12
Environmental Justice Areas (number) b/	25	22

Presence of critical habitat or federally endangered or threatened species (Yes/No). Number of species.	No / 0	No / 0
Shallow bedrock crossed (miles)	10.5	5.1

a/ Assuming 100-foot-wide construction rights-of-way and 50-foot-wide permanent rights-of-way. Includes a 16.6-mile long lateral to T-15 Dan River Interconnect.

b/ U.S. Census Bureau 2017b, 2017c.

c/ Includes pasture/hay and cultivated crops.

d/ NWI and NHD data. Assuming 75-foot-wide construction rights-of-way and 50-foot-wide permanent rights-of-way.

3.4.1.4 Major Route Alternatives Conclusion

While we did identify major route alternatives that would meet the Project objective and were technically (and probably economically) feasible, we did not identify a major route alternative that would provide a significant environmental advantage, when compared with the corresponding portions of the proposed route.

3.4.2 Minor Route Alternatives

We evaluated six minor route alternatives for the Project pipeline route in response to several public comments received to increase collocation with existing rights-of-way in order to minimize impacts on residences and other areas of public concern. Collocation alternatives developed include the Haw River Alternative, the Haw River West Alternative, the Green Level Alternative, Duke Energy Powerline Alternative, and the City of Burlington Alternative. The Jimmie Kerr Road Alternative was developed in response to public concerns about the area the proposed route traverses from MP 72.0 to 73.0. For minor route alternatives, our comparison of resources affected includes only the area (MP range) where the deviation occurs. A brief analysis of these alternatives is presented below.

3.4.2.1 Haw River Alternative

We considered the Haw River Alternative in response to stakeholder concerns, and from a request by the EPA on September 12, 2019, to utilize existing rights-of-way to avoid or minimize impacts on residences between the Stony Creek Reservoir in Burlington, North Carolina and the Project terminus in Graham, North Carolina. This alternative deviates from the proposed route between MP 63.9 and MP 72.9. The alternative extends southeast paralleling the existing Cardinal Pipeline for 2.2 miles crossing and paralleling the Haw River and the existing Cardinal Pipeline for an additional 3.4 miles. The alternative deviates from the Cardinal Pipeline just south of Interstate 40/85, turning east to cross the Haw River and reconnect with the proposed route at MP 72.9. Table 3.4-4 provides a comparison between the proposed route and the Haw River Alternative, and the location of the alternative is shown on figure 3.4-2.

The Haw River Alternative would be collocated for an additional 5.6 miles of rights-of-way; cross 32 fewer parcels, 3.3 fewer acres of forested land, and 12.8 fewer acres of agricultural land; require 9.3 acres less of construction rights-of-way; and has four less residences within 25 and 50 feet of the construction rights-of-way. However, the alternative would cross two additional Environmental Justice Areas, five more waterbodies, affect an additional 6.2 acres of wetland, and is 0.8 mile more in length compared to the proposed route within the range of the alternative. Given the consideration of these factors, we conclude that the Haw River Alternative does offer some advantages and affects less residences, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-4

Comparison of the Haw River Alternative and the Southgate Proposed Route

Feature	Haw River Alternative	Proposed Route
Total length (miles)	8.7	5.7
Construction rights-of-way (acres) a/	105.4	114.7
Total number of parcels crossed	55	87
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	1 / 1	5 / 5
Environmental Justice Areas (number) b/	7	5
Unlisted/Potential Eligible Historic Properties (number)	0	1
Number of waterbodies crossed	24	19
Number of NWI wetlands crossed	9	1
NWI wetlands within construction right-of-way (acres) c/	6.4	0.2
Agricultural Land within construction right-of-way (acres) d/	18.0	30.8
Forested Land affected during construction (acres)	65	68.3
Length adjacent to existing right-of-way (miles)	5.6	0

a/ Assuming 100-foot-wide construction right-of-way.
b/ U.S. Census Bureau 2017b, 2017c.
c/ NWI and NHD data. Assuming 75-foot-wide construction right-of-way.
d/ Includes pasture/hay and cultivated crops.

Haw River Alternative

Figure 3.4-2

Southgate Project

Minor Route Alternatives
Haw River Alternative

3.4.2.2 Haw River West Alternative

We evaluated the Haw River West Alternative in response to stakeholder concerns, and from a request by the EPA on September 12, 2019, to utilize existing rights-of-way to minimize impacts on residences between Haw River and Graham. This alternative follows the same footprint as the Haw River Alternative between MP 69.1 and MP 72.5 of the proposed route, with a slight variation at the Haw River crossing just south of East Harden Street where it joins the proposed route at MP 73.0. Table 3.4-5 provides a comparison between the proposed route and the Haw River West Alternative, and the location of the alternative is shown on figure 3.4-3.

The Haw River West Alternative would be collocated with an existing right-of-way for an additional 3.5 miles, affect 5 less residences within 25 and 50 feet of the construction rights-of-way; cross 11 less parcels; and 6.0 acres less of forested land. However, the alternative would be 0.1 miles longer, require 0.6 acres of construction rights-of-way, include multiple crossings of Haw River; cross an additional three Environmental Justice Areas and five waterbodies; and impact 6.3 more acres of wetland and 0.2 acres of agricultural land compared to the proposed route. Given the consideration of these factors, we conclude that Haw River West Alternative has some advantages and affects less residences, but overall, would result in resource impacts that are similar to the proposed route. Consequently, the alternative does not provide a significant environmental advantage when compared to the proposed route.

TABLE 3.4-5

Comparison of the Haw River West Alternative and the Southgate Proposed Route

Feature	Haw River West Alternative	Proposed Route
Total length (miles)	4.0	3.9
Construction rights-of-way (acres) a/	48.5	47.9
Total number of parcels crossed	32	43
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0 / 0	5 / 5
Environmental Justice Areas (number) b/	6	3
Unlisted/Potential Eligible Historic Properties (number)	0	1
Number of waterbodies crossed	13	8
Number of NWI wetlands crossed	9	0
NWI wetlands within construction right-of-way (acres) c/	6.4	0.1

Minor Route Alternatives
Haw River West Alternative

3.4.2.3 Green Level Alternative

We evaluated the Green Level Alternative in response to stakeholder concerns and comments to utilize existing rights-of-way to minimize impacts on populated areas in the vicinity of Green Level, North Carolina. This alternative deviates from the proposed route at MP 65.8 and proceeds east and south around the community of Green Level before rejoining the proposed route at MP 70.8. Table 3.4-6 provides a comparison between the proposed route and the Green Level Alternative, and the location of the alternative is shown on figure 3.4-4.

The Green Level Alternative would have three fewer residences within 25 of the workspace; affect one less potentially eligible historic property, and collocate with an additional 1.9 miles of existing rights-of-way in comparison with the proposed route. However, the Green Level alternative would be 4.1 miles longer; require an additional 49.8 acres of construction rights-of-way; cross two more Environmental Justice Areas, and impact an additional 0.2 acre of wetlands, 22.8 acres of agricultural land, and 24.4 acres of forested land compared to the proposed route. Given the consideration of these factors, we conclude that the Green Level Alternative does offer some advantages and affects less residences, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-6

Comparison of the Green Level Alternative and the Southgate Proposed Route

Feature	Green Level Alternative	Proposed Route

Figure 3.4-4

Southgate Project

Minor Route Alternatives
Green Level Alternative

3.4.2.4 Jimmie Kerr Road Alternative

We evaluated the Jimmie Kerr Road Alternative in response to multiple landowner and stakeholder concerns in the area between MP 72 and 73. The Jimmie Kerr Road Alternative originates at MP 71.8 traveling southeast, west, and southwest before rejoining the proposed route at MP 73.1. Table 3.4-7 provides a comparison between the proposed route and the Jimmie Kerr Road Alternative, and the location of the alternative is shown on figure 3.4-5.

The alternative would have two less residences within 25 feet of the workspace compared to the proposed route, however, the alternative would affect three additional parcels, 9.9 acres of agricultural land, and 0.6 acres of forested land compared to the proposed route. Additionally, the alternative would be 0.8 mile longer than the proposed route and require 9.0 acres of additional construction rights-of-way. Given the consideration of these factors, we conclude that Jimmie Kerr Road Alternative does not provide a significant environmental advantage when compared to the proposed route.

TABLE 3.4-7

Comparison of Jimmie Kerr Road Alternative and the Southgate Proposed Route

Feature	Jimmie Kerr Road Alternative	Proposed Route
Total length (miles)	2.2	1.4
Construction rights-of-way (acres) a/	26.4	17.4
Total number of parcels crossed	19	16
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0 / 0	2 / 2
Environmental Justice Areas (number) b/	3	2
Unlisted/Potential Eligible Historic Properties (number)	0	0
Number of waterbodies crossed	3	3
Number of NWI wetlands crossed	0	0
NWI wetlands within construction right-of-way (acres) c/	0	0
Agricultural Land within construction right-of-way (acres) d/	12.0	2.1
Forested Land affected during construction (acres)	11.9	11.3
Length adjacent to existing right-of-way (miles)	0	0

a/ Assuming 100-foot-wide construction right-of-way.
b/ U.S. Census Bureau 2017b, 2017c.
c/ NWI and NHD data. Assuming 75-foot-wide construction right-of-way.
d/ Includes pasture/hay and cultivated crops.

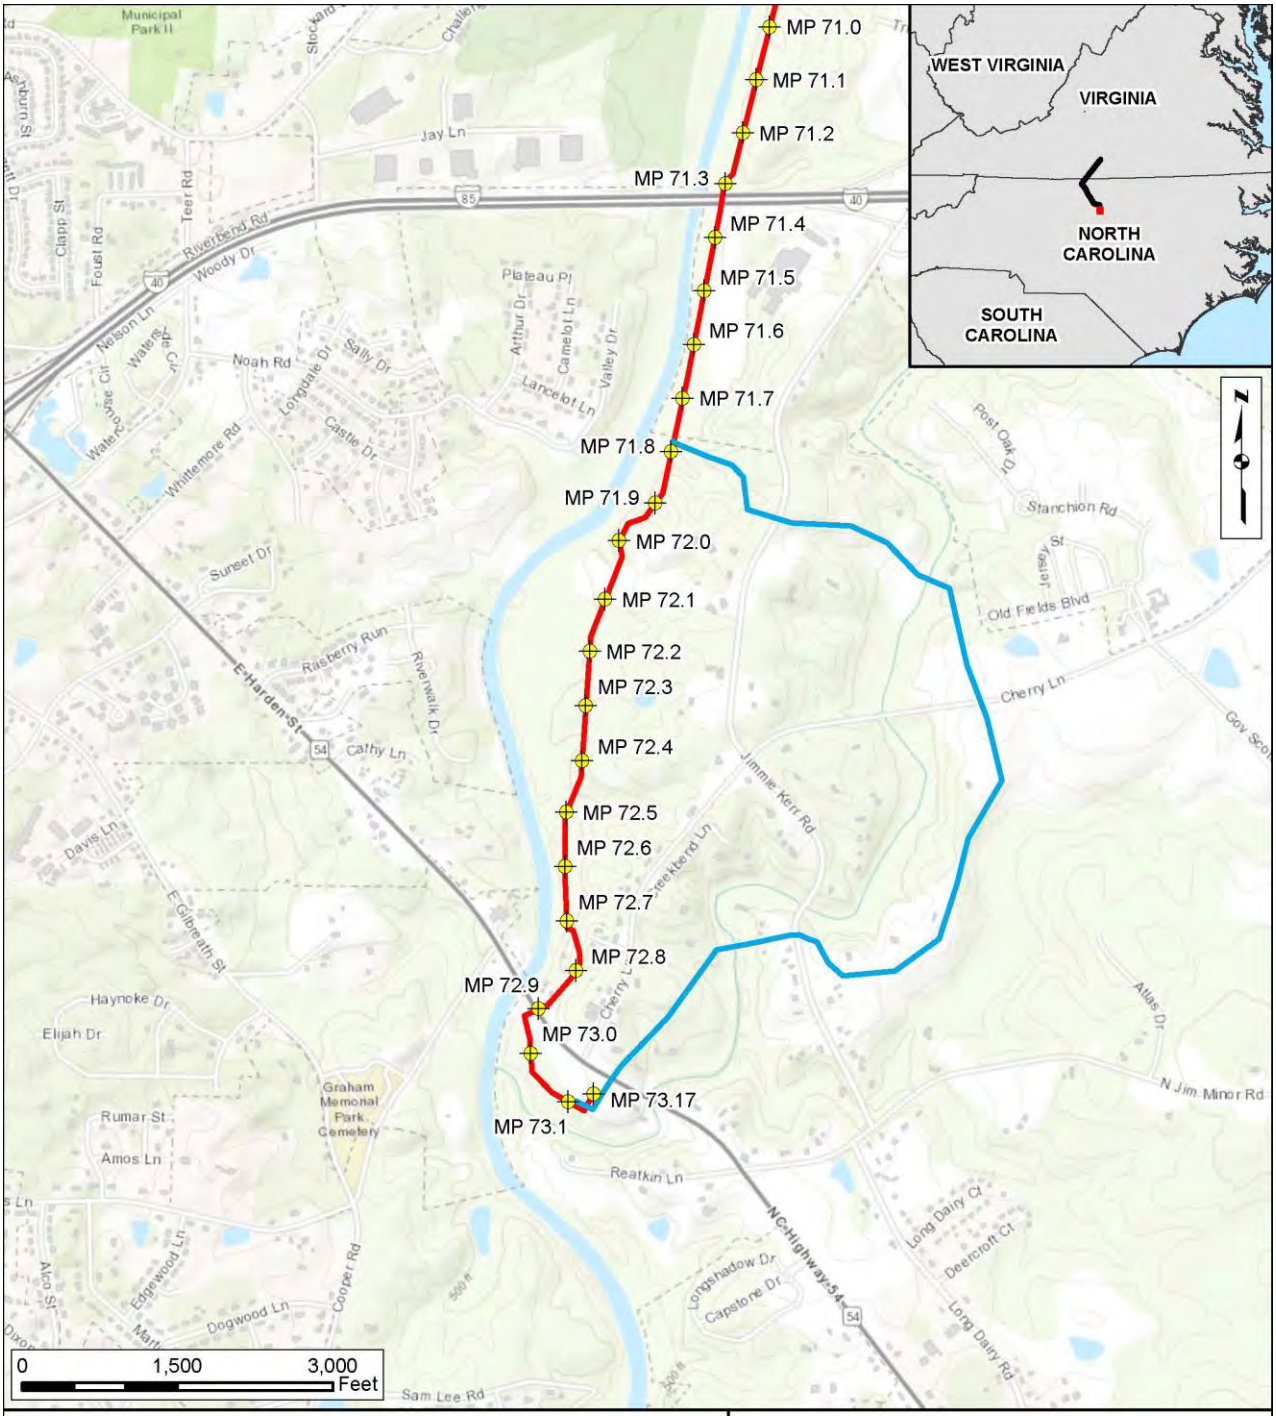

Figure 3.4-5

Southgate Project

Minor Route Alternatives
Jimmie Kerr Road Alternative

3.4.2.5 Duke Energy Powerline Extension Alternative

We evaluated an alternative that would increase collocation with the existing Duke Energy electrical transmission line rights-of-way between MP 58.2 and MP 62.0. The alternative originates at MP 58.2 of the proposed route and extends south, collocated with a Duke Energy electrical transmission line easement, crossing Burch Bridge Isely School Road, and rejoining the proposed route at MP 62.0. Table 3.4-8 provides a comparison between the proposed route and the Duke Energy Powerline Extension Alternative, and the location of the alternative is shown on figure 3.4-6.

The Duke Energy Powerline Extension Alternative would be collocated for an additional 2.2 miles of rights-of-way, and would impact 5.6 acres less of agricultural land compared to the proposed route. However, the alternative would be slightly longer (0.6 mile); be within 25 feet of one additional residence; cross seven more parcels; and require an additional 7.2 acres of construction rights-of-way. The alternative would impact 14.4 more acres of forested land and cross 5 additional waterbodies compared to the proposed route. Given the consideration of these factors, we conclude that the Duke Energy Powerline Extension Alternative does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-8

Comparison of the Duke Energy Powerline Extension Alternative and the Southgate Proposed Route

Feature	Duke Energy Powerline Extension Alternative	Proposed Route
Total length (miles)	4.4	3.8
Construction rights-of-way (acres) a/	53.3	46.1
Total number of parcels crossed	28	21

Extension Alternative

3.4.2.6 City of Burlington Alternative

Based on comments from the City of Burlington, submitted on September 16, 2019,[2] we evaluated an alternative that would avoid city property and reduce potential impacts on public water supplies. The alternative originates at MP 61.4 of the proposed route and extends east and south for 3.1 miles, rejoining the proposed route at MP 62.0. Table 3.4-9 provides a comparison between the proposed route and the City of Burlington Alternative. The location of the alternative is shown on figure 3.4-7.

The City of Burlington Alternative is 0.1 mile shorter, would require 0.7 acre less of construction right-of-way, and cross three less waterbodies, 0.3 acre of wetlands, and 4.5 acres of agricultural land compared to the proposed route. However, the alternative would cross 19 more parcels; be within 25 feet of nine residences and within 50 feet of 14 residences; cross 5.3 acres of addional forest land; and be collocated 0.1 mile with existing rights-of-way. Given the consideration of these factors, we conclude that the City of Burlington Alternative does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-9

Comparison of the City of Burlington Alternative and the Southgate Proposed Route

Feature	City of Burlington Alternative	Proposed Route
Total length (miles)	3.1	3.2
Construction rights-of-way (acres) a/	38.3	39.0
Total number of parcels crossed	34	15
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	9 / 14	0 / 0

Route Alternatives
City of Burlington Alternative

3.4.2.7 Minor Route Alternatives Conclusion

While we did identify minor route alternatives that would meet the Project objective and were technically (and probably economically) feasible, we did not identify a minor route alternative that would provide a significant environmental advantage, when compared with the corresponding portions of the proposed route.

3.4.3 Minor Route Variations

Route variations are shorter than route alternatives, but are generally longer and more substantial than minor route deviations designed to avoid or further reduce impacts on specific localized resources. We have considered eight route variations that Mountain Valley developed during initial Project planning and throughout the pre-filing and environmental scoping processes, generally in response to stakeholder or FERC staff comments. Many of the variations were assessed at the request of landowners who wanted the route to avoid their property due to sensitive features, such as wells, septic systems, and agricultural operations. As stated in section 4.3 of this EIS, though landowner surveys by Mountain Valley to identify these features are not complete, they are committed to work with landowners to make micro adjustments to the route and workspaces if necessary to avoid and/or ensure protection of all private water wells, septic systems, and sensitive features located in or near the construction workspace. In addition, Mountain Valley would offer water quality testing of any private well within 150 feet of the Project workspace.

Private landowner routing concerns that have been identified during the comment and review process are provided in Table 3.4-10. These landowner concerns have been addressed or evaluated by Mountain Valley. We have also reviewed these concerns and addressed them as appropriate. One landowner concern regarding impacts directly on their property, Pollock-Hillview Farms, is still being considered by Mountain Valley. More information is provided in the sections below.

TABLE 3.4-10

Private Landowner Routing Concerns

Landowner	Nearest MP	Landowner Concern	Resolution Status
Nicholson	3.8	Request re-route due to landowner concerns.	A variation was considered on the Nicholson property, see section 3.4.3.1. The variation does not offer an environmental advantage when compared to the proposed route and is eliminated from further consideration.
Whitehead	4.7	Landowner requested re-route due to concerns about silviculture operation and excessive removal of timber due to workspace layout and additional temporary workspace on their property.	Mountain Valley has removed the use of access road TA-PI-009 and associated temporary workspace on the Whitehead property for the Project. Mountain Valley would also reduce temporary workspace from 100 feet to 75 feet the entire distance on the Whitehead property. ATWS 1049, 1045, and 1046 would remain as part of the Project to assist with crossing of a large wetland, the Banister River, and Highway 29

TABLE 3.4-10

Private Landowner Routing Concerns

Landowner	Nearest MP	Landowner Concern	Resolution Status
Pollok – Hillview Farms	15.0	Landowner and tenant farmer are requesting special provisions due to certified seed operation and potential impact to his operation	Mountain Valley has indicated that they have coordinated with Mr. Pollok to address these concerns, including route adjustments and workspace changes. Mountain Valley has agreed to continue to work with Mr. Pollock to develop a plan to protect his operation.
Taylor	19.5	Request re-route of pipeline through adjacent property. Pipeline would go between their residence and their 10 apartments. Also use of driveway as access road.	The Taylor East and Taylor West Variations were developed by Mountain Valley to avoid or minimize impacts on the the single-family residence and apartment complex on the Talyor property during construction. Variations would result in resource impacts that are similar those of the proposed route and therefore were not adopted. Mountain Valley has eliminated access road TA-PI-049 from the Project.
Moore	33.4	Request re-route due to landowner concerns.	A variation was considered on the Moore property, see section 3.4.3.4. The Moore Variation does not offer an environmental advantage when compared to the proposed route and is eliminated from further consideration.
Strader	40.0	Request re-route due to concern regarding residences on their propery.	Strader Variation was considered. See section 3.4.3.5. Mountain Valley has modified the proposed route to minimize impacts on the property based on meetings with Mr. and Ms. Strader.
Madren	58.4	Landowner is concerned that the Project will cross extensive water and septic infrastructure.	Mountain Valley has recently gained survey access to the property. Mountain Valley has agreed to work with the landowner to reduce or avoid impacts to the infrastructure on the property without modifying the pipeline alignment.
Bombardier	59.0	Requests re-route on property. Congested area off Danieley Wheeler Rd.	A route variation has been adopted by Mountain Valley in this area and the Danieley Wheeler Road crossing.
Shambley	59.4	Requesting pipeline be moved due to newly constructed house within 40 feet of pipeline	A route variation has been adopted by Mountain Valley that minimizes impacts the Shambley property.
Wallace	59.6	The landowner is concerned that the Project would be near their new home and would result in the clearing of large oak trees they would like to keep.	A route variation has been adopted by Mountain Valley in this area and the Danieley Wheeler Road crossing.
Smith	66.3	Requests the route be moved to the edge of their property instead of cutting through the middle	Mountain Valley has adopted a route modification on the Smith property to move the pipeline towards the property line and away from the middle of the property and their residence. Moving the pipeline further west and closer to the property line is not feasible due to residences directly across Sandy

TABLE 3.4-10

Private Landowner Routing Concerns

Landowner	Nearest MP	Landowner Concern	Resolution Status
			Creek Road. Additional route modifications were evaluated at the request of FERC staff; however the routes were not environmentally preferable and would impact additional landowners.
Bollinger		Request relocation of pipeline on property.	Pipeline no longer crosses Bollinger property due to route changes to accommodate a new house at an adjacent property.

3.4.3.1 Nicholson Variation

We evaluated the Nicholson Variation that Mountain Valley developed to avoid or reduce impacts on the Nicholson property and address comments submitted to the FERC Docket on August 21, 2018.[3] This variation deviates from the proposed route at MP 3.65 extending southeast and south before turning northeast, rejoining the proposed route at MP 4.0. Table 3.4-11 provides a comparison between the proposed route and the Nicholson Variation, and the location of the variation is shown on figure 3.4-7.

This variation would affect 0.1 less acres of forested land in comparison to the proposed route. However, the Nicholson Variation would cross one additional parcel; be 0.3 mile longer; affect an additional 4.2 acres of agricultural land; and require an additional 4.2 acres of construction rights-of-way than the proposed route. Given the consideration of these factors, we conclude that the Nicholson Variation does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

Minor Route Variations
Nicholson Variation

3.4.3.2 Whitehead Variation

We evaluated the Whitehead Variation that Mountain Valley developed to avoid the Whitehead property and address comments submitted to the FERC Docket on September 11, 2018[4]. This variation deviates from the proposed route at MP 3.65 extending southeast and south before turning to cross U.S. Route 29, rejoining the proposed route at MP 5.1. Table 3.4-12 provides a comparison between the proposed route and the Whitehead Variation, and the location of the variation is shown on figure 3.4-8.

The Whitehead Variation would cross one less waterbody in comparison to the proposed route. However, the variation would be 0.3 mile longer; cross two additional parcels; and impact an additional 5.7 acres of agricultural land. It would also affect an additional 0.2 acre of wetland and 2.7 acres of forested land than the proposed route. Given the consideration of these factors, we conclude that the Whitehead Variation does not offer a significant environmental advantage when compared to the proposed route and is eliminated from further consideration.

TABLE 3.4-12

Comparison of Whitehead Variation and the Southgate Proposed Route

Feature	Whitehead Variation	Proposed Route
Total length (miles)	1.8	1.5
Construction rights-of-way (acres) a/	21.5	18.1
Total number of parcels crossed	12	10
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0/0	0/0

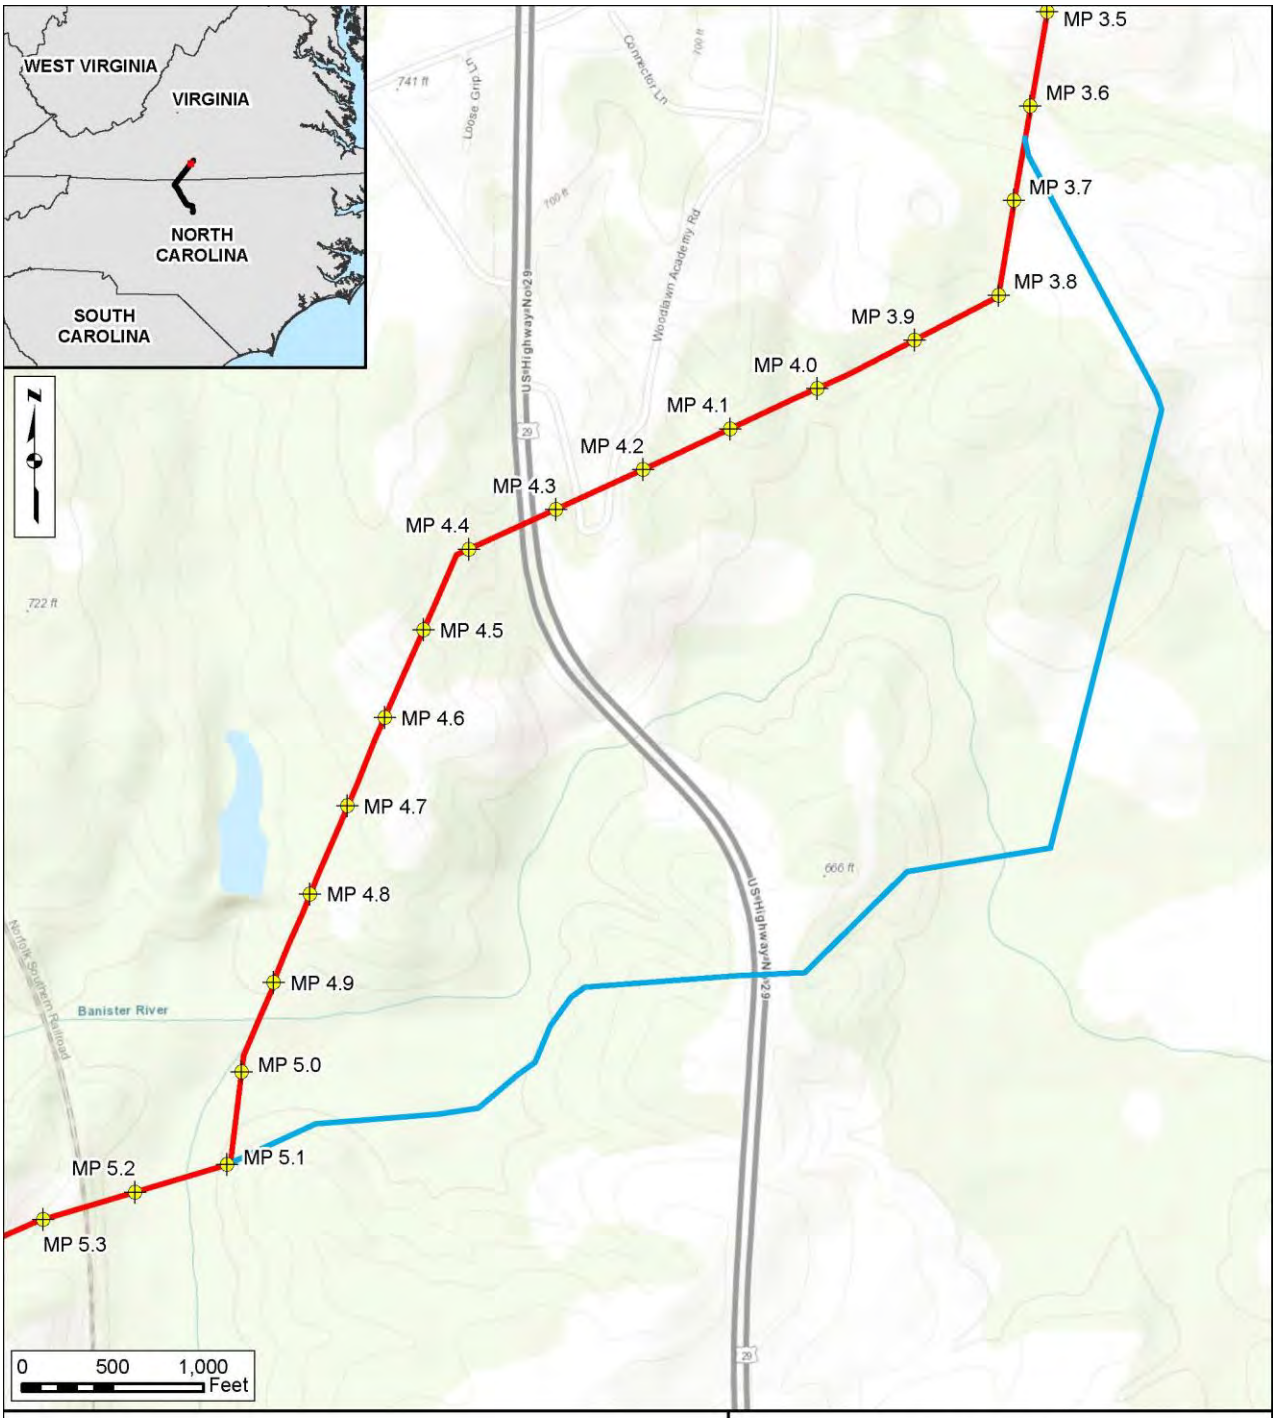

Figure 3.4-9

Southgate Project

Minor Route Variations
Whitehead Variation

3.4.3.3 Robert Pollok-Hill View Farms Variation

We evaluated this variation developed by Mountain Valley to avoid and/or minimize impacts on the Robert Pollok-Hill View Farms. This variation deviates from the proposed route at MP 14.7 extending west of the proposed route, paralleling an existing utility easement, crossing Whitmell School Road/County Road 750, rejoining the proposed route at MP 15.7. Table 3.4-13 provides a comparison between the proposed route and the Robert Pollok-Hill View Farms Variation, and the location of the variation is shown on figure 3.4-9.

The Robert Pollok-Hill View Farms Variation would affect 0.5 acre less of forest land and collocate with 1.0 mile more of existing rights-of-way in comparison with the proposed route. However, the proposed route would affect 0.4 acre less of agricultural land and cross one less property. While the entire variation was not incorporated into the proposed route, Mountain Valley has meet with Mr. Robert Pollok and has incorporated workspace adjustments at the landowners request to avoid a sediment catch area and a pond on the property. Mountain Valley has also eliminated approximately 1,300 feet of access road and 0.3 acre of temporary workspace on the property between MPs 14.7 and 15.7. Mountain Valley continues to meet with Mr. Robert Pollok to refine the Project footprint and reduce impacts on the property. Given the consideration of these factors, we conclude that the Robert Pollok-Hill View Farm Variation does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route and is eliminated from further consideration.

TABLE 3.4-13

Comparison of the Robert Pollok-Hill View Farms Variation and the Southgate Proposed Route

Feature	Robert Pollok-Hill View Farms Variation	Proposed Route
Total length (miles)	1.0	1.0
Construction rights-of-way (acres) a/	12.1	12.2
Permanent rights-of-way (acres) a/	6.0	6.0
Total number of parcels crossed	6	5
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0/0	0/0
Unlisted/Potential Eligible Historic Properties (number)	0	0

Minor Route Variations
Robert Pollok-Hill Farms Variation

3.4.3.4 Moore Variation

We evaluated the Moore Variation developed by Mountain Valley to avoid impacts on the Moore property, addressing comments submitted to the FERC Docket on August 20, 2018[5]. This variation deviates from the proposed route at MP 33.1 extending south and southeast crossing Moir Road, turning south and southwest rejoining the proposed route at MP 33.9. Table 3.4-14 provides a comparison between the proposed route and the Moore Variation, and the location of the variation is shown on figure 3.4-10.

The Moore Variation would affect 2.8 miles less of agricultural land, however, the variation would affect 4.6 additional acres of forested land, cross four additional parcels, and would be collocated 0.7 mile less than the proposed route. Given the consideration of these factors, we conclude that the Moore Variation does not offer an environmental advantage when compared to the proposed route and is eliminated from further consideration. Mountain Valley continues to refine the Project footprint and reduce impacts on the Moore property.

TABLE 3.4-14

Comparison of the Moore Variation and the Southgate Proposed Route

Feature	Moore Variation	Proposed Route
Total length (miles)	0.9	0.8
Construction rights-of-way (acres) a/	11.4	10.4
Total number of parcels crossed	8	4
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0/0	0/0

Moore Variation

Figure 3.4-11

Southgate Project

Minor Route Variations
Moore Variation

3.4.3.5 Strader Variation

We considered this variation developed by Mountain Valley to avoid and/or minimize impacts on residences on the Strader property. This variation deviates from the proposed route at MP 40.0 extending south and southwest, crossing Narrow Gauge Road, turning east and southeast to rejoin the proposed route at MP 41.4. Table 3.4-15 provides a comparison between the proposed route and the Strader Variation, and the location of the variation is shown on figure 3.4-11.

The Strader Variation is not within 50 feet of any residences, whereas the proposed route is within 50 feet of one residence. The Strader Variation would affect two fewer parcels compared to the proposed route. However, the variation would be 0.1 mile longer, and impact an additional 0.1 acre of wetland, 1.5 acres of agricultural land, and 1.6 acres of forest land than the proposed route. While the entire variation was not incorporated into the proposed route, Mountain Valley has modified the proposed route to minimize impacts on the property based on meetings with Mr. and Ms. Strader. The Strader Variation does offer some advantages, but when considering all affected resources, does not offer a significant environmental advantage when compared to the proposed route.

TABLE 3.4-15

Comparison of the Strader Variation and the Southgate Proposed Route

Feature	Strader Variation	Proposed Route
Total length (miles)	1.6	1.5
Construction rights-of-way (acres) a/	19.7	18.1
Total number of parcels crossed	8	10
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0/0	1/1

3.4.3.6 Madren Variation

FERC evaluated this variation developed by Mountain Valley to avoid impacts on the Madren property, addressing comments submitted to the FERC Docket on August 23, 2018[6]. This variation deviates from the proposed route at MP 58.1 extending south and southeast, turning east and southeast paralleling an existing electric transmission easement, rejoining the proposed route at MP 58.9. Table 3.4-16 provides a comparison between the proposed route and the Madren Variation, and the location of the variation is shown on figure 3.4-12.

The Madren Variation would impact 1.4 acres less of agricultural land and is collocated with 0.2 miles of additional rights-of-way in comparison to the proposed route. However, the variation would be 0.4 mile longer; require 4.3 acres more of construction rights-of-way; cross one additional parcel; one additional wetland; and impact an additional 4.2 acres of forested land. Given the consideration of these factors, we conclude that the Madren Variation does not offer a significant environmental advantage when compared to the proposed route and is eliminated from further consideration.

TABLE 3.4-16

Comparison of the Madren Variation and the Southgate Proposed Route

Feature	Madren Variation	Proposed Route
Total length (miles)	1.2	0.8
Construction rights-of-way (acres) a/	14.7	10.4
Total number of parcels crossed	7	6
Number of residences within 25 and 50 feet of the edge of the construction right-of-way	0/0	0/0

Proposed Pipeline Route
Madren Variation

Figure 3.4-13

Southgate Project

Minor Route Variations
Madren Variation

3.4.3.7 Taylor East and Taylor West Variations

The Taylor East and Taylor West Variations were developed by Mountain Valley to avoid or minimize impacts on the the single-family residence and apartment complex on the Taylor property during construction. The variations were developed from stakeholder input to minimize impacts from a construction access road (TA-PI-049). We note Mountain Valley has eliminated access road TA-PI-049 from the Project in an effort to reduce construction impacts on the residence and apartment complex.

The Taylor East Variation deviates from the proposed route at MP 19.2 extending east through forested areas rejoining the proposed route at MP 19.6. The Taylor West Variation deviates from the proposed route at MP 19.4 extending northwest and southwest crossing open land and forest to rejoin the proposed route at MP 19.7. Table 3.4-17 provides a comparison between the proposed route and the Taylor East Variation, and Table 3.4-18 provides a comparison between the proposed route and the Taylor West Variation. The locations of the Taylor East and Taylor West Variation are shown on figure 3.4-13.

The Taylor East Variation crosses four less parcels, and 0.4 less acre of agricultural land. However, the variation would require 0.3 acre more of construction right-of-way, 0.1 acres more of permanent right-of-way, cross 2 more waterbodies, and impact 0.4 additional acres of forest land in comparison to the proposed route. The Taylor West Variation crosses one less parcel; however, the variation would require 1.1 acres of additional construction right-of-way, is not collocated with existing rights-of-way, and affects 0.2 acre of additional agricultural land and 0.9 acre of additional forested land.

The Taylor East and Taylor West Variations would result in resource impacts that are similar to the proposed route. Consequently, we conclude the variations do not provide a significant environmental advantage when compared to the proposed route.

TABLE 3.4-17

Comparison of the Taylor East Variation and the Southgate Proposed Route

Feature	Taylor East Variation	Proposed Route

3.5 ABOVEGROUND FACILITY ALTERNATIVES

We did not evaluate alternative locations for meter stations because the locations of those facilities are largely determined by interconnections with other pipeline systems and delivery points, and the facilities have a relatively small footprint. Similarly, the locations of proposed MLVs are based in part on PHMSA regulations, and MLVs and other appurtenant aboveground facilities generally occupy only a small footprint within existing or proposed pipeline rights-of-way. Although we considered alternate locations for the Lambert Compressor Station, we found the proposed location of the Lambert Compressor Station to be acceptable, and we did not receive suggested alternatives from affected stakeholders concerning the siting. Given these factors, we are not providing a detailed evaluation of alternative sites for the meter stations, MLVs, or the Lambert Compressor Station.

3.5.1 Electric-driven Compression Alternatives

We evaluated the feasibility of using electric motor-driven compressors at the proposed Lambert Compressor Station as an alternative to the proposed natural gas-fired turbines. An existing high voltage electric transmission system is located approximately 1 mile from the Lambert Compressor Station. Its use would likely require an upgrade as well as a minimum of 1 mile of new, high voltage powerlines, and an additional substation within the Lambert Compressor Station site that would result in an increased size. The extensions of powerlines would have the disadvantages of its own set of environmental impacts with likely clearing of forest, modification of wildlife habitat, ground disturbance for installation of power poles, changes to visual setting, and permanent maintenance of a linear corridor in a grassy or scrub-shrub condition.

The energy needed to run electric-driven compressors would be generated in the region, which includes a variety of power generation sources. A comparison between the emissions associated with the gas-fired turbines and the emissions associated with imported power from the grid is complicated because grid power could be obtained from a variety of power sources (such as fossil fuel and renewable fuels). Further, there would be differences in the contributing fossil fuel-fired generating stations: they may use gas, oil, or coal for fuel; they would have different plant configurations (simple cycle or combined cycle power generation); and the plants would likely have different emission control systems. However, it is possible to provide a generic estimate the emissions of grid power using EPA's emission factors for grid supplied power for the region.

We utilized the EPA's Emissions & Generation Resource Integrated Database (eGRID) as well as EPA's Avoided Emissions and Generation Tool (AVERT) to estimate the hypothetical regional carbon dioxide (CO_2), nitrogen dioxide (NO_2), particulate matter with a diameter less than 2.5 micrometers, and sulfur dioxide (SO_2) emissions that would occur if electric-driven compressor units were installed rather than natural gas-fired compressor units. The eGRID integrates many different federal data sources on power plants to allow for comparison of environmental attributes of electric generation within defined regions of the United States. AVERT uses data that "represents the dynamics of electricity dispatch based on the historical patterns of actual generation in one selected year."[7] Currently, AVERT has data for 2007-2018. A comparison of emissions is provided in table 3.5.1 for 21.6 megawatt (MW) of power, compared

[7] US EPA AVERT, https://www.epa.gov/statelocalenergy/avoided-emissions-and-generation-tool-avert#how

with two Solar turbines and associated equipment that would be used for the compression and transmission of natural gas.

Emissions of NO_2, and SO_2 were signficantly higher using purchased power, while emissions of $PM_{2.5}$ would be about the same. Greenhouse gas (GHG) emissions (as CO2e) varied depending upon the model used. eGRID assumes more of baseload case and would be more accurate if the Lambert Compressor Station was constantly in use while AVERT assumed that the station would run intermittently. It is likely that the electrical power generation would be more than 21.6 MW due to line loss in the electrical transmission system which obviously varies. This would result in a slight increase in purchased power requirements.

TABLE 3.5.1

Comparison of Direct and Indirect Power Generation Emissions

Power Option	Annual Pollutant Emissions (tpy)			
	NO_2	SO_2	$PM_{2.5}$	CO_2e
Natural Gas Turbine Emissions (Direct) a/	34.9	5.4	10.3	123,287
Purchased Power Emissions - eGRID (Indirect) b/	47.3	28.4	NA	76,641
Purchased Power Emissions – AVERT (Indirect) c/	79.3	87.0	9.6	142,000

a/ See table 4.11-3 for detailed information on emissions from each type of emission source at the Lambert Compressor Station. This data included the 2 Solar Taurus turbines, 5 micro-turbines, and fuel gas heater emissions. Assumes 100% of NO_x is converted to NO_2

b/ EPA, 2018a The indirect emission factors for GHG, NOx, and SO_2 are based on EPA data for 2016 for the SRVC eGRID subregion (SERC Virginia/Carolina). eGrid does not have standard factors for $PM_{2.5}$. Assumed 100% of NO_x is converted to NO_2

c/ The indirect emissions calculated using EPA AVERT and are based upon 2018 data for the AVERT Southeast Region.

Although the use of electric units would reduce local environmental impacts, it would result in increased power generation (and emissions) from the regional grid that stretches across 11 southeastern states. These generation sources, if fossil-fuel fired, would increase utilization and/or emissions in those local areas. Based on the available past data for electrical power generation emissions, we cannot conclude that the alternative of using purchased power and electric-driven compression offers a significant environmental advantage over the proposed use of gas-fired turbines.

3.6 ALTERNATIVES CONCLUSIONS

We reviewed alternatives to Mountain Valley's proposal based on our independent analysis and comments received. In all cases, we did not find an alternative that would meet the Project objectives; be technically and economically feasible and practical; and provide a significant environmental advantage over the Project. Based on our findings, we conclude that the proposed Project, as modified by our recommended mitigation measures, is the preferred alternative that can meet the Project's stated purpose.

4.0 ENVIRONMENTAL ANALYSIS

This section of the EIS describes the affected environment as it currently exists and discusses the environmental consequences of the proposed Project. The discussion is organized by the following major resource topics: geology; soils; water resources; wetlands; vegetation; wildlife and aquatic resources; special status species; land use, recreation, special interest areas, and visual resources; socioeconomics (including transportation and traffic); cultural resources; air quality and noise; reliability and safety; and cumulative impacts.

The environmental consequences of constructing and operating the Project would vary in duration and significance. Four levels of impact duration were considered: temporary, short-term, long-term, and permanent. Temporary impacts generally occur during construction with the resource returning to pre-construction condition almost immediately afterward. Short-term impacts could continue for up to 3 years following construction. This could include the time it takes for herbaceous/shrub vegetation to grow on the right-of-way after restoration. Impacts were considered long-term if the resource would require more than 3 years to recover. For example, although trees would be allowed to regenerate in temporary work areas, it would take decades for them to mature. A permanent impact could occur as a result of any activity that modifies a resource to the extent that it would not return to pre-construction conditions during the life of the project (more than 50 years). The construction and operation of aboveground facilities would have permanent impacts.

When determining the significance of an impact, the geographic, biological, and/or social context in which the effects would occur, as well as the intensity (e.g., severity), were also considered. In the following sections, we address direct and indirect effects collectively by resource. Section 4.13 analyzes the Project's contribution to cumulative impacts.

As part of its proposal, Mountain Valley developed certain mitigation measures to reduce the impact of the Project so that impacts would not be significant. In some cases, we determined that additional mitigation measures could further reduce the Project's impacts. Our additional mitigation measures appear as bulleted, boldfaced paragraphs in the text of this section and are also included in section 5.2. We will recommend to the Commission that these measures be included as specific conditions in any Order the Commission may issue authorizing this Project. We have reviewed our conclusions and recommendations based on supplemental information and commitments from Mountain Valley, as well as public comments we received on the draft EIS. The conclusions in the EIS are based on our analysis of the environmental impact and the following assumptions:

- Mountain Valley would comply with all federal and federally delegated permits;
- the proposed facilities would be constructed and operated as described in section 2.0 of the EIS;
- Mountain Valley would implement the mitigation measures included in its application and supplemental submittals to the FERC; and

- Mountain Valley would comply with our recommended mitigation measures, listed in section 5.2.

In our experience, necessary modifications to a project, both spatial and procedural, are identified after it is authorized. These changes may include additional or different minor workspace configurations, changes to access roads, or even specific construction techniques (e.g., construction across waterbodies). These changes are often identified by the applicant once on-the-ground implementation work is initiated. Any Project modifications would be subject to review and approval from FERC's Director of the OEP to verify compliance with the Commission's Order. Review and approval may also be required by other permitting/authorizing agencies with federal or federally delegated jurisdiction.

4.1 GEOLOGY

4.1.1 Geologic Setting

The Project would be in the Piedmont Upland section of the Piedmont physiographic province in Pittsylvania County, Virginia and Rockingham, Alamance, and Caswell Counties, North Carolina (Fenneman and Johnson, 1946). The Piedmont province is primarily underlain by weathered granite, gneiss, and schist bedrock of Proterozoic to Paleozoic age, with limited outcropping (Fenneman, 1938). The Piedmont Upland section is characterized by gentle slopes along a rolling surface, bounded or cut by valleys of greater depth and steeper slopes. In the Project vicinity, elevations range from 470 to 880 feet above mean sea level (Fenneman, 1938).

4.1.1.1 Surficial Geology

Surficial geology crossed by the Project has not been mapped in detail. However, the USGS *Surficial Materials in the Conterminous United States* map (Soller et al., 2009) depicts the Project area as mass-movement sediments consisting of colluvium, alluvial sediments, and loess, as well as residual materials formed from the weathering of metamorphic, sedimentary, and carbonate bedrock. These sediments range in grain size from clay to boulders, may contain organic material, and are poorly sorted and stratified (Soller and Reheis, 2004). Appendix C.1 and figure 4.1-1 present the surficial geology crossed by the Project.

4.1.1.2 Bedrock Geology

The bedrock along the Project route generally consists of Cambrian to Triassic Period granite, gneiss, sandstone, and schist (USGS, 2018a). Appendix C.2 contains a summary table of the bedrock crossed by the Project and figure 4.1-2 provides an illustration of bedrock types.

4.1.2 Mineral Resources

Information regarding mineral resources in Virginia and North Carolina was obtained though the VADEQ (VADEQ, 2018a); Virginia Department of Mines, Minerals and Energy (VADMME [VADMME, 2018a; 2018b]); USGS (2016a); North Carolina Department of Environmental Quality (NCDEQ, 2018a) and the North Carolina Geological Survey (NCGS [NCGS, 2016]). Based on this review, active, inactive, abandoned, and proposed surface or subsurface extraction and deposits of fuel resources (coal, oil, and natural gas) were not identified within 0.25 mile of any Project workspaces.

Nonfuel mineral resources are extracted in the Project vicinity, including crushed stone, lithium minerals, phosphate, and sand and gravel. Geologic formations in southwest Virginia also have the potential to contain uranium-bearing minerals; however, of uranium occurrences explored to date, only the deposit at Coles Hill is recognized as large enough and of a high enough grade to be potentially economically viable (NRC, 2012). This deposit is located 3.5 miles north of the Lambert Compressor Station. However, in 1982, Virginia enacted a moratorium on uranium mining, requiring that a program to regulate mining be established before the Commonwealth could accept uranium mining permit applications; to date this moratorium remains in place.

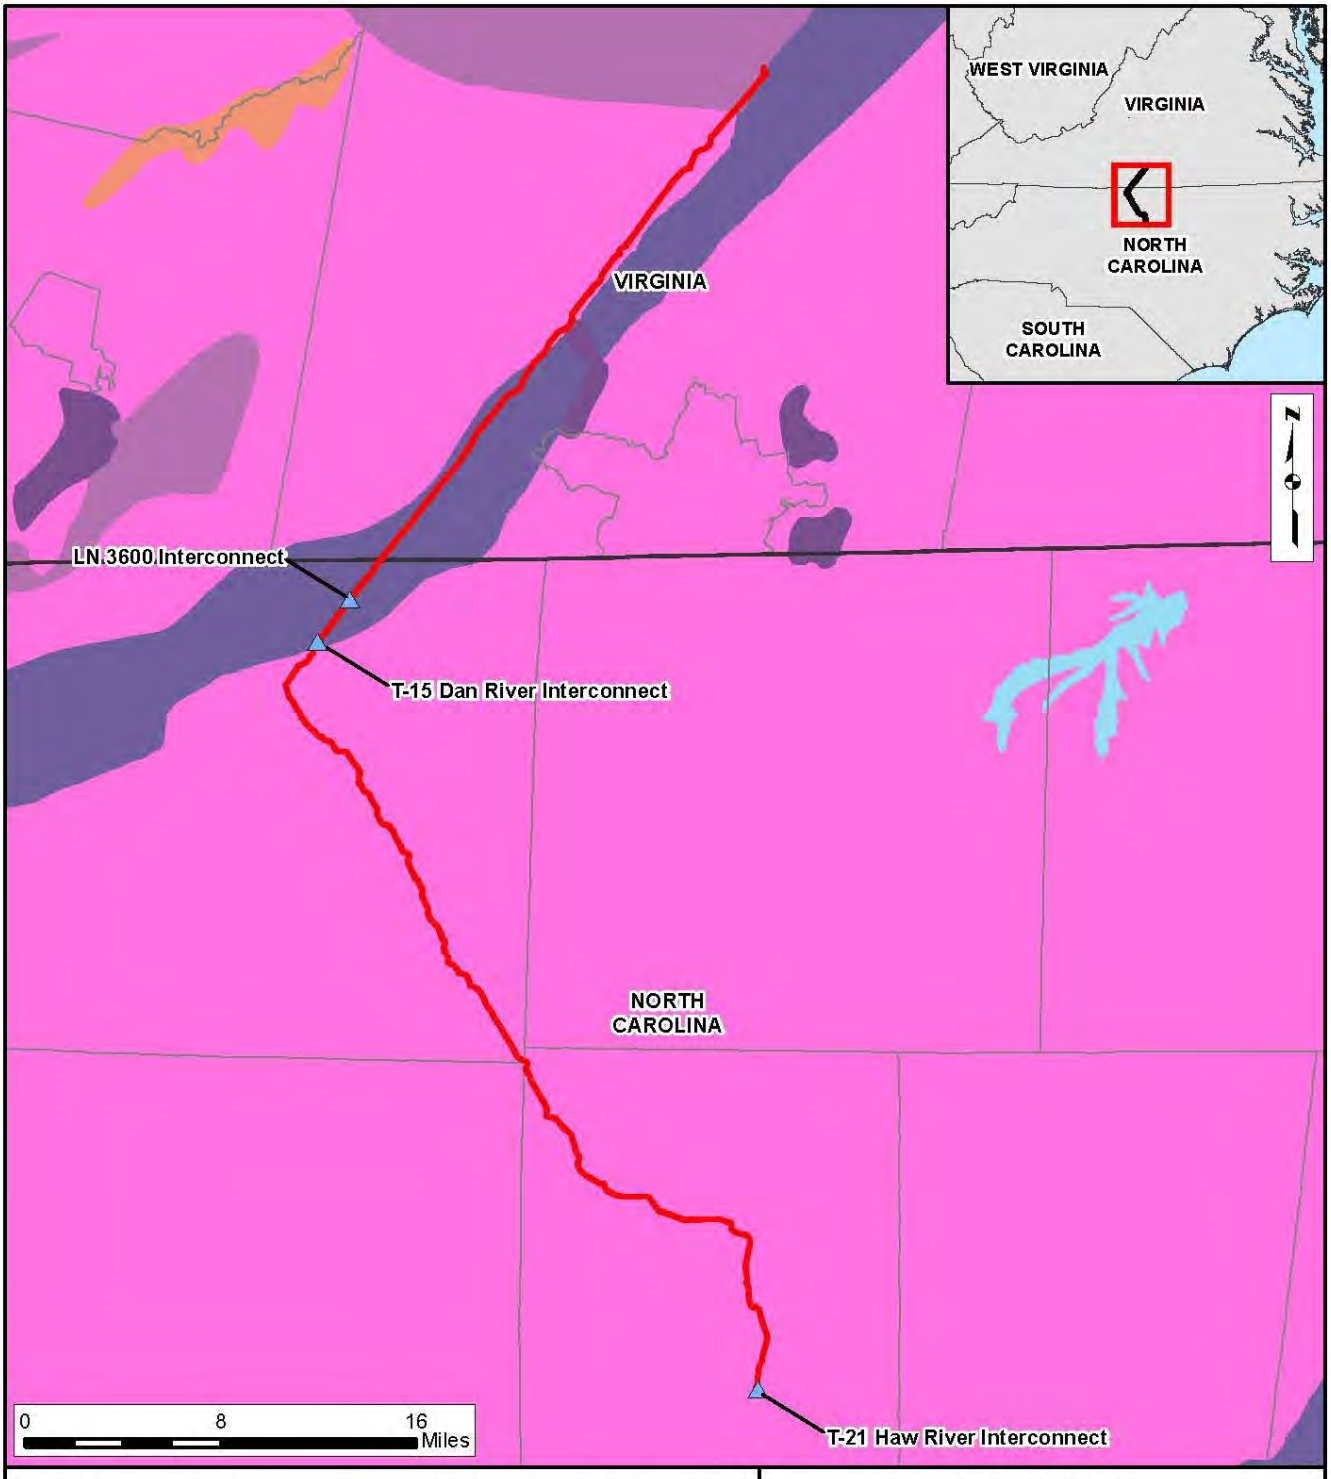

Figure 4.1-1

Southgate Project

Surficial Geology Crossed by the Southgate Project

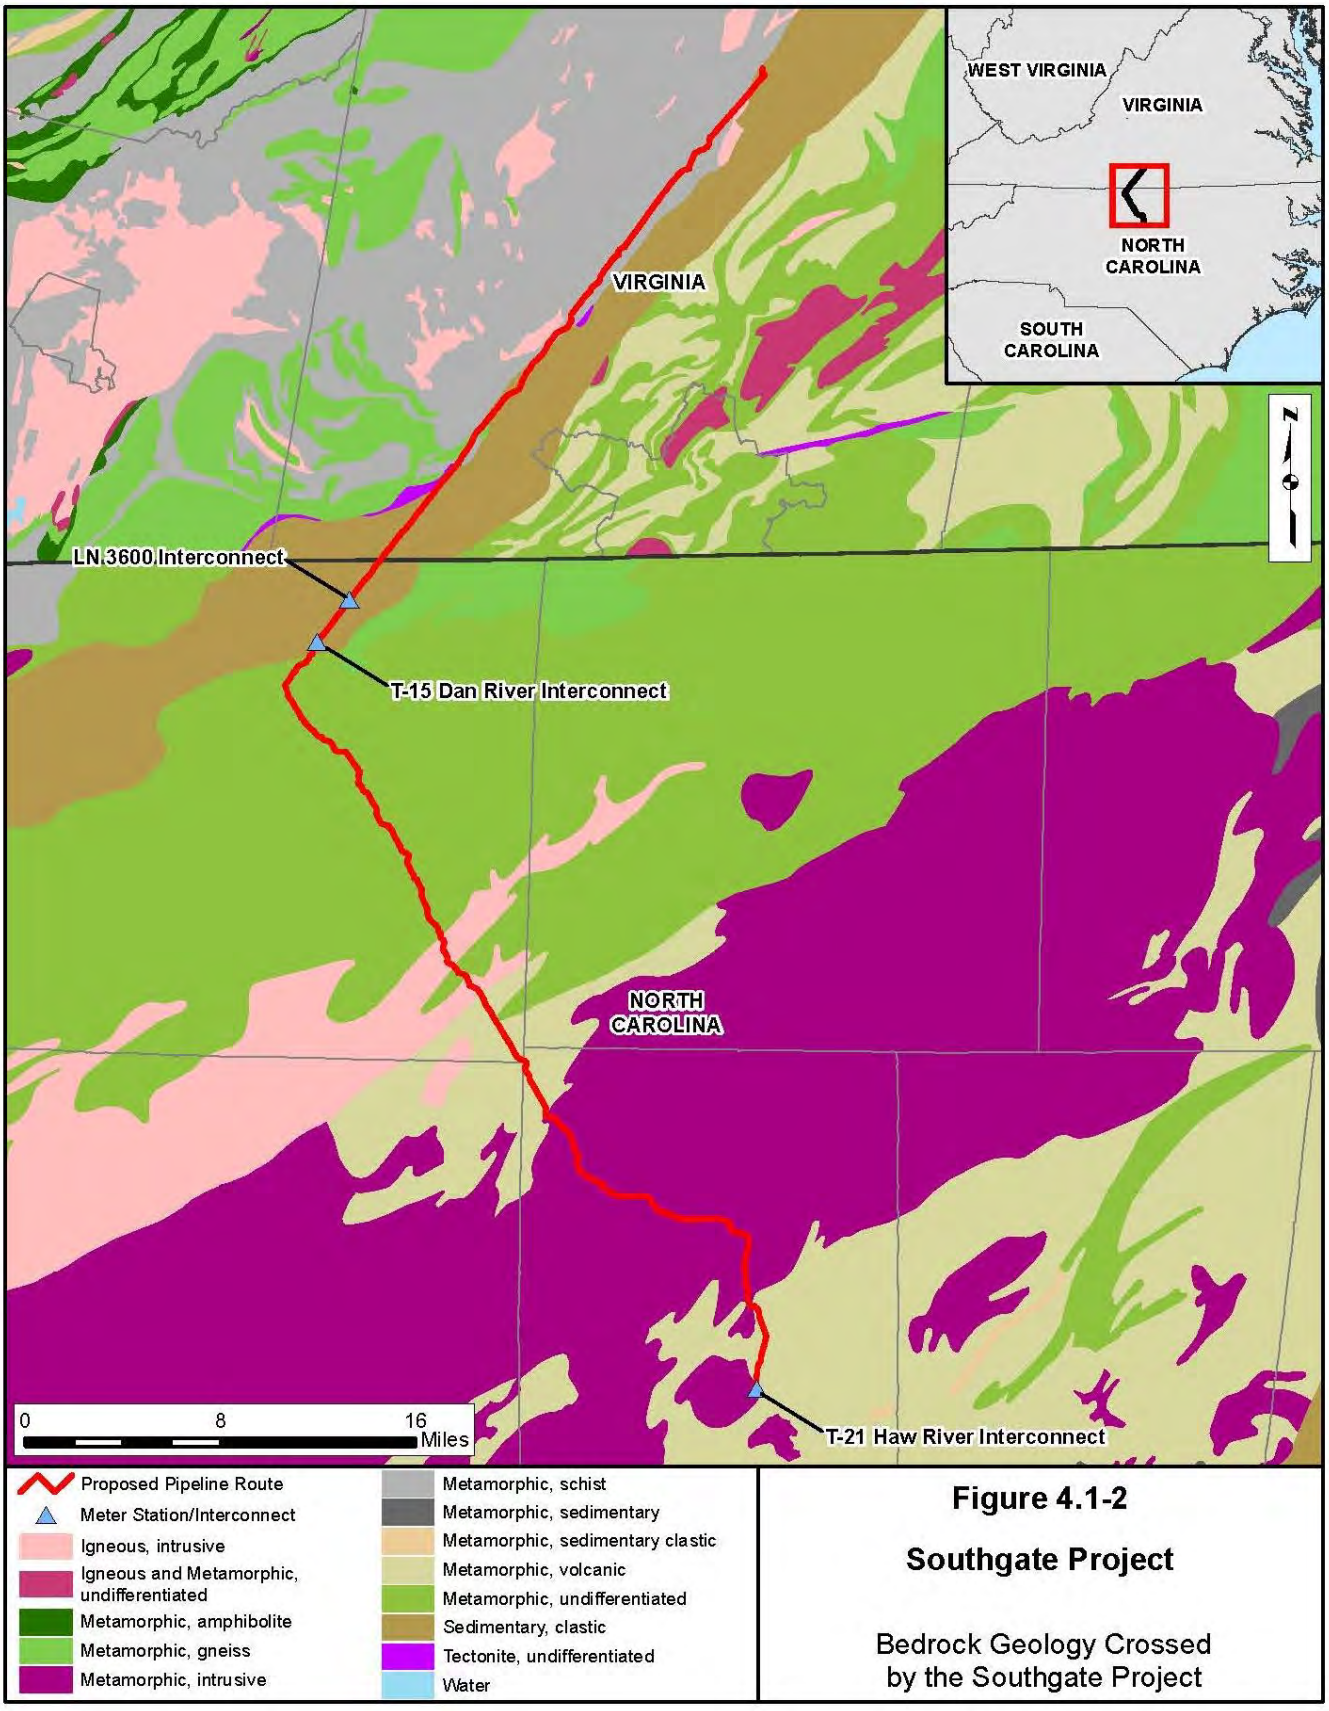

Figure 4.1-2

Southgate Project

Bedrock Geology Crossed by the Southgate Project

The East Alamance Quarry is a crushed stone aggregates operation in Haw River and is owned and operated by Martin Marietta Materials, Inc. (North Carolina Department of Environmental and Natural Resources Permit No. 01-08) on 600 acres of land, 375 acres of which are bound under Permit No. 01-08. This permit also provides limitations on blasting practices at the quarry, restricting maximum peak particle velocities to 1.0 inch per second. The Project permanent easement would be an average of 100 feet from parcels owned by the East Alamance Quarry, and approximately 28.5 feet away at its nearest distance. Based on a review of the East Alamance Quarry mining permit revision (dated April 2019), Mountain Valley understands there to be a 25-foot buffer inside of the property line of Martin Marietta Materials, Inc.-owned parcels that includes all aspects of activity related to mining (e.g. berms, drains, basins, erosion devices etc.). This permit also depicts active mining as occurring another 200 feet inside of the property line, thus increasing the distance between the pipeline and mining activity. Based on these factors, we conclude that the Project would not significantly impact or be affected by the East Alamance Quarry.

The Project pipeline route would also be within 0.2 mile of a USGS-identified plant comprised of a rotary kiln, listed as a bloating materials (lightweight concrete aggregate products) commodity type (USGS, 2011). The site is mapped west of MP 26.6 in Rockingham County, North Carolina; however, an active plant site was not observed based on a review of recent aerial imagery. Further, given the distance from the Project boundary, no impacts from construction or operation of the Project are anticipated.

4.1.3 Paleontological Resources

There is the potential for the discovery of fossils along the Project pipeline route in areas of shallow sedimentary bedrock. Potential fossils that may occur within the Piedmont province include insects, freshwater fish, and dinosaur footprints in Triassic-age rift basin deposits (College of William and Mary, 2018a). Furthermore, the Project would be in the vicinity of Solite Quarry, which straddles the border between North Carolina and Virginia about 9 miles east of the Project boundary near MP 26.1. The Solite Quarry is known to contain preserved reptiles, fish, plant parts, and a variety of insect fossils from the Triassic Period. Fossils found in the Solite Quarry are typically well preserved in sandstone, mudstone, and lacustrine shales from the Cow Branch Formation (College of William and Mary, 2018b). Dinosaur body fossils have not been discovered at the Solite Quarry but the presence of specific trace fossils indicates that dinosaurs did exist in the area (Speights, 2018).

EIs would be trained to respond if suspected paleontological resources are identified during trench excavation or site preparation based on the Project-specific *Unanticipated Discovery Plan for Paleontological Resources*[1]. This plan requires that a paleontologist review any vertebrate fossil discovery before construction may proceed. The paleontologist would determine if the fossil is of scientific significance, and if so they would contact FERC as well as the Virginia Division of Geology and Mineral Resources or the North Carolina Museum of Natural Sciences to develop a

[1] Mountain Valley's Unanticipated Discovery Plan for Paleontological Resources was included as appendix 6-H to Resource Report 6 in its November 06, 2018, application. The Unanticipated Discovery Plan for Paleontological Resources can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

documentation and recovery plan. Based on comments from the NCDEQ, Mountain Valley contacted North Carolina state agencies to determine the involvement of agency representatives during construction regarding unanticipated discoveries of paleontological resources. Based on correspondence between the NCDEQ and Mountain Valley, the NCDEQ stated it would review and comment on Mountain Valley's Paleontological Unanticipated Discoveries Plan in January 2020; however, NCDEQ's comments on this plan, to date, have yet to be received. Mountain Valley would continue to consult with North Carolina state agencies and would file updated correspondence as received. Given the above-described measures, we conclude that potential impacts on paleontological resources would be avoided or adequately mitigated.

4.1.4 Geologic Hazards

Geologic hazards evaluated for the proposed Project include seismicity (e.g., earthquakes), surface faults, soil liquefaction, landslides, karst terrain, subsidence, shallow bedrock, and the presence of uranium deposits in the Project vicinity. These hazards, as well as the feasibility of utilizing HDD, based on hydrogeologic conditions present in the Project area, are discussed below. The conditions necessary for the development of other geologic hazards, including avalanches and volcanism, are not present in the area of the Project and therefore not discussed.

4.1.4.1 Seismicity

The majority of significant earthquakes around the world are associated with tectonic subduction zones, where one crustal plate is overriding another (e.g., the Japanese islands), where tectonic plates are sliding past each other (such as in California), or where tectonic plates are converging (e.g., the Indian Sub-Continent). Unlike these highly active tectonic regions, the east coast of the United States is a passive tectonic plate boundary located on the "trailing edge" of the North American continental plate, which is relatively seismically quiet when compared with active plate boundaries in the United States, such as the San Andreas fault, a transformative plate boundary, and the Juan de Fuca convergent (subduction) plate boundary, both along the western coast of the United States. Earthquakes, however, do occur in the eastern United States, primarily due to trailing edge tectonics and residual stress released from past, mountain-building events.

The shaking during an earthquake can be expressed in terms of the acceleration as a percent of gravity (g), and seismic risk can be quantified by the motions experienced at the ground surface or by structures during a given earthquake expressed in terms of g. USGS National Seismic Hazard Probability Mapping shows that for the Project area, within a 50-year period, there is a 2 percent probability of an earthquake with an effective peak ground acceleration (PGA) of 6 to 8 percent g; and a 10 percent probability of an earthquake with an effective PGA of 2 to 3 percent g being exceeded (USGS, 2014). For reference, a PGA of 10 percent g (0.1g) is generally considered the minimum threshold for damage to older structures or structures not constructed to resist earthquakes.

The modified Mercalli scale (Modified Mercalli Intensity or MMI) measures the intensity of an earthquake at a particular location while the Richter scale measures the size of the earthquake at its source (USGS, 2016a). In general, modern pipeline systems have not sustained damage during seismic events except due to permanent ground deformation, or traveling ground-wave propagation greater than or equal to a Modified Mercalli Intensity of VIII (similar to a Richter

scale magnitude around 6.8 to 7.0) (O'Rourke and Palmer, 1996; USGS, 2018a). The largest recorded earthquake within 50 miles of the Project had a magnitude of 3.0 with an epicenter approximately 46 miles from the Project in Virginia (USGS, 2019a).

4.1.4.2 Active Faults

The USGS maintains a Quaternary fault and fold database of the United States for any fault or fold with evidence of deformation in the past 1.6 million years (USGS, 2018b). Quaternary faults where there has been displacement in the last 10,000 years are considered to be active by the USGS (USGS, 2019b). The Project does not cross nor would any aboveground facility overlie any Quaternary faults (USGS, 2018b).

Regional faults are presented in table 4.1-1. The Project would be within 100 miles of six USGS-recognized faults and fault zones. The USGS classifies these faults from A to C. Class A faults have geologic evidence that demonstrates tectonic origin either exposed by mapping or inferred from deformational features. The nearest Class A faults to the Project are within the Central Virginia Seismic Zone, 95 miles from the pipeline alignment.

TABLE 4.1-1

Faults and Fault Zones within 100 Miles of the Southgate Project

Fault or Zone Name	Class	Distance	Last Active Period/Era
Central Virginia Seismic Zone	A	95 miles	Quaternary (late Pleistocene) (15 ka)
Pembroke Fault	B	75 miles	Undifferentiated Quaternary (<1.6 ma)
Linside Fault Zone	C	85 miles	No Quaternary Movement Demonstrated
Everona Fault	C	94 miles	No Quaternary Movement Demonstrated
Stanleytown Fault	C	19 miles	Unknown
Hares Crossroads faults	C	65 miles	Unknown

Sources: USGS, 2018b; Crone and Wheeler, 2000; Wheeler, 2006; Law et al, 1994.
ka = thousand years ago
ma = million years ago.

Class B faults have geologic evidence indicative of Quaternary deformation but the fault is not deep enough to be a potential source for earthquakes, or the evidence available is insufficient to assign a fault as either Class C or Class A (USGS, 2018b). There is one Class B fault, the Pembroke Fault, located 75 miles from the pipeline alignment. The evolution for this fault is thought to be dissolution of underlying carbonate bedrock or subsidence induced by collapse of subsurface karst, and not a seismic event (Crone and Wheeler, 2000; Wheeler, 2006).

Class C features are classified as having insufficient evidence to demonstrate the existence of tectonic origin, or slip and deformation. There are four Class C features between 19 and 94 miles from the pipeline alignment (see table 4.1-1).

Due to the relatively low seismic risk and the absence of active faults in the immediate Project vicinity, impacts from seismic activity are not anticipated to affect operation or construction of the Project. Furthermore, the Project facilities would be constructed per the

International Building Code (IBC) 2012 (Chapter 16 and Section 1613), in accordance with federal standards for natural gas pipeline safety (49 CFR 192), and American Society of Civil Engineers (ASCE) 7-10, Minimum Design Loads for Buildings and Other Structures.

4.1.4.3 Soil Liquefaction

Soil liquefaction is a phenomenon often associated with seismic activity in which saturated, non-cohesive soils temporarily lose their strength and liquefy (i.e., behave like viscous liquid) when subjected to forces such as intense and prolonged ground shaking (generally, a PGA of 10 percent g or greater). Due to the low potential for a seismic event that would cause strong and prolonged ground shaking, the potential for soil liquefaction to occur is very low and we conclude the potential for soil liquefaction to impact Project facilities is negligible.

4.1.4.4 Landslides

Landslides are defined as the movement of rock, debris, or soil down a slope. Some landslides develop and move slowly and cause damage progressively over a period of many years. Some landslides move rapidly and can cause damage suddenly. Ground failure and slope failure (slips) are typically associated with steep slopes and may be initiated by precipitation, seismic activity, slope disturbance due to construction, or a change in groundwater conditions, such as a seasonal high groundwater table, and soil characteristics. Landslides could occur during the construction, operation, and maintenance of the Project. Construction factors that may increase the potential for slope failure include trenching along slopes and the burden of construction equipment on unstable surfaces.

An overview of landslide incidence and susceptibility was derived from USGS mapping (USGS, 2016b) and Light Imaging Detection and Ranging (LiDAR) data. The Project would cross 2.0 miles of slopes greater than 30 percent (see appendix C.3) based on Project-specific LiDAR data. In areas of steep slope or side slope construction, Mountain Valley would employ temporary sediment barriers such as reinforced silt fences and silt socks, which would be installed prior to any clearing activities on the right-of-way to prevent movement of sediment. To divert water to vegetated areas or reduce water runoff, Mountain Valley may install temporary slope breakers during grading activities per its Plan and the Project-specific E&SC Plan. Additionally, Mountain Valley would install post-construction stormwater controls and permanent slope breakers as needed**.**

For slopes 32 percent or greater, as identified via LiDAR data, as well as for side slopes that may result in parallel or near parallel pipeline construction and areas of identified historic landslide, Mountain Valley completed additional field assessment and assigned site-specific control measures to these areas in their Landslide Mitigation Report[2]. Mountain Valley has proposed to implement mitigation and stabilization control measures including: trench breaker daylight drains, cutoff drains, transverse trench drains, rock lined swales, riprap natural drains, riprap slope breakers, trench breaker pass-through drains, brow ditches, geogrid reinforcement,

[2] Mountain Valley's Landslide Mitigation Report was included in the October 23, 2019 supplement and updated as attachment 29-1 to the December 16, 2019 response to the December 2, 2019 EIR . The Landslide Mitigation Report can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191216-5158 in the "Numbers: Accession Number" field.

and highwall revetment, steep slope revetment and compact slope breakers. Appendix C.4 lists areas of potential landslide concern and proposed mitigation and/or stabilization control measures. Based on Mountain Valley's characterization of slopes in the Project area and proposed mitigation measures, we conclude that potential Project effects related to landslides would be adequately minimized.

4.1.4.5 Land Subsidence

Subsidence, involving the localized or regional lowering of the ground surface, may be caused by karst formation due to limestone or gypsum bedrock dissolution; sediment compaction due to groundwater pumping and/or oil and gas extraction; and underground mining. Oil and gas well production, underground mines, and large groundwater withdrawals do not occur in the Project area.

Karst features, such as sinkholes, caves, and caverns, can form as a result of the long-term action of groundwater on soluble carbonate rocks (e.g., limestone, marble, and dolostone). These features could present a hazard to the pipeline due to cave or sinkhole collapse. Because karst features provide a direct connection to groundwater, there exists the potential for pipeline construction to impact groundwater from increased turbidity due to runoff of sediment into karst features or from inadvertent spills of fuel or other hazardous materials from construction equipment (see section 4.3.1.7). Karst areas are also associated with seeps and springs, which could experience temporary changes in flow characteristics from construction of the pipeline. Seeps and springs along steep slopes could likewise contribute to and be the cause of landslides or other earth movements.

In the Piedmont province of Virginia, sinkholes occur in narrow marble belts (VADMME, 2015). Based on the Weary and Doctor (2014) 1:500,000-scale digital map of karst in the United States, portions of the Project alignment would cross a marble-containing (karst-susceptible) conglomerate unit.

Mountain Valley completed a Karst Hazard Assessment of potential karst features for the Project. During desktop assessment, Mountain Valley consulted 1:24,000-scale Virginia Division of Geology and Mineral Resources (VADGMR) geologic maps and identified five locations where the conglomerate unit would be crossed by the Project alignment (table 4.1-2). Pedestrian survey was completed within 150 feet of the proposed alignment at these five locations to further assess the environment for the presence of karst terrain. No karst features were identified. Based on this assessment, subsidence hazards from karst terrain are not anticipated to impact the Project during construction or operation.

If karst features are observed during construction, Mountain Valley would employ a karst specialist to conduct a field investigation to inspect and characterize the karst features and potential for subsurface connectivity. The karst specialist would coordinate with the Project geologist to conduct the field inspection and would notify the applicable agencies regarding the karst feature. If the karst feature is determined to have subsurface connectivity and present a potential hazard to pipeline construction and operation, or be a potential conduit to local groundwater resources, appropriate mitigation measures would be identified by a karst specialist, and would be discussed with the applicable agencies prior to implementation.

TABLE 4.1-2

Locations of Field Surveys of Karst-Susceptible Bedrock near the Southgate Project

State	County	From Milepost	To Milepost	Crossing Length	Rock Type	Construction Method
Virginia	Pittsylvania	0.03	1.0	3,696	Conglomerate (covered by terrace deposits)	Open-cut and bore (road crossings)

4.1.4.6 Shallow Bedrock and Blasting

Areas with shallow bedrock (bedrock within 60 inches of the ground surface) were identified using the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey (USDA NRCS, 2018a). The Project pipeline route would traverse approximately 5.5 miles (119.6 acres) of shallow bedrock. Areas of shallow bedrock are listed in detail by milepost in appendix C.5. The potential for blasting exists at all locations where shallow bedrock may be encountered. Blasting may also be required at the Lambert Interconnect and MLV 1 as well as at the LN 3600 Interconnect due to slope and depth to bedrock at both locations.

If unrippable bedrock is encountered, Mountain Valley would first attempt trenching with rock trenching machines, rock saws, hydraulic rams, and jackhammers. If blasting becomes necessary, it typically involves a small scale, controlled, rolling detonation procedure resulting in limited ground upheaval. These blasts do not typically result in large, aboveground explosions. Any required blasting would be conducted in accordance with all federal, state, and local regulations.

Mountain Valley completed a desktop assessment to identify steep slopes (18 degrees or more) with shallow bedrock in its Force Assisted Excavation (FAE) and Slope Stability evaluation.[3] This evaluation included the review of LiDAR data associated with the Project to

[3] Mountain Valley's Force Assisted Excavation evaluation was included as Attachment 5 to Mountain Valley's May 22, 2019 supplemental filing. This information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190522-5174 in the "Numbers: Accession Number" field.

identify slopes greater than 18 degrees and a comparison of the identified slopes in conjunction to areas designated as having a shallow depth to bedrock less than 10 feet below land surface. The areas that satisfied both requirements were assessed to determine the potential for FAE to trigger landslides. Based on this analysis, 19 locations were identified that may require blasting. The purpose of FAE is to fracture and loosen bedrock near land surface to allow for the mechanical removal of bedrock for pipeline installation. This process is intended to leave behind competent bedrock after removal of the fractured pieces associated with the FAE. The use of blasting along slopes has the potential to increase the risk of landslides during pipeline construction. Mountain Valley would deploy a qualified geotechnical engineer or geologist to conduct a site visit at each of these areas after tree clearing and site grading, but before excavation. Actual site conditions would be evaluated and site-specific data collected for further engineering analysis if deemed necessary. Based on this site-specific analysis, mitigation measures would be developed and deployed before, during, and after blasting and ditching to stabilize slopes. Further, blasting conducted in these areas would be confined to the right-of-way alignment during trench excavation and explosives used for blasting would be managed for weight, powder factor, type of explosive and delays implemented to be adjusted for the management of peak particle, longitudinal, vertical and transverse velocities for the reduction in transferred energy to surrounding slopes allowing for the mitigation of potential slope movement.

In order to minimize potential impacts from blasting, Mountain Valley would comply with all federal, state, and local regulations for blasting. Mountain Valley filed a *General Blasting Plan*[4] that describes the measures and BMPs it would implement during construction to reduce and mitigate impacts from blasting. As outlined in the *General Blasting Plan*, Mountain Valley would:

- limit the charge size;
- use heavy mats or other suitable cover to prevent the scattering of debris;
- use seismograph equipment to monitor the velocity of the blasts at select monitoring locations including closest adjacent facilities;
- conduct pre-and post-blast testing and inspections of water wells and structures within 150 feet of blasting area;
- man valves at adjacent pipelines in case of an emergency arising from nearby blasting activities;
- provide verbal and written notification of residents and owners of structures within 150 feet of blasting activities, before blasting activities would begin;
- use warning signals, flags, and barricades;
- conduct pre-blast and post-blast surveys at locations within 150 feet of the blasting activity; and
- use excess rock from blasting to restore the right-of-way, placed as per landowner agreements, or hauled off-site to an approved disposal site.

[4] Mountain Valley's *General Blasting Plan* was included as attachment 3 to Mountain Valley's October 18, 2019 response to the October 3, 2019 FERC Environmental Information Request (EIR). The *General Blasting Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191018-5168in the "Numbers: Accession Number" field.

We have concerns about Mountain Valley's proposed use and disposal of excess rock. Mountain Valley has committed to backfilling the trench with excavated rock material only to the height of the existing bedrock horizon, and where rock is present in soils pre-construction, Mountain Valley would incorporate rock (generated during blasting and trenching) in the backfill to a depth of 4 inches or more below the surface to encourage revegetation. Further, in its General Blasting Plan, Mountain Valley indicates that excess rock may be used in the restoration of disturbed right-of-way limits, with the rock buried within the reclamation limits of the right-of-way. We find this to be inconsistent with our Plan (see section III.E. and V.A.3.) and not conducive to successful restoration of affected lands. Burying rock in locations other than where it originated could impact soil quality, subsurface water flow, and revegetation of affected lands. Therefore, we recommend that:

- **Prior to construction, Mountain Valley should file with the Secretary, for review and written approval by the Director of OEP, a revised *General Blasting Plan* that clarifies it will not bury excess rock fragments generated during trenching or blasting in any location other than where the rock originated. Excess rock fragments not suitable for reburial at the point of origin should be considered construction debris and should be disposed of consistent with our Plan at sections III.E and V.A.3.**

In addition, Mountain Valley's *General Blasting Plan* requires the blasting contractor to prepare Project/site-specific blasting plan(s) for approval by Mountain Valley prior to the use of any explosives. In response to comments on the draft EIS made by the EPA, Mountain Valley stated it would also provide verbal and written notification to any building occupants within 250 feet of blasting activities. Mountain Valley would investigate damage claims associated with blasting and would repair or mitigate damage through agreements with landowners. Refer to section 4.3.1 for a discussion of blasting impacts and mitigation measures for drinking water supplies.

4.1.4.7 Flooding

Flash flooding occurs when there is rapid and substantial increases in water flow rate and water volume within waterbodies or onto adjacent floodplains. Flash flooding can occur after excessive or significant rainfall over a short period of time (less than 6 hours). The occurrence of flash flooding can be within minutes or hours of significant rainfall and is dependent on the size of the contributing watershed after dam or levee failure, and/or the duration of the rain event (NWS, 2010). The National Weather Service (NWS) Flash Flood Guidance estimates that the amount of rainfall needed to generate flash flooding in the counties crossed by the Project is 1.5 to 2.0 inches per hour (National Oceanic and Atmospheric Administration, 2019).

Seasonal and flash flooding hazards are a potential concern where facilities would cross or be near major streams and small watersheds. To minimize or prevent impacts resulting from flash flooding during construction, Mountain Valley would remove any equipment or loose material from potentially affected areas prior to any anticipated significant rain event. Although flooding itself does not generally present a risk to pipeline facilities, bank erosion and/or scour could expose the pipeline or cause sections of pipe to become unsupported. Flooding can also affect the pipeline by increasing buoyancy, causing the pipe to rise toward the land surface where it may become

exposed. Mountain Valley would implement mitigation measures per its Procedures and the Project E&SC Plan, as needed, within floodplains to minimize potential impacts from flood events. These measures may include:

- using concrete coating, gravel-filled blankets, or concrete weights on the pipeline to maintain negative buoyancy; and
- restoring floodplain contours and waterbody banks to their pre-construction condition so that there is no net loss of flood storage capacity.

Given that Mountain Valley would implement measures to prevent or minimize pipeline buoyancy and to restore floodplain contours after completion of construction, we conclude that adverse impacts from flood hazards would be minor during construction and operation of the Project. Refer to section 4.3.2 for further discussion on floodplain storage.

4.1.4.8 Uranium

Marline Uranium Corporation initiated ground surveys in Virginia in 1977 and began to acquire mineral leases in Pittsylvania, Fauquier, Orange, Madison, and Culpeper counties. Geological exploration identified more than 55 occurrences of uranium in Virginia, primarily in the Piedmont and Blue Ridge regions. However, for a uranium occurrence to be considered commercially viable, it must be of sufficient size, appropriate grade, and be amenable to mining and processing (National Research Council [NRC], 2012). Of the sites explored in Virginia to date, only the deposit at Coles Hill is large enough and of a high enough grade to be potentially economically viable.

The Coles Hill deposit is in Pittsylvania County, Virginia, 3.5 miles north of the Lambert Compressor Station (Coles Hill, LLC; NRC, 2012). This deposit is exposed locally but proceeds to dip and extend underground (RTII, 2012). No encounters with the Coles Hill deposit are anticipated as a result of Project-required excavation due to the deposit depth and distance from the Project. The Coles Hill deposit is within a fault-bounded wedge of the sheared and highly potassic calcalkaline Leatherwood Granite, at the northwest margin of the Triassic-age Danville Basin (NRC, 2012). The Project would be 3.5 miles from the Coles Hill deposit, but would cross the Leatherwood Granite at one location (from approximate MP 1.2 to 1.9) and is sited near the western margin of the Danville Basin.

Commenters specifically noted potential uranium occurrences in the vicinity of Judy Byrd Mountain and Perkins Mountain. The pipeline alignment crosses near the base of these mountains at approximate MP 23 and MP 21.7, respectively. Bedrock geology of Judy Byrd Mountain and Perkins Mountain is mapped by the USGS as Triassic-age sedimentary rock of the Newark Supergroup (sandstone, siltstone, conglomerate, and shale). This formation could host roll-front type uranium deposits (mineralized zones between reduced sandstone on the hydrological gradient downside and oxidized sandstone on the hydrological gradient upside); however, the average concentration of uranium in two cataclystic rock samples collected approximately 1,750 feet west of MP 22.5 was approximately 4.7 parts per million (ppm) (USGS, 2019c). For reference, uranium has an average concentration in U.S. soils of about 3 ppm (U.S. Department of Health and Human Services [U.S. DHHS], 2013); and the average concentration of uranium globally in shales is 3.2

ppm, the average concentration in sandstones is 1.4 ppm, and the average concentration in granite is 4.8 ppm (NRC, 2012).

Uranium mobilization in the environment can occur through the exposure of uranium-containing rocks and sediments to the weathering process (physical or chemical), causing uranium to be released from its parent material. Redistribution can further occur via activities and processes that move soil and rock. Therefore, background concentrations of uranium in soils, sediments, shallow bedrock, and groundwater were assessed via a review of publicly available information.

The USGS National Uranium Resource Evaluation (NURE) database contains the results of sediment and water sampling completed under the NURE program from approximately 1975 through 1984. Within 0.5 mile of the Project workspace in Virginia, NURE analyzed 16 sediment samples and 11 groundwater samples[5] for uranium (USGS, 2004). The average concentration of uranium in these groundwater samples was 0.09 micrograms per liter (µg/L) and the highest concentration was 0.388 µg/L; the average uranium concentration in the 16 sediment samples was 8.07 ppm and the highest uranium concentration was 13.6 ppm. The EPA primary drinking water standard (maximum contaminant level [MCL] - the maximum level allowed of a contaminant in water which is delivered to any user of a public water system) for uranium is 30 µg/L. Based on NURE sampling results, uranium concentrations in groundwater near the Project are significantly lower than the EPA MCL.

Based on a review of USGS soil geochemistry data (4,857 sites in the conterminous U.S.), uranium concentrations near the Project in Virginia are approximately 2.0 to 2.2 ppm for a depth of 0 to 5 centimeters (cm) (50 to 60th percentile), 1.5 to 1.8 ppm for the A horizon (30 to 40th percentile), and 2.1 to 2.4 ppm for the C horizon (50 to 60th percentile) (Smith et. al., 2014). This is generally consistent with NURE aeroradiometric data (airborne gamma-ray spectrometry), which estimated concentrations of uranium in shallow bedrock and soils (top few centimeters) in Pittsylvania County to range from approximately 1.0 ppm to approximately 2.6 ppm. We also reviewed rock samples in the National Geochemical Database. In addition to the two previously-referenced samples in the vicinity of MP 22.5, a sample of granitic rock that was collected approximately 1,000 feet east of MP 15 and was found to contain uranium at a concentration of approximately 1.5 ppm. Geochemical information for other rock samples in Pittsylvania County were from locations greater than 0.5 mile from the proposed easement.

The mobility of uranium in soil and its vertical transport (leaching) to groundwater depend on soil properties such as pH, oxidation-reduction potential, concentration of complexing anions, porosity of the soil, soil particle size, and sorption properties, as well as the amount of water available (U.S. DHHS, 2013). The transport and dispersion of uranium in surface water and groundwater are affected by adsorption and desorption of the uranium on surface water sediments. In most waters, sediments act as a sink for uranium and the uranium concentrations in sediments and suspended solids are several orders of magnitude higher than in surrounding water (U.S. DHHS, 2013). In anoxic waters (reductive environment), soluble U(VI) is reduced to U(IV) and deposited into the sediment (U.S. DHHS, 2013). Uranium can also be removed from solution by physical adsorption processes, such as adsorption onto oxides of iron or manganese that occur as

[5] Of the groundwater samples collected, 10 were collected from wells with reported depths ranging from 44 feet to 165 feet and a single sample was collected from a source labeled as a spring.

coatings on the particles of soil and sediment (U.S. DHHS, 2013). This process is reflected in the higher concentrations of uranium present in the NURE sediment data described above.

The sorption of uranium in most soils is such that it may not leach readily from soil surface to groundwater, particularly in soils containing clay and iron oxide although other geological materials such as silica, shale, and granite have poor sorption characteristics (U.S. DHHS, 2013). However, while the main ore minerals of the Coles Hill, and presumably any similar deposits, are easily leachable, they are hosted by hard, granitoid rock that is difficult to crush (NRC, 2012). Uranium is transported poorly from soils to plants; the uptake of uranium by plants is dependent on levels of available (soluble) uranium. Particulate uranium represents an inhalation source for humans, dependent upon concentration and particle size. For particulate uranium to be an inhalation hazard to humans, the particulates must be in the size range of 1–10 micrometers (μm) (U.S. DHHS, 2013).

Based on the types of potential deposits present in Virginia and existing data, it is considered unlikely that deposits with grades in excess of 10,000 ppm uranium occur in Virginia (NRC, 2012), and as described in the above assessment, concentrations of uranium in sediment, soils, shallow bedrock, and groundwater near the Project workspace in Pittsylvania County are comparable to concentrations in environmental media in the conterminous United States. Uranium is generally not highly mobile in the environment, and Mountain Valley would implement their E&SC Plan to address fugitive dust mitigation, stormwater control, and erosion and sediment control measures during ground disturbance activities, which would reduce the mobilization of uranium during Project construction. Project activities would be similar to other roadway and infrastructure projects, including subsurface utilities with which the majority of the pipeline is collocated in Pittsylvania County. Given the linear nature and shallow depth (generally 5.5 to 9 feet below grade) of pipeline construction activities, it is not anticipated that the Project would disturb or mobilize uranium into the environment at concentrations significantly exceeding background concentrations. Therefore, significant impacts on human health and the environment are not anticipated during construction and operation of the Project.

4.1.4.9 HDD Feasibility and Geotechnical Investigations

Mountain Valley has proposed the use of the HDD method to cross sensitive resources at two separate locations (Dan River and Stony Creek Reservoir). Length of an HDD alignment, pipeline diameter, and subsurface material are factors in the technical feasibility of an HDD installation. Subsurface conditions that can affect feasibility of an HDD installation include excessive rock strength and abrasiveness, unconsolidated gravel and boulder materials, poor bedrock quality, solution cavities, and artesian conditions. It is also possible for HDD pipeline installation operations to fail, primarily due to encountering unexpected geologic conditions such as transitioning from coarse unconsolidated materials into bedrock or if the pipe were to become lodged in the hole during pullback operations.

During HDD operations, drilling fluid consisting primarily of water and bentonite clay is pumped under pressure through the inside of the drill pipe and flows back (returns) to the drill entry point along an annular space between the outside of the drill pipe and the drilled hole. Because the drilling fluid is pressurized, in certain conditions it can seep into the surrounding rocks and sediment. Formational drilling fluid losses typically occur when the drilling fluid flows through pore spaces in soil or within fractures in rock formations. Inadvertent returns (IR) of

drilling fluid to the ground surface are more likely to occur in less permeable soils or via fractures or fissures in bedrock. Chances for an IR to occur are greatest near the drill entry and exit points where the drill path has the least amount of ground cover. This can be caused by low soil shear strength and pre-existing fractures in the bedrock formations. A summary of geotechnical investigations and feasibility assessments completed for each proposed crossing follows.

Dan River

The total crossing length of Mountain Valley's proposed Dan River HDD would be 2,523 feet. Mountain Valley completed three geotechnical borings along the proposed alignment to depths of 175 to 176 feet below the ground surface (bgs)[6]. Overburden material was found to be sands, silts, and clays; bedrock was encountered at a depth of 25.5 to 53.3 feet bgs and consisted primarily of sandstone, siltstone and mudstone that extended to the terminal depth of each boring. A proposed depth of cover of 45 bgs would be maintained between the Dan River bed and the proposed alignment. At this depth, the drill path would be within bedrock. Based on available analysis, a majority of the drill path would be within competent bedrock with high rock quality designation values (greater than 50 percent). Mountain Valley's geotechnical contractor determined that the current HDD design is feasible.

A hydrofracture risk assessment determined that there would be an elevated risk of IR near the exit point of the drill. Mountain Valley proposes to expand its mud-receiving pit to include the area with elevated IR potential. Another area of elevated IR risk would be at the highly weathered and fractured rock layer between overburden and competent bedrock which, based on geotechnical information, would be crossed approximately 1,900 feet into the horizontal drill path. The drill would be greater than 8,00 feet from the bank of the Dan River when it crosses this layer, but may underlie wetland W-B18-36.

Stony Creek Reservoir

The total crossing length of Mountain Valley's proposed Stony Creek Reservoir HDD would be 1,619 feet. Mountain Valley completed two geotechnical borings along the proposed alignment to a depth of 176 to 180 feet bgs. Overburden material was found to be sands, silts, and clays; bedrock was encountered at a depth of 18.9 to 25 feet bgs and consisted primarily of sandstone, granite, diorite, quartzite, and schist. A proposed depth of cover of 50 to 55 feet bgs would be maintained between the Stony Creek Reservoir and the proposed alignment. At this depth, the drill would be within bedrock. Based on available analysis, a majority of the drill path would be within competent bedrock with high rock quality designation values (greater than 50 percent). Mountain Valley's geotechnical contractor determined that the current HDD design is feasible.

---

[6] Mountain Valley's Geotechnical Report of Subsurface Exploration – Southgate Dan River HDD Crossing and Stoney Creek HDD Crossing was included as attachment 26-1 to Mountain Valley's December 16, 2019 response to the December 2, 2019 FERC Environmental Information Request (EIR). The *General Blasting Plan* was also included in this filing by Mountain Valley. Both plans can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191216-5158 in the "Numbers: Accession Number" field.

A hydrofracture risk assessment determined that there would be an elevated risk of IR near the exit point of drill for the Stony Creek Reservoir HDD crossing. Mountain Valley proposes to expand its mud-receiving pit to include the area with elevated IR potential. Another area of elevated IR risk would be at the highly weathered and fractured rock layer between overburden and competent bedrock which, based on geotechnical information, would be crossed approximately 1,400 feet into the horizontal drill path. The drill would be approximately 350 feet from the bank of Stony Creek when it crosses this layer.

HDD General Impacts and Mitigation

Drilling fluids associated with HDD operations would consist primarily of water and bentonite clay. Mountain Valley would require approval from FERC staff for the use of any additional proposed additives, and all additives would comply with applicable permit requirements. Mountain Valley's *HDD Contingency Plan*[7] specifies the use of instrumentation to monitor drilling fluid pressure and discharge rate, torsional pressure, and annular pressure during pilot hole drilling. Spill kits would be stored on-site, and a vacuum truck would be present prior to and during drilling operations to respond to any potential IR. In addition, containment materials, including straw, fabric filter fence, sand bags and boom and turbidity curtains, would be positioned on-site for immediate use, if necessary. Sediment barriers would also be constructed around the drill entry and exit pits. The *HDD Contingency Plan* requires that regular pedestrian surveys be completed on the land-based sections of drill alignments during drilling operations to facilitate rapid identification and response to an IR. Mountain Valley's *HDD Contingency Plan* would ensure that drill operations are monitored and adjusted to avoid potential IRs, and if one should occur, that the release would be contained to the extent practicable and remediated. We have reviewed Mountain Valley's *HDD Contingency Plan* and find it acceptable.

Based on the above analyses, we conclude that subsurface conditions identified by the geotechnical studies would not render the HDDs infeasible. With consideration of the adopted mitigation measures, we conclude that potential impacts from HDD construction and potential IRs would not be significant.

4.1.5 Geology Conclusions

The Project would traverse a range of geologic conditions and resources. We conclude that construction and operation of the Project facilities in accordance with Mountain Valley's specific *Unanticipated Discovery Plan for Paleontological Resources* and other Project plans would not result in a significant impact on mines, mineral resources, or paleontological resources.

Mountain Valley would reduce the potential for impacts from landslides by following the measures outlined in its Landslide Mitigation Report. In addition, with the implementation of the measures outlined in Mountain Valley's *General Blasting Plan*, *HDD Contingency Plan,* and E&SC Plan, we conclude that impacts on geological resources would be adequately minimized.

[7] Mountain Valley's *Horizontal Directional Drill Contingency Plan* was included as attachment 4 to Mountain Valley's October 23, 2019 supplemental information filing. The *Horizontal Directional Drill Contingency Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191023-5022 in the "Numbers: Accession Number" field.

4.2 SOILS

The soils crossed by the Project were identified and assessed using various data sources including the publicly available Web Soil Survey database. The Web Soil Survey database is a digital version of the original county soil surveys developed by the USDA NRCS (USDA, 2018a). It provides the most detailed level of desktop soils information for general natural resource planning and management. However, it should be noted that the minimum delineation size for many soil surveys is about 1.5 acres, which is over 600 feet of the Project's right-of-way. The Web Soil Survey database provides the proportionate extent of the component soils and their properties for each soil map unit, allowing for an evaluation of potential hazards and soil limitations along the Project. Appendix D identifies by milepost the specific soil units that would be crossed by the Project.

Construction of the Project facilities would temporarily and permanently disturb soils, resulting in increased potential for erosion, compaction, and reduced vegetation following construction. The potential for soil erosion would be minimized through the use of erosion controls and revegetation measures as described in Mountain Valley's Plan and E&SC Plan.

4.2.1 Soil Limitations

Several soil characteristics have the potential to affect or be affected by construction and operation of the Project. These soil limitations include erosion potential, farmland classification, compaction prone soils, rocky soils/shallow depth to bedrock, and poor revegetation potential. Table 4.2-1 lists soil limitations for the Project.

4.2.2 Erosion Potential

Erosion is a continuing natural process that can be accelerated by human disturbance. Factors such as soil texture, structure, slope, vegetation cover, rainfall intensity, and wind intensity can influence the erosion process. Soils most susceptible to erosion by water are typified by bare or sparse vegetation cover, non-cohesive soil particles with low infiltration rates, and moderate to steep slopes. Soils typically more resistant to erosion by water include those that occupy low relief areas, are well vegetated, and have high infiltration capacity and internal permeability. Wind erosion processes are less affected by slope angles than water erosion processes. Wind-induced erosion often occurs on dry soil where vegetation cover is sparse and strong winds are prevalent.

Soils were considered to be prone to water erosion if soils were ranked as having a "K factor" of 0.4 (Moderate erosion classification) or greater. The K factor is a quantitative representation of the potential for bare soil to undergo particle detachment and transportation via water. Soils are considered to be prone to wind erosion if they are in wind erodibility groups (WEG) 1 or 2 (USDA, 2018a). The WEG is a quantitative measure for susceptibility to wind erosion based on soil layers, soil moisture, and plant growth as contributing factors.

Construction of the Project would disturb about 34.4 acres of soils classified as being highly erodible by water. None of the soils that would be disturbed by construction of the Project are highly prone to erosion by wind; however construction activities such as clearing, grading, and equipment movement can nonetheless accelerate the erosion process.

Note: Pig launchers and receivers and Mainline Valves (MLVs) 1, 4, and 8 would be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect); therefore, acreages calculations for the pig launchers and receivers and MLVs are included with those facilities.

a/ Prime farmland includes soils designated by the USDA NRCS as drained and / or reclaimed of excess salts and sodium. No areas of unique farmland or farmland of local importance would be affected by the Project (USDA, 2018b).

b/ Soils with clay loam or finer texture and a drainage class of poor, somewhat poor, or very poor.

c/ Soils with a K factor that is greater than 0.4.

d/ Soils in wind erodibility groups 1 or 2.

e/ Soils that have a depth to bedrock of less than 5 feet (60 inches).

f/ Soils with an average low rating based on factors including but not limited to: drainage class of excessively drained or very poorly drained; K Factor greater than 0.4; and slope greater than 25 percent

g/ Soils with a cobbly, stony, bouldery, shaly, channery, very gravelly, or extremely gravelly modifier to the textural class of the surface layer and / or that have a surface layer that contains greater than 5 percent by weight rock fragments larger than 3 inches.

h/ Totals do not equal 100 percent as not all soils are classified with limitations and certain soils are classified as having multiple limitations.

To minimize soil erosion, the Project would follow BMPs included in Mountain Valley's E&SC Plan. These BMPs may include, but are not limited to:

- installation of slope breakers and trench breakers;
- installation of sediment barriers, such as silt fence and straw bales;
- restoration of soil layering;
- restoration of surface contours; and
- stabilization of disturbed work areas with permanent seeding within seven working days of final grade, weather and soil conditions permitting.

Temporary erosion control devices (ECDs) would be installed immediately following soil disturbance. ECDs would be inspected regularly and would only be removed following the successful revegetation of an affected area. Mountain Valley would also employ permanent ECDs such as trench breakers (at the base of slopes greater than 5 percent and within 50 feet of waterbodies or wetlands) and slope breakers (in all areas except for cultivated lands). In addition, Mountain Valley would implement dust suppression measures, including watering construction areas to reach optimum soil moisture for dust control, thus reducing soil loss due to wind erosion.

4.2.3 Prime Farmland

The USDA (2018b) defines prime farmland as "land that has the best combination of physical and chemical characteristics for producing food, feed, fiber, and oilseed crops." Developed land and open water cannot be designated as prime farmland. Prime farmland typically contains few or no rocks, is permeable to water and air, is not excessively erodible or saturated with water for long periods, and is not subject to frequent or prolonged flooding during the growing season. Soils that do not meet the above criteria may be considered prime farmland if the limiting factor is mitigated (e.g., by draining or irrigating).

The NRCS also recognizes unique farmland and farmland of statewide or local importance. Unique farmland is land that is used for production of specific high-value food and fiber crops. Soils may be considered of statewide or local importance if those soils are capable of producing a high yield of crops when managed according to accepted farming methods.

Construction of the Project would disturb approximately 1,172 acres of prime farmland and farmland of statewide importance, of which 182.6 acres are currently in agricultural use (refer to table 4.2-2).

TABLE 4.2-2

Prime Farmland Affected by the Southgate Project

	Area of Project Workspace within Prime Farmland Areas (Acres) a/							
	Mapped Prime Farmland b/		Prime Farmland Currently in Agricultural Use c/		Mapped Farmland of Statewide Importance d/		Farmland of Statewide Importance Currently in Agricultural Use e/	
Facility	Const f/	Oper g/	Const	Oper	Const	Oper	Const	Oper

Project Total h/	**555.1**	**159.4**	**112.9**	**38.6**	**616.7**	**198.5**	**69.7**	**25.3**

Note: Pig launchers and receivers would be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect); therefore, acreage calculations for the pig launchers and receivers are included with those facilities. MLVs 1, 4, and 8 would be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect); therefore, acreage calculations for these MLVs are included with those facilities.

a/ No areas of farmland of local importance or unique farmland would be affected by the Project.

b/ Prime farmland includes soils mapped and designated as prime farmland by the NRCS if drained and/or irrigated and/or reclaimed of excess salts and sodium.

c/ Agricultural land (i.e., cultivated land) within areas identified as prime farmland. Numbers represent actual land in agricultural use.

d/ Farmland of statewide importance is mapped by Web Soil Survey and determined by the appropriate state agencies which may include areas of soils that nearly meet the requirements for prime farmland and that economically produce high yields of crops when treated and managed according to acceptable farming methods.

e/ Agricultural land (i.e., cultivated land) within areas identified as farmland of statewide importance. Numbers represent actual land in agricultural use.

f/ Construction acres include the area affected by construction (i.e., temporary and additional temporary workspace, contractor yards, and access roads) and the area affected by operation of the Project (i.e., facility operation footprint and 50-foot pipeline permanent right-of-way). The 50-foot-wide permanent right-of-way between HDD entry and exit points and railroad rights-of-way are not included in this acreage.

g/ Includes only the operational footprint of the Project facilities and the 50-foot-wide permanent pipeline right-of-way.

h/ Sums may not equal addends due to rounding. Addends consist of six-decimal digits.

Permanent impacts on prime farmland and farmland of statewide importance would be limited to soils within the footprint of new aboveground facilities (approximately 10.8 acres total) and new permanent access roads (5.5 acres total), where soils would be permanently converted to industrial use. These impacts represent less than 0.01 percent of available prime farmland and farmland of statewide importance in Pittsylvania, Rockingham, and Alamance Counties.[8]

Except where land would be permanently converted to industrial use, in areas currently in agricultural use, impacts on prime farmland and farmland of statewide importance would be minimized by implementing BMPs included in Mountain Valley's Plan. These include measures to conserve and segregate the upper 12 inches of topsoil; test and alleviate compaction (generally via discing); and remove excess rock from topsoil. Mountain Valley would also protect and maintain existing drainage tile and irrigation systems, prevent the introduction of weeds, and retain existing soil productivity, thereby minimizing the potential for long-term impacts on agricultural lands.

4.2.4 Compaction Prone Soils

Soil compaction modifies the structure and reduces the porosity and moisture-holding capacity of soils; the degree of potential compaction was evaluated based on soil texture and drainage class. Compaction is typically of concern when the moisture content of the soils is high such as in hydric soils or during precipitation events.

Impacts on compaction prone soils would be minimized by limiting construction traffic along the right-of-way. Mountain Valley would also decompact all heavily disturbed areas by tilling and/or discing. Mountain Valley would conduct topsoil and subsoil compaction tests using a penetrometer or other appropriate device at regular intervals in agricultural and residential areas, and elsewhere at the discretion of the EI in areas of heavy compaction. If additional decompaction of the area is required, additional mechanical methods (i.e. deep tilling) would be used following consultation with the landowner and state agencies based on desired land use.

4.2.5 Rocky Soils/Shallow Depth to Bedrock

Soils with textural classifications of cobbly, stony, bouldery, shaly, channery, very gravelly, or extremely gravelly in any layer; or that have a surface layer that contains greater than 5 percent by weight rock fragments larger than 3 inches, may be characterized as stony or rocky soils. Typically, stony/rocky soils do not hold water well and exhibit a low revegetation potential due to low water content and higher seed mortality. Additionally, in areas with shallow bedrock (bedrock within 5 feet of the ground surface), there is increased potential to introduce rocks into the topsoil during construction activities.

Construction of the Project, including the right-of-way, ATWS, access roads, and contractor yards would affect 37.3 acres of soils considered to be stony/rocky and 119.6 acres of shallow bedrock. Aboveground facilities associated with the Project would not affect stony/rocky or shallow to bedrock soils.

[8] Mapped prime farmland and farmland of statewide importance totals 515,021 acres in Pittsylvania County; 253,584 acres in Rockingham County; and 232,316 acres in Alamance County (USDA NRCS, 2018b).

The strength and hardness of shallow bedrock encountered during pipeline construction activities would dictate the techniques used for excavation. Mechanical means, such as ripping or conventional excavation would be prioritized for removal of bedrock prior to any bedrock blasting. However, it is anticipated that blasting may be required in some areas, as detailed in section 4.1.4.6.

Mountain Valley would remove excess rock from topsoil, consistent with its Plan, in all disturbed cultivated and rotated croplands, hayfields, and pastures. According to Mountain Valley's Plan, the trench may be backfilled with excavated rock material only to the height of the existing bedrock horizon. In areas of rocky soils, Mountain Valley stated excess rock would be backfilled to a depth of 4 inches or more in locations where rock was present pre-construction such that it would not inhibit herbaceous growth. Otherwise, excess rock would be disposed at an approved site unless the landowner or land managing agency approves an alternative beneficial reuse.

4.2.6 Poor Revegetation Potential

The revegetation potential of soils is based on the surface texture, drainage class, slope, and erosion potential. The clearing and grading of soils with poor revegetation potential could result in a lack of adequate vegetation following construction and restoration of the right-of-way, which could lead to increased erosion, a reduction in wildlife habitat, and adverse visual impacts.

Construction of the Project, including the right-of-way, ATWS, access roads, and contractor yards would affect 24.8 acres of soils classified as having poor revegetation potential. Aboveground facilities would not affect any soils with poor revegetation potential.

In order to minimize and mitigate potential impacts on soils with poor revegetation potential, Mountain Valley would follow measures in its Plan, such as:

- reseeding would be based on seed mix and rate information received for each county from the local NRCS and State Conservation Districts;
- site-specific soil pH modifiers and fertilizers, as required by landowners or regulatory agencies, would be incorporated into the top 2 inches of soil as soon as practicable;
- standard soil amendments (i.e. lime, fertilizer) would be applied in areas of low revegetation potential where no site-specific requirements are identified, to enhance plant establishment and offset potential nutrient loss;
- specific plant composition for revegetation (i.e. cover crops) requests from landowners would be replanted with those specified species; and
- conducting follow-up inspections to determine the success of revegetation and address landowner concerns and development of a corrective action plan for areas that are not responding to revegetation.

Section 2.0 of this EIS provides additional information regarding inspections, and seed mixes are discussed in section 4.4.

4.2.7 Contaminated Soils

A search of federal and state regulatory databases was conducted and 30 sites of potential contamination concern within 0.25 mile of the Project area were identified.[9] The nearest site with an active or unresolved status, Midway Auto Sales, is approximately 100 feet from the proposed Project workspace near MP 43.6. This site is down-gradient of the Project alignment, and available information describes groundwater contamination only. Based on distance from the proposed construction work area and regulatory status, the Project is not anticipated to be affected by other identified sites. Further discussion of potential contaminated sites is provided in section 4.3.1.

Should contamination be discovered during construction, Mountain Valley would notify the affected landowner, coordinate with the appropriate agencies, and follow the procedures put forth in its *Unanticipated Discovery of Contamination Plan*. We have reviewed this plan and find it acceptable. Mountain Valley's *Unanticipated Discovery of Contamination Plan* provides seven stages of response should contamination be discovered during construction:

- Stage 1 – suspend all work activities and movement of personnel to a safe area;
- Stage 2 – identify immediate threats, notify emergency response, and evacuate as necessary;
- Stage 3 – if safety permits, secure the contaminated area with fencing or flagging and provide site personnel to restrict access as needed;
- Stage 4 – the contractor would notify Mountain Valley and the VADEQ or NCDEQ as appropriate;
- Stage 5 – document the discovery;
- Stage 6 – take remedial action including sampling, remedial action determination, remedial action implementation, and disposal; and
- Stage 7 – records of the unanticipated discovery disposal would be kept in accordance with record keeping requirements.

During construction, facilities and equipment may contain hazardous water or fluids, such as oil and fuel, which could leak or be spilled. Proper storage, containment, and handling procedures, as outlined in the SPCC Plan, would minimize the chance of spills and leaks. Additionally, any soils imported to the site for use as fill would be certified contaminant free prior to use.

[9] The list of hazardous sites within 0.25 mile of the Project was included as part of Mountain Valley's March 05, 2019 response to our February 13, 2019 environmental information request, accession number 20190305-5214. Additional information was provided in Mountain Valley's December 16, 2019 supplemental filing, accession number 20191216-5158. The information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field.

4.2.8 Soils Conclusions

Construction and operation of the Project would convert about 16.3 acres of prime farmland and farmland of statewide importance to industrial/commercial use. This constitutes a permanent, but minor impact due to the availability of prime farmland and farmland of statewide importance in the vicinity of the Project.

Mountain Valley would implement its Plan, E&SC Plan, SPCC Plan, and *Unanticipated Discovery of Contamination Plan* to minimize Project impacts on soils. Measures in these plans include installation, inspection, and maintenance of ECDs during construction; spill prevention and clean-up measures; topsoil segregation in agricultural and residential areas; soil compaction mitigation; and revegetation of temporary workspaces and the permanent pipeline right-of-way.

Based on the overall soil conditions and the Project's proposed construction and operation methods, we conclude that construction and operation of the Project would not significantly impact or be affected by soils**.**

4.3 WATER RESOURCES

4.3.1 Groundwater Resources

4.3.1.1 Aquifers

The Project is within the Piedmont physiographic province (USGS, 2000). The Project would cross the Early Mesozoic Basin and Piedmont Crystalline-Rock aquifer systems in Virginia and North Carolina (see table 4.3-1). Each aquifer system crossed by the Project is described below. Unconsolidated surficial aquifers consisting primarily of reworked Pleistocene-age glacial sediments and Holocene-age alluvium also overlie both aquifer systems but are discontinuous in extent and character. These surficial aquifers are not commonly used as potable water sources in the Project area but are generally suitable for municipal purposes. North Carolina and Virginia do not have state level aquifer designations or regulations. The Project would not cross any sole source aquifers or principal source aquifer areas.

TABLE 4.3-1

Source: USGS, 2000
gpm=gallons per minute

Piedmont Crystalline-Rock Aquifer System

The Piedmont Crystalline-Rock aquifer system is the most common and widespread aquifer in the region (USGS, 2000). This aquifer system is generally comprised of crystalline metamorphic and igneous rock types, including coarse-grained gneiss and schist; however, fine-grained rocks such as phyllite, and metamorphosed volcanic rock such as volcanic tuff, ash, and lava flows are also common. Unconsolidated saprolite, colluvium, alluvium, and soil overlie the bedrock in most areas. The most significant water supplies in this aquifer system are found within a few hundred feet of the surface. Generally, the water is suitable for drinking; however, iron, manganese, and sulfate can occur locally in elevated concentrations.

Early Mesozoic Basin Aquifer System

The Early Mesozoic Basin aquifer system composes a small portion of the aquifers in the region (USGS, 2000); the Project is in the Dan River-Danville Basin aquifer area. The sedimentary rocks of the early Mesozoic systems generally had considerable effective porosity between grains but due to compaction and cementation, only a small part of the groundwater now flows between pores. Groundwater primarily moves along joints, fractures, and bedding planes. Aquifers in the Early Mesozoic Basin generally yield more water than other non-carbonated aquifers in the Piedmont province and are generally suitable for drinking.

4.3.1.2 Water Supply Wells and Springs

Published, recent data on springs in Virginia and North Carolina are not currently available. Information on public water supply wells was obtained from the EPA's Safe Drinking Water Information System (SDWIS) (EPA, 2016a). Digital location information for public water

supplies was obtained from the VADEQ and the NCDEQ. Based on surveys completed at this time, there are no public water supply wells or springs within 150 feet of the Project. Based on current information there are 34 private wells within 150 feet of the Project. The majority of private wells identified have undetermined use, except for six that have been identified as groundwater testing wells and one that has been identified as a monitoring well. Landowner surveys by Mountain Valley to identify any private wells and springs that are used for potable water on affected properties are ongoing. Therefore, **we recommend that**:

- **Prior to construction, Mountain Valley should file with the Secretary, for review and written approval by the Director of OEP, the locations of all private water wells and springs identified within 150 feet of the Project work areas, including the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs.**

Construction grading, clearing, trench excavation, and blasting have the potential to affect water well quality through a short-term increase in turbidity at nearby wells and/or springs. Heavy construction equipment and excavation could physically damage wells. Spills of fuels and hazardous substances during construction also have the potential to affect shallow groundwater sources. Additionally, blasting may impact water well yields since vibrations caused by blasting have the potential to locally affect bedrock fractures within the bedrock aquifer, which could temporarily result in diminished well yields and increased turbidity. Details of blasting locations, procedures, and mitigation measures are included in section 4.1.4.7. Potential impacts on wells and shallow groundwater sources are discussed in more detail below in section 4.3.1.7.

If springs are identified that could be affected by construction activities, Mountain Valley would consult with the appropriate regulatory agencies and with individual landowners to minimize impacts. In areas where a public or private water supply well or spring is identified within 150 feet of the Project, Mountain Valley would flag the wellhead or spring as a precaution, and notify the water supply well owner/operator of Project activities prior to commencing construction in that area.

As described in the Project's *Water Resources Identification and Testing Plan*[10], Mountain Valley would offer pre-construction and post-construction water quality and yield testing for all water supply wells located within 150 feet of Project workspaces. With landowners' permission, Mountain Valley would conduct two pre-construction water quality and yield evaluations on water wells and springs. One pre-construction evaluation would be conducted 6 months prior to construction and the second pre-construction evaluation would be conducted 3 months prior to construction. If a landowner does not grant permission for pre-construction testing, Mountain Valley would not conduct post-construction testing as there would no baseline data by which to measure potential changes in water yield and quality.

[10] Mountain Valley's *Water Resources Identification and Testing Plan* was included in the March 05, 2019 filing. The *Water Resources Identification and Testing Plan* can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190305-5214 in the "Numbers: Accession Number" field.

Pre-construction and post-construction water quality analysis would test for the target analytes based on EPA guidance on Analytic Methods for Drinking Water (EPA, 2019). The target analytes include: pH, specific conductance, temperature, turbidity, total and fecal coliform bacteria, total dissolved solids, total suspended solids (TSS), hardness, alkalinity, sulfate, chloride, nitrate, bicarbonate, calcium, magnesium, sodium, potassium, iron, manganese, oil and grease, volatile and semi-volatile organic compounds, and hydrocarbons. Mountain Valley has also agreed to conduct water yield testing during the pre-construction and post-construction sampling.

Mountain Valley would evaluate any complaints of damage to water supply wells associated with construction of the Project and identify a suitable settlement with the landowner if damage occurs. If it is determined that suitable potable water is no longer available due to construction-related activities, Mountain Valley would provide adequate quantities of potable water during repair or replacement of the damaged water supply. In the event that an impact occurs to a livestock well, Mountain Valley would provide a temporary water source to sustain livestock while a new water supply well is constructed. In the event that an impact occurs to an irrigation well used for crops, Mountain Valley would compensate landowners for losses in crops resulting from well damage and provide a temporary water source while a new permanent water supply is constructed.

For public water supplies, existing documentation of well production would be used to establish baseline yield. The pre-construction testing program would be updated to include a tailored analysis list that meets the requirements of the public supplier permit and is agreed upon by the public supplier. If it is determined that a long-term solution is required, Mountain Valley would restore the well's water quality and yield to pre-construction conditions by providing the affected public supply source with either a new permanent treatment system, a new on-site well, or a combination of both.

The Project does not propose to use groundwater for hydrostatic testing, dust control, or HDD. However, some groundwater would be removed from the trench during dewatering. Water pumped from the trench during dewatering activities would be released back into the same drainage basin thus not constituting a consumptive use of groundwater from the basin. Mountain Valley would comply with all federal, state, and local agencies permits and requirements for water procurement and water releases, so as to minimize impacts on groundwater resources. Considering the small amount of water withdrawn and released during construction activities, and measures that would be implemented to reduce impacts from water withdrawals and release, the Project would not significantly change the availability of groundwater in the area.

4.3.1.3 Wellhead and Source Water Protection Areas

The 1986 amendment to the Safe Drinking Water Act (SDWA) requires each state to develop and implement a wellhead protection program. In 1996, the SDWA was amended to require the development of a broader-based Source Water Assessment Program (SWAP). The intent of each state's SWAP is to assess contamination threats to all public groundwater and surface water drinking water sources. No wellhead or source water protection areas were identified in Rockingham or Alamance Counties, Virginia or Pittsylvania County, North Carolina.

4.3.1.4 Contaminated Groundwater

Existing contaminated groundwater resources may be encountered during construction of the Project. Contaminated groundwater may pose health and safety concerns to construction workers and potentially elevate environmental risk. The EPA's Facility Registry Service database was used to identify contaminated sites located within 0.25 mile of the Project. Additional federal, state, and local databases containing information of known locations of current and historic contamination were used to identify locations of potential contamination concern. The nearest site with an active or unresolved status, Midway Auto Sales, is approximately 100 feet from the Project workspaces near MP 43.6[11]. This site is listed for a release of gasoline to groundwater that was identified during the removal of an underground storage tank in 1994. Given the nature and the age of the release, as well as media impacted and because the site is topographically down-gradient of the alignment, the potential for Project activities to encounter associated groundwater contamination, if still present, is negligible. Further discussion of potential contaminated sites is provided in section 4.2.7.

Disturbance of contaminated groundwater by construction activities could potentially elevate environmental risk. During construction, facilities and equipment may contain hazardous water or fluids, such as oil and fuel, which could leak or be spilled. Proper storage, containment, and handling procedures, as outlined in the SPCC Plan, would minimize the chance of spills and leaks.

4.3.1.5 General Impacts and Mitigation

The construction of the Project could encounter shallow groundwater during excavation of the trench to install the pipe. Trench dewatering could temporarily alter overland water flow, groundwater recharge, and groundwater levels in the immediate vicinity of the trench. Construction grading, clearing, trench excavation and trench blasting could temporarily alter overland water and groundwater recharge and create minor fluctuations in groundwater levels. Ground disturbance associated with construction could potentially increase erosion and sedimentation and result in elevated levels of turbidity.

Trenches are not expected to inhibit groundwater flow because they would be immediately backfilled following pipeline installation and the pipeline is not large enough to both laterally and vertically impede groundwater flow. In addition, the pipeline would not inhibit water infiltration because the pipe would not be large enough to create an impermeable barrier over the aquifer.

Once construction is complete, Mountain Valley would re-establish vegetation and restore the ground surface to original contours as closely as practicable. Restoration would facilitate establishment of pre-construction overland water flow and recharge patterns. Use of construction

[11] The list of hazardous sites within 0.25 mile of the Project was included as part of Mountain Valley's March 05, 2019 response to our February 13, 2019 environmental information request, accession number 20190305-5214. Additional information was provided in Mountain Valley's December 16, 2019 supplemental filing, accession number 20191216-5158. The information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field.

practices outlined in Mountain Valley's Plan and Procedures, and the Project-specific E&SC Plan would minimize impacts of the Project.

The Project's SPCC Plan addresses the prevention and mitigation measures that would be implemented to avoid or minimize the potential impacts of a hazardous material spill during construction. Measures outlined in the SPCC Plan include, but are not limited to:

- identification, labeling, and reporting of all potential pollutant sources at the work site;
- regular inspection of containers and tanks for leaks;
- prohibition of fueling, lubricating activities, and hazardous material storage in or adjacent to sensitive areas;
- use of secondary containment for storage of fuels, oils, hazardous materials, and equipment;
- implementation of emergency response procedures, including spill reporting procedures; and
- use of standard procedures for excavation and disposal of any soils contaminated by spillage.

Environmental inspectors would be trained to detect evidence of soil and groundwater contamination (e.g., visible sheen). If contaminated groundwater is encountered during construction, Mountain Valley would implement the measures outlined in its *Unanticipated Discovery of Contamination Plan*. Construction activities would be suspended and the area around potential contamination would be restricted. Sampling and remediation efforts would be undertaken to identify and contain the contamination. Mountain Valley would mobilize an appropriate contractor to segregate and dispose of contaminated soils. Mountain Valley would notify the affected landowner and the appropriate federal or state agency of the contamination and clean-up efforts.

Groundwater contamination from pipeline operations is unlikely because the pipeline would carry methane, a substance lighter than air that would rapidly dissipate in the event of a leak. Additionally, methane has a solubility limit of 3.5 milliliter/100 milliliter of water at a temperature of 17°C, degasses from an aqueous solution, and is considered non-toxic when dissolved in water. As a result, there is no risk of methane dissolution into groundwater. In addition, Mountain Valley would regularly monitor the pipeline for signs of leaks.

As previously stated, blasting has the potential to affect groundwater quality through a short-term increase in turbidity at nearby wells and/or springs. Although no springs have been identified within 150 feet of the Project areas, blasting may impact groundwater yield by altering the discharge to springs in the vicinity of blasting areas. Vibrations caused by blasting also have the potential to locally affect bedrock fractures within the bedrock aquifer, which could temporarily result in diminished well yields and increased turbidity.

In areas of shallow bedrock, Mountain Valley would use mechanical methods to excavate the pipeline trench when possible. However, blasting may be necessary to achieve the required

trench depth if mechanical methods prove to be ineffective or inefficient. Mountain Valley would minimize or avoid impacts on groundwater during blasting by implementing the construction practices outlined in its *General Blasting Plan*. As stated in the *General Blasting Plan*, licensed blasting contractors would conduct the blasting activities in accordance with all applicable permits. Mountain Valley would conduct pre-construction and post-construction water quality testing for groundwater supply resources within 150 feet of the Project's construction workspace, with landowner permission. If it is determined that blasting activities caused an adverse effect to a specific groundwater supply, Mountain Valley would work with the owner to ensure they have water until the damaged supply is repaired or replaced, at Mountain Valley's expense.

4.3.1.6 Groundwater Conclusions

Temporary, minor, and localized impacts could result during trenching activities in areas with shallow groundwater (at depths less than 10 feet below the ground surface). Mountain Valley would implement BMPs to protect groundwater resources, including erosion controls, restoration of the right-of-way, revegetation, and enhanced mitigation BMPs as discussed above.

Mountain Valley would adhere to all applicable federal, state, and local requirements to protect groundwater resources. We conclude that the groundwater mitigation measures proposed by Mountain Valley would adequately avoid or minimize potential impacts on groundwater resources. Therefore, we do not anticipate long-term or significant impacts on groundwater resources as a result of construction or operation of the Project.

4.3.2 Surface Water Resources

The USGS classification for surface waters divides drainage basins into successively smaller hydrologic units. Each hydrologic unit is identified by a unique hydrologic unit code, referred to as a hydrologic unit code (HUC), consisting of two to 12 digits. The Project crosses four sub-basins (8-digit HUC) and six watersheds (10-digit HUC), which are listed in table 4.3-2.

In general, the watersheds crossed by the Project contain development consistent with a rural environment. The watersheds contain forests, open land, agriculture, silviculture, and residential development. Development in the watersheds results in some degradation of water quality. For instance, agricultural runoff or runoff from cleared areas in a typical rain event will cause short-term turbidity in streams. We expect that the water quality and biota within the Project area streams is largely reflective of the degree of upstream development.

TABLE 4.3-2

Watersheds Crossed by the Southgate Project

County	Milepost	Sub-basin (8-digit HUC) a/	Watershed (10-digit HUC)
Virginia			
Pittsylvania	0.0-10.8	Banister River (03010105)	Cherrystone Creek-Banister River (0301010501)
	10.8-19.9	Upper Dan (03010103)	Wolf Island Creek-Dan River (0301010310)
	19.9-26.1		Cascade Creek-Dan River (0301010309)
North Carolina			
Rockingham	26.1-39.7	Upper Dan (03010103)	Cascade Creek-Dan River (0301010309)
	39.7-48.2	Lower Dan (03010104)	Hogans Creek-Dan River (0301010401)
	48.2-52.6	Haw River (03030002)	Headwaters Haw River (0303000202)
Alamance	52.6-56.1	Haw River (03030002)	Headwaters Haw River (0303000202)
	56.1-73.2		Back Creek-Haw River (0303000204)

Sources: VADEQ, 2018c; NCDEQ, 2018c

a/ HUC is a classification system developed by the USGS to classify drainage basins from the regional level to individual watersheds.

4.3.2.1 Protected Watersheds and Public Supply Intakes

North Carolina

The North Carolina Division of Water Resources (NCDWR) Water Supply Watershed Protection Program is a cooperative program administered by local governments which follows statewide management requirements. The program designates critical and protected watershed areas. Critical watershed designations apply to areas upstream of a water supply intake or reservoir where pollution risk is elevated. The designation covers the area extending 0.5 mile, or to the top of the nearest ridgeline (whichever is closest), from the edge of the normal pool elevation. Protected watershed designations apply to areas five miles upstream of the critical watershed designation in a WS-IV water supply area. Watershed designations restrict development density but do not include any additional restrictions for pipelines or specific erosion and sediment control requirements.

One public water supply intake is located within 3 miles downstream of the Project in North Carolina. The City of Burlington water intake in the Stony Creek Reservoir is located 1.8 river miles downstream of the Project. This water intake is further discussed in section 4.3.2.4 below. The Project would cross two designated protected watersheds and one designated critical watershed in North Carolina. The critical watershed and surrounding protected watershed are associated with Stony Creek (WS-II, HUC-10: 0303000204). The second protected watershed is associated with the Haw River (WS-IV, HUC-10: 0303000202). The Project would cross a total of approximately 7.1 miles of designated protected watershed area and 1.5 miles of designated critical watershed area. Mountain Valley would implement mitigation measures specified in its Plan and Procedures, and its Project-specific E&SC Plan to minimize any potential impacts on public water sources.

Virginia

The Virginia Department of Health Office of Drinking Water (VADH-ODW) maintains the SWAP in Virginia for both ground and surface water. Because the program is voluntary and lacks reporting requirements, an accurate database of ground and surface water sources does not exist. The VADEQ classifies 16 waterbodies crossed by the Project as public water supply; however, no public surface water supply intakes are located within 3 miles of the Project in Virginia. As mentioned above, Mountain Valley would implement mitigation measures specified in its Plan and Procedures, and its Project-specific E&SC Plan to minimize any potential impacts on public water sources. Based on past experience, the implementation of proposed mitigation measures and the distance between the pipeline crossings and water supply intake are sufficient to safeguard the water supply intake during pipeline construction and operation. VADEQ classifications are discussed further in section 4.3.2.3.

4.3.2.2 Surface Water Crossings

Mountain Valley's Procedures define waterbodies as any natural or artificial stream, river, or drainage with perceptible flow at the time of crossing, and other permanent waterbodies such as ponds and lakes. Perennial waterbodies contain water for most of the year. Intermittent streams include those that flow only seasonally or following rainfall events. Ephemeral waterbodies include those that only carry stormwater in direct response to precipitation, with water flowing only during and shortly after large precipitation events.

Mountain Valley's Procedures further categorize waterbodies by their size as minor, intermediate, or major crossings. Minor waterbodies are less than or equal to 10 feet wide at the water's edge. Intermediate waterbodies are greater than 10 feet wide but less than or equal to 100 feet wide. Major waterbodies are greater than 100-feet-wide. Table 4.3-3 summarizes the waterbodies crossed by the Project. A complete list of waterbody crossings pending COE's field review is located in appendix B.5.

A total of 277 waterbodies would be either crossed by the Project or are present within construction workspace. The pipeline would require 223 crossings of waterbodies, four of which are major waterbodies. Access roads for the Project would cross seven minor and one intermediate waterbodies. A total of 46 waterbodies are present in the temporary or permanent workspace but would not be crossed by the pipeline. None of the access road crossings or workspace impacts would affect major waterbodies.

The Project crossings would follow Mountain Valley's Procedures, the E&SC Plan, and NPDES permit requirements. Five crossings would be conducted by four conventional bores and three crossings would be conducted by two HDD crossings. All other crossings would be open cut, dry-ditch crossing methods (dam-and-pump or flume method). All open-cut, dry-ditch crossings would be minor or intermediate waterbodies except the proposed Sandy River crossing, which would be a major waterbody at the crossing location. Additional information regarding the Sandy River crossing is included in section 4.3.2.4. Mountain Valley would determine if it would use the dam-and-pump or flume crossing method at each crossing based on-site conditions. Descriptions of these crossing methods are located in section 2.4.1. All in-stream work would be conducted during low flow periods when practicable.

TABLE 4.3-3

Flow Types of Waterbody Crossings for the Southgate Project a/

Project/ State	FERC Size Classification					Flow Type				
	Minor	Inter-mediate	Major	N/A b/	Total	Pond	Peren	Interm	Ephem	Total
H-605 (VA)	1	0	0	0	1	0	0	1	0	1
H-650 (VA)	41	20	1	6	68	2	38	25	3	68
H-650 (NC)	121	36	3	24	184	3	90	72	19	184
Access Roads (VA)	3	0	0	5	8	0	2	5	1	8
Access Roads (NC)	4	1	0	11	16	0	6	7	3	16
Total	**170**	**57**	**4**	**46**	**277**	**5**	**136**	**110**	**26**	**277**

a/ Some waterbodies would be crossed at more than one location. This table accounts for each crossing of all affected waterbodies.

b/ N/A FERC Classifications are waterbodies which are within the workspace, but are not crossed by the pipeline centerline, road, or aboveground facility.

Abbreviations:

Ephem = Ephemeral

Interm = Intermittent

Peren = Perennial

We received comments on the draft EIS regarding evaluation of trenchless methods across all waterbodies crossed by the Project. During the environmental review process, we evaluated all waterbody crossings proposed by Mountain Valley and in certain cases where we considered a waterbody to be sensitive and a trenchless method feasible, we requested Mountain Valley propose a trenchless method (HDD or conventional bore). In all other cases, we determined a dry-ditch crossing would not result in significant impacts on the waterbody.

Conventional bore and HDD crossing methods both avoid direct impacts on waterbodies by boring underground to cross the waterbody instead of trenching through the streambed and banks. For both crossing methods, Mountain Valley would place boring locations outside of the waterbody and associated riparian area and no disturbance of the waterbody is required. Conventional bore and HDD crossing methods are proposed for crossings where sensitive fish or mussel species presence required the crossing to avoid waterbody disturbance. HDD crossings are typically used for waterbody crossings unless local conditions require a conventional bore. Additional information regarding sensitive species at waterbody crossings is included in section 4.6.5.

Mountain Valley would use HDD crossings at the Dan River (248 feet wide at MP 30.1) in Rockingham County, North Carolina and the Stony Creek Reservoir (296 feet wide at MP 63.6) in Alamance County, North Carolina. Both crossings are major waterbodies. An ephemeral

waterbody (S-A18-17) would also be crossed as part of the Dan River HDD. HDD crossing methods are required for these crossings due to the long distance of each crossing and topographic constraints on pit excavation for a conventional bore crossing. Section 4.1.4.10 contains further description and analysis of the proposed HDD crossings. Potential impacts associated with the HDD method are described further below in section 4.3.2.7.

The conventional bore crossing at Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek are proposed due to the potential presence of federal or state-listed aquatic species in these systems. Cascade Creek is a major waterbody, Wolf Island Creek is an intermediate waterbody, and Deep Creek is a minor waterbody. Dry Creek is an intermediate waterbody that would also be crossed by the Cascade Creek conventional bore since the pipeline crossing at this location is at the convergence of Cascade Creek and Dry Creek. An intermittent waterbody (S-A19-269) is within the span of the Wolf Island Creek conventional bore crossing.

In comparison with HDD crossing methods, using conventional bore methods at the Cascade/Dry Creek crossing would result in a substantially shorter crossing length, construction time, and temporary workspace impacts. The proximity of Cascade/Dry Creek to the existing Transco pipeline right-of-way poses additional construction hurdles to an HDD crossing. The Wolf Island Creek crossing does not have sufficient space in the current alignment to accommodate the temporary workspace that would be required for an HDD crossing. Whereas, a conventional bore crossing requires less temporary workspace and would be feasible within the current alignment. Conventional bores require large entry and exit pit excavations at each end of the bore pathway and therefore create the risk of sediment runoff entering the adjacent waterbody. Of greatest risk to the waterbody is the possibility of the borehole collapsing without warning. In such a case the bed of the waterbody could collapse and reroute the waterbody into the bore pathway. As with its other construction methods, Mountain Valley would implement measures to reduce runoff from the construction right-of-way as provided in Mountain Valley's Plan and Procedures, the E&SC Plan, and NPDES permit requirements. Mountain Valley would allow for a vegetative buffer on each side of the waterbody crossing to the extent practicable as noted in the site-specific crossing plans[12]. Mountain Valley would use a casing, if required, to prevent the bore from collapsing. Mountain Valley has developed final site-specific plans for each of the HDD and conventional bore crossings, which we have reviewed and find acceptable.

Mountain Valley's Procedures specify that all extra work areas should be set back at least 50 feet from waterbodies and wetlands. Mountain Valley has proposed ATWSs at 15 locations within 50 feet of a waterbody. Appendix B.3 provides the locations where Mountain Valley proposes less than a 50-foot setback from a waterbody and the site-specific rationale for the requested modification to the Mountain Valley Procedures. Based on our review, and additional

[12] Mountain Valley's site-specific crossing plan for the Sandy River was included as attachment 14-1 to Mountain Valley's May 13, 2019 filing, accession number 20190513-5181. A revised crossing plan was provided at attachment 9-1 to Mountain Valley's December 16, 2019 filing, accession number 20191216-5158. Mountain Valley's site-specific crossing plan for Deep Creek was included in its October 23, 2019 supplemental filing accession number 20191023-5022. This information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field.

justifications provided by Mountain Valley, we have determined that Mountain Valley has provided adequate justification for the requested ATWSs.

Waterbody crossings would be aligned perpendicular to the axis of the waterbody channel as closely as local conditions and engineering constraints allow. In accordance with Mountain Valley's Procedures, when a pipeline route runs parallel to a waterbody, the Project would maintain a 15-foot buffer of undisturbed vegetation between the waterbody, or adjacent wetland, and the construction workspace, unless local conditions do not allow the setback. Mountain Valley is requesting modification to the FERC Procedures at 23 locations (totaling 0.25 mile) where the Project would parallel a waterbody, or adjacent wetland, and remove vegetation within 15 feet. These locations and removal of vegetation within 15 feet of the waterbody is needed to avoid construction on side slopes, to collocate the pipeline with existing rights-of-way, or to avoid residences. We have reviewed all of the justifications for the parallel locations and find them all to be acceptable. Appendix B.8 includes details for each location.

Mountain Valley would use measures outlined in its Plan and Procedures, as well as the Project-specific E&SC Plan to minimize impacts. We received comments regarding special measures to protect waterbodies where the Project workspace would parallel and remove vegetation within 15 feet of the waterbody.[13] In response to these comments, Mountain Valley stated that enhanced and/or additional ECDs may be required to further protect the resource, thus potentially creating additional maintenance requirements.[14] Mountain Valley did not give specific details about these enhanced erosion control measures and maintenance requirements; therefore, **we recommend that:**

- **Prior to construction, Mountain Valley should file with the Secretary, for review and written approval by the Director of OEP, site-specific plans detailing the enhanced erosion control measures and maintenance requirements for each location where the Project would parallel and remove vegetation within 15 feet of a waterbody**.

Once the pipeline installation is complete, Mountain Valley would restore construction areas and re-establish vegetation in order to prevent erosion and sedimentation along these waterbodies and wetlands. With implementation of Mountain Valley's Plan and Procedures, and our recommendation for Mountain Valley to provide additional details regarding their proposed enhanced erosion control measures prior to construction and subject to review and approval from the Director of OEP, we conclude that impacts on waterbodies and wetlands would be minimized.

[13] See Mountain Valley's response to NCWRC's comments (accession number 20190916-5189) on the draft EIS, accession number 20191023-5022. The information can be viewed on the FERC website at http://www.ferc.gov. 4.3.2.3 Contaminated Sediments and Impaired Waters

CWA Section 303(d) requires that each state review, establish, and revise water quality standards for all surface waters within each state. State classification systems develop monitoring and migration programs to ensure that water standards are attained as designated. Waters that fail to meet their designated beneficial use are considered as impaired and are listed under a state's 303(d) list of impaired waters.

North Carolina

In February 2014, the Eden North Carolina Coal Ash Spill occurred approximately 2.3 river miles upstream from the Project's crossing of the Dan River at MP 30.1 in Rockingham County (EDR, 2018). An estimated 39,000 tons of coal ash spilled from Duke Energy's Dan River Steam Station into the Dan River. In 2015, after extensive clean-up efforts, the EPA determined that the Dan River needed no further ash removal and that no exceedances of human health or ecological screening thresholds associated with coal ash had occurred. Mountain Valley proposes to cross the Dan River via HDD and no in-stream disturbance is anticipated. Due to the clean-up efforts and the HDD crossing, no impacts associated with this coal ash release are expected. Surface water withdrawal from the Dan River is proposed at MP 30.1 for hydrostatic testing, HDD, and dust control. These withdrawals would be conducted at a fixed point on the river, with the intake screened and floated above the stream bed, and maintained at a low enough rate that significant sediment disturbance would not be expected. As a result, the withdrawals would not be expected to have an impact on past coal ash deposits in the sediment.

The NCDEQ lists the Dan River as impaired in North Carolina due to turbidity in the draft 2018 NCDEQ 303(d) list (NCDEQ, 2018b). Due to the use of an HDD crossing method, impacts would be limited to surface water withdrawal. As discussed above, withdrawal and discharge procedures would not be expected to impact turbidity and we do not expect the Project to contribute to further impairment of the Dan River. The majority of other waterbodies crossed in North Carolina have not been assessed for impairment or are classified as Category 3a (Inconclusive Data).

The Project would also comply with the NPDES permits which minimize pollutant discharge. The Project would follow requirements for increased inspections to twice per week for NPDES measures within TMDL limited watersheds. Mountain Valley would coordinate with NCDEQ to ensure that areas with increased inspection schedules are properly identified and schedules are observed.

Virginia

Virginia Antidegradation Policy (9VAC25-260-30) classifies all surface waters into one of three tiers that determines antidegradation protection (additional information is provided in section 4.3.2.6). Tier I crossings require satisfying adopted water quality standards. Tier II crossings permit limited negative effects on water quality only in specific circumstances. The VADEQ considers Tier III waters exceptional quality and increased pollutant discharge is prohibited. Tier I and II crossing requirements are addressed by the E&SC Plan and impacts are not expected to affect water quality. The Project does not cross any Tier III waters in Virginia.

Three waterbodies crossed by the Project in Virginia are designated as Category 4a Impaired (VADEQ, 2018b). Little Cherrystone Creek, White Oak Creek (crossed twice), and Sandy Creek are listed as impaired due to *Escherichia coli*. The VADEQ lists the Dan River in Virginia as impaired due to *Escherichia coli* as well as mercury and polychlorinated biphenyl (PCB) levels in fish tissues. In addition the VADEQ lists the Banister River as being impaired with *Escherichia coli*. However, it should be noted that the portions of the Banister River and the Dan River listed as impaired are downstream from the Project crossing locations. The majority of other waterbodies crossed in Virginia have not been assessed for impairment or are classified as Category 3a (Inconclusive Data).

Mountain Valley would cross impaired waters in Virginia using a dry crossing technique (e.g. flume or dam-and-pump) if there is flowing water at the time of construction. Mountain Valley would use BMPs and measures outlined in Mountain Valley's Plan and Procedures, as well as the Project-specific E&SC Plan to maintain stream conditions and minimize further impairment. Furthermore, Mountain Valley would design and install BMPs in compliance with NPDES permit requirements that control soil erosion and sedimentation down-gradient of construction areas. Once the waterbody crossing is complete, Mountain Valley would restore construction areas and re-establish vegetation in order to prevent erosion and sedimentation along waterbodies.

We do not anticipate that a pipeline installed underneath waterbodies would contribute to the impairment of streams for *E. coli* and therefore would not contribute to the further impairment of Little Cherrystone Creek, White Oak Creek, and Sandy Creek in Virginia. VADEQ commented that hydroseeding could be a contributing factor to PCB concentrations in the Dan River (VADEQ, 2018b). The Project would avoid hydroseeding within 100 feet of direct tributaries to the Dan River.

4.3.2.4 Federal and State Designated Use and Exceptional Waters

National Wild and Scenic Rivers

The Nationwide Rivers Inventory (NRI) designates free-flowing river segments in the United States that possess outstandingly remarkable natural or cultural values, which are considered to be of national significance (NPS, 2017). The National Park Service (NPS) maintains the NRI as a list of river segments that potentially qualify as national wild, scenic, or recreational river areas. In addition to the NRI database, we reviewed the National Wild and Scenic River System database to identify federally designated wild, scenic, or recreational waterbodies.

The segment of the Dan River crossed by the Project is included in the NRI list, but not designated as a National Wild and Scenic River. The NPS consultation indicated that an HDD crossing of the Dan River and implementation of appropriate BMPs would reduce potential impacts on the river and the surrounding landscape. Mountain Valley would install applicable BMPs outlined in the E&SC Plan and would implement the *HDD Contingency Plan* as described in section 4.1.

State Scenic Rivers

Virginia administers the Virginia Scenic River Program to identify, designate, and protect rivers and streams that possess outstanding scenic, recreational, historic, and natural characteristics of statewide significance. The Sandy River is a major waterbody crossed by the Project and qualifies for a potential designation that may result in a scenic river designation in the future. The Project would cross the Sandy River by using a dry crossing method (flume). To decrease visual impacts from the crossing, Mountain Valley would use native seed mixes and hand plant riparian vegetation. In addition, Mountain Valley would coordinate with the VADCR to determine if additional mitigation measures are necessary. Mountain Valley would use applicable BMPs to minimize impacts, as outlined in the E&SC Plan.

The Project does not cross other waters designated in the Virginia Scenic River Program. The Project would cross the Banister River which has a potential Virginia Scenic River Program future designation as a Blueway (a designated recreational water trail). However, the current construction schedule anticipates that the Project would be complete prior to any listing as a Blueway. The Project's effects on boating and recreational use of the Sandy and Banister rivers is discussed in section 4.8.4.1.

North Carolina administers a river designation intended to protect specific rivers with outstanding natural, scenic, educational, recreational, geologic, fish and wildlife, historic, scientific, cultural or other values. The Project does not cross any North Carolina rivers with these designations.

State Designated Use and Exceptional Waters.

Virginia maintains a program administered by VADEQ that uses six primary designations: aquatic life, fish consumption, public water supply, recreation use, shellfishing, and wildlife use. The VADEQ uses additional subcategories in the classification system, but none of the subcategories applies to waters crossed by the Project. The majority of the waters crossed by the Project have not been assessed and default to the basic four classifications (aquatic life, recreation, fish consumption, and wildlife). Waterbodies crossed by the Project include the following classifications: aquatic life, wildlife, fish consumption, and recreation. Some of the waterbodies crossed by the Project are also designated for the public water supply use. Crossings would use applicable BMPs as established in Mountain Valley's Plan and Procedures and the E&SC Plan to minimize impacts.

The NCDWR has established surface water designations that define the best uses to be protected within these waters. The designations identify water quality standards that protect those uses. The Project would cross waters with the following designations:

- Class C: Secondary use for recreation, fishing, wildlife, fish consumption, and aquatic life.
- Critical Area (CA): Area adjacent to a water supply intake or reservoir where risk associated with pollution is greater than from the remaining portions of the watershed.

- High Quality Waters (HQW): Supplemental classification to protect waters rated as exceptional for biological or physical/chemical characteristics.
- Nutrient Sensitive Waters (NSW): Waters needing additional nutrient management due to excessive growth of microscopic or macroscopic vegetation.
- Water Supply II (WS-II): Water sources for drinking, culinary, or food processing where a Water Supply I (WS-I) classification is not feasible. WS-II waters are generally in predominantly undeveloped watersheds. All WS-II waters are also designated HQW and Class C.
- Water Supply IV (WS-IV): Water sources for drinking, culinary, or food processing where a WS-I, WS-II, or WS-III classification is not feasible. WS-IV waters are generally in moderately to highly developed watersheds. All WS-IV waters are also designated Class C.
- Water Supply V (WS-V): Water supplies draining into WS-IV waters, waters used by industry to supply drinking water to employees, or waters formerly used as water supplies. All WS-V waters are also designated as Class C.

All but four of the waters crossed by the Project in North Carolina are designated only as Class C. The two waters designated as WS-II, HQW, NSW, and CA would be crossed by HDD (Stony Creek Reservoir, MP 63.6) or conventional bore (Deep Creek, MP 64), thus minimizing any disturbance to the waterbody. The City of Burlington expressed concern about the potential impacts of an IR into the Stony Creek Reservoir. As discussed in section 4.1.4.9, the HDD should cross into competent bedrock approximately 350 feet from the bank of Stony Creek Reservoir and would remain within competent bedrock, with a depth of cover of 50 to 55 feet, for the length of the reservoir crossing. Based on subsurface conditions and depth of cover, an IR is not likely to occur within or immediately adjacent to the Stony Creek Reservoir. Further, drilling fluids associated with HDD operations would consist primarily of water and bentonite clay; additional additives would require approval by FERC staff prior to use. Mountain Valley would follow its HDD Contingency Plan, which specifies measures to ensure that drilling operations are monitored and adjusted to avoid potential IRs. Therefore, impacts on this reservoir are not expected. In the unlikely event of an IR, the HDD Contingency Plan contains measures to contain and remove the material, if practicable.

The Project would cross one WS-V and NSW designated waterbody (Boyds Creek, MP 67.6) and one WS-IV and NSW designated water (Giles Creek, MP 48.7) via dam-and-pump or flume methods. Crossings would use applicable BMPs as established in the E&SC Plan and Mountain Valley's Procedures. Crossings of these waterbodies would temporarily increase turbidity which could migrate downstream. However, turbidity from a dry crossing is short lasting and would be expected to dissipate within a few hundred feet of the crossing.

As mentioned in section 4.3.2.1 above, the closest surface water intake to the Project is 1.8 miles downstream of the crossing of the Stony Creek Reservoir. No other surface water intakes are within 3 miles of the crossings. Based on the use of an HDD and the distance to the intake, we conclude that the Project is not likely to impact the intake.

The VADGIF and NCWRC maintain state lists of designated trout waters based on aesthetics, productivity, resident fish population, and stream structure. The Project does not cross any VADGIF or NCWRC designated trout waters.

All waterbodies crossed by the Project are designated warmwater fisheries. The FERC requires all in-stream work, except the installation and removal of equipment bridges, be completed in warmwater fisheries between June 1 and November 30 unless expressly permitted or further restricted by an appropriate federal or state agency in writing. Based on results of fish and mussel surveys and correspondence with VADGIF, Mountain Valley proposes a construction window of July 16 through April 14 for surface waterbody crossings in Virginia. NCWRC has agreed that no construction window would be needed for waterbody crossings in North Carolina. Details of specific survey results and agency correspondence are addressed in section 4.6.5.

North Carolina Jordan Lake Riparian Buffer Area

The Jordan Lake impoundment was created in 1983 on the Haw River near the confluence with the Deep River. Jordan Lake provides drinking water to approximately 500,000 people and provides recreational swimming, boating and fishing opportunities to the area. The Jordan Lake impoundment is located 25 miles southeast from the pipeline but the watershed is included in a riparian buffer area as part of a strategy to improve water quality in the lake. The watershed is considered the Jordan Lake Riparian Buffer (JLRB) area and is divided into multiple subwatersheds. The Project crosses the Haw River subwatershed for approximately 24 miles (MP 49-73) in Rockingham and Alamance Counties. Project construction within JLRB area would follow requirements identified in the Jordan Watershed Riparian Buffer Protection Ordinance. Mountain Valley is working with the NCDEQ to complete an application for a 401 Individual Water Quality Certification and Buffer Authorization for impacts proposed within the JLRB area. The application would include a major variance request for specific stream impacts and provide mitigation for impacts as outlined under NCDEQ rules. Mountain Valley has provided variance justification for non-perpendicular waterbody crossings in the JLRB area that appear to meet siting rules. Justifications focused on collocation of the pipeline with existing infrastructure right-of-way, minimizing Project footprint, and avoiding residences or existing infrastructure (e.g. roads, landowner structures). Implementation of Mountain Valley's Plan and Procedures; E&SC Plan; and applicable NPDES and buffer protection requirements would minimize potential impacts on surface waters within the JLRB area. Due to the distance between the Project and the Jordan Lake impoundment and the proposed surface water protection measures, no impacts would be expected to Jordan Lake's water quality or function.

Mountain Valley submitted its Section 401 applications to the NCDEQ in November 30, 2018. On June 3, 2019, NCDEQ issued a letter of denial of the Section 401 Water Quality Certification and JLRB variance for the Project due to procedural issues. Mountain Valley resubmitted a Section 401 and JLRB variance application in August 2019. NCDEQ provided a response that it would require until August 2020 to review and assess Mountain Valley's application. Mountain Valley continues to coordinate with NCDEQ regarding the Section 401 Water Quality Certification and JLRB variance for the Project.

4.3.2.5 Designated Flood Zones

The Federal Emergency Management Agency (FEMA) has prepared Flood Insurance Rate Maps that delineate Special Flood Hazard Areas (SFHA). FEMA defines SFHAs as the area that would be inundated by a 100-year (1 percent annual chance of occurrence) flood event. SFHAs are further categorized into zones. The Project crosses A and AE designated flood zones in Virginia and North Carolina. Zone A is the FEMA designation for areas subject to inundation by the 1-percent-annual-chance flood and where predicted floodwater elevations have not been established. Zone AE areas are subject to inundation by the 1-percent-annual-chance flood event determined by detailed methods and where predicted floodwater elevations above mean sea level have been established (FEMA, 2018). Table 4.3-4 identifies the FEMA flood zones crossed by the pipeline.

No access roads or interconnection meter stations would be located within the FEMA 100-year flood zone in Virginia. Two permanent access road and one interconnection meter station would be located within the FEMA 100-year flood zone in North Carolina. All permanent impacts would occur in the Cascade Creek-Dan River watershed (HUC-10) which totals 10,469 acres in size. Two permanent gravel access roads (PA-RO-082, PA-RO-082A) would occupy a 0.2 acre area but would not create any new floodplain displacement because they are existing roads which do not require improvement. The T-15 Dan River Interconnect/MLV 4 facilities would occupy a 0.8 acre area but site design would be largely at grade and total net floodplain displacement would be zero. Temporary access roads would disturb 6.5 acres within floodplains and may have a temporary impact on flood storage capacity. However, Mountain Valley would restore all temporary impacts after construction and result in no permanent impact to flood storage. Mountain Valley may leave in place some temporary access roads if requested by the landowner or agency. We received comments on the draft EIS expressing concern about impacts of flooding during construction where the Project would occur in a floodplain. Mountain Valley would consider the likelihood of flooding when installing ECDs and would monitor these devices in areas prone to flooding, especially after measurable rain events. Mountain Valley would appropriately adjust erosion control measures as necessary to minimize the impacts from heavy precipitation events. Mountain Valley would prioritize work schedules in order to minimize active construction within flood prone areas. Flood gauges and weather would be monitored for advance notice of flood events. Prior to storm events that could result in flooding, construction equipment would be removed and disturbed areas would be stabilized. Mountain Valley would also obtain all required authorizations and permits from local administrations where the Project occurs in a floodplain (see table 1.4-1 in section 1.4). General impacts and mitigation for flooding is further discussed below in section 4.3.2.7.

4.3.2.6 Surface Water Appropriations

Hydrostatic Test Water

Water would be required for the Project to perform hydrostatic testing of the pipeline. Mountain Valley would use a total of 5.9 million gallons of water for hydrostatic test water (see table 4.3.5). A withdrawal location on the Dan River, located at MP 30.1 in North Carolina, would

serve as the primary water source for hydrostatic test water. No surface waters in Virginia would be used for surface water withdrawals. Municipal water sources would be used if conditions in the Dan River are not suitable for withdrawal.

TABLE 4.3-5

Hydrostatic Test Water Sources for the Southgate Project

MP	Required Water (gallons)	Proposed Water Source	Proposed Discharge Watershed
0.0-30.4	3,600,000	Dan River (Primary) Municipal (Secondary)	Roanoke River Basin
30.4-73.2 RR	2,300,000	Dan River (Primary) Municipal (Secondary)	Roanoke River Basin

Mountain Valley would store the test water in tanks prior to pumping it into the pipe. To reduce the total amount of water needed for testing, Mountain Valley would transfer test water from one test section to the next. After hydrostatic testing is complete, Mountain Valley would discharge the water into well vegetated upland locations using NPDES compliant energy dissipating devices.

As the Dan River is known to contain the federally endangered and state-endangered Roanoke logperch, Mountain Valley would obtain written concurrence from the FWS prior to conducting any water withdrawals. See section 4.6.5.3 and 4.7.3.1 for further discussion and recommendations.

The hydrostatic test water would contact only new or cleaned and certified PCB-free pipe. If chemical methods are used to clean pipes, chemical laden water would be collected and disposed of at an approved waste facility. Mountain Valley would adhere with the sampling, monitoring, and effluent limits of the General Virginia Pollutant Discharge Elimination System Permit for Discharges from Petroleum Contaminated Sites, Groundwater Remediation, and Hydrostatic Tests as applicable to discharges of hydrostatic test water. This includes sampling the water for Total Petroleum Hydrocarbons, Total Organic Carbon, Total Suspended Solis, pH, and Total Residual Chlorine prior to discharge. Prior to construction, Mountain Valley would apply for the applicable permits to discharge hydrostatic test water.

Horizontal Directional Drill Water

The HDD process requires water to be added to a bentonite clay mixture to create drilling fluid. A surface water withdrawal location on the Dan River, located at MP 30.1 in North Carolina, would serve as the primary water source for the Dan River HDD crossing. No surface waters in Virginia would be used for surface water withdrawals. Municipal water sources would be the primary water source for the Stony Creek Reservoir HDD crossing, and would be used as the alternative water source if the Dan River was temporarily not available (see table 4.3-6). Mountain Valley may additionally utilize drilling fluid additives that are safe for use during drinking water well construction (comply with National Sanitation Foundation/American National Standards Institute [NSF/ANSI] standard 60) (NSF International, 2018) and comply with federal and state

requirements. All drilling fluid would be disposed of at an approved facility or recycled in an approved manner in accordance with the *HDD Contingency Plan*. Mountain Valley would separate all water from HDD equipment washing areas from wetlands or waterbodies by drainage barriers to prevent any runoff entry. HDD water withdrawals would be covered under the permits outlined for hydrostatic test water and follow the same procedures.

TABLE 4.3-6

HDD Water Requirements by Crossing for the Southgate Project

HDD Crossing	Required Water Hydrostatic Testing HDD (gallons)	Required Water HDD Operations (gallons)	HDD MP	Water Source
Dan River HDD	60,000	105,000	30.4	Dan River (Primary) Municipal (Secondary)
Stony Creek Reservoir HDD	16,500	105,000	63.8	Municipal (Primary) Dan River (Secondary)

Dust Control

Controlling dust on unpaved roads during construction would require water. Water sprayed on road surfaces would only be sufficient to surface crust and is not expected to create runoff. The lead EI would determine locations and disbursement of dust control spraying based on local conditions. It is anticipated that the Project would require a maximum daily total of 30,000 gallons of water during dry weather. Mountain Valley would obtain water for dust control from the surface water sources describe above or from municipal sources if the Dan River does not have adequate flow. Mountain Valley would follow the same mitigation measures as previously described for hydrostatic test and HDD water use. To minimize aquatic species entrainment on surface water withdrawals, Mountain Valley would screen the intake hose of using mesh sizes of 1 mm, maintain intake velocities below 0.25 feet per second, and withdraw no more than 10 percent of instantaneous flow rate from the channel.

Because Mountain Valley has not yet received concurrence from the FWS to use the Dan River as a water source, and thus, their water sources are not yet finalized, **we recommend that**:

- **Prior to construction, Mountain Valley should file with the Secretary, for review and written approval by the Director of OEP, its final list of water sources to be used for the Project (dust control, hydrostatic testing, and HDD operations), including intake location, waterbody name, withdrawal rate and method, and measures to minimize entrainment of aquatic species. Mountain Valley should also provide written concurrence from the FWS for any water withdrawals from the Dan River.**

4.3.2.7 General Impacts and Mitigation on Surface Water

Construction activities in stream channels and on adjacent banks may affect waterbodies. Clearing and grading of stream banks, in-stream trenching, the installation and removal of temporary crossing structures (e.g., culverts, cofferdams), trench dewatering, and backfilling could

each cause temporary, local modifications of aquatic habitat involving sedimentation, increased turbidity, and decreased dissolved oxygen concentrations; however, in almost all cases, these impacts would be limited to the period of in-stream construction.

In-stream construction would cause a temporary increase in sediments mobilized downstream. The extent of the impact would depend on sediment loads, stream velocity, turbidity, bank composition, and sediment particle size. These factors would determine the density and downstream extent of the turbidity plume. In-stream construction could cause the dislodging and transport of channel bed sediments and the alteration of stream contours. Changes in the stream bottom contours could alter stream dynamics and increase downstream erosion or deposition. Turbidity resulting from the resuspension of sediments due to in-stream construction and erosion of cleared right-of-way areas could reduce light penetration and photosynthetic oxygen production. In-stream disturbance could also introduce chemical and nutrient pollutants from sediments. Resuspension of deposited organic material and inorganic sediments could cause an increase in biological and chemical use of oxygen, potentially resulting in a decrease of dissolved oxygen concentrations in the affected area. Lower dissolved oxygen concentrations could cause temporary displacement of motile organisms, such as fish, and may kill non-motile organisms within the affected waterbody.

The use of HDD crossings reduces impacts at waterbody crossings by avoiding disturbance to the waterbody bed and bank. However, an IR of drilling fluid can occur during accidental escape of fluid through overlying substrate and into the waterbody. Site-specific HDD crossing plans for each crossing outline the measures that would minimize potential impacts of an IR to water quality. The HDD crossing plans, and *HDD Contingency Plan*, also provide procedures to monitor, contain, and clean up any inadvertent drilling fluid release.

The clearing and grading of stream banks could expose soil to erosional forces and would reduce riparian vegetation along the cleared section of the waterbody. The use of heavy equipment for construction could cause compaction of near-surface soils, an effect that could result in increased runoff into surface waters in the immediate vicinity of the proposed construction right-of-way. Increased surface runoff could transport sediment into surface waters, resulting in increased turbidity levels and increased sedimentation rates in the receiving waterbody. Disturbances to stream channels and stream banks could also increase the likelihood of scour after construction.

In order to limit impacts on riparian zones, Mountain Valley would follow measures outlined in Mountain Valley's Plan and Procedures. These measures allow a riparian strip at least 25 feet wide to permanently revegetate with native plant species across the entire construction right-of-way. A corridor centered on the pipeline and up to 10 feet wide may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state; and trees that are located within 15 feet of the pipeline in wetland riparian areas may be cut and removed from the permanent right-of-way. In addition, Mountain Valley would not clear the riparian areas that are between HDD entry and exit points during construction except for a 3-foot-wide path that would be hand cleared to allow for the HDD guide wire, these areas would not be maintained or mowed during operations.

Dewatering of the pipeline trench and conventional bore pits may require pumping of groundwater in areas where there is a high water table. Dewatering may cause minor temporary fluctuations in surface water turbidity. Mountain Valley would minimize or avoid impacts by implementation of the construction practices outlined in its Procedures, the E&SC Plan, and the NPDES permit requirements for North Carolina and Virginia. During construction, discharge of water removed from excavations would be directed to the vegetated land surfaces to control erosion and runoff. If adequate vegetation is absent, water would be filtered through haybale-lined dewatering structures. Because water removed from excavations would be reintroduced in the immediate proximity of excavations, potential dewatering impacts would be localized, temporary, and would not affect surface waters.

Mountain Valley would hydrostatically test the pipeline to verify structural integrity prior to placing the Project into service. Water for hydrostatic testing would be obtained from a single surface water withdrawal location (MP 30.1 Dan River) or from municipal water sources. To minimize or avoid impacts, Mountain Valley would implement, the E&SC Plan and comply with conditions of NPDES permits. To minimize scour, erosion, and sediment transport, hydrostatic test water would be discharged over vegetated land surfaces through energy dissipation devices, filter bags, or hay bale-lined dewatering structures. Additionally, the discharge rate would be regulated using valves and energy dissipation devices. Mountain Valley would adhere to the sampling, monitoring, and effluent limits of the *General Virginia Pollutant Discharge Elimination System Permit for Discharges from Petroleum Contaminated Sites, Groundwater Remediation, and Hydrostatic Tests* as applicable to discharges of hydrostatic test water.

Blasting may be required within surface water crossings that contain shallow bedrock and can cause a short-term increase in sedimentation. Injury to fish and mussels may also occur from the shockwave created by blasting, however, none of the crossings with sensitive fish or mussel species have the potential to require blasting. To minimize potential blasting impacts on surface waters, Mountain Valley would use blasting as the final option after all other reasonable means of trench excavation are unsuccessful. Blasting at surface waters with intermittent flow, or at crossings of less than 20 feet, would be completed during dry or low flow periods where practicable. Mountain Valley's *General Blasting Plan* details blasting procedures and this plan would minimize any potential sedimentation impacts from the activity.

Flash floods could occur during construction, which could lead to increased erosion and sedimentation in streams. To minimize or prevent impacts resulting from flash flooding during construction, Mountain Valley would remove any equipment or loose material from potentially affected areas prior to any anticipated significant rain event. Additionally, Mountain Valley would implement erosion and sedimentation control measures, such as installing trench breakers and water bars to inhibit water flow along the trench and right-of-way. Mountain Valley would monitor weather conditions during construction and appropriately adjust erosion control measures as necessary to minimize the impacts from heavy precipitation events. In areas with known flood risk, such as floodplains of large rivers, Mountain Valley would prioritize scheduling to minimize the duration of construction within floodplain areas during seasonal high water periods. Upon completion of construction, Mountain Valley would restore the ground surface as closely as practicable to original contours and re-establish vegetation to facilitate restoration of pre-construction overland flow.

4.3.2.8 Surface Water Conclusions

Temporary and localized impacts on surface waters could result from in-stream construction activities and potential erosion and runoff from upland construction. Mountain Valley's Plan and Procedures and E&SC Plan would be implemented to protect surface water resources, including reducing sediment loads, restoring stream habitat, and restoring riparian strips along streams. We conclude that the surface water mitigation measures proposed by Mountain Valley would adequately avoid or minimize potential impacts on surface water resources. Therefore, we do not anticipate long-term or significant impacts on surface water resources because of construction or operation of the Project.

4.3.3 Water Resources Conclusions

The Project is not expected to permanently affect surface or ground water resources. Though temporary impacts would result from the Project, with implementation of BMPs and mitigation proposed by Mountain Valley, as well as our recommendations, we conclude the Project would not significantly affect water resources.

4.4 WETLANDS

Wetlands are areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation adapted for life in saturated soil conditions (COE, 1987). Wetlands serve several functions including, but not limited to flood control, groundwater recharge, maintenance of biodiversity, wildlife habitat, and maintenance of water quality.

Wetlands in the Project area are regulated at the federal and state levels. At the federal level, the COE regulates wetlands under Section 404 of the CWA and Section 10 of the RHA. The EPA shares responsibility to administer and enforce the Section 404 program. The COE delegates wetland activities under Section 401 of the CWA to the appropriate state agencies: the VADEQ in Virginia, and the NCDWR in North Carolina.

At the time of this EIS, Mountain Valley was unable to survey all parcels; therefore, the total acreages given below were determined through a combination of field survey data and a desktop analysis of National Wetlands Inventory (NWI) data, aerial imagery, and nearby conditions of delineated resources. Wetland field survey data is available where access was granted as of August 2019 (approximately 96 percent of the alignment).

4.4.1 Existing Wetland Resources

Mountain Valley conducted surveys to identify and determine the extent of wetlands crossed along the pipeline routes and access roads, or within ATWS, aboveground facility sites, pipe/contractor yards, and staging areas. Based on USGS data, Virginia and North Carolina currently have approximately 1.0 and 5.7 million total acres of existing wetlands, respectively. Mountain Valley delineated wetlands in accordance with the COE 1987 Wetland Delineation Manual (COE, 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region (Version 2.0) (COE, 2012). Table 4.4-1

summarizes the wetland types crossed by the Project, and appendix B.6 details each wetland crossing.

Certain wetlands can be considered sensitive or of high or exceptional value because of their ecological quality and high level of functionality. However, no protected wetlands or wetlands of exceptional value have been identified by Mountain Valley in the Project area.

If the Commission authorizes the Project, Mountain Valley would be required to complete all of the remaining field wetland surveys after access is obtained. Mountain Valley would provide the results of these surveys to the permitting agencies, including the FERC, COE, and appropriate state resource agencies (VADEQ and NCDEQ).

Three wetland types as described by Cowardin et al. (1979) would be crossed by the Project including: emergent, scrub-shrub, and forested wetlands.

4.4.1.1 Emergent Wetlands

Palustrine emergent (PEM) wetlands are dominated by erect, rooted, herbaceous, perennial hydrophytic vegetation. Emergent wetlands within the Project area are typically dominated by sedges (*Carex spp*.), jewelweed (*Impatiens capensis*), soft rush (*Juncus effusus*), dark green bulrush (*Scirpus atrovirens*), sensitive fern (*Onoclea sensibilis*), tapertip rush (*Juncus acuminatus*), panicled aster (*Symphyotrichum lanceolatum*), and rice cut grass (*Leersia oryzoides*).

4.4.1.2 Scrub-Shrub Wetlands

Palustrine scrub-shrub (PSS) wetlands are dominated by woody vegetation that is less than 20 feet tall, including shrubs, young trees, and trees or shrubs that are small due to environmental conditions. Scrub-shrub wetlands within the Project area are typically dominated by black willow (*Salix nigra*), red maple (*Acer rubrum*), American sycamore (*Platanus occidentalis*), sweetbay magnolia (*Magnolia virginiana*), black elder (*Sambucus nigra*), smooth alder (*Alnus serrulata*), sedges, sensitive fern, jewelweed, and soft rush.

4.4.1.3 Forested Wetlands

Palustrine forested (PFO) wetlands are dominated by woody vegetation that is equal to or greater than 20 feet tall with a tolerance to a seasonally high water table. Forested wetlands within the Project area are dominated by green ash (*Fraxinus pennsylvanica*), red maple, sweetgum (*Liquidambar styraciflua*), American sycamore, American elm (*Ulmus americana*), willow oak (*Quercus phellos*), swamp dewberry (*Rubus hispidus*), and poison ivy (*Toxicondendron radicans*).

TABLE 4.4-1

Type of Wetland Impacts Associated with the Southgate Project

Type/State a/	Construction (acres) b/	Operation (acres) b/
PEM Wetlands		
Virginia	6.3	0.7

North Carolina	6.5	2.3
Total PFO Wetland Impacts	*11.6*	*4.2*
Total Wetland Impacts	*25.7*	*5.6*

Note: Totals may not sum correctly due to rounding.

a/ PEM = Palustrine Emergent; PSS = Palustrine Scrub-Shrub; PFO = Palustrine Forested (Cowardin et al., 1979).

b/ Construction impacts include those within the operational footprint.

4.4.2 General Impacts and Mitigation

Table 4.4-2 summarizes the impacts of the proposed Project on wetlands. The majority of impacts on wetlands resulting from construction and operation of the Project would be temporary. In accordance with the Mountain Valley's Procedures, Mountain Valley would maintain an herbaceous corridor up to 10 feet wide centered on the pipeline to facilitate periodic corrosion/leak surveys and would selectively cut trees within 15 feet of the pipeline with roots that could compromise the integrity of pipeline coating. This would result in the conversion of 0.2 acre of PSS wetland to PEM wetland, and 4.2 acres of PFO wetlands to PSS and PEM wetlands within the Project's operational right-of-way.

The use of temporary access roads would impact 0.1 acre of wetlands during construction in order to provide access to the construction right-of-way. Wetlands along temporary access roads would be allowed to revert to pre-construction conditions following construction. Two permanent access roads that would be used by Mountain Valley during operation of the Project cross wetlands. Access road PA-RO-082 is an existing gravel road that is 161 feet in length. During operation of the Project, Mountain Valley would use this road to access the Dan River Interconnect and MLV-4. Access road PA-RO-000 is also an existing gravel road that is 4,956 feet in length and would be used to access the LN 3600 Interconnect. No temporary or permanent impacts on wetlands from PA-RO-082 or PA-RO-000 are anticipated as no improvements would occur within the wetlands crossed by the access roads. No impacts on wetlands would occur during construction or operation at the proposed contractor yards. Mountain Valley would consult with appropriate federal and state agencies for compensatory mitigation of permanent wetland impacts.

The primary impact of pipeline construction and right-of-way maintenance activities on wetlands would be the temporary, short-term, and long-term alteration of wetland vegetation and permanent conversion of PFO wetlands to PSS or PEM wetlands and of PSS wetlands to PEM wetlands. Effects on wetlands would be greatest during and immediately following construction. Following construction, wetland areas will be seeded with a wetland mix. To control the spread of noxious weed and invasive plant species within temporarily disturbed wetland areas, Mountain Valley will implement their *Exotic and Invasive Plant Species Control Plan*[15], as well as monitor and control occurrences. Additional detail on noxious weeds and invasive plant species can be found in section 4.5.

During construction, failure to segregate topsoil could result in the mixing of topsoil with the subsoil. This could prevent establishment of appropriate species from existing seed bank and alter nutrient availability and soil chemistry, thereby inhibiting recruitment of native wetland vegetation after restoration.

TABLE 4.4-2

Southgate Project Wetland Impacts by Facility Type

Notes: N/A – Not Applicable; Totals may not sum correctly due to rounding.

a/ PEM = Palustrine Emergent; PSS = Palustrine Scrub-Shrub; PFO = Palustrine Forested (Cowardin et al., 1979).

b/ N/A = wetlands not crossed by the centerline but within the construction workspace.

c/ Construction impacts include those within the operational footprint, as well as those within temporary workspaces.

d/ Pipeline facilities include the permanent right-of-way, temporary workspace, and additional temporary workspace.

Other impacts associated with construction of the Project could include local, temporary changes in wetland hydrology and water quality. Increases in turbidity would likely occur during trenching within ponded wetlands, and could potentially be caused by erosion and sediment-laden stormwater runoff from nearby disturbed areas. Temporary removal of wetland vegetation during construction could alter the capacity of wetlands to function as habitat and as erosion control buffers. Heavy equipment operating during construction could result in soil compaction or rutting that would alter water infiltration, hydrology, and potentially inhibiting germination of seeds and the ability of plants to develop root systems. Additionally, discharges from stormwater, dewatering structures, or hydrostatic testing could transport sediments and pollutants into wetlands, affecting water quality.

The effect of the Project on PEM wetlands would be short-term because the emergent vegetation would regenerate quickly, typically within 1 to 3 years. Following revegetation, permanent impacts on PEM wetlands within the right-of-way would be minimal because these areas consist of and would be maintained as open and herbaceous communities. The duration of the impact on PSS and PFO wetlands would be longer term or permanent. Woody vegetation may take several decades for maturation. Vegetation maintenance over the pipeline, would permanently convert it to PEM wetlands. As a result, the Project would convert 4.2 acres of PFO wetlands and 0.1 acre of PSS wetlands to non-forested wetlands during operation. The conversion from one vegetation cover type to another could result in changes in wetland functions and values. In general, affected wetlands would continue to provide important ecological functions such as sediment/toxicant retention, nutrient removal and transformation, flood attenuation, groundwater recharge/discharge, and wildlife habitat. The PFO and PSS wetlands within temporary construction work areas would be allowed to revert to pre-construction conditions following construction; however, due to the time required for these wetlands to regenerate, impacts would be considered long-term to permanent.

Mountain Valley is consulting with the COE and would develop a Compensatory Mitigation Plan to offset permanent wetland impacts, including those that would convert PFO to PEM or PSS wetlands as discussed in section 4.4.4.

Mountain Valley proposes to use the HDD method to install the mainline beneath two wetlands (W-B18-36 and W-B18-39) near MP 30.3 in conjunction with the Dan River crossing. Use of the HDD method would reduce mechanical clearing, and eliminate the need for trenching and operating heavy construction equipment within these wetlands. Mountain Valley would conduct limited hand clearing at this location to create a 3-foot-wide footpath for personnel to lay an HDD guide wire between the entry and exit points.

Federal and state agencies require "sequencing" when proposing a project that may affect wetlands. Sequencing involves three steps. First, wetlands must be avoided to the maximum extent practicable. Second, if avoidance is not an option, impacts must be minimized to the maximum extent practicable. Third, if wetland impacts are unavoidable, wetland replacement or compensatory mitigation is required via the CWA to replace lost wetland functions and values.

Mountain Valley routed its respective pipelines and sited its associated aboveground facilities to avoid wetlands to the maximum extent practicable. As discussed in sections 3.4 and 3.5, we reviewed several potential route alternatives and variations to Mountain Valley's proposal, in response to input from FERC staff, affected landowners, agencies, and other stakeholders to avoid or minimize impacts on environmental resources including, in many cases, wetlands. Based on the proposed and recommended pipeline routes and configuration of aboveground facilities, we have determined that wetland impacts have been avoided to the maximum extent practicable.

Where wetland impacts could not be avoided, Mountain Valley would implement specialized wetland construction procedures within wetlands as described in Mountain Valley's Procedures and section 2.4.2.2. Additional wetland protection measures include, but are not limited to:

- using one traffic lane for construction equipment in non-saturated wetlands;

- using low ground pressure equipment or equipment/timber mats to prevent rutting or soil mixing;
- storing all hazardous materials, including fuels, chemicals, and lubricating fluids, a minimum of 100 feet from any wetland boundary;
- prohibiting parking or refueling of vehicles within 100 feet of a wetland unless the on-site EI determines that there is no practicable alternative and secondary containment structures are used;
- restoring pre-construction contours to maintain the original wetland hydrology; and
- prohibiting the use of herbicides or pesticides within 100 feet of wetlands or waterbodies except as specified by the appropriate land management or state agency.

There are four locations where Mountain Valley is requesting a greater than 75-foot-wide construction corridor in wetlands due to utility lines, road crossing, and extensive HDD operations. The locations where these modifications would be located for the Project are identified in appendix B.3 and B.8. We have reviewed these locations and find that the expanded construction corridor at these four locations is adequately justified.

Following construction, Mountain Valley would ensure that all disturbed wetland areas are successfully revegetated. Along with any additional agency permit requirements, we would not consider revegetation successful until:

- the affected wetland satisfies the current federal definition for a wetland;
- vegetation is at least 80 percent of either the cover documented for the wetland prior to construction, or at least 80 percent of the cover in adjacent wetland areas that were not disturbed by construction;
- the plant species composition is consistent with early successional wetland plant communities in the affected ecoregion; and
- invasive species and noxious weeds are absent, unless they are abundant in adjacent areas that were not disturbed by construction.

In accordance with Mountain Valley's Procedures, Mountain Valley would conduct routine wetland monitoring for a minimum of 3 years to assess the success of wetland revegetation. As applicable, specific monitoring requirements required by other permitting agencies would also be implemented. Three years after construction (or sooner if determined to be successful), Mountain Valley would file a report with the Secretary identifying the status of wetland revegetation efforts and documenting success as defined above. Where revegetation is not successful at the end of 3 years, Mountain Valley would develop and implement remedial revegetation plans, in consultation with a professional wetland ecologist, to actively revegetate any unrestored wetland and continue revegetation efforts and file annual reports until wetland revegetation is deemed successful by the appropriate state and federal agencies.

4.4.3 Extra Workspaces within 50 Feet of Wetlands

Mountain Valley's Procedures specify that all extra work areas should be set back at least 50 feet from wetlands. Mountain Valley has requested modifications to their Procedures at ATWS at 15 locations within 50 feet of a wetland boundary. Appendix B.3 provides the locations where Mountain Valley proposes less than a 50-foot setback from a wetland and the site-specific rationale for the requested modification from Mountain Valley's Procedures. We have reviewed these ATWS locations and find them acceptable.

4.4.4 Compensatory Mitigation

In accordance with Mountain Valley's Procedures and the CWA Section 404(b)(1) Guidelines, Mountain Valley would avoid wetlands along the proposed pipeline whenever possible. Where impacts on wetlands cannot be avoided, the COE requires mitigation to replace the loss of wetland functions and values.

As discussed in section 4.4.2, construction and operation of the Project would permanently convert 4.2 acres of PFO wetlands and 0.1 acre of PSS wetlands to other wetland types. As part of the Section 404 CWA permitting process, Mountain Valley may be required to develop a Compensatory Mitigation Plan to mitigate unavoidable wetland impacts. The *Compensatory Mitigation Plan* would be subject to review and approval by the District Engineer for the COE, Norfolk District in Virginia and Wilmington District in North Carolina. Mitigation amounts may change as field surveys are completed; Mountain Valley would submit any changes in mitigation to the COE for approval.

Mountain Valley submitted a *Compensatory Mitigation Plan* to the COE in November 2018. The COE is still reviewing Mountain Valley's Plan and will continue to work with Mountain Valley to determine the appropriate type and amount of mitigation needed for Mountain Valley's wetland impacts in Virginia and North Carolina. For unavoidable wetland impacts in Virginia and North Carolina, Mountain Valley plans to purchase wetland and stream credits from approved mitigation banks in the respective states. The in-lieu fee program may also be considered in Virginia. Mountain Valley would provide proof of compensatory mitigation credit purchase to the COE prior to construction.

According to Mountain Valley's filing on October 23, 2019, there are 133 wetlands (5.6 acres) with permanent impacts requiring mitigation, 56 in Virginia (2.7 acres) and 77 in North Carolina (2.9 acres). The operational easement would permanently affect these wetlands, and these are addressed in Mountain Valley's wetland permit applications to the COE districts. Appendix B.6 lists these wetlands.

4.4.5 Wetlands Conclusions

Permanent impacts on wetlands would include the conversion of forested wetlands to scrub-shrub or emergent wetlands within the pipeline permanent easement. In addition, long-term to permanent impacts on woody vegetation would occur as it may take several decades for the vegetation to reach maturation. While minor adverse and long-term effects on wetlands would occur, with adherence to Mountain Valley's Procedures and implementation of BMPs, we

conclude that construction and operation of the Project would result in minor impacts on wetlands that would be appropriately mitigated and reduced to less than significant levels. In addition, the COE could require Mountain Valley to offset unavoidable impacts on wetlands through the creation, restoration, enhancement, or preservation of at least an equal amount of wetlands through implementation of an agency-approved *Compensatory Mitigation Plan*.

4.5 VEGETATION

4.5.1 Existing Vegetation Conditions

Ecoregions are areas that have similar environmental resources and characteristics, including geology, physiography, vegetation, climate, soils, land use, wildlife, and hydrology (EPA, 2013). These characteristics provide a useful means for classifying and describing vegetation resources within the Project area. The Project is located wholly within the Piedmont Region, sitting between the Appalachian Mountains and the Atlantic coastal plain and stretching from New Jersey in the north to central Alabama in the south. The Project area has been heavily used as cropland; however, many of these areas have regrown into successional forests.

Vegetation community types in the Project area were classified based on a review of aerial photography, existing land use classifications, and field surveys. Managed or developed land classes include agricultural land, commercial, industrial, and residential areas and represent about 21 percent of the proposed land that would be required for the Project. Of the approximately 94 percent of vegetated areas within the Project footprint[16], the majority (about44 percent) consists of forested upland, followed by herbaceous/scrub-shrub upland (about 39 percent); less than 2 percent of the pipeline Project area is within wetland vegetation communities. Wetlands crossed by the Project are discussed in section 4.4.

The Project would cross through three major natural upland vegetation cover types: agricultural land, forested land, herbaceous/scrub-shrub as shown in table 4.5-1. Common species observed within the construction and operational workspace are included in the table below.

[16] Vegetated areas noted here include agriculture and silviculture lands, which are also included in the managed or developed land classes percentage provided above; agriculture and silviculture lands account for approximately 15 percent of the total Project acreages.

TABLE 4.5-1

Upland Vegetation Cover Types Associated with the Southgate Project

Class Name	Description	Construction (acres)	Operation (acres)
Agricultural	Areas of grasses, legumes, or grass-legume mixtures planted for livestock grazing or the production of seed or hay crops. Also includes active cropland, orchards, vineyards, or hay fields.	199.3	66.1
Upland Forest	Non-wetland forested and woodland communities supporting a dominance of tree cover. Representative species include: red oak (*Quercus rubrum),* white oak (*Quercus alba)*, willow oak*,* American beech (*Fagus grandifolia)*, red maple, and evergreen trees such as pitch pine (*Pinus rigida)*, Virginia pine (*Pinus virginiana),* and Loblolly pine (*Pinus taeda)*.	618.3	237.4
Upland Herbaceous/ Scrub-Shrub	Non-wetland native grasslands or areas of shrubs less than 15 feet tall. Herbaceous vegetation is usually greater than 80 percent of total vegetation and can be used for grazing, but not intensely managed. Dominant herbaceous species included: orchard grass (*Dactylis glomerata)*, red fescue (*Festuca rubra)*, common velvet grass (*Holcus lanatus)*, Japanese stilt-grass (*Microstegium vimineum)*, Kentucky blue grass (*Poa pratensis)*, meadow false rye grass (*Schedonorus pratensis)*, white clover (*Trifolium repens)*, wingstem (*Verbesina alternifolia)*, and giant ironweed (*Veronia gigantea)*. Dominant scrub-shrub species included Allegheny blackberry (*Rubus allegheniensis),* dogwoods (*Cornus spp.)*, willows (*Salix spp.)*, spicebush (*Lindera benzoin)*, blueberry (*Vaccinium spp.)*, and black elder (*Sambucus nigra)*.	549.5	131.5

4.5.2 Vegetation Communities of Special Concern or Value

Mountain Valley consulted with federal and state resource agencies to identify sensitive or protected vegetation types, natural areas, and unique plant communities in the Project area. The FWS identified two federally listed plant species potentially occurring in the Project area in North Carolina: small whorled pogonia (*Isotria medeoloides)* and smooth coneflower (*Echinacea laevigata).* The small whorled pogonia is considered rare, and is found in leaf litter along small intermittent streams in hardwood and conifer-hardwood forests.. The smooth coneflower is also rare, and is found on roadsides and other open areas with plenty of sunlight. Its current range is limited to within the states of Virginia, North Carolina, South Carolina, and Georgia. These species are discussed further in section 4.7.

The Virginia Department of Conservation and Recreation, Division of Natural Heritage (VADCR-DNH) identified three species of rare plants that have historically occurred near the Project area: American blueheart (*Buchnera americana)*, Downy phlox (*Phlox pilosa)*, and Piedmont Barbara's-button (*Marshallia obovata)*. The North Carolina Natural Heritage Program (NCNHP) identified one state-listed rare plant species, cliff stonecrop (*Sedum glaucophyllum)*, that is known to occur in Rockingham County. In Virginia, species classified as rare do not have

any legal status and are not afforded state protections. Similarly, in North Carolina, the NCWRC requires monitoring of species of special concern but there is no legal protection from take for these species. We discuss potential Project impacts on these species in section 4.7.2.

The NCNHP identified the Dry-Mesic Oak-Hickory Forest and Mesic Mixed Hardwood Forest communities near the Project area, which may contain sensitive and/or protected species. However, these communities were found either outside the Project area or already disturbed. Impacts on these forest communities would also be minimized due to collocation with an existing right-of-way. Mountain Valley would minimize impacts on forest habitat through adherence to its Plan and Procedures. We discuss potential Project impacts on sensitive and/or protected species in section 4.7.

4.5.3 Noxious Weeds and Invasive Plant Species

Invasive species are those that display rapid growth and spread, becoming established over large areas (USDA, 2017). Most commonly, they are exotic species that have been introduced from another part of the United States, another region, or another continent, although some native species that exhibit rapid growth and spread are also considered invasive. Invasive plant species can change or degrade natural vegetation communities, which can reduce the quality of habitat for wildlife and native plant species. Similar to invasive species, noxious weeds are frequently introduced but are occasionally native. Noxious weeds are defined as those that are injurious to commercial crops, livestock, or natural habitats and typically grow aggressively in the absence of natural controls (USDA, 2017). Clearing and excavation associated with construction of the Project would expose the topsoil to exotic or invasive species seeds and increase the potential for their introduction or spread along the right-of-way.

Mountain Valley used the VADCR-DNH Virginia Invasive Plant Species List and the North Carolina Invasive Plant Council List (Virginia Invasive Species Council, 2005; North Carolina Invasive Plant Council, 2016) to identify possible invasive plant species that could occur in the Project area. Mountain Valley documented noxious weeds on accessible tracts during field surveys conducted in 2018 and 2019. To date, Mountain Valley has completed surveys along approximately 96 percent of the Project workspace. Mountain Valley documented exotic or invasive species in most of their surveys conducted in Virginia and North Carolina. The most common exotic or invasive species documented in Virginia included Japanese honeysuckle, Chinese lespedeza, Japanese stilt-grass, Chinese privet, tree of heaven, multiflora rose, spotted knapweed, and Johnson grass. The most common exotic or invasive species documented in North Carolina included Japanese honeysuckle, Japanese stilt-grass, multiflora rose, Chinese privet, and tree of heaven.

4.5.4 Impacts and Mitigation

Table 4.5-2 lists the amount of vegetation cover types that would be affected by construction and operation of the proposed Project. Construction of the Project, including the construction right-of-way, ATWS, aboveground facilities, contractor yards, and access roads would affect 1,392.6 acres of vegetated lands. This would include agricultural land (14 percent), upland herbaceous/scrub-shrub (40 percent), PEM and PSS wetlands (1 percent), upland forested land (44 percent), and forested wetland (less than 1 percent). Following construction, vegetation

in temporary construction areas would be allowed to revert to pre-construction vegetation conditions. Of the 1,392.6 acres of vegetation affected during construction of the Project, 440.6 acres (32 percent) would be affected by the operation of the Project, including routine mowing in the maintained pipeline rights-of-way, conversion of vegetation within the aboveground facility sites, and permanent access roads. Vegetation cover types that would be affected by operation of the Project include agricultural land (15 percent), upland herbaceous/scrub-shrub (30 percent), PEM and PSS wetlands (less than 1 percent), upland forested land (54 percent), and forested wetland (1 percent). We discuss impacts on wetlands further in section 4.4.

Tree clearing within temporary construction work areas is considered a long-term, permanent impact because it may take several decades for these areas to resemble the forest vegetation that was present before construction. See section 4.8 for additional information on land use impacts.

We received comments regarding the effects of tree removal on air quality, impacts on large and old (100-year-old) trees, and the potential for mitigation to compensate for the removal of trees. Construction could result in the removal of large and older individual trees that have intrinsic aesthetic value and may currently provide a visual barrier for residential areas. Mountain Valley would follow measures outlined in its Plan, which requires that they avoid removal of mature trees and landscaping within residential areas unless necessary for safe operation of construction equipment, or as specified in landowner agreements. An easement agreement between a company and a landowner would typically negotiate and specify compensation for losses resulting from construction, including losses of decorative and ornamental trees. In general, removal of trees would result in the loss of carbon sequestration capacity since forest habitat would be permanently removed and converted to herbaceous right-of-way; however, in temporary workspaces, over time, arboreal vegetation will regenerate and provide carbon sequestration. Since forested areas are common and well represented throughout the region and in the immediate vicinity of the Project, we anticipate a very minor loss of carbon sequestration capacity, and impacts on air quality, if any, should be indiscernible. Further discussion of impacts on air quality are discussed in section 4.11.

We received a comment from the Roanoke River Basin Association (RRBA), which suggested mitigation for tree removal at a 5:1 ratio to offset the GHG effects of pipe leakage. The RRBA estimated that five new trees should be planted for every tree removed for construction of the pipeline right-of-way. Their estimate is based on their findings of 1% leakage rates of methane gas from other pipelines. RRBA states that methane is 25 times stronger than carbon dioxide in its effect as a greenhouse gas, and while it would be better to eliminate pipe leakage, the leakage should be offset with tree mitigation until the pipe leakage can be eliminated. We note that Virginia has 15.72 million acres of forestland (Virginia Department of Forestry [VADOF]) and North Carolina has 18.8 million acres of forests (North Carolina Forestry Association [NCFA]). Within this context, we conclude that impacts on forests would be long-term but would not be significant.

Note: Pig launchers and receivers will be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect); therefore, acreage calculations for the pig launchers and receivers are included with those facilities. Mainline valves (MLVs) 1, 4, and 8 will be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect); therefore, acreage calculations for MLVs 1, 4, and 8 are included with those facilities.

a/ Cultivated land (e.g., tobacco, soybeans, hay, corn).

b/ Upland forest and wooded lands, including those being managed for forest products (i.e., silviculture).

c/ Utility rights-of-way, grasslands, open fields, vacant land, herbaceous and scrub uplands, non-forested lands, golf courses, and municipal land.

d/ Palustrine emergent, palustrine scrub-shrub and palustrine forested wetlands as identified from field delineations where access is available and NWI where survey access not available (see section 4.4.2)

TABLE 4.5-2

Vegetation Communities Affected by Construction and Operation of the Southgate Project f/ g/

	Const	Oper	Const	Oper	Const	Oper	Const	Oper	Const	Oper	Const	Oper

e/ Sums of addends may not equal totals due to rounding.

f/ Construction acres includes the area affected by construction (i.e., temporary and additional temporary workspace, contractor yards, and access roads) and the area affected by operation of the Project (i.e., facility operation footprint and 50-foot pipeline permanent right-of-way). The 50-foot-wide permanent right-of-way between horizontal directional drill entry and exit points are not included in this acreage. Acreage includes a three-foot path between the HDD entry and exit workspace areas to allow for placement of the HDD guide wire.

g/ Includes only the operation footprint of the Project facilities, the 50-foot-wide permanent pipeline right-of-way in uplands, except in wetland areas where the operation width has been reduced to 10 feet in emergent wetlands, scrub-shrub wetlands, and within 25 feet of waterbodies; and 30 feet in forested wetlands. The 50-foot-wide permanent right-of-way between horizontal directional drill entry and exit points and within railroad rights-of-way are not included in this acreage.

h/ Includes the 50-foot-wide permanent right-of-way and temporary workspace areas.

i/ Includes ATWS areas for both the H-605 and H-650 pipelines. ATWS areas to be used for construction of aboveground facilities are included in the acreage calculations for the applicable aboveground facilities.

4.5.4.1 Pipeline Facilities

The extent of impacts on vegetation from the pipeline construction would vary depending on the type of vegetation affected and the area and frequency of vegetation maintenance conducted during operation. The primary effect of pipeline construction would be cutting, clearing, and/or removing 1,136.5 acres of existing vegetation, of which 597.5 acres would be forested uplands. The remaining vegetation would include 176.1 acres of agricultural lands, 338.1 acres of upland herbaceous/scrub-shrub and 24.9 acres of wetlands (including 11.5 acres of forested wetlands and 13.4 acres of non-forested wetlands). Secondary impacts associated with disturbances to vegetation could include increased soil compaction and erosion, increased soil temperature and dryness, increased potential for the introduction and establishment of non-native and invasive species, and physical damage to nearby trees. See section 4.4 for a discussion of mitigation measures for impacts on wetlands.

Clearing activities would include the removal of vegetation within the proposed construction workspace by mechanical or hand cutting methods. During clearing activities, Mountain Valley would cut down brush and trees into the construction area to minimize damage to trees and structures adjacent to the workspace, and would take care to avoid damaging adjacent tree limbs and feeder roots. Mountain Valley would conduct selective side-trimming on trees adjacent to the construction area where necessary for safety. Stumps would be cut as low to the ground as possible. Stumps would be removed along the trench line, and selectively in other construction areas to allow for the safe installation of the pipeline.

As described in section 2.4.1, Mountain Valley states that merchantable timber would be cut to useable lengths and stacked on the edge of the right-of-way to a maximum height of 4 feet with openings every 200 feet, which Mountain Valley believes would allow the safe passage of wildlife. Typically, cut timber would be disposed in accordance with landowner wishes; unless Mountain Valley purchases the timber as part of its compensation agreements. Mountain Valley further states that brush cleared from the construction corridor would be open burned, windrowed, chipped/mulched on the right-of-way, or hauled off for disposal at an approved location. Mountain Valley would determine methods and locations for the collection, containment, and disposal of brush and timber during construction in coordination with the landowner. Open burning would not be conducted without landowner approval. Disposal of brush and timber for beneficial reuse would not result in adverse environmental impact and would be subject to compliance with landowner approval, permit requirements, and local regulations.

Mountain Valley's proposed timber and brush disposal methods do not comply with the FERC's *Upland Erosion Control, Revegetation, and Maintenance Plan*, section III.E.; specifically, in regards to the lack of details describing the timeframe for the windrowing of timber along on the right-of-way . Windrowed timber along the right-of-way is considered construction debris and would serve as visual impact and a barrier to smaller wildlife. Furthermore, the FERC requires that beneficial reuse of excess construction debris must not result in adverse environmental impact. Therefore, **we recommend that:**

- **During construction and prior to the Project in-service approval, Mountain Valley should remove and dispose of timber and debris from the right-of-way. Mountain Valley must ensure that any beneficial reuse of timber that is not removed and remains on or adjacent to the right-of-way, as agreed to by the landowner, is located at access points where the landowner can reasonably retrieve timber without any inadvertent impacts on the restored right-of-way, in accordance with the FERC *Upland Erosion Control, Revegetation, and Maintenance Plan*, section III.E.**

Topsoil would be segregated during construction within cultivated or rotated agricultural lands, and at the landowner's request in other areas. Impacts on agricultural lands would be temporary to short-term because these areas are disturbed annually to produce crops and would typically return to their previous condition shortly following construction, cleanup, and restoration. Following pipeline installation, topsoil would be returned in order to mitigate impacts on subsequent crop production.

Construction in herbaceous and scrub-shrub uplands would remove the vegetative ground cover over the entire width of the construction right-of-way. Lands currently dominated by herbaceous growth would revegetate quickly, often within one growing season after seeding and otherwise typically within 3 years. Areas of scrub-shrub vegetation would likely require 3 to 5 years to regain its woody composition.

The majority of vegetation affected by construction of the Project would be upland forested land, which would result in long-term impacts. Construction in forested uplands would remove the tree canopy over the entire width of the construction right-of-way, which would change the structure and environment of the underlying and adjacent areas. Forested uplands within the maintained right-of-way, including areas of silviculture and tree farms, would be permanently converted to an herbaceous cover type. Lands adjacent to the right-of-way would remain forested; however, they could experience reduced habitat value compared to pre-construction conditions. The creation of edge habitat could increase the risk of invasive species and other impacts on wildlife species. The regrowth of shrubs and trees within the temporary workspaces would reduce the edge effect and provide connectivity between adjacent forested tracts to some extent (Tewksbury et al., 2002).

Soils that were previously shaded by the tree canopy would receive increased amounts of light, which could lead to drier soils and higher soil temperatures until vegetation returns. Trees on the edge of the right-of-way might be subject to mechanical damage and roots could be affected by soil disturbance and compaction, all of which could result in the decreased health and viability of some trees and root systems. Some edge trees that were previously within dense forested stands

may also lack stability following removal of adjacent supporting trees, which could result in increased susceptibility to wind damage.

Following construction, Mountain Valley would seed the construction workspace and allow natural succession to revegetate workspaces disturbed by construction in accordance with its Plan and Procedures. Mountain Valley would use and apply a seed mix that incorporates recommendations from the local soil conservation authority, the landowner, or land management agency, including:

- using a native seed mixture with specific varieties based on specific sites and area of adaptation;
- applying seed at suggested rates;
- applying seed within the recommended seeding dates; and
- providing appropriate temporary erosion control measures when seeding cannot be implemented within the recommended seeding dates.

To control the spread of noxious weed species within the Project area, Mountain Valley developed an *Exotic and Invasive Plant Species Control Plan*[17] in coordination with VADCR[18] and NCNHP[19], which includes implementation of the following measures:

- thoroughly clean all construction equipment prior to mobilization to the Project construction area and when moving between construction spreads that may have different concentrations of exotic or invasive species presence;
- store segregated topsoil from portions of the right-of-way known to contain exotic or invasive species separate from less contaminated topsoils;
- use weed-free mulch (i.e., straw, hay, or other erosion control materials) during construction, sediment erosion control, and restoration efforts;
- monitor the right-of-way during and after construction for exotic or invasive species infestations or spread; and
- promptly reseed all disturbed areas after final grading is completed using native species within seed mixes in consideration of recommendations from local soil conservation authorities.

---

[17] Mountain Valley's *Exotic and Invasive Species Control Plan* was included as was included in the October 23, 2019 supplemental filing. The *Exotic and Invasive Species Control Plan* can be viewed on the FERC website at http://www.ferc.gov/. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20191023-5022in the "Numbers: Accession Number" field.

[18] Virginia DCR Guidance for invasive species control measures is available at: https://www.dcr.virginia.gov/natural-heritage/factsheets#invasives.

[19] Invasive Exotic Plants of North Carolina (published by North Carolina Department of Transportation) includes the control for invasive plants in the state and is available at: https://connect.ncdot.gov/resources/Environmental/Compliance%20Guides%20and%20Procedures/Invasive_Exotic_Plants_Manual_May_2012.pdf.

Once construction is complete, Mountain Valley would monitor and address occurrences of noxious and invasive weed species for 2 years post-construction. Mountain Valley would determine control measures for infestations in consultation with the VADCR and NCNHP. These measures could include hand cutting, mechanical removal, or the use of non-persistent and biodegradable herbicides, applied by locally certified personnel. If the use of herbicide is specified for use by federal or state agencies near streams or wetlands, then Mountain Valley would utilize herbicide applications approved for aquatic use.

In accordance with Mountain Valley's Plan and Procedures, Mountain Valley would conduct follow-up inspections of all disturbed areas to determine the success of revegetation. FERC inspectors would also complete inspections to determine compliance with Mountain Valley's Plan and Procedures, and to ensure certificate conditions are being met. Revegetation in non-agricultural areas would be considered successful when the density and cover of non-nuisance vegetation are similar to adjacent, undisturbed lands. In agricultural areas, revegetation would be considered successful when, upon visual survey, crop growth and vigor are similar to adjacent undisturbed portions of the same field unless otherwise specified in the easement agreement. Mountain Valley would file with the Secretary quarterly activity reports documenting the results of revegetation for at least 2 years following construction.

Mountain Valley would mow or clear vegetation within the operational right-of-way every 3 years. However, Mountain Valley proposes to maintain an herbaceous corridor up to 10 feet wide centered on the pipeline to facilitate periodic corrosion/leak surveys.

4.5.4.2 Aboveground Facilities, Contractor Yards, and Access Roads

Construction of the proposed aboveground facilities would disturb about 30.3 acres of vegetation including 13.1 acres of agricultural land, 11.5 acres of upland herbaceous/scrub-shrub, 5.3 acres of forested uplands, and 0.5 acre of wetlands. Following construction, 4.9 acres of agricultural land, 2.6 acres of upland herbaceous/scrub-shrub, and 3.4 acres of forested uplands would be permanently converted to developed land for operation of the aboveground facilities. The remaining 19.4 acres of construction workspace would be stabilized, seeded, and allowed to revegetate in accordance with Mountain Valley's Plan and Procedures.

Construction of the Project access roads and contractor yards would disturb about 78.8 acres of vegetation. The open uplands affected during construction would be allowed to revert back to pre-construction conditions. The majority of the access roads are existing roads including paved roads and access ways, gravel roads, and unimproved dirt roads. Tree trimming would be selectively conducted along the existing access roads, as necessary. Seventeen access roads would be retained for operation of the Project and would result in the permanent conversion of about 4.9 acres of vegetation, including 0.7 acre of agricultural land, 3.8 acres of upland herbaceous/scrub-shrub, and 0.4 acre of forested upland.

4.5.4.3 Interior Forest

Interior forest has been described as forested areas greater than 300 feet from the influence of forest edges or open habitat (Robbins, 1988; Rosenberg, et al., 1999; Ontario Ministry of Natural Resources, 2000; Jones et al., 2001; Rodewald, 2001). Interior forest is considered important

because a variety of plant and wildlife species of concern depend upon the conditions present (within the interior forest environment) to thrive; and intact expanses of interior forest are generally decreasing in the United States (Landowner Resource Center, 2000; Riitters and Wickham, 2012).

Interior Forest Fragmentation and Edge Effects

Interior forests were identified by Mountain Valley using aerial imagery of the Project area taken in April 2018. Constructing the Project would create a new, cleared corridor in areas of interior forest where the rights-of-way would not be collocated with existing linear corridors. Clearing or fragmentation of interior forests creates more edge habitat and smaller forested tracts, which can impact characteristics of vegetation communities including their suitability for wildlife. We received multiple comments on the draft EIS stating that we should more fully analyze impacts on interior forest.

The term "edge effect" is commonly used to describe the physical and biological effects that open, disturbed, or developed lands, including pipeline corridors, have on adjacent vegetation. . Clearings adjacent to forested areas increase sunlight and wind within the forest, which can cause trees to become less healthy due to increased wind shear, drying out the interior of the forest close to the edge, and changes in air temperature, soil moisture, and light intensity. These changes can in turn encourage growth of opportunistic species, including non-native invasive species, that may displace species more acclimated to non-edge habitat (Murcia, 1995). Fragmentation of forested areas can result in the loss of high habitat value interior forest and the plant and animal species associated with that habitat. Conversely, forest edges also play a key role in ecosystem functions, including the dispersal of plants and wildlife, the spreading of fire, as corridors for wildlife movements, and in shaping vegetation composition and structure. As edges and newly cleared areas begin to revegetate, they generally support herbaceous and shrub species, including various species of berries, which are productive habitat for the species that exploit these conditions. Over time, the edge is partially sealed by proliferating second growth, and microclimatic gradients lessen in intensity.

Edge effects have been documented as extending from as little as a few meters into a forest patch, to more than several hundred meters, depending on the stressor, the effect being measured, the intervening habitat type and the sensitivity of the attribute (e.g., Batáry and Báldi, 2004 ; Murcia, 1995 ; Wood et al., 2006). Habitat fragmentation has the strongest negative effects on ecosystems with high productivity and biomass accumulation, such as wet tropical and wet temperate forests. Much more research on edge effects has occurred in tropical systems than in other regions. Evidence suggests that negative edge effects on biodiversity are much stronger in tropical than in temperate systems (Fahrig, 2003). However, this observation may be based on a lack of research in temperate regions.

A conservative definition of edge habitat would be forest within 300 feet of open or non-forest habitat (Environment Canada, 2013). However, studies (e.g., Harper et al., 2005) have shown that this distance and the magnitude of the edge effect within edge habitat can vary. Variation in the distance and magnitude may be influenced by factors such as the forest type, the type of clearing adjacent to the forest habitat, whether the clearing is maintained, prevailing wind directions along the clearing, and the general climate of the area. Harper et al. (2005) found that the edge influence associated with some maintained clearings (e.g., pipeline rights-of-way) was

less than 150 feet due to a "sidewall" of dense vegetation growth along the interface of the forest and the clearing.

The landscape along the route of the Project is generally fragmented by existing roads, utility rights-of-way, residential and commercial development, pastures, and agriculture. Mountain Valley would collocate about 49 percent (36.8 miles) of the pipeline route with existing linear corridors. The route would pass through portions of 26 blocks of interior forest (4 blocks in Virginia and 22 blocks in North Carolina)[20] in sections where the pipeline route would not be collocated with other existing corridors. Construction of the Project would impact 49.3 acres of interior forest (4.1 acres in Virginia and 45.2 acres in North Carolina). The maximum amount of interior forest that would be cleared from an individual block would be about 12.8 acres.

After construction, Mountain Valley would maintain the 50-foot-wide permanent right-of-way in an herbaceous state, but would allow trees and shrubs within the temporary construction areas to revegetate. A total of 18.5 acres of interior forest would be permanently converted to an herbaceous state as part of the permanent right-of-way (1.3 acres in Virginia and 17.2 acres in North Carolina). The remaining acreage cleared during construction would revegetate as edge habitat. Though it would take years for forest to regenerate.

In areas where the pipeline is collocated with existing cleared corridors, clearing of the edge habitat could extend the edge effect into adjacent interior forest and thereby convert a portion of the existing interior forest into edge habitat. Mountain Valley would allow the temporary construction workspace at the edge of the 50-foot-wide permanent right-of-way to regenerate as edge forest, though as previously stated, this would take years. Mountain Valley has voluntarily committed to working with VADCR, the Virginia Forest Conservation Partnership, and NCWRC regarding additional mitigation for clearing interior forest.

4.5.5 Vegetation Conclusions

Based on our review of the potential impacts on vegetation as described above, we conclude that the primary impact from construction and operation of the Project would be on forested lands. However, given the high level of collocation with existing, maintained rights-of-way through the majority of large forested areas crossed by the proposed pipeline routes, and the extensive distribution of similar vegetation communities adjacent to the proposed right-of-way, we conclude that impacts on vegetation, including forested areas, would be adequately reduced to less than significant levels. In addition, impacts on forested and non-forested vegetation types, as well as the introduction or spread of noxious weeds or invasive plant species, would be further mitigated through adherence to the measures outlined in Mountain Valley's Plan and Procedures, and other mitigation measures described above.

[20] We use the term "block" here to describe any contiguous expanse of forested area that is at least 300 feet from non-forested habit (i.e., surrounded by ≥ 300 feet of edge habitat).

4.6 WILDLIFE AND FISHERIES

4.6.1 Terrestrial Wildlife

The Project is located in the Piedmont Region of south-central Virginia and northcentral North Carolina and contains diverse wildlife habitats suitable for commonly found large and small mammals, reptiles and amphibians, and birds (raptors, waterfowl, and songbirds) of the region. Federal and state special status species (i.e., endangered, threatened, and species of concern) are described in section 4.7.

Wildlife is generally dependent on available habitat, which is typically directly linked to existing vegetation cover types. As described in sections 4.3.3, 4.4, and in the sections below, the Project would cross several upland and wetland vegetation cover types. These include forested, scrub-shrub, and herbaceous uplands; and herbaceous, scrub-shrub, and forested wetlands.

Table 4.6-1 identifies the terrestrial wildlife species commonly associated with the vegetation cover types that would be crossed by the Project.

TABLE 4.6-1

Wildlife Species Commonly Associated with Vegetation Communities Affected by the Southgate Project

Habitat Type	Wildlife Species
Upland Forest	***Mammals:*** *Big Brown Bat, Bobcat, Eastern Chipmunk, Eastern Gray Squirrel, Fox Squirrel, Eastern Red Bat, Gray Fox, Red Fox, Striped Skunk, White-Tailed Deer;* ***Birds:*** *Acadian Flycatcher, Barred Owl, Black-And-White Warbler, Blue Jay, Blue-Headed Vireo, Common Raven, Great Horned Owl, Hooded Warbler, Ovenbird, Pileated Woodpecker, Red-Bellied Woodpecker, Red-Shouldered Hawk, Scarlet Tanager, Wild Turkey;* ***Herpetofauna:*** *Eastern Box Turtle, Northern Copperhead, Spotted Salamander, White-Spotted Slimy Salamander, Wood Frog*
Upland Scrub-Shrub	***Mammals:*** *Eastern Cottontail, Red Fox, White-Footed Mouse, White-Tailed Deer;* ***Birds:*** *Eastern Towhee, Brown Thrasher, Cooper's Hawk, Eastern Screech Owl, Indigo Bunting, Song Sparrow, White-Eyed Vireo, Yellow-Breasted Chat;* ***Herpetofauna:*** *Northern Black Racer, Northern Rough Greensnake*
Upland Herbaceous	***Mammals:*** *Coyote, Groundhog, Meadow Vole, Red Fox, White-Tailed Deer;* ***Birds:*** *Eastern Meadowlark, American Kestrel, Eastern Bluebird, Grasshopper Sparrow, Vesper Sparrow, Wild Turkey;* ***Herpetofauna:*** *Eastern Gartersnake, Northern Brownsnake, Milksnake*
Wetland	***Mammals:*** *American Beaver, Bobcat, Mink, Muskrat, Raccoon, River Otter, Virginia Opossum, White-Tailed Deer;* ***Birds:*** *Common Yellowthroat, Great Blue Heron, Green Heron, Red-Winged Blackbird, Swamp Sparrow, Tree Swallow, Wood Duck;* ***Herpetofauna:*** *Spring Peeper, Bullfrog, Eastern Painted Turtle, Eastern Red-Spotted Newt, Green Frog, Snapping Turtle, Spotted Salamander, Upland Chorus Frog*
Agricultural Land	***Mammals:*** *Deer Mouse, Groundhog, Raccoon, White-Tailed Deer;* ***Birds:*** *Brown-Headed Cowbird, Barn Swallow, Horned Lark, Mourning Dove;* ***Herpetofauna:*** *Eastern Ratsnake. Eastern Gartersnake*

4.6.1.1 Terrestrial Wildlife Impacts and Mitigation

Pipeline Facilities

Upland forest comprises the largest component of the wildlife habitat crossed by the pipeline right-of-way (about 44 percent; actual acreages are provided in table 4.5-1). Three types of upland forest habitat would be affected: deciduous, evergreen, and a mix of deciduous and evergreen. Upland forests contain a wide variety of wildlife species, attributable to the diverse range of habitat types that forests provide, from the overhead canopy of the forest trees to the understory vegetation and forest-floor detritus. Tree and shrub layers provide food and cover for birds and larger mammals, such as white-tailed deer. Forest hardwood species such as oaks, beech, and poplar, produce acorns and seeds, which are important food sources for many bird and mammal species. Fallen trees and limbs give rise to insects, which also serve as important food sources, and the dense leaf litter and other detritus within the understory provide food and cover for invertebrates, amphibians, reptiles, and smaller mammals.

Herbaceous and scrub-shrub uplands and agricultural lands comprise the second and third largest components of wildlife habitat crossed by the Project (at 39.5 percent and 14.3 percent, respectively). Agricultural land and other non-forested upland habitats, such as idled croplands, hayfields, and old fields and pastures provide nesting, denning, and foraging habitat for grassland birds, upland game birds, and small to large mammals. Utility rights-of-way maintained in early successional communities also provide nesting and foraging habitats for grassland bird species and serve as grazing habitat for deer. These lands are, in turn, also prime hunting grounds for predator species such as foxes, coyotes, and raptors.

Constructing the Project would disturb about 1,393 acres of wildlife habitat, including agricultural lands. The temporary and permanent loss and/or conversion of habitat and the general disturbance created by the use of construction equipment would impact wildlife. This impact would vary depending on the type and quantity of habitat affected and the ability of species to leave Project work areas and successfully utilize adjacent habitats.

Constructing the Project may result in limited mortality of less mobile animals, such as small rodents, reptiles, amphibians, and invertebrates, which may not be able to relocate from the immediate construction area. In addition, during pipeline installation, there is potential for wildlife to be injured by falling into an open trench. Open trenches containing standing water could prove hazardous to smaller, less mobile animals. Mountain Valley would implement the following measures to reduce construction-related injury or mortality of wildlife:

- provide pre-construction training of personnel regarding the potential presence of wildlife within the Project area and protocols for delaying or stopping work should wildlife be present within active workspace areas;
- maintain breaks or gaps in temporary spoil piles and pipe stringing to facilitate wildlife migration through the construction corridor;
- install bi-directional ramps within open trench areas, at intervals of approximately 0.1 mile, to facilitate exiting of the trench by wildlife traveling in either direction;

- inspect workspaces and the trench in active construction areas prior to the start of each construction day to ensure that wildlife is not present; if wildlife is present, construction activities would be delayed in that area to allow the animals present to move outside of the workspace;
- inspect equipment left within the workspace prior to the start of each construction day to ensure that no wildlife is present within or under the equipment;
- prohibit direct handling of wildlife with the exception of relocation of injured or immobile animals by the environmental inspector(s);
- prohibit direct handling of any state or federally listed rare species unless otherwise approved by the applicable regulatory agencies;
- regulate equipment speed on access roads to minimize the potential for wildlife mortality; and
- require disposal of construction debris according to federal, state, and local regulations, and practice of good housekeeping to prevent garbage from attracting opportunistic wildlife and predators.

We expect that mobile wildlife would relocate to similar adjacent habitats during Project construction. However, displaced wildlife could experience inter- and intra-specific competition, lower reproductive success, and overall increased rates of stress, injury, and mortality if adequate adjacent habitat was not available. Where similar adjacent habitat is present, displacement impacts would generally be short-term. Wildlife would be expected to return and colonize successfully restored habitats that were temporarily affected by construction. Based on our restoration monitoring efforts for other natural gas infrastructure projects, we have found that wetland and upland herbaceous and shrub vegetation typically restore to pre-construction conditions in a relatively short time (i.e., between 1 to 5 years). Therefore, construction impacts on most mobile species occupying these habitats would be temporary.

The impacts on forest-dwelling wildlife species would be greater because forest habitat takes a comparatively longer time to regenerate within the revegetated temporary workspace. Restoring the temporary construction areas to forest habitats similar to that which existed prior to construction could take several decades, depending on site-specific conditions, such as rainfall, elevation, grazing, and weed introduction. Forest would be permanently removed within the operational right-of-way.

As noted in section 4.5.4.3, we received comments expressing concerns regarding the Project's impact on interior forest. We define interior forest and discuss the general effects of forest fragmentation in that section. Fragmentation of forest habitat can affect all orders of wildlife. Impacts on wildlife generally associated with habitat fragmentation include displacement, avoidance, and increased predation. For example, smaller species, such as reptiles and amphibians could experience greater impacts from habitat fragmentation as they are relatively less mobile and generally more averse to crossing wide corridors due to the increased risk of predation. Conversely, habitat fragmentation can increase wildlife migration and the fitness of species that can adapt to disturbance.

Forest habitat fragmentation generally affects interior dwelling birds by creating dispersal barriers, resulting in smaller suitable microhabitats, smaller population sizes, and reduced species diversity (Degraaf and Healy, 1990; Environment Canada, 2013). Newly opened corridors within forest habitat may expose forest-nesting birds to increased nest predation pressure from both mammalian and avian predators (including raccoons, jays, and crows) and to brood parasitism by brown-headed cowbirds. This in turn could affect avian reproductive output and result in long-term impacts on avian populations within these newly-created corridors. However, overall breeding bird density and richness generally are higher in disturbed habitats. Increased abundances near edges are generally more common than decreases or negative edge responses (Villard, 1998; Sisk and Battin, 2002). Many wildlife species forage opportunistically for insects and fruit in forest patches (Greenberg et al., 2007).

Beyond the suitability of the converted habitat for indigenous wildlife, there is also an edge effect that penetrates some distance into the adjacent forest. The extent of the edge effect reported in hundreds of research articles is highly variable, both because different species respond differently and because abiotic factors such as edge orientation and edge contrast may influence the effect. Ultimately, the impact would depend on the life histories and habitat preferences for the indigenous species. As stated above, the response may be negative (for forest interior species), neutral (for habitat generalists), or positive (Ries and Sisk, 2004) (see additional discussion in section 4.5).

The Project would be collocated with existing utility corridors for 49 percent (36.8 miles) of the Project right-of-way. Collocating reduces the amount of fragmentation and new edges by shifting the existing forest edge as opposed to creating a completely new corridor. As noted in section 4.5.4.3, in areas where the Project is not collocated, the right-of-way would pass through interior forest habitats. In Virginia, the Project would directly impact 4.1 acres of interior forest. In North Carolina, the Project would directly impact about 45.2 acres of interior forest. In total, the Project would impact about 629.9 acres of forest habitat (including forested wetland) during construction. Removal of forest habitat, including areas of silviculture and tree farms, for the operation of the Project would be permanent. The time needed for forested wildlife habitats to recover within the temporary right-of-way would be long-term. However, the relatively small size of the interior forest habitat blocks that would be affected would minimize the amount of interior forest habitat being converted to edge habitat at any one location. Therefore, impacts on wildlife species would not result in long-term or significant population-level effects, given the stability of local populations and the abundance of available habitat adjacent to the proposed right-of-way. Nonetheless, to further minimize impacts, Mountain Valley has voluntarily committed to working with VADCR, the Virginia Forest Conservation Partnership, and NCWRC regarding mitigation for clearing interior forest.

Noise generated by the Project is discussed in detail in section 4.11.2.3. Noise levels along the construction right-of-way would vary depending on the phase of work, equipment in use, distance from noise receptors, and intervening topography and vegetation outside the right-of-way. Wildlife species rely on aural cues for courtship and mating, prey location, predator detection, and/or homing. These functions could be affected by noise resulting from construction and operation of the Project. Specifically, construction noise could lead to nest abandonment, which in turn can lead to egg failure, reduced juvenile growth and survival, or malnutrition or starvation of the young. During construction, the effects of noise on wildlife would be greatest immediately

adjacent to the construction right-of-way. As described previously, construction along the right-of-way proceeds through a particular habitat and then moves along to the next one, usually within 6 to 12 weeks. Therefore, construction noise impacts would be temporary.

Blasting along the right-of-way may be necessary during construction where bedrock is present at depths less than the proposed pipeline trench depth (see section 4.1.4.7). Generally, noise levels produced during blasting are instantaneous and vary based on a number of factors, including the type and amount of explosives used, the depth below-ground of the explosives, and whether noise mitigation is applied. Potential impacts of blasting would be similar to those from general construction noise. Typical construction blasting operation noise levels have been documented at about 94 dBA at a distance of 50 feet; whereas construction equipment noise levels would typically be around 85 dBA at 50 feet when the equipment is operating at full load (FHWA, 2006a). Although slightly louder than typical construction equipment, blasting activities would be infrequent and over very short durations. Blasting typically involves a small scale, controlled, rolling detonation procedure resulting in limited ground upheaval. The blasts do not typically result in large, above ground explosions. Nonetheless, blasting in proximity to bird nests, during sensitive periods, for example, may cause adults to abandon nests, which could lead to egg or nestling mortality. Mountain Valley has prepared a Project-specific *General Blasting Plan* and would coordinate with appropriate federal and state agencies prior to conducting blasting operations to minimize impacts related to blasting.

While pipelines have no operational noise associated with them, during the operation of the pipeline, noise emissions also would be generated during monitoring and maintenance activities, such as vegetation clearing on the permanent right-of-way, or during ground or air surveillance of the pipeline, as required by DOT regulations. Surveillance activities could cause startle effects in wildlife in proximity to the pipeline; however, these activities would be infrequent and short-term in duration. The effects on wildlife due to noise emissions would be minimal and highly localized.

Artificial lighting used during construction and at the aboveground facilities of the Project during operation would generate light pollution. Ecological light pollution refers to artificial lighting that affects natural patterns of light and dark in ecosystems, which in turn may affect wildlife (Longcore and Rich, 2004). The effects of ecological light pollution may include disorientation in nocturnal animals, disrupting migratory patterns of birds, altering seasonal day-length cues, which some wildlife may rely on as a trigger for critical behavior (e.g., migration).

Mountain Valley would only use artificial lighting as necessary during pipeline construction between the hours 7:00 am and 7:00 pm (on average) except for during emergencies or limited instances of 24-hour construction activities (e.g., HDD). Therefore, light pollution during construction would be minimal or, in the instances of the HDD activities, only for a relatively short duration.

To increase the speed and success of restoration of wildlife habitat, Mountain Valley would implement right-of-way restoration measures contained in Mountain Valley's Plan and Procedures, E&SC Plan, and solicit guidance from the USDA NRCS, VADCR, and NCWRC to restore the pipeline corridor using native seed mixes, including species beneficial to pollinators, specific to the Project locations. Mountain Valley would allow the right-of-way adjacent to a 10-

foot-wide center strip, maintained to facilitate periodic corrosion/leak surveys over the pipeline, to grow as scrub-shrub habitat, which would provide a more gradual transition between the pipeline corridor and surrounding forested habitat. Additionally, Mountain Valley would follow the recommendations of VADCR and NCWRC to only conduct maintenance mowing of the right-of-way center strip during the non-growing season between October 15 and April 1.

Aboveground Facilities, Contractor Yards, Access Roads

Agricultural lands and non-forested uplands combined would comprise the majority of wildlife habitat that would be affected by construction of the aboveground facilities. Approximately 44 percent of the lands affected by aboveground facilities would occur on agricultural lands and 38 percent would occur on herbaceous/scrub-shrub upland habitat. Upland forest habitat would comprise approximately 17 percent of the habitat affected by aboveground facilities, leaving less than 2 percent that would occur in wetland habitat. As noted in section 4.4.2, aboveground facilities and access roads would permanently affect approximately 0.1 acre of wetlands.

Approximately 98 percent of the contractor yard acreages would occur in herbaceous/scrub-shrub upland habitat. The remaining 2 percent would occur in forested upland habitat.

Access roads would cross agricultural, upland forest, open upland, and both herbaceous/scrub-shrub and forested wetland habitats. Approximately 71 percent of the acreage necessary for access roads would cross herbaceous/scrub-shrub upland habitat. Wetland habitat would only incur temporary impacts related to use of temporary access roads and would comprise less than one percent of the acreage necessary for access roads. Total acreages for the different components of the Project are provided in table 4.5-2.

The permanent footprint at the Lambert Compressor Station, and other aboveground facilities would be converted to developed land. Areas used for temporary and additional workspace at each facility would be restored and maintained as open land or allowed to revert to pre-construction land use cover. Following construction, Mountain Valley would restore and reseed any previously vegetated areas affected at contractor yards (unless approved in writing by the landowner). Use of access roads by construction personnel would temporarily displace wildlife species, and there would be the potential for a minor increase in wildlife fatalities along access roads due to the temporary increase in traffic during construction. We expect wildlife would return to the restored areas at aboveground facilities, contractor yards, and access roads post-construction. Wildlife habitat within the permanent footprint at aboveground facilities, which would be enclosed by fencing, and permanent access roads would be limited primarily to supporting songbirds and small mammals.

The Lambert Compressor Station would generate noise on a continuous basis once in operation, which would be limited to the general vicinity of the facilities. In addition, Transco's Compressor Station 166 is located approximately 600 feet north, and the Transco's Compressor Station 165 is located within a half mile of the location proposed for the Lambert Compressor Station. Noise levels associated with compressor unit venting activities required for maintenance and emergency shutdown unit ventings would occur infrequently and would be short-term in

duration. Section 4.11.2.3 provides a more in-depth description of noise levels associated with the Lambert Compressor Station.

Effects on wildlife from chronic noise may vary by species (e.g., Barber et al., 2009; Francis et al., 2011a, b; Francis et al., 2012; Blickley et al., 2012). Noise levels decrease exponentially with distance from the source and this decrease is accelerated within forested areas relative to the type of forest and the extent of understory present (Huisman and Attenborough, 1991). A mix of forest, open agricultural land, and developed industrial land would surround the Lambert Compressor Station. Mountain Valley would employ noise mitigation measures, such as compressor building walls, roof, doors, and ventilation systems designed to reduce noise emissions, turbine exhaust and intake silencers and breakouts, compressor unit venting silencers, and underground suction and discharge piping. The noise levels that wildlife would be exposed to beyond the compressor station property boundary would vary based on the distance from the facility. In the years following initial construction, wildlife tolerant of the operational noise associated with the new and existing compressor station facilities would remain in the area, while other species would likely move into similar available habitat farther from the noise source.

Mountain Valley would use downward facing, shielded lighting fixtures as required for security and operations purposes during operations at the aboveground facilities. Additionally, the Lambert Compressor Station would be located near existing compressor stations that are illuminated by artificial lighting in a similar capacity as would be required for the Lambert Compressor Station. As such, wildlife in the area are likely tolerant of artificial lighting at this location. Therefore, the effects of artificial lighting on wildlife would be sufficiently minimized.

As with the pipeline right-of-way, Mountain Valley would implement post-construction restoration measures at aboveground facilities, contractor yards, and access roads to increase the speed and success of restoration of wildlife habitat. Mountain Valley would follow guidelines contained in its Plan and Procedures and solicit guidance from the USDA NRCS, VADCR, and NCWRC to restore these areas using native seed mixes, including species beneficial to pollinators, specific to the Project locations. We expect wildlife would return to the restored areas post-construction.

4.6.2 Sensitive and Managed Wildlife Habitats

Sensitive or managed wildlife habitats such as national forests and wildlife refuges, state forests and parks, wildlife management areas, and reserve program lands are generally established to protect lands and waters that have a high habitat value for wildlife, or for public hunting, trapping, fishing, and other compatible recreational uses. The Project would not cross any National Wildlife Refuges, Wildlife Management Areas, or other federally protected lands. The Project would not come within 3 miles of any state Wildlife Management or Game Lands in North Carolina but would pass within a mile of the White Oak Mountain Wildlife Management Area in Virginia between approximate MPs 0.0 and 1.3. The Project would also cross multiple state-managed or private conservation areas, including three North Carolina Forest Legacy Areas (MPs 26.1 to 36.3, MPs 42.2 to 48.4, and contractor yard CY25) and a Piedmont Land Conservancy Easement (MP 37.7). The Forest Legacy Program was created by the U.S. Congress to protect environmentally important forest lands that are threatened by conversion to non-forested uses

(NCFS, 2017a). The Piedmont Land Conservancy easements are voluntary legal agreements entered into by private landowners to protect their property from development.

4.6.2.1 Sensitive and Managed Wildlife Habitat Impacts and Mitigation

The Project would not impact wildlife within the White Oak Mountain Wildlife Management Area. State Highway 57 and State Route 703 run between the Project right-of-way and the Wildlife Management Area. The impacts on wildlife within the North Carolina Forest Legacy Areas and Piedmont Land Conservancy Easement would be consistent with those of the corresponding habitats in other portions of the Project right-of-way. Within the North Carolina Forest Legacy Areas, the Project route would primarily be collocated with an existing utility right-of-way and contractor yard CY25 would be in an area of primarily open or previously cleared land. The Project would cross a mixture of non-forested upland habitats and would impact 152.9 acres of deciduous, evergreen, and mixed forested habitat and 6.3 acres of forested wetland. The land crossed within the Piedmont Land Conservancy Easement would consist of an approximately 0.1-mile stretch comprised of 0.3 acre of early successional forest edge habitat.

The Project would also pass through about 3 miles of the Virginia Piedmont Forest Block Complex Important Bird Area (IBA) between MPs 22.7 and 25.7. The IBA Program is an international initiative developed to identify, protect, and manage critical areas associated with vital bird habitat and associated biodiversity (Audubon, 2019). IBAs are sites that provide essential habitat to one or more bird species for at least one portion of their life history (e.g., during breeding, wintering, and/or migrating). Areas designated as IBAs support species of conservation concern (e.g., threatened, endangered, or rare species), species with limited or restricted ranges, and/or species that are vulnerable because their populations are concentrated in one habitat type or occur in high concentrations due to congregation. The National Audubon Society administers the IBA Program in the United States in partnership with BirdLife International. The Forest Block Complex IBAs were established as a means to protect viable populations of priority bird species by establishing a network of forested landscapes along the Atlantic Flyway, which the Project would cross[21].

However, the portion of the Virginia Piedmont Forest Block Complex IBA that would be crossed by the Project is not a uniform block of forested habitat. The block is currently crossed by U.S. Highway 311, multiple state roads, a railroad right-of-way, an electrical transmission right-of-way, and an additional existing right-of-way with which the Project would be collocated. The block contains approximately 15,567 acres of forested habitat based on a National Land Cover Database (NLCD) review (Homer et. al., 2015). Construction activities would clear approximately 60.4 acres of forested edge habitat along an existing right-of-way and operation of the Project would permanently convert approximately 16.7 acres of the forested edge habitat to herbaceous or scrub-shrub habitat. This would equate to a long-term decrease of 0.4 percent of the forested habitat and permanent loss of 0.1 percent of the forested habitat in the block of the Virginia Piedmont Forest Block Complex through which the Project would pass. Given that the Project route would affect primarily forest edge habitat, would be primarily collocated with an existing

[21] The Atlantic flyway is one of four broad areas (in addition to the Mississippi, Central, and Pacific flyways) that contain the routes of migrating birds from summer nesting sites throughout North America, including the Arctic, to their wintering grounds in southern North America, the Caribbean, and South America. In the United States, the Atlantic flyway generally consists of the states along the east coast, including North Carolina and Virginia.

right-of-way, and would impact a relatively low proportion of forested habitat within the forest block, we conclude the effects of the Project on wildlife within sensitive and managed wildlife areas would not be significant.

4.6.3 Migratory Bird Treaty Act, Bald and Golden Eagle Protection Act, and Colonial Nesting Birds

4.6.3.1 Migratory Birds

Migratory birds are protected under the MBTA (16 United States Code [U.S.C.] 703-711). The MBTA, as amended, prohibits the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, or nests unless authorized under a FWS permit. Bald and golden eagles are protected under the BGEPA (16 U.S.C. 668-668d). Executive Order (EO) 13186 directs executive departments and agencies to identify where unintentional take is likely to have a measurable negative effect on migratory bird populations and to avoid or minimize adverse impacts on migratory birds through enhanced collaboration with the FWS. The EO states that emphasis should be placed on species of concern, priority habitats, and key risk factors, and that particular focus should be given to addressing population-level impacts.

On March 30, 2011, the FWS and the FERC entered into a Memorandum of Understanding that focuses on avoiding and minimizing adverse impacts on migratory birds, with a focus on species of concern, and strengthening migratory bird conservation through enhanced collaboration. This voluntary agreement does not waive legal requirements under the MBTA, BGEPA, ESA, Federal Power Act, NGA, or any other statutes and does not authorize the take of migratory birds.

The FWS created the Birds of Conservation Concern (BCC) list (FWS, 2008) with the goal of preventing or removing the need for additional ESA bird listings by implementing proactive management and conservation actions and coordinating consultations in accordance with EO 13186.

A variety of migratory birds and BCC use or could use the habitats affected by the Project. These birds use these habitats for resting (stopover), sheltering, foraging, breeding, and/or nesting. The Project would be in the North American Bird Conservation Initiative (NABCI) Bird Conservation Region (BCR) 29 (BCR 29: Piedmont; NABCI, 2018). Table 4.6-2 lists 17 Project-specific migratory bird species of concern with preferred nesting habitat that would potentially be affected by the Project. These include BCC species, species listed as conservation priorities in the BCR 29 Implementation Plan (Watson, 2014), species listed in the Virginia Wildlife Action Plan (VADGIF, 2015) and North Carolina Wildlife Action Plan (NCWRC, 2015) as species of greatest conservation need, and species listed by the NCNHP (2018a) as species with conservation concerns.

TABLE 4.6-2

Migratory Bird Species of Concern Potentially Present within the Southgate Project Area

Common Name	Source a/	Project County	Preferred Nesting Habitat b/	Primary Nesting Season
Acadian flycatcher	NCWAP	Rockingham; Alamance	Moist hardwood forests, usually near a creek or in bottomland forests.	Apr 21 to Aug 15
American kestrel	NCWAP	Rockingham; Alamance	Fields, pastures, open farmland.	Mar 15 to Jul 31
American woodcock	BCR 29 Plan; NCWAP VADGIF	Pittsylvania; Rockingham; Alamance	Habitat consists of young forests and abandoned farmland mixed with forested land. Generally considered an edge species.	Apr 1 to Aug 31
bald eagle	BGEPA; BCC; NCWAP	Pittsylvania; Rockingham; Alamance	Nests in trees among forests adjacent to large water bodies	Jan 1 to Aug 31
barn owl	NCWAP	Rockingham; Alamance	Open farmland; nests in manmade structures.	Feb. 1 to Jul 31
brown-headed nuthatch	BCC; BCR 29 Plan; NCWAP	Rockingham; Alamance	Mature and open longleaf pine stands; at least locally common in open loblolly, shortleaf, and pond pine stands, less so in Virginia pine. In the Piedmont, birds favor thinned or more open pine stands, such as in residential areas, golf courses, margins of lakes and ponds, and edges.	Apr 15 to Aug 15
eastern whip-poor-will	BCC; BCR 29 Plan	Pittsylvania	Forests and woodlands; no nest built, eggs laid on flat ground.	May 1 to Aug 15
grasshopper sparrow	BCR 29 Plan; NCNHP	Pittsylvania; Rockingham; Alamance	Fallow fields, pastures, hayfields, grasslands, and other areas dominated by graminoid vegetation.	May 15 to Aug 15
Kentucky warbler	BCC; BCR 29 Plan; NCWAP	Pittsylvania; Rockingham; Alamance	Prefers deep shaded woods with dense, humid thickets, bottomlands near creeks and rivers, ravines in upland deciduous woods, and edges of swamps; nests on ground or within a few inches of it	May 1 to Aug 15
Louisiana waterthrush	NCWAP	Rockingham; Alamance	Streams and rivers associated with hardwood forests	Mar 15 to Aug 15
northern bobwhite	BCR 29 Plan; NCWAP	Pittsylvania; Rockingham; Alamance	Fallow fields, pastures, hayfields, grasslands, and other areas dominated by graminoid vegetation	Apr 15 to Aug 31
prairie warbler	BCC; BCR 29 Plan	Pittsylvania; Rockingham; Alamance	Shrubby pastures, low pines; nest usually in a tree (such as pine, cedar, sweetgum, oak), 1-45' above the ground	May 1 to Jul 31

TABLE 4.6-2

Migratory Bird Species of Concern Potentially Present within the Southgate Project Area

Common Name	Source a/	Project County	Preferred Nesting Habitat b/	Primary Nesting Season
prothonotary warbler	BCR 29 Plan; NCWAP	Rockingham; Alamance	Wooded swamps, wetlands, river bottom hardwoods; Nest site usually 5- 10' up (sometimes 3-30' up), above standing water in hole in tree or stump.	May 15 to Jul 31
red-headed woodpecker	BCR 29 Plan; NCWAP	Rockingham; Alamance	Groves, farm country, orchards, shade trees in towns, large scattered trees; nests in tree cavities	May 10 to Sep 10
willow flycatcher	NCNHP	Rockingham	Open country, mainly in wide valleys with streamside thickets and corridors of trees adjacent to fields; marshes with shrubs and small trees	June 1 to Aug 15
wood thrush	BCC; BCR 29 Plan	Pittsylvania; Rockingham; Alamance	Mainly deciduous woodlands; nest placed in vertical fork of tree (usually deciduous) or saddled on horizontal branch, usually about 10-15' above the ground, sometimes lower, but rarely as high as 50'.	May 1 to Aug31
Yellow-throated warbler	NCWAP	Rockingham; Alamance	Mesic forests; swamps, bottomlands, streamside groves, and some pinelands	Mar 15 to Jul 15

a/ BCC: Included as 2008 Bird of Conservation Concern for Bird Conservation Region 29 (FWS, 2008); BCR29 Plan: Considered a priority species in the 2014 BCR 29 Implementation Plan (Watson, 2014). VAFWIS: Virginia Fish and Wildlife Information Service. NCNHP: North Carolina Natural Heritage Program's database; NCWAP: North Carolina Wildlife Action Plan. BGEPA = Bald and Golden Eagle Protection Act.

b/ acreages of habitat that would be affected by the Project are provided in tables 4.5-1 and 4.8-1.

Generally, the migratory bird species of concern listed in table 4.6-2 are experiencing population declines due to habitat loss and fragmentation. Loss and fragmentation of forested habitat could negatively affect species such as the brown-headed nuthatch, prothonotary warbler, willow flycatcher, and wood thrush; however, clearing associated with the Project could eventually provide habitat for species such as the American woodcock, eastern whip-poor-will, grasshopper sparrow, northern bobwhite, and prairie warbler.

4.6.3.2 Migratory Birds Impacts and Mitigation

If construction occurs during the nesting season, increased human presence and noise from construction activities could disturb actively nesting birds resulting in incidental take of migratory bird species. Impacts would likely not be significant for non-nesting birds, as these individuals could temporarily relocate to avoid construction activities. However, construction activity near active nests during incubation or brood rearing could result in nest abandonment; which, in turn,

could lead to overheating, chilling, or desiccation of unattended eggs or young; and subsequently nestling mortality; premature fledging; and/or ejection of eggs or young from the nest. Additionally, loss and/or conversion of existing habitat and the subsequent displacement of birds could affect mating, nesting, rearing, foraging, and predator avoidance behaviors. As a result, migratory birds could experience increased predation, competition, and rates of stress, injury, and mortality.

Mountain Valley has attempted to minimize the loss of migratory bird habitat by collocating the Project route with existing rights-of-way or previously disturbed habitat for approximately 49 percent of the proposed route and reducing the width of the construction right-of-way to 75 feet where the pipeline would cross waterbodies or wetlands. Mountain Valley would attempt to minimize Project impacts on nesting migratory birds by conducting construction-related vegetation clearing outside of the peak migratory bird nesting season within each state (March 15 through August 15 in Virginia and April 1 through August 31 in North Carolina).

During operation of the Project, Mountain Valley would coordinate with the VADGIF, NCWRC, and local conservation districts to develop right-of-way mowing schedules and conservation practices beneficial to bird species (and other wildlife) that may use the Project right-of-way as nesting or foraging habitat. Due to recommendations from VADCR and NCWRC, Mountain Valley has proposed to modify its Plan to restrict maintenance clearing or mowing of the right-of-way between April 1 and October 15 of any year.

Conducting vegetation clearing outside of the peak migratory bird nesting season would minimize incidental take of nesting migratory birds. If avoiding the migratory bird nesting season during construction-related clearing becomes infeasible, Mountain Valley would consult with the FWS to identify measures to implement to minimize impacts on migratory birds. Mountain Valley would file these communications in their weekly construction status reports. Construction and operation of the Project would have short-term to permanent effects on migratory bird habitat. Impacts on non-forested upland habitat by construction of the pipeline would be short-term and temporary, since these areas would return to their herbaceous or scrub-shrub vegetative cover within 1 to 2 years post-construction. Impacts on forested habitat would be long-term to permanent, as forested habitat cleared for construction would likely require several decades to recover and forested habitat in the permanent right-of-way would be permanently converted to herbaceous or non-forested habitat for the operational life of the Project. Approximately 629.9 acres of forest habitat (including forested wetland) would be affected by construction of the Project, 241.6 acres of which would be permanently converted to herbaceous or scrub-shrub habitat for the operational life of the Project.

Given the steps Mountain Valley would take to attempt to minimize Project impacts on migratory birds, and the relatively low percentage of forested habitat generally and interior forest habitat specifically that would be affected in comparison with available forested habitat in the vicinity of the Project (as described in sections 4.5.4.3 and 4.6.1.1), we conclude Project impacts on migratory birds would be minimized to the extent practicable and not significant.

4.6.3.3 Bald and Golden Eagles

The Project would not cross any known bald eagle (*Haliaeetus leucocephalus*) concentration areas (FWS, 2018a). Additionally, no bald eagle nests are located within 0.5 mile of the Project footprint in either Virginia or North Carolina based on assessments of the FWS Virginia Field Office's Bald Eagle Map Tool (FWS, 2018a), the Center for Conservation Biology Virginia Bald Eagle Nest Locator (Center for Conservation Biology, 2018), and the NCNHP Data Explorer (NCNHP, 2018a). According to information provided by VADGIF, the closest known bald eagle nest exists approximately 8 miles from the Project right-of-way in Pittsylvania County. Golden eagles are not known to nest in the eastern United States and are primarily only found in the western mountainous regions of Virginia and North Carolina during migration or in winter (Katzner et al, 2012).

4.6.3.4 Bald and Golden Eagles Impacts and Mitigation

Although there are no currently documented bald eagle nests within 0.5 mile of the Project footprint, the possibility exists that bald eagles could build nests in the vicinity of the Project prior to the start of construction. To account for this possibility, and in order to ensure that impacts on bald eagles would be minimized, Mountain Valley would conduct bald eagle nest surveys during the winter prior to the beginning of construction within 0.5 mile of the Project rights-of-way. We provide a recommendation below that Mountain Valley file the results of the bald eagle nest surveys with the Secretary prior to the beginning of construction.

If bald eagle nests were discovered during the pre-construction winter nest surveys, Mountain Valley would follow measures adapted from the FWS National Bald Eagle Management Plan Guidelines (FWS, 2007) and the Virginia Department of Game and Inland Fisheries Bald Eagle Guidelines for Landowners (VADGIF, 2012) between December 15 and July 15. The measures Mountain Valley would follow include:

- restricting blasting or any use of explosives to greater than 0.5 mile (or 1 mile in open areas) from an active nest during the nesting season (December 15 through July 15);
- maintaining a buffer of at least 660 feet between Project-related activities and the nest;
- restricting all vegetation clearing and ground disturbance within 660 feet of the nest to outside of the nesting season; and
- maintaining any established landscape buffers between Project-related activities and active nests.

Based on Mountain Valley's intent to conduct nest surveys and implement the noted protective measures, we conclude Project impacts on bald eagles would be avoided or minimized sufficiently.

4.6.3.5 Colonial Nesting Birds

In BCR 29, colonial nesting birds commonly consist of wading birds such as great blue herons, great egrets, and other smaller herons and egrets that nest in multispecies colonies in trees

and shrubs in close proximity to waterbodies. In North Carolina, population trends of some smaller herons and egrets such as little blue herons, tri-colored herons, and snowy egrets indicate declines in the numbers of nesting pairs but the causes of these declines are unknown (NCWRC, 2015). Wading bird habitat in the Piedmont Region generally consists wetland areas associated with ponds, lakes, reservoirs, and rivers (Hunter et. al., 2006). The primary threat to wading bird populations is habitat loss and degradation due to land clearing and construction activities associated with human development (Hunter et. al., 2006; NCWRC, 2015).

4.6.3.6 Colonial Nesting Birds Impacts and Mitigation

Mountain Valley received a recommendation from the NCWRC in August of 2018 (NCWRC, 2018b) to avoid construction activities within 0.5 mile of any active colonial nesting bird rookeries. The NCWRC further recommended that Mountain Valley conduct surveys for rookeries within 0.5 mile of the Project rights-of-way during the winter months prior to construction. Mountain Valley has accordingly committed to conducting the rookery surveys concurrently with the bald eagle nest surveys. Additionally, Mountain Valley would maintain established landscape buffers between Project-related activities and active rookeries and would refrain from construction activities within 0.5 mile of any rookery between February 15 and July 31. Therefore, we conclude Project impacts on colonial nesting birds would be avoided or minimized to the extent practicable.

Based on Mountain Valley's intent to conduct bald eagle and rookery surveys, and implement the noted protective measures, we conclude Project impacts on bald eagles and colonial nesting birds would be avoided or minimized to the extent practicable. However, Mountain Valley has not yet identified areas where these measures would be necessary. Therefore, **we recommend:**

- **In order to identify locations where additional protection measures would be needed, and to inform compliance monitoring, Mountain Valley should file with the Secretary, the results of the pre-construction bald eagle nest and colonial rookery surveys prior to construction.**

4.6.4 Game Species

Big game species that may be present in the vicinity of the Project include white-tailed deer and wild turkey. Other game species, such as furbearers, game birds, and small game, may be found in the Project area. Furbearers include American beaver, common raccoon, gray fox, muskrat, red fox, and striped skunk. Small game species within the Project area include species such as eastern gray squirrel, fox squirrel, groundhog, and Virginia opossum. Game birds in the vicinity of the Project would potentially include both upland birds, such as the American woodcock and mourning dove, as well as waterfowl, such as the American black duck, American coot, blue- and green-winged teal, Canada goose, northern pintail duck, and sora.

4.6.4.1 Game Species Impacts and Mitigation

Impacts on game species would be similar to the general impacts on wildlife discussed previously. Following construction, game species could utilize the newly established rights-of-way for foraging and travel. Restored pipeline rights-of-way generally provide an opportunity for

developing high quality feeding areas for game species, especially if noxious weeds are adequately controlled and native forage seeding is successful. In general, large and small game species would be expected to return to habitats they vacated after construction and restoration efforts are completed, and harvest success rates would likely be similar to pre-construction success rates.

The new pipeline rights-of-way could increase access to remote hunting areas, which could result in increased hunting success. Increased public recreation along cleared rights-of-way in the hunting season, especially near crossings of existing access points, has been documented elsewhere (Crabtree, 1984). This increased access to previously inaccessible hunting areas could also result in trespassing on private lands, and an increase of poaching of game and non-game wildlife.

4.6.5 Fisheries and Aquatic Resources

The Project would cross freshwater waterbodies, including perennial, intermittent, and ephemeral streams. No marine or estuarine waterbodies would be crossed or affected by the Project. Refer to section 4.3 for additional information regarding waterbodies; table 4.3-4 summarizes the waterbodies crossed by the Project. As described in section 4.3.2.1, constructing and operating the Project would require 224 waterbody crossings, many of which provide aquatic habitat and support fisheries. The H-650 pipeline would cross 125 perennial waterbodies but the H-605 pipeline would not cross any perennial waterbodies.

The character of fisheries and aquatic habitats are typically influenced by water temperature (warmwater or coldwater), fishing uses (commercial or recreational), and migration patterns (anadromous and catadromous fish species). Warmwater streams are generally capable of supporting a high diversity of fish assemblages, including suckers, sunfishes, and catfishes, and other species that are able to tolerate water temperatures greater than 68°F. The Project would only cross warmwater fisheries. In addition to supporting fisheries, crossed waterbodies support other aquatic species including mussels and other invertebrates. Fish and aquatic species commonly found in the waterbodies crossed by the Project are listed in table 4.6-3.

TABLE 4.6-3

Typical Fish and Aquatic Species within the Southgate Project areas a/

Fish
bowfin, central stoneroller, American shad, American eel, blue ridge sculpint, redbreast sunfish, rosyside dace, mountain redbelly dace, white catfish, pirate perch, white sucker, yellow bullhead, brown bullhead, flier, satinfin shiner, whitefin shiner, gizzard shad, bluespotted sunfish, creek chubsucker, redfin pickerel, chain pickerel, swamp darter, Johnny darter, tessellated darter, sawcheek darter, cutlip minnow, speckled killifish, eastern mosquitofish, eastern silvery minnow, northern hog sucker, longnose gar, green sunfish, pumpkinseed, warmouth, bluegill, white shiner, crescent shiner, blueside shiner, largemouth bass, spotted sucker, white perch, striped bass, blacktip jumprock, notchlip redhorse, golden redhorse, shorthead redhorse, bluehead chub, bull chub, golden shiner, whitemouth shiner, highfin shiner, comely shiner, redtip shiner, spottail shiner, coastal shiner, swallowtail shiner, orangefin madtom, margined madtom, yellow perch, piedmont darter, chainback darter, shield darter, black crappie, eastern blacknose dace, brassy jumprock, creek chub, eastern mudminnow

a/ Typical fish and aquatic species; list is not intended to be comprehensive.

4.6.5.1 Fisheries of Special Concern

Federally or state-listed endangered, threatened, or candidate fish or aquatic species, coldwater fisheries, and fisheries with significant economic value resulting from the presence fish stocking programs, or commercial harvesting are all considered fisheries of special concern. In the Commonwealth of Virginia, the VADEQ has water use classifications that include propagation and growth of a balanced indigenous population of aquatic life. In North Carolina, NCDEQ designated Outstanding Resource Waters based on the functional value and use of a waterbody. Federally or state-listed endangered, threatened, or candidate fish and aquatic species are addressed in section 4.7.

The Project would cross 21 perennial waterbodies containing fisheries of special concern: 2 in Virginia, and 19 in North Carolina. Recreational fishing is a large economic driver in both Virginia and North Carolina. However, the Project would not cross any trout waterbodies or coldwater fisheries and the Project would not directly affect fishing rivers or streams suggested by the VADGIF (VADGIF, 2019a) or fishing access locations suggested by the NCWRC (NCWRC, 2019a). Therefore, aside from potential temporary disruptions of fishing in the vicinity of the waterbody crossings during construction, we do not expect the Project to incur more than minor and temporary impacts on recreational fisheries in Virginia or North Carolina. Table 4.6-4 summarizes the crossings of waterbodies containing fisheries of special concern, including waterbody name, location, fishery of special concern, and crossing restrictions.

Note: MP listed for access roads is nearest pipeline MP.

a/ Restricted In-Stream Construction Windows are the date ranges in which in-water construction is allowed to occur.

b/ As stipulated by VADGIF; July 16 – April 14 is the VADGIF mandated warmwater habitat construction window; in-water work, except that required to install or remove equipment bridges, must be completed between these dates in Virginia waterbodies.

c/ Based on the results of aquatic surveys at the proposed waterbody crossings, NCWRC will not request any time-of-year restrictions for construction in the waterbodies crossed by the Southgate Project (contingent on Mountain Valley using HDD or conventional bore crossing methods for the waterbodies noted as such within this table).

Virginia's Marine Resources Commission (VMRC) notified the Commission that it will exert its jurisdiction over all proposed crossings of perennial streams with a drainage area equal to or greater than 5 square miles or with a mean annual in-stream flow of 5 cubic feet per second. This jurisdiction is based on the state of Virginia's ownership of submerged lands (Code of Virginia Title 28.2, Subtitle III, Chapter 12, Article 1, § 28.2-1204) and is administered under its Submerged Lands Permit (see table 1.4-1). Eight proposed crossings in Virginia fit these parameters: Little Cherrystone Creek (MP 0.4), Cherrystone Creek (MP 1.7), Banister River (MP 4.9), White Oak Creek (MPs 5.0, 5.1), Sandy Creek (MP 12.8), Sandy River (MP 17.7) and Trotters Creek (MP 23.2). The VMRC provides the following recommendations to protect freshwater aquatic resources at each of the VMRC jurisdictional stream crossings. The recommendations are standard VMRC in-stream permit conditions and, as noted in the sections below and other applicable sections of this EIS, will be followed by Mountain Valley.

- An HDD inadvertent release contingency plan must be provided for any crossings utilizing a directional drill crossing method.
- No in-stream construction shall be conducted during any recommended time-of-year restrictions of any year unless waived by VADGIF in writing.
- In-stream construction activities shall be accomplished during low flow periods utilizing dam-and-pump or flume methods; stream bottoms and adjacent lands shall be restored to their original contours and natural conditions within 30 days; and all excess materials shall be removed to an upland site and contained to prevent its reentry into state waters.
- Erosion and sediment control measures shall be in conformance with the Virginia Erosion and Sediment Control Handbook, Third Edition, 1992, and shall be employed throughout construction.
- If blasting is necessary, at any of the crossings, VADGIF shall be notified a minimum of 48 hours in advance of the blasting.
- If karst landscape features are encountered at any stream crossings, VADCR shall be notified.
- VADGIF shall be contacted for any work in trout waters to avoid conflicts with trout stocking activities.

4.6.5.2 Fisheries of Special Concern Impacts and Mitigation

Impacts on fisheries of special concern would be the same as those described below for impacts on general fisheries and aquatic resources. Mountain Valley would implement erosion and sediment control BMPs described in its E&SC Plan at all crossings of waterbodies containing fisheries of special concern. Mountain Valley would also adhere to all federal and state permit conditions, including those regarding the minimization of impacts on fisheries of special concern including adhering to the recommended work window for in-water construction in Virginia (see

table 4.6-4; North Carolina agencies have stated no work windows would be required for in-water construction in North Carolina).

Mountain Valley would attempt to minimize impacts on fisheries by relocating all aquatic species, including fishes, freshwater mussels, crayfish, reptiles, and amphibians, from the construction areas. All fish and freshwater mussel relocations would be supervised by qualified, professional biologists in possession of applicable federal and/or state permits. The NCWRC stated it would confer with Mountain Valley regarding relocation methods once it reviews the results of Mountain Valley's aquatic species surveys. Standard protocols for mussel relocations in Virginia are outlined in the Freshwater Mussel Guidelines for Virginia (FWS and VADGIF, 2018). The methods stipulate that mussels within the direct project footprint or within imminent danger from project impacts may be relocated to suitable habitat. The direct Project footprint is defined as the area of potentially disturbed substrate, any zone of heavy equipment operation, plus the distance downstream that may experience significant sedimentation from construction. The guidelines further stipulate that the reach from which mussels should be relocated is at least 100 meters including the Project footprint. Suitable habitat is generally defined as an area upstream of the Project impacts that already harbors mussels. At least two relocation surveys are required. The first must occur within 30 to 45 days of in-stream construction activities and the second must occur within 30 days of in-stream construction activities and at least 7 days after the first relocation survey. If a protected species is found during the relocation surveys, additional surveys would be required until no protected species are found.

4.6.5.3 General Fisheries and Aquatic Resources Impacts and Mitigation

Constructing and operating the Project could temporarily impact fisheries and aquatic resources through physical hindrances or by creating inhospitable environmental conditions. Construction activities such as installing dams for dry waterbody crossings and culverts for access roads could disrupt the movement of indigenous aquatic life and species that normally migrate through the areas. However, Mountain Valley would use appropriate methods at waterbody crossings to maintain water flow conditions and allow fish passage. Mountain Valley would install appropriately-sized culverts, aligned with the natural stream flow direction, to allow fish passage, maintain low or normal water flow, and withstand any expected high flows. As discussed in greater detail below, sedimentation and turbidity, alteration or removal of in-stream and stream bank cover, stream bank erosion, introduction of water pollutants, water depletions, and entrainment of small fishes and fry during water withdrawals could increase the rates of stress, injury, and mortality experienced by fish and other aquatic life. In general, fish would migrate away from these activities. This displacement could lead to a temporary increase in competition for habitat and food and could affect fish survival and health. The degree of impact on fisheries from construction activities would depend on the waterbody crossing method, the timing of construction, and the characteristics of aquatic species present.

Sedimentation and Turbidity

Increased sedimentation and turbidity resulting from in-stream and adjacent construction activities could displace and impact fish and aquatic resources. Sedimentation could smother fish eggs and other benthic biota and alter stream bottom characteristics, such as converting sand, gravel, or rock substrate to silt or mud. These habitat alterations could reduce juvenile fish

survival, spawning habitat, and benthic community diversity and health. Increased turbidity could also temporarily reduce dissolved oxygen levels in the water column and reduce respiratory functions of in-stream biota. Turbid conditions could also reduce the ability for biota to find food sources or avoid prey. The extent of impacts from sedimentation and turbidity would depend on sediment loads, stream flows, stream bank and stream bed composition, sediment particle size, and the duration of the disturbances. Mountain Valley proposes to use dry crossing techniques for all waterbodies that would not be crossed using HDD or bore methods.

While several factors can influence the effectiveness of dry-ditch construction across waterbodies, if the crossings are properly installed and maintained during construction and restoration, the levels of sediment and turbidity produced are typically minor. A study conducted by the USGS (Moyer and Hyer, 2009) investigating the effects of dry-ditch waterbody crossings on downstream sediment loading found that short-term increases in turbidity downstream of construction did occur, but the magnitude of the increase was small and considered to be minimal compared to increased turbidity associated with natural runoff events. Other literature (e.g., Reid et. al., 2004) assessing the magnitude and timing of suspended sediment produced from dry-ditch crossing methods indicates the duration of increased sedimentation would be mostly short-term (i.e., less than 1 to 4 days) and remain near the crossing location (i.e., an approximate downstream distance of a few hundred feet).

Benthic invertebrates, some benthic fishes, and freshwater mussels could also be affected by elevated turbidity and suspended sediments. Aquatic invertebrates, including insect larvae, would generally be unable to avoid work areas. However, these areas would rapidly recolonize as a result of upstream drift and new egg deposition from adults within days to months (Brooks and Boulton, 1991; Matthaei and Townsend, 2000). As noted in section 4.6.5.2, Mountain Valley would relocate all aquatic species, including fishes, freshwater mussels, crayfish, reptiles, and amphibians, present in the waterbody crossing construction area under the direction of qualified, professional biologists in possession of applicable federal and/or state permits.

In addition to in-stream construction, runoff from disturbed areas adjacent to the stream can also generate in-stream turbidity. Mountain Valley would establish 50-foot construction buffers at all waterbody crossings using erosion and sediment control devices as approved by the VADEQ and NCDEQ and provided in its E&SC Plan. Mountain Valley would leave the vegetation within these buffers intact during the initial clearing of the upland right-of-way. Mountain Valley would hand-fell all trees within the buffer but would not remove the root systems or otherwise disturb the vegetation in the buffer. Mountain Valley would only clear the buffer areas immediately prior to construction commencing at the waterbody crossing and would stabilize the cleared buffer area immediately upon completing construction at the crossing. Waterbody crossings would be conducted by separate construction crews that specialize in stream and wetland crossings. Mountain Valley's use of HDD, bore, or dry crossing techniques and maintenance of riparian buffers would limit downstream sedimentation and turbidity resulting from in-stream and adjacent construction activities and thereby limit the potential impacts on fisheries and aquatic resources.

Inadvertent Releases during Horizontal Direction Drilling and Impacts of Conventional Boring

Conventional bore and HDD crossing methods both avoid direct impacts on waterbodies by boring underground to cross the waterbody instead of trenching through the streambed and banks. For both crossing methods, Mountain Valley would place boring locations outside of the waterbody and associated riparian area and no disturbance of the waterbody is required. Conventional bore and HDD crossing methods are proposed for crossings where sensitive fish or mussel species presence required the crossing to avoid waterbody disturbance. Further discussion of conventional bore impacts and mitigation are provided in section 4.3.2.2.

The HDD method could result in a release of drilling fluid into a waterbody. Although drilling fluid consists of non-toxic materials (see section 4.1.4.10), if inadvertently released into a waterbody, the drilling fluid could settle on the streambed and temporarily inundate bottom habitat. Benthic organisms and spawning and nursery habitat could be adversely affected by the settling of drilling fluids. Additionally, an inadvertent release of drilling fluid would result in turbidity and suspension of drilling fluids in the water column, affecting aquatic biota as described above for turbidity impacts. Mountain Valley would implement protocols provided in its *Horizontal Directional Drill Contingency Plan* to readily detect an inadvertent release of drilling fluid and take immediate action to minimize impacts on aquatic habitat.

Loss of Stream Bank Cover

Stream bank vegetation, large woody debris, rocks, and undercut banks are known cumulatively as riparian habitat. Riparian habitat provides valuable structure and opportunities for fish and stream biota. Open-cut crossings would temporarily remove shading over this habitat making the locations less suitable for aquatic biota. Consequently, fish and other stream biota would likely be displaced to similar habitat upstream or downstream of the pipeline crossing.

Mountain Valley would minimize clearing of trees and other riparian vegetation to include only what is necessary to construct and operate the Project safely. Mountain Valley would minimize impacts on riparian vegetation by narrowing the width of the standard construction rights-of-way at waterbody crossings to 75 feet, and would locate ATWS at least 50 feet from waterbody banks (Mountain Valley would be required to request deviations from the FERC Procedures where it is infeasible to do such). Once construction is complete, streambeds and banks would be stabilized and restored to pre-construction conditions to the fullest extent possible in compliance with Mountain Valley's Procedures.

Stream banks would be revegetated with native vegetation seed mixes based on the vegetative community present prior to construction. Mountain Valley would keep trees clear from a 10-foot-wide corridor directly over the pipeline, which would be mowed at a frequency sufficient to keep the corridor in an herbaceous state, and selectively remove trees as needed over a 30-foot-wide corridor to prevent tree roots from damaging the pipeline. However, trees could regenerate in the temporary construction work areas, allowing much of the ecological function of the riparian conditions (e.g., bank stabilization, filtration, shade, future large wood, and organic input) to return.

After construction and restoration, stream bank shrub and riparian tree species would be expected to re-establish over several months to a few years. Streambed biota, such as invertebrates that serve as food sources for fishes, would be expected to recolonize the affected areas within days to months (Brooks and Boulton, 1991; Matthaei and Townsend, 2000) or longer for some species (Wallace, 1990). Thus, impacts on stream banks should be mostly short-term, except within the permanent operational pipeline easement where the conversion of forest to shrub vegetation would be permanent. The recovery of riparian habitat in forested areas of temporary construction workspaces would be long-term because of the time it would take for trees to regenerate and mature.

Fuel and Chemical Spills

An inadvertent release of fuel or oil or other hazardous materials from construction equipment into waterbodies could impact fish and aquatic species. A leak of hazardous material into a waterbody could result in direct mortality to aquatic species, altered behavior, changes in physiological processes, or changes in food sources. In turn, ingestion of large numbers of contaminated fish or aquatic species could impact other species located higher in the food chain that prey on these biota.

Mountain Valley would implement its SPCC Plan, which would include preventive measures such as personnel training, equipment inspection, and refueling procedures to reduce the likelihood of spills, as well as mitigation measures such as containment and cleanup to minimize potential impacts should a spill occur. Adherence to the SPCC Plan would largely prevent a large spill from occurring near surface waters because construction equipment fueling and bulk hazardous material storage would be prohibited within 100 feet of the waterbody banks. In addition, portable equipment such as water pumps would be placed in secondary containment structures in order to contain any leaks or spills.

Hydrostatic Testing and Water Withdrawals

Mountain Valley proposes to use water from the Dan River as the primary water source for hydrostatic testing of the pipeline and dust control (see section 4.3.2.6). Mountain Valley estimates it would require about 3,600,000 gallons for Construction Spread 1 (MPs 0.0 to 30.4) and about 2,300,000 gallons for Construction Spread 2 (MPs 30.4 to 73.2). If required, additional water would be acquired from approved municipal sources. Mountain Valley would minimize crushing, entrainment, or impingement of mussels and fishes associated with water intake pumps by following guidance from VADEQ pertaining to screen size and through-screen intake velocity protective of aquatic organisms. Mountain Valley would use temporary floating, screened intake pumps with screen mesh sizes no larger than 0.039 inches and intake velocities of 0.25 feet per second or less. Mountain Valley would also withdraw no more than 10 percent of the instantaneous flow rate from source waterbody, which would in part serve to minimize downstream impacts if the withdrawals are conducted during low flow conditions.

Mountain Valley would minimize impacts from water withdrawals by adhering to the measures in Mountain Valley's Procedures and E&SC Plan. The measures outlined in these plans prohibit water withdrawal from and discharges into exceptional value waters or waters that provide habitat for federally listed threatened and endangered species, unless approved by applicable

resource and permitting agencies; therefore, Mountain Valley is coordinating with the FWS to obtain written concurrence to use the Dan River as a water source. Other measures include screening and positioning water intakes at the water surface to minimize the entrainment of fish and other biota; maintaining adequate flow rates to protect aquatic species; placing water pumps in secondary containment devices to minimize the potential for fuel spills or leaks; regulating discharge rates; and using energy dissipating devices and sediment barriers to prevent erosion. Mountain Valley would obtain and comply with all state water withdrawal and discharge permits.

Blasting

The effects of blasting on aquatic biota varies by species (Yelverton et al., 1975), but generally relatively small organisms and those close to the blast or near the sediment surface experience higher mortality (Yelverton et al., 1975; Munday et al., 1986). Non-lethal effects may include eye distension, hemorrhage, hematuria, and damage to bodily systems (Hastings and Popper, 2005; Godard et al., 2008; Carlson et al., 2011; Martinez et al., 2011).

Mountain Valley would attempt to avoid blasting during waterbody crossings. If blasting is deemed necessary, Mountain Valley would follow the measures outlined in its *General Blasting Plan* including isolating the work area from the surrounding waterbody prior to setting off charges. That plan indicates that Mountain Valley would prepare and implement Project-specific blasting plans, in coordination with federal and state agencies, to minimize impacts on aquatic species. The locations where blasting would potentially be necessary are discussed in section 4.1.4.7.

4.6.6 Wildlife and Fisheries Conclusions

Mountain Valley would minimize impacts on wildlife and habitat by following the measures outlined in its Plan and Procedures, and other BMPs, by routing the pipeline to minimize impacts on sensitive areas, collocating the pipeline with other rights-of-way where feasible, and reducing the construction right-of-way through wetlands. Based on our review of the potential impacts discussed above, we conclude that constructing and operating the Project would not significantly impact wildlife, terrestrial habitats, migratory birds, or fisheries and aquatic resources.

4.7 THREATENED, ENDANGERED, AND OTHER SPECIAL STATUS SPECIES

Special status species are afforded protection by law, regulation, or policy by federal and/or state agencies. For the purposes of this EIS, special status species include federally listed species that are protected under the ESA or are proposed for such listing by the FWS; federal species of concern; and species that are state-listed as threatened, endangered, or have been given certain other state designations.

Impacts on endangered, threatened, and other special status species would be similar to those listed in section 4.6 for wildlife and aquatic species. However, impacts on special status species may be greater than impacts on other wildlife and vegetation because these species may be more sensitive to disturbance; more specific to a habitat; and less able to move to unaffected suitable habitat since such habitat may not be available within a reasonable proximity, may not be

available at all, or may exist only in small tracts. Potential impacts that could affect the conservation needs of a species or decrease the viability of a population include habitat fragmentation, loss, or degradation; decreased breeding or nesting success; increased predation or decreased food sources; and injury or mortality.

4.7.1 Federally Listed Threatened, Endangered, and Other Species of Concern

Federal agencies are required by the ESA Section 7(a)(2) to ensure that any action authorized, funded, or carried out by the agency would not jeopardize the continued existence of a federally listed threatened or endangered species or species proposed for listing, or result in the destruction or adverse modification of designated critical habitat. As the lead federal agency, the FERC is responsible for determining whether any federally listed endangered or threatened species or any of their designated critical habitats are near the proposed action, and to determine the proposed action's potential effects on those species or critical habitats. None of the waters crossed by the Project are managed by the National Marine Fisheries Service (NMFS). Consequently, consultation with the NMFS is not required.

For actions involving major construction activities with the potential to affect listed species or critical habitats, the lead federal agency must prepare a BA. The lead federal agency must submit its BA to the FWS and, if it is determined that the action may adversely affect a federally listed species, the lead agency must submit a request for formal consultation to comply with Section 7 of the ESA. We have determined that the Project would not be likely to adversely affect any listed species. We are submitting this EIS as our final BA and requesting concurrence from the FWS for our determinations of effect for federally listed species potentially affected by the Project in accordance with Section 7 of the ESA.

Mountain Valley informally coordinated with the FWS regarding federally listed species and designated critical habitat in the Project areas. Mountain Valley also communicated with the VADCR-DNH, VADGIF, NCNHP, and NCWRC. Based on these communications and a review of the FWS' Information for Planning and Conservation (IPaC) database and other publicly available information, eight federally listed or otherwise sensitive species were identified as occurring or possibly occurring in the Project areas. Table 4.7-1 lists the federally threatened, endangered, and other federal species of concern that are known to occur or could occur within the Project areas. None of the identified species have designated critical habitat in the Project area.

The Project would not affect any federally threatened, endangered, or special status species of birds. Bald and golden eagles are not listed species under the ESA; however, they are protected under the MBTA and BGEPA. Federal protection of bald and golden eagles and their presence in the vicinity of the Project is discussed in section 4.6.1.1.

a/ Nine additional listed species were noted by federal and state agencies as potentially being present in the Project counties; however, the species are not known to occur in the portions of the counties that would be crossed by the Project and they are therefore not listed in this table. The species are listed here: Cape Fear shiner (*Notropis mekistocholas*), eastern big-eared bat (*Corynorhinus rafinesquii macrotis*), eastern small-footed bat (*Myotis leibii*), gray bat (*Myotis grisescens*), Indiana bat (*Myotis sodalis*), Rafinesque's big-eared bat (*Corynorhinus rafinesquii rafinesquii*), Schweinitz's sunflower (*Helianthus schweinitzii*), southeastern bat (*Myotis austroriparius*), Virginia big-eared bat (*Corynorhinus townsendii virginianus*), and yellow lance (*Elliptio lanceolata*).

b/ E = Listed Endangered; T = Listed Threatened; PT = Proposed Threatened; SC = Species of Concern .

4.7.2 Mammals

4.7.2.1 Northern Long-eared Bat

The northern long-eared bat is federally threatened and state threatened in Virginia. The current range includes Pittsylvania County but does not extend into Rockingham or Alamance Counties (FWS, 2019). It hibernates during the winter in small crevices and cracks within caves and mines with constant temperatures, high humidity, and no air currents. In the summer, the northern long-eared bat roosts singly or in colonies beneath the bark or in cavities or crevices of live and dead trees (snags). Males and non-reproductive females may also roost in caves or mines during the summer. As previously described, the Project would involve the clearing of forest, which has the potential to affect sensitive bat species and their habitat, including roosting trees and hibernacula. Generally, construction activities and noise/vibrations from equipment also has the potential to disturb nearby roosting and hibernating bats.

In January of 2016, the FWS finalized a rule under authority of Section 4(d) of the ESA that provides measures that are necessary and advisable to provide for the conservation of the

northern long-eared bat. The rule prohibits purposeful take[22] of the species throughout its range except to remove it from human structures or to otherwise protect human health or property. The rule generally allows incidental take of northern long-eared bats in Virginia[23] but prohibits incidental take in the following circumstances:

- actions are prohibited if they cause take of bats within the hibernacula or alter the environment of a hibernacula in a manner that causes incidental take;
- tree removal activities are prohibited at any time of year within 0.25 mile of the entrance/exit of a known, occupied hibernacula; and
- tree removal activities are prohibited from destroying a known, occupied maternity roost tree, or any tree within a 150-foot radius of a maternity roost tree, between June 1 and July 31 (all tree removal activities may resume outside of this date range, including removal of the maternity roost tree).

No hibernacula or maternity roosts are known to be present in the vicinity of the Project. However, the FWS requested that Mountain Valley conduct surveys in the Project area to augment bat occurrence data in this region. Mountain Valley conducted desktop and targeted field surveys for bats in 2018. Mountain Valley's *Bat Survey Study Plan* was approved by the FWS, VADGIF, and NCWRC in July of 2018 and Mountain Valley conducted targeted mist net and acoustic surveys during July and August of 2018. No federally listed bat species were documented during these surveys in Virginia or North Carolina.

Mountain Valley also conducted searches for bat portals (entrances to hibernacula) in the vicinity of the Project area between June 2018 and August 2019. Mountain Valley was granted access by landowners to approximately 94 percent of the Project area in Virginia and 92 percent of the Project area in North Carolina. No potential hibernacula were documented during these portal surveys, but approximately 3.2 miles of the Project route has not been surveyed to date due to lack of access permission. Mountain Valley conducted desktop surveys of these areas and found no suitable hibernacula habitat. Mountain Valley will continue to seek access to the unsurveyed areas and provide any subsequent reports to FWS, VADGIF, NCWRC, and FERC upon completion. Given that there are no known hibernacula and maternity roosts in the survey area, the lack of suitable habitat in unsurveyed areas, and with the application of the 4(d) rule for this species, we have determined that the Project *may affect but is not likely to adversely affect* the northern long-eared bat.

[22] From Section 3(18) of the Federal Endangered Species Act: "The term 'take' means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

[23] Virginia and North Carolina are within the portion of the United States that is designated under the final 4(d) rule as the white-nose syndrome (WNS) zone (i.e., U.S. counties within 150 miles of positive counties/districts containing WNS-infect hibernacula). As of May 31, 2018, the WNS zone encompassed the entire northeast, upper Midwest, and much of the southeast United States (FWS, 2018b). WNS is a fungal disease that affects many hibernating U.S. bat species. WNS has resulted in 90 to 100 percent mortality in bats affected by the disease in the eastern United States. The final 4(d) rule allows incidental take outside of the white-nose syndrome zone and specifies conditions in which incidental take is prohibited inside of the zone.

4.7.3 Fish

4.7.3.1 Roanoke Logperch

The Roanoke logperch (*Percina rex*) is federally endangered and state-endangered in Virginia and North Carolina. It is known to occur in Pittsylvania County in Virginia and Rockingham County in North Carolina (FWS, 2019). Roanoke logperch typically exist in low-density populations and inhabit medium-to-large sized warm, clear streams and small rivers of moderate to low gradient. Adults usually occupy riffles, runs, and pools containing sand, gravel, or boulders that are free of silt. Young-of-year congregate in mixed-species schools in shallow habitat underlain by sand and gravel along stream margins (FWS, 2015).

Roanoke logperch are not known to occur in any of the waterbodies that would be crossed by the Project in Virginia. The FWS and VADGIF advised Mountain Valley that fish surveys within waterbodies that would be crossed in Virginia would not be required (VADGIF, 2019b). The Project would cross three waterbodies in Rockingham County that are known to contain Roanoke logperch (Dan River, Cascade Creek, and Wolf Island Creek) and Mountain Valley proposes to use water from the Dan River as the primary water source for hydrostatic testing of the pipeline and dust control (see section 4.3.2.6). Impacts on Roanoke logperch could result from in-water work that would result in turbidity and downstream sedimentation in streams that contain suitable habitat or from crushing, entrainment, or impingement during water withdrawals. Mountain Valley is assuming Roanoke logperch are present in the three aforementioned waterbodies and is currently proposing to use HDD to cross the Dan River and conventional bore techniques to cross Cascade and Wolf Island Creeks, both of which would avoid any direct impacts on the waterbody and aquatic habitat. The NCWRC advised Mountain Valley that as long as the Dan River, Cascade Creek, and Wolf Island Creek are crossed using HDD or conventional bore, no time-of-year restrictions for construction would be required for these waterbodies or any other waterbody crossings in North Carolina. Sections 4.6.5.3 and 4.3.2.7 discuss the impacts on aquatic species from conventional bores and HDD crossing methods and the steps Mountain Valley would take to minimize such impacts. Mountain Valley has developed an *HDD Contingency Plan* detailing methods it would follow to reduce the likelihood of an IR affecting aquatic habitat or minimize the impacts associated with a potential drilling fluid release within a waterbody. We find this Plan acceptable. Mountain Valley is coordinating with the FWS to obtain written concurrence from the agency to use the Dan River as a water source Section 4.6.5.3 describes the measures Mountain Valley would implement during water withdrawals to avoid or minimize impacts on Roanoke logperch and other aquatic species.

We received a comment from the FWS regarding whether the Project would impact waterbodies containing protected species by crossing tributaries upstream of these waterbodies but within close enough proximity to allow sedimentation from the crossings to reach the waterbodies. The Project would cross tributaries upstream of the Dan River, Cascade Creek, and Wolf Island Creek. Mountain Valley would cross the tributaries using open-cut, dry-ditch crossing methods (dam-and-pump or flume method). In-stream construction can cause sedimentation and turbidity, which could negatively impact the aquatic biota downstream of the crossings. However, as noted in section 4.6.5.3, studies by USGS (Moyer and Hyer, 2009) and others (e.g., Reid et. al., 2004) indicate the effects of dry-ditch waterbody crossings on downstream sediment loading are generally short-term in duration (i.e., less than 1 to 4 days) and remain near the crossing location

(i.e., an approximate downstream distance of a few hundred feet). The closest crossing of a tributary to the Dan River, Cascade Creek, or Wolf Island Creek would be upwards of 1,350 feet (or approximately 0.25 mile); therefore, we do not anticipate crossings of tributaries upstream of these waterbodies would impact Roanoke logperch or other aquatic species.

In general, upland construction has the potential to result in additional sedimentation in watersheds that contain Roanoke logperch. Additional sedimentation has the potential to alter Roanoke logperch habitat and result in adverse impacts on individuals (see section 4.6.5.3). During construction, Mountain Valley would implement erosion and sediment control measures described in Mountain Valley's Plan and Procedures as well as its E&SC Plan which were designed in coordination with Virginia and North Carolina state resource agencies. Mountain Valley's Plan and Procedures contain performance-based standards for erosion control measures that are designed to keep sediment from leaving the right-of-way and thereby minimize sediment runoff into nearby streams and tributaries. Mountain Valley would use sediment barriers along sloped sections of the construction right-of-way and maintain 50-foot construction buffers at all waterbody crossings. Mountain Valley would maintain vegetation within the buffers intact during the initial clearing of the upland right-of-way. Mountain Valley would only clear the buffer areas immediately prior to construction commencing at the waterbody crossing, and would stabilize the cleared buffer area immediately upon completing construction at the crossing.

Given the trenchless methods proposed to cross Roanoke logperch waterbodies, and Mountain Valley's implementation of measures as described in its Plan and Procedures to prevent upland erosion and runoff into streams and as described in its *HDD Contingency Plan* to protect aquatic habitat from the potential negative effects of an IR, we have determined the Project *may affect but is not likely to adversely affect* the Roanoke logperch.

4.7.4 Mussels

4.7.4.1 James Spinymussel

The James spinymussel is federally endangered and state-endangered in Virginia and North Carolina (FWS, 2019; NCNHP, 2016; Roble, 2016). It is a small mussel (less than 3 inches in length) found in clear, free-flowing streams that are free of silt (FWS, 2019). The James spinymussel is only known to occur in Rockingham County, in the Dan River and its tributaries (FWS, 2019).

4.7.4.2 Atlantic Pigtoe

The Atlantic pigtoe is proposed for listing as threatened under the ESA and is listed as state threatened in Virginia and state-endangered in North Carolina (FWS, 2019; NCNHP, 2016; Roble, 2016). Critical habitat is also proposed for the species in Virginia and North Carolina including within the Dan River; however, the Project would not cross the portion of the Dan River that is proposed as critical habitat nor any of the other waterbodies proposed as critical habitat (FWS, 2019). The Atlantic pigtoe is a small (less than 2 inches in length) mussel typically found in gravel and coarse sand in silt-free, moderate-flowing creeks and rivers (FWS, 2018e). It has been documented in Pittsylvania, Rockingham, and Alamance Counties but it is not known to occur in the sections of waterbodies that would be crossed by the Project (FWS, 2019).

4.7.4.3 Green Floater

The green floater is a federal species of concern and is listed as state threatened in Virginia and endangered in North Carolina (FWS, 2019; NCNHP, 2016; Roble, 2016). It is a small mussel (less than 2 inches in length) found in sand and gravel substrates of clean, calm portions of streams and rivers (NCWRC, 2019b; VADGIF, 2015). It has been documented in Pittsylvania and Rockingham counties but is not known to occur in waterbodies crossed by the Project (FWS, 2019; NCWRC, 2019b).

4.7.4.4 Yellow Lampmussel

The yellow lampmussel is a federal species of concern and is listed as a state species of very high conservation need in Virginia and endangered in North Carolina (FWS, 2019; NCNHP, 2016; Roble, 2016). It is not known to occur in Pittsylvania County (FWS, 2019) but has been recorded in Deep Creek in Alamance County upstream of the proposed Project crossing (NCWRC, 2018c). The yellow lampmussel occurs in many different habitat types; however, it is most often found in sandy substrate downstream of large boulders in medium sized rivers and medium-to-large sized creeks with relatively fast flow (NCWRC, 2019c).

4.7.4.5 Mussels Summary

Mountain Valley conducted surveys between April and October in 2019 for freshwater mussels consistent with FWS and NCWRC guidance and the VADGIF Draft Freshwater Mussel Survey Guidelines for Virginia. Based on direction from the VADGIF and NCWRC, Mountain Valley conducted mussel surveys in the Banister and Sandy rivers in Virginia and at 19 waterbody crossings within the Dan and Haw River basins in North Carolina. Survey protocols stipulated that surveys be conducted throughout a 30-meter zone encompassing the area of direct impact of the waterbody crossing and extend 100 meters upstream and 300 meters downstream of the area of direct impact, for a total surveyed area of 340 meters. Live mussels were observed in the Banister River, Dan River, an unnamed tributary to the Haw River, Stony Creek Reservoir, and Boyds Creek; however, no federally listed mussel species were documented during the surveys (table 4.7-2; ESI, 2019a, b). Surveyors did not observe any live or deadshell mussels within any of the other waterbodies that were surveyed.

a/ eastern elliptio (*Elliptio complanata*) mussels, which are not protected at the federal or state level, observed during surveys.

b/ paper pondshell (*Utterbackia imbecillis*) mussels, which are not protected at the federal or state level, observed during surveys.

In general, impacts on mussels could result from turbidity and habitat alteration from in-water work and sedimentation caused by runoff from upland construction. These potential impacts are more fully described in the aquatic and fisheries discussion in section 4.6.5.3. Although no protected mussels were found during surveys, Mountain Valley would avoid in-water construction impacts on the Dan River by using the HDD crossing method and in Deep Creek by using conventional bore to install the pipeline. Mountain Valley's *HDD Contingency Plan* details methods it would follow to reduce the likelihood of an IR affecting aquatic habitat or minimize the impacts associated with a potential drilling fluid release within the Dan River. Sections 4.6.5.3 and 4.3.2.7 discuss the impacts on aquatic species from HDD and conventional bores and provides steps Mountain Valley would take to minimize such impacts. Section 4.6.5.3 discusses measures Mountain Valley would implement during water withdrawals from the Dan River, should the FWS not object, to avoid impacts on mussels and other aquatic species.

Mountain Valley would relocate non-listed mussels observed during the aquatic surveys in 2019. If previously undocumented protected species are found during the relocation surveys, Mountain Valley would coordinate with the FWS, VADGIF, and NCWRC to relocate the individuals as described in section 4.6.5.2 and conduct additional surveys until no further protected species are found.

Mountain Valley would further reduce potential impacts on freshwater mussels downstream of crossings by implementing measures in its Plan, Procedures and E&SC Plan. These include the measures described in section 4.7.3.1 to minimize downstream sedimentation and turbidity associated with construction in uplands and at the waterbody crossings, which can lead to, among other things, smothering of mussels (see section 4.6.5.3). With implementation of the measures described here and in the noted sections and given that no listed or sensitive mussel

species were documented during the surveys conducted at the waterbody crossings throughout the Project area, we have determined that the Project *may affect, but is not likely to adversely affect* the James spinymussel and the Atlantic pigtoe. We also determine that adverse impacts on the green floater and yellow lampmussel are unlikely.

4.7.5 Plants

4.7.5.1 Small Whorled Pogonia

The small whorled pogonia (*Isotria medeoloides*) is federally threatened, state-endangered in Virginia, and threatened in North Carolina. It is a member of the orchid family and occurs on upland sites in mixed-deciduous or mixed-deciduous/coniferous forests that are generally in second- or third-growth successional stages. Where it is found, populations are typically small, consisting of less than 20 plants (FWS, 1992).

Correspondence with the FWS indicated small whorled pogonia might be present within the Project area in Rockingham and Alamance Counties and recommended that Mountain Valley conduct surveys for the species (FWS, 2018c, 2018d). If small whorled pogonia occurs in the Project right-of-way, it could be vulnerable to removal during clearing and grading, or trampling and crushing by foot traffic or movement of heavy machinery. Right-of-way clearing could also adversely affect small whorled pogonia habitat by altering light exposure or hydrology or by increasing sedimentation and runoff in the vicinity of the right-of-way. The nearest documented occurrence to the Project area is in Guilford County, North Carolina (NCNHP, 2019a). Mountain Valley identified approximately 271 acres of potentially suitable habitat in the Project area using desktop Geographic Information System (GIS) analysis and soils data. Mountain Valley conducted field surveys of approximately 125.7 acres of potential small whorled pogonia habitat in 2018 and approximately 72.3 acres of potential small whorled pogonia habitat in 2019, including new areas resulting from Project reroutes and areas that were previously inaccessible due to lack of access permission. Field surveyors documented a total of approximately 45.0 acres of suitable habitat for small whorled pogonia. No small whorled pogonia plants were observed. However, approximately 14.7 acres were surveyed outside of the optimal survey window for the plant. Therefore, Mountain Valley documented where suitable habitat may occur and will conduct surveys at these locations in 2020 during the appropriate survey window (mid-May through early-July). If surveyors document the presence of small whorled pogonia during the 2020 surveys, Mountain Valley will consult with the FWS regarding appropriate avoidance and minimization measures to implement for the Project. Due to Mountain Valley's commitment to follow minimization measures required by FWS if individuals are found during the 2020 surveys, we have determined that the Project *may affect, but is not likely to adversely affect* the small whorled pogonia.

4.7.5.2 Smooth Coneflower

The smooth coneflower (*Echinacea laevigata)* is federally listed as endangered and state-listed as threatened in Virginia and endangered in North Carolina. It generally occurs in well-drained soils of open woods, cedar barrens, roadsides, clearcuts, utility line rights-of-way, and dry limestone bluffs (FWS 1995). This species is not known to occur in Virginia Project areas but

may be present in North Carolina, as it has been previously documented in Rockingham County (FWS, 2019; NCNHP, 2019a).

The FWS recommended surveys for the smooth coneflower along the North Carolina portion of the Project area (FWS, 2018d). As with small whorled pogonia, smooth coneflower could be vulnerable to removal during clearing and grading, or trampling and crushing by foot traffic or movement of heavy machinery. Right-of-way clearing could also adversely affect smooth coneflower habitat by increasing sedimentation and runoff in the vicinity of the right-of-way. Mountain Valley identified approximately 88.3 acres of potentially suitable habitat in the Project area using desktop GIS and soils data. Mountain Valley conducted field surveys of approximately 57.4 acres of potential smooth coneflower habitat in 2018 and approximately 7.3 acres of potential smooth coneflower habitat in 2019 including new areas resulting from Project reroutes and areas that were previously inaccessible due to lack of access permission. No suitable habitat for smooth coneflower or smooth coneflower plants were documented. However, Mountain Valley was not able to survey approximately 2.1 acres with potentially suitable habitat due to a lack of access. Therefore, Mountain Valley plans to complete surveys for smooth coneflower in 2020. If surveyors document the presence of smooth coneflower during the 2020 surveys, Mountain Valley will consult with the FWS regarding appropriate avoidance and minimization measures to implement for the Project. Due to Mountain Valley's commitment to follow minimization measures required by FWS if individuals are found during the 2020 surveys, we have determined that the Project *may affect but is not likely to adversely affect* the smooth coneflower.

4.7.6 Federally Listed Threatened, Endangered, and Other Species of Concern Conclusions

Our determinations of effects described above are based on current information available for the species in the Project area. To date, Mountain Valley has not completed all surveys or provided survey results to the Commission for federally listed bat hibernacula, small whorled pogonia, or smooth coneflower along the Project survey corridor. Therefore, **we recommend that**:

- **Mountain Valley should <u>not begin</u> construction activities <u>until</u>:**

  a. Mountain Valley files with the Secretary the results of all outstanding biological surveys;

  b. the staff completes ESA consultation with the FWS; and

  c. Mountain Valley has received written notification from the Director of OEP that construction or use of mitigation may begin.

4.7.7 State-Listed and Special Concern Species

As identified in table 4.7-3, 12 species listed as either endangered or threatened in Virginia and/or North Carolina were identified as occurring or potentially occurring in the Project area. Eight of these are federal species and were previously discussed. An additional 15 species are identified as rare, significantly rare, species of concern, or species of greatest conservation need in

Virginia and/or North Carolina. In Virginia, species classified as rare or species of greatest conservation need do not have any legal status and are not afforded state protections. Similarly, in North Carolina, the NCWRC requires monitoring of species of special concern but there is no legal protection from take for these species. Nonetheless, Mountain Valley is currently consulting the Virginia and North Carolina resource agencies regarding avoidance and minimization measures for the different tiers of state-listed species.

b/ North Carolina Status. E = Listed Endangered; T = Listed Threatened; SC = Species of Special Concern; SR = Significantly Rare; SGCN = Species of Greatest Conservation Need as listed in the Wildlife Action Plan

c/ Species not known to occur within the Project area (by State).

4.7.7.1 Mammals

Seven state-listed species of bats (including the federally threatened northern long-eared bat) potentially occur within the Project area. The little brown bat and tri-colored bat are both listed as endangered in Virginia. Each of the species potentially occur in Pittsylvania County and the little brown bat, eastern red bat, hoary bat, silver-haired bat, and tri-colored bat may also occur in Alamance and Rockingham counties. As noted in section 4.7.1, Mountain Valley conducted desktop and targeted field surveys for bats in Virginia and North Carolina in 2018. A single juvenile female tri-colored bat was captured during surveys in Virginia but otherwise no other state threatened or -endangered bat species were documented. No roost trees for tri-colored bats are known to occur in the Project area. Mountain Valley coordinated with the VADGIF to develop avoidance, minimization, or mitigation approaches to reduce potential impacts on state-listed bats and bat habitat. As part of these measures, Mountain Valley adjusted the layout of contractor yard CY-01 so that no workspaces would be within the Transco Road Net Conservation Area near MP 0.0. Additionally, Mountain Valley would restore all temporary access roads; allow previously forested temporary workspaces to naturally regrow as forest habitat; and only conduct maintenance mowing of the right-of-way between October 15 and April 1. Given the 2018 survey results thus far and Mountain Valley's planned efforts to avoid or minimize impacts on state-listed bats and bat habitat, we conclude the Project would not likely significantly impact state-listed bat species in Virginia or North Carolina.

4.7.7.2 Fish

Two state-listed fish species, the Roanoke logperch and the riverweed darter, potentially occur in the Project area. The Roanoke logperch is discussed in section 4.7.3. The riverweed darter is a species of special concern in North Carolina and is known to occur in Rockingham County within the Dan River watershed in clear, swift-flowing portions of waterbodies containing

medium sized gravel, rubble, or small boulders, especially among rocks covered with riverweed (*Podostemum ceratophyllum*) (Tracy, 2014). The Project could affect the riverweed darter by altering suitable habitat during construction at waterbody crossings and through turbidity and downstream sedimentation in streams that contain the species. As noted in section 4.7.3, Mountain Valley would cross the Dan River using HDD and Cascade and Wolf Island creeks using conventional bore. The NCWRC notified Mountain Valley that it would not require fish surveys but requested that any state-listed species or species of greatest conservation need encountered during freshwater mussel surveys be reported (NCWRC, 2018c). Given Mountain Valley's planned approach to use HDD or conventional bore to cross the waterbodies that may contain state-listed fishes and its adherence to measures within its *HDD Contingency Plan* and the measures referred to in section 4.3.2.7 to minimize impacts from conventional boring, we conclude the Project would not likely significantly impact state-listed fish.

4.7.7.3 Amphibians

Two state-listed amphibian species, the four-toed salamander and the mole salamander, potentially occur in the Project area. Both are species of special concern and species of greatest conservation need in North Carolina (NCWRC, 2015). The mole salamander is also listed as a Tier II species (very high conservation need) in the Virginia Wildlife Action Plan (VADGIF, 2015). The four-toed salamander was historically known to occur in Alamance County, is currently known to occur in Rockingham County, and is likely to occur in Pittsylvania County. Likewise, the mole salamander is known to occur in Rockingham and Pittsylvania counties. Though their local population levels are unknown, both species typically inhabit small wetland communities associated with headwaters in hardwood and mixed-species forests and seasonal (fish free) pools of floodplains within riparian forests (NCWRC, 2015; VADGIF, 2015).

Mountain Valley performed a desktop habitat assessment of the Project area in Rockingham and Alamance Counties to determine whether the right-of-way would cross suitable breeding habitat for the four-toed and mole-salamanders. Mountain Valley used aerial imagery to assess 157 wetlands and 297 streams that had been identified within the proposed Project right-of-way during aquatic resource surveys. Mountain Valley considered suitable four-toed salamander habitat as being comprised of areas with slow moving streams (either perennial or intermittent) connected with or in proximity to wetlands and large wetland complexes and flood plain areas with forested habitat potentially harboring standing water. Mountain Valley considered suitable mole salamander habitat as being comprised of seasonal or permanent ponds and wetlands in close proximity to mature forest with limited previous disturbance from human development such as roadways or agricultural fields. Based on these parameters, Mountain Valley determined that 75 wetlands, 5 ponds, and 55 streams could potentially provide breeding habitat for four-toed salamanders and 34 wetlands, 19 ponds and 8 streams could potentially provide breeding habitat for mole salamanders. Mountain Valley continues to consult with the NCWRC and VADGIF regarding the necessity of field surveys for four-toed and mole salamanders in the Project area.

Potential effects of the Project on these species would primarily occur during construction in areas with suitable habitat. Clearing of vegetation could alter habitat conditions making certain areas unsuitable. Additionally, large equipment and vehicles could injure or kill individuals. Because these species are mobile, they would likely avoid construction areas. Construction activities would be temporary and Mountain Valley would restore temporary work areas in these

habitat types to pre-construction conditions in accordance with Mountain Valley's Plan and Procedures. Although the Project could result in alteration of habitat and/or direct mortality of individuals unable to flee the work area, we conclude the Project would not significantly impact the mole and four-toed salamanders due to the short duration of construction activities in any one area and Mountain Valley's commitment to restore wetland and riparian areas to pre-construction conditions. Nonetheless, Mountain Valley continues to coordinate with the NCWRC and the VADGIF regarding the potential impacts of the Project on these two species.

4.7.7.4 Mussels

Three state-listed mussel species, in addition to the four species discussed in section 4.7.4, potentially occur in the Project area. The eastern creekshell and eastern lampmussel are both known to occur in Alamance County in the Haw River basin. The Savannah lilliput may also occur in the Haw River basin, but records for this species are very sparse. NCWRC requested that Mountain Valley include the Savannah lilliput as a species that could potentially be present within the Project area (NCWRC, 2018c). Potential impacts of the Project on mussels are described in section 4.7.4. As noted in 4.7.4, Mountain Valley conducted surveys between April and October of 2019 for freshwater mussels. Freshwater mussels were documented in 5 of the 21 waterbodies surveyed at the direction of the VADGIF and NCWRC. No listed or sensitive mussels were documented in the Project area..

Section 4.7.4.5 discusses potential Project impacts on freshwater mussels, including references to sections 4.6.5.3 and 4.3.2.7, which discuss potential impacts on aquatic species from HDD and conventional bores and provides steps Mountain Valley would take to minimize such impacts. Mountain Valley would relocate freshwater mussels present in the direct Project footprint at the waterbody crossings to suitable habitat upstream of Project impacts (see section 4.7.4.5). Mountain Valley would further minimize potential impacts on freshwater mussels downstream of crossings by implementing measures in Mountain Valley's Plan and Procedures. These include the measures described in section 4.7.3.1 to minimize downstream sedimentation and turbidity associated with construction in uplands and at the waterbody crossings, which can lead to, among other things, smothering of mussels (see section 4.6.5.3). With implementation of these measures and given that no listed or sensitive mussel species were documented during the surveys conducted at the waterbody crossings throughout the Project area, we conclude that the Project would not likely significantly impact state-listed freshwater mussels.

4.7.7.5 Arthropods

Two species of crayfish classified in North Carolina as significantly rare (Carolina ladle crayfish) and as a species of special concern (Greensboro burrowing crayfish) may occur in the Project area. The Carolina ladle crayfish occurs along the banks of freshwater creeks and streams under large rocks or in burrows and is thought to only exist in the eastern upper Piedmont Region of North Carolina (Cooper, 2000). It has been documented in Rockingham County within 6 miles of the Project area. The Greensboro burrowing crayfish occurs exclusively in burrows (i.e., it has never been documented in open surface waters) along stream banks and along floodplains within the Haw River basin (Cooper, 2010). It has not been documented in the counties crossed by the Project, but the full distribution of the species is unknown due to a lack of targeted surveys (NCWRC, 2018c). No sensitive species of crayfish are known to occur in the Project area in

Pittsylvania County. Based on guidance from the NCWRC, Mountain Valley conducted surveys in Rockingham and Alamance Counties for Carolina ladle crayfish in 2019 in conjunction with its mussel surveys. Carolina ladle crayfish were documented in streamside burrows of 13 of the 17 waterbody crossings surveyed (table 4.7-4; the Dan River and Stony Creek Reservoir crossings were not surveyed for crayfish because, per NCWRC guidance, crayfish surveys are limited to perennial first, second, or third order streams[24] and the Dan River and Stony Creek Reservoir are seventh and fourth order streams, respectively). Mountain Valley is coordinating with the NCWRC regarding the necessity of field surveys for the Greensboro burrowing crayfish.

Table 4.7-4

Results of Crayfish Surveys Conducted at Southgate Project Waterbody Crossings in North Carolina in 2019

County	MP	Stream Name	Rare Crayfish Observed
Rockingham	27.3	UNT to Cascade Creek	No
Rockingham	27.5	Cascade Creek	No
Rockingham	31.3	Rock Creek	Yes
Rockingham	32.2	Machine Creek	Yes
Rockingham	32.7	Town Creek	Yes
Rockingham	33.0	Town Creek	Yes
Rockingham	38.8	Wolf Island Creek	Yes
Rockingham	41.2	Lick Fork	Yes
Rockingham	43.3	Jones Creek	Yes
Rockingham	47.0	Hogan's Creek	Yes
Rockingham	48.7	Giles Creek	No
Rockingham	50.8	UNT to Haw River	Yes
Alamance	52.7	UNT to Haw River	Yes
Alamance	53.7	UNT to Haw River	Yes
Alamance	58.7	UNT to Haw River	Yes
Alamance	64.1	Deep Creek	No
Alamance	67.6	Boyds Creek	Yes

Potential effects of the Project include crushing of crayfish individuals and burrows by construction equipment and smothering of individuals and burrows by sediment runoff from the construction right-of-way. Mountain Valley would reduce potential impacts on crayfish species by implementing measures in Mountain Valley's Plan and Procedures, and E&SC Plan, including narrowing the construction right-of-way at waterbody crossings, minimizing construction equipment crossings of waterbodies, and controlling sediment runoff from the construction right-of-way.

Although the Project could result in direct mortality of individuals we conclude the Project would not significantly impact the Carolina ladle crayfish and Greensboro burrowing crayfish due to the relatively limited area of direct impact at the waterbody crossings, the short duration of construction activities in any one area, and Mountain Valley's commitment to restore wetland and riparian areas to pre-construction conditions. With the implementation of the measures contained in Mountain Valley's Plan and Procedures, and E&SC Plan, we conclude that the Project would not significantly impact the Carolina ladle crayfish or the Greensboro burrowing crayfish.

[24] A first-order stream is the source (or headwaters) of a waterbody; the order level increases (i.e., second-order, third-order, etc.) downstream at each confluence with another waterbody (Strahler, 1952).

4.7.7.6 Plants

The VADCR-DNH (2018) identified three species of rare plants that have historically occurred near the Project area and for which potentially suitable habitat occurs in the vicinity of the Project along the entire proposed right-of-way: American blueheart (*Buchnera americana)*, downy phlox (*Phlox pilosa)*, and Piedmont Barbara's-button (*Marshallia obovata)*. American blueheart occurs primarily along the edges of wet depressions, limestone glades, prairies, moist sandy soils, and open woods. Nine populations are documented in Pittsylvania County (VADCR-DNH, 2018). Downy phlox occurs in open areas, such as prairies and woodlands. Four populations are documented in Pittsylvania County. Piedmont Barbara's-button occurs in dry, open woodlands, roadsides, and pine savannahs. Five populations have been documented in in Pittsylvania County (VADCR-DNH, 2018).

The NCNHP (2018b) identified one state-listed rare plant species, cliff stonecrop (*Sedum glaucophyllum)*, known to occur in Rockingham County. Cliff stonecrop is native to the Appalachian Mountains and grows on lightly shaded limestone outcrops in soils that are damp but well-drained. According to correspondence from NCNHP (2019b), construction of the Project would not impact any known populations of cliff stonecrop.

Species present in the construction right-of-way could be vulnerable to removal during clearing and grading, or trampling and crushing by foot traffic or movement of heavy machinery. Mountain Valley conducted surveys for these species in June of 2019. Following guidance from VADCR, surveyors targeted areas where the Project right-of-way could be collocated with existing maintained rights-of-way that provides open canopy habitat. Desktop habitat assessments identified approximately 230.4 combined acres of potential habitat for all three species. Surveyors were able to access approximately 169.9 acres with the remaining acreage remaining inaccessible because surveyors were not granted landowner access. Field surveyors identified a combined 12 habitat patches, totaling approximately 11.9 acres, that contained low potential habitat for the three species. No individual plants of any of the species were observed.

Mountain Valley would implement its Plan and Procedures, and *Exotic and Invasive Plant Species Control Plan* to avoid or minimize impacts on these three plant species in the Project areas that were not surveyed due lack of access. In the absence of survey results, VADCR would not provide Mountain Valley with mitigation or minimization guidance beyond requesting that Mountain Valley avoid any areas that contain the plants (Mountain Valley, 2019). With the implementation of the measures contained in Mountain Valley's Plan and Procedures and *Exotic and Invasive Plant Species Control Plan*, and the low potential for presence of American blueheart, downy phlox, and Piedmont Barbara's-button in the areas that have not been surveyed, we conclude that the Project would not significantly impact these species.

4.7.7.7 Conclusions for State-Listed and Other Sensitive Species

Based on Mountain Valley's commitment to implement mitigation measures in its Plan, and Procedures, avoidance of sensitive habitat, and its consultations with the NCWRC and VADCR, we conclude that the Project would not significantly impact the state-listed bats, fish, salamanders, freshwater mussels, crayfish, and plants that may be present within the Project area.

4.8 LAND USE, SPECIAL INTEREST AREAS, AND VISUAL RESOURCES

4.8.1 Land Use

This section discusses the lands required to construct and operate the Project, the current use of those lands, crossings of recreational and special interest areas, and visual resources in the Project area.

Land uses crossed by the Project are generally classified into the following categories and definitions:

- agricultural: crop land, pasture/hay fields, and vineyards/orchards;
- forested/woodland: upland and conifer forests, and deciduous woodlands, forested wetlands;
- industrial/commercial: manufacturing or industrial plants, paved areas, landfills, mines, quarries, utilities, roads, railroads, and commercial or retail facilities;
- silviculture: wooded lands being managed for forest products (i.e., pine plantations);
- open land: utility rights-of-way, grasslands, range lands, scrub-shrub uplands, golf courses, and recreational (non-forested) land, scrub-shrub, and emergent wetlands, and unmanaged lands;
- residential: houses, farmsteads, apartments, mobile home parks, and residential subdivisions; and
- other: ponds, reservoirs, lakes, rivers, and streams.

Table 4.8-1 summarizes the amount of each land use that would be affected by constructing and operating the Project. Constructing the Project would impact 1,465.9 acres of land. Approximately 79 percent of this land would be utilized for the pipeline facilities, including the construction right-of-way (59.1 percent) and additional temporary extra workspace (20 percent). The remaining acreage affected during construction would be associated with contractor yards, access roads, and aboveground facilities and cathodic protection beds. Following construction, lands outside of the permanent right-of-way, such as extra workspace areas, contractor yards, and temporary access roads, would be allowed to revert to previous land uses. The primary land uses affected by construction would be forested/woodland (42.1 percent) and open land (38.4 percent). Agricultural, silviculture, industrial/commercial, other and residential would make up the remaining 19.5 percent of land types affected during construction.

Operating the Project would permanently impact 450.0 acres. The permanent easement would account for 431.6 acres or 95.9 percent of land affected. The remaining 18.4 acres or 4.1 percent of permanent impact would be associated with aboveground facilities, cathodic protection beds, and permanent access roads.

Note: Pig launchers and receivers will be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect), therefore, acreages calculations for the pig launchers and receivers are included with those facilities. MLVs 1, 4, and 8 will be within other aboveground facility sites (i.e., the Lambert Compressor Station, T-15 Dan River Interconnect, and T-21 Haw River Interconnect), therefore, acreage calculations for MLVs 1, 4, and 8 are included with those facilities.

a/ Construction acres includes the area affected by construction (i.e., temporary and additional temporary workspace, contractor yards, and access roads) and the area affected by operation of the Project (i.e., facility operation footprint and 50-foot pipeline permanent right-of-way). The 50-foot-wide permanent right-of-way between HDD entry and exit points and within railroad rights-of-way are not included in this acreage.

b/ Includes only the operation footprint of the Project facilities, the 50-foot-wide permanent pipeline right-of-way in uplands, except in wetland areas where the operation width has been reduced to 10 feet in emergent wetlands, scrub-shrub wetlands, and within 25 feet of waterbodies; and 30 feet in forested wetlands. The 50-foot-wide permanent right-of-way between HDD entry and exit points and within railroad rights-of-way are not included in this acreage.

c/ Includes the 50-foot-wide permanent right-of-way and temporary workspace areas.

d/ Includes ATWS areas for the pipeline facilities. ATWS areas to be used for construction of aboveground facilities are included in the acreage calculations for the applicable aboveground facilities.

e/ Sums may not equal the total of addends due to rounding. Addends consist of six-decimal digits.

f/ Project totals includes 1.8 acres of temporary and permanent impacts associated with cathodic protection beds.

4.8.1.1 Pipeline Facilities

Constructing and operating the pipeline would temporarily and permanently impact land uses. Mountain Valley proposes to generally use a 100-foot-wide construction right-of-way, consisting of 50 feet of permanent right-of-way and 50 feet of temporary construction workspace. In wetland areas, Mountain Valley proposes to use a 75-foot-wide construction right-of-way. Various ATWS would be used for Project construction, in addition to the construction right-of-way. As discussed in section 2.3.3, Mountain Valley identified several areas where site-specific conditions would require the use of extra workspace outside of the 100-foot-wide construction right-of-way. Based on our review of the site-specific conditions and identified workspaces, we find these to be acceptable. Additional discussion of these extra workspace areas is presented in section 4.4.4.

Where the pipeline would be collocated with existing pipelines or electric transmission lines, the construction right-of-way could consist of a portion of the existing, cleared permanent right-of-way and some additional new right-of-way (see table 2.3-1). The land retained as new permanent right-of-way would generally be allowed to revert to its former use, except for forested land as discussed below. Also, activities such as the construction of permanent structures, including houses, house additions, garages, patios, pools, or the planting of trees, would be prohibited. To facilitate pipeline inspection, operation, and maintenance, the entire permanent right-of-way in upland areas would be maintained in an herbaceous/scrub-shrub vegetated state. Mowing would occur no more than once every 3 years, but a 10-foot-wide strip centered over the pipeline might be mowed annually. However, as discussed in section 4.6.1.4 annual mowing would not be allowed during bird nesting season.

Forested Land

Forest land that would be affected by the Project consists mainly of mixed-deciduous and evergreen forests (see section 4.5.1). About 597 acres of forested land would be cleared within the pipeline right-of-way and ATWS. Impacts on forest land would be long-term and permanent. Trees within temporary construction work areas would be cleared, but following construction, these lands would be allowed to naturally revert to forest through natural successional processes; however, impacts on forest resources in these areas could take 30 or more years to return to pre-construction conditions. Following construction, the maintained portion of the right-of-way would be permanently converted to open land.

Silviculture

Mountain Valley has identified seven tracts containing pine plantations that would be affected by the Project. These areas include loblolly pines and other hardwood species. Similar to forest lands, impacts on pine plantations would be long-term and permanent. During construction about 11.8 acres of pine plantation would be cleared. If requested by the landowner, cleared trees would be placed at the edge of workspaces for use/removal by the landowner. To ensure that trees left at the edge of workspace do not result in additional impacts, in section 4.5.4.1 we have recommended that Mountain Valley place any timber for beneficial reuse at access points where the landowner can reasonably retrieve timber without any inadvertent impacts on the restored right-of-way. Several landowners expressed concern about access to their pine

plantations. Mountain Valley has committed to working with landowners to maintain property access. Landowners would need to coordinate with Mountain Valley to coordinate safe travel of heavy logging equipment across the right-of-way. Once construction is complete, areas not affected by permanent right-of-way (7.3 acres) would be allowed to be replanted; however, given that it typically takes 30 or more years for trees to mature, this would result in a long-term impact to these areas. During operation of the Project, trees within the permanent right-of-way would not be permitted to regrow, resulting in a loss of future marketable timber for the life of the Project on 4.5 acres. However, Mountain Valley would compensate landowners for any temporary and permanently lost timber. Normal logging operations would be permitted to continue during operation of the Project.

Agricultural Land

Agricultural lands in the Project area are generally used for the production of crops including: tobacco, soybeans, sorghum, barley, oats, wheat and corn; forage production that includes: greenchop, grass silage, haylage and hay; vegetable production for potatoes and sweet potatoes; orchards, livestock and poultry (USDA Natural Agricultural Statistics Services, 2012). Prime farmlands and statewide important farmlands are addressed in section 4.2.2.7. Constructing the Project would temporarily preclude agricultural practices and could affect future crop productivity. Fields would generally be taken out of production for one growing season while the pipeline is constructed. Mountain Valley would compensate landowners for lost production and crop damages due to construction of the Project as negotiated with the landowners. Construction activities such as clearing, grading, trenching, stripping, and backfilling would potentially affect agricultural lands by causing soil erosion, damaging surface or subsurface irrigation or drainage systems, and by degrading fertile soils through mixing and compaction. These impacts could result in direct loss of crops or pasture, as well as reduced crop productivity in future planting seasons.

To avoid and minimize impacts on agricultural lands, Mountain Valley would implement numerous measures as identified in its Plan including measures that address soil segregation, soil compaction, and irrigation systems and would adhere to all other applicable federal, state, and local permit requirements. Mountain Valley would compensate landowners for lost production and crop damages due to construction of the Project as negotiated with the landowners. Additionally, Mountain Valley would coordinate with landowners to ensure they have access to all agricultural areas outside of the right-of-way during construction, including those areas across the right-of-way. Crops, other than trees, would be allowed to be cultivated within both the construction and permanent rights-of-way once construction has been completed. Mountain Valley would work with landowners to replace and return features of their property that needed to be removed for construction, including fences for livestock. As such, unless the land is used for tree-related farming, no permanent change in land use or permanent reduction in the amount of land available for cultivation would be associated with the pipeline right-of-way. Mountain Valley would conduct post-construction monitoring to evaluate the recovery of revegetation. While issues such as compaction could result in impacts on crop yields if not properly mitigated, adherence to measures outlined in Mountain Valley's Plan would limit these impacts on the short-term. According to Mountain Valley's Plan, revegetation would be considered successful once the affected agricultural area has "crop growth and vigor" that is similar to adjacent undisturbed portions of the same field. With the implementation of Mountain Valley's impact avoidance and minimization measures and its commitment to compensate farmers for lost crops, impacts on

agricultural lands would be minor. During the scoping period, one landowner, Robert Pollok on tract VA-PI-099.000, identified his farm as a certified seed farm, and requested that Mountain Valley implement additional mitigation measures. As discussed in section 4.8.2, Mountain Valley would work with the landowner during easement negotiations to identify any specialized mitigation measures requested by the landowners. Additionally, Mountain Valley assessed a potential route variation within the tract to determine if a more environmentally preferable route could be identified (see section 3.4.3.3).

Open Lands

Open lands that would be affected by the Project include open fields, existing utility rights-of-way, herbaceous and scrub-shrub uplands, non-forested lands, emergent and scrub-shrub wetlands, and non-paved roads. Similar to agricultural lands, constructing and operating the Project would temporarily preclude activities on open lands. However, these impacts would be temporary and would be minimized by the implementation of Mountain Valley's Plan. Following construction, most open land would return to pre-construction conditions within 2 years.

Industrial/Commercial Land

Industrial/commercial land uses could be temporarily affected during construction of the pipeline Project by increased dust from exposed soils, construction noise, and traffic congestion. Mountain Valley would implement several mitigation measures to minimize impacts on commercial land uses including coordinating driveway crossings with business owners to provide access across the construction right-of-way, timing construction to avoid peak use, and expediting construction in these areas.

Mountain Valley would ensure access for emergency vehicles during road crossings by using temporary platforms across the pipeline trench as needed. Road surfaces would be restored as soon as practicable so that normal access could resume, and commercial land uses would be restored to pre-construction conditions, or as specified in landowner agreements.

As discussed in section 4.9.4, Mountain Valley has developed and would implement a *Residential Access and Traffic Mitigation Plan*.

Residential Land

As currently designed, 8.9 acres of residential land would be affected by construction of the pipeline portion of the Project. Following construction, 2.9 acres of residential land would be within the permanent pipeline right-of-way and would be subject to restrictions on planting large trees (over 15 feet) and the placement of certain structures. The remaining 6.5 acres of affected residential land would be restored to pre-construction conditions and would not be subjected to any restrictions. In restoring properties, Mountain Valley would adhere to its Plan and any specific requirements identified by landowners agreed to during negotiations. In most cases, property owners would be able to use the permanent right-of-way as they did before construction as long as the use does not conflict with Project operation and the terms of the landowner's negotiated easement agreement. A more detailed discussion regarding residential lands can be found below in section 4.8.3.

4.8.1.2 Aboveground and Other Facilities

Mountain Valley would use 30.3 acres to construct the aboveground facilities. As described previously, table 4.8-1 summarizes the land uses affected by constructing and operating the aboveground facilities. The MLVs and pig launchers/receivers would be located within the pipeline permanent operational easement or would be within the foot print of other aboveground facilities. The erection of aboveground facilities would permanently convert 10.9 acres existing land use to industrial/commercial land use. This would include the permanent conversion of 4.9 acres of agricultural land to industrial use. As described previously, landowners would be compensated for any temporary and permanent crop loss. Associated temporary workspace associated with construction of aboveground facilities would experience both short-term and long-term impacts.

4.8.1.3 Contractor Yards

Mountain Valley's eight proposed contractor yards would affect a total of 248.7 of acres of land. Of that total, 216.1 acres would be open land and 29.1 acres would be commercial or industrial land and 3.5 acres of forested land. Following construction, all of the yards would be restored and returned to their previous condition and land use. However, because forested areas can take 15 to 30 years to recover, impacts on forested lands would be long-term to permanent.

4.8.1.4 Access Roads

Mountain Valley proposes to use 160 (new or existing) roads to access construction workspace (see appendix B.4). Use of these roads would temporarily affect a total of about 99.5 acres of land and would permanently affect a total of about 5.7 acres of land. Of the 160 access roads that would be used during construction, 119 are existing roads. The existing surface of these roads vary from simple two-track or dirt roads to finished concrete or asphalt roads. Mountain Valley stated that 113 of the existing roads would need improvements such as adding stone or gravel, installing culverts, grading, or widening. Mountain Valley would construct 41 new access roads to construct the Project, affecting about 5.6 acres of land. Following construction, all temporary access roads would be returned to pre-construction conditions unless otherwise negotiated with the landowner.

Mountain Valley would use 17 roads to operate the Project including 7 existing roads and 10 new roads. The land use types that would be affected by construction of permanent roads includes agricultural, forested, open land, and some developed land. Overall, the construction of new permanent roads, modifications to existing roads, and the use of these roads that would permanently impact about 5.7 acres of land.

4.8.2 Land Ownership and Easement Requirements

Pipeline operators must obtain easements from existing landowners to construct and operate authorized facilities, or acquire the land on which the facilities would be located. Easements can be temporary, granting the operator the use of the land during construction (e.g., extra workspaces, temporary access roads, contractor yards), or permanent, granting the operator the right to operate and maintain the facilities once constructed.

Mountain Valley would need to acquire new easements or acquire the necessary land to construct and operate the new pipeline. These new easements would convey both temporary (for construction) and permanent (no greater than 50-feet-wide for operation) rights-of-way to Mountain Valley.

An easement agreement between a company and a landowner typically specifies compensation for losses resulting from construction, including losses of non-renewable and other resources, damages to property during construction, and restrictions on existing uses that would not be permitted on the permanent right-of-way. Compensation would be fully determined through negotiations between Mountain Valley and the landowner. Mountain Valley identified that it has based its offerings on a market study conducted by a licensed real estate appraiser.

If an easement cannot be negotiated with a landowner and if the Project is approved by the Commission, Mountain Valley may use the right of eminent domain granted to it under section 7(h) of the NGA and the procedure set forth under the Federal Rules of Civil Procedure (Rule 71A) to acquire the necessary property rights to construct and operate its Project. This right would apply to all Project-related workspace covered by an approval, including the temporary and permanent rights-of-way, aboveground facility sites, contractor yards, access roads, and extra workspaces. Mountain Valley would still be required to compensate the landowner for the right-of-way and damages incurred during construction. However, the level of compensation would be determined by a court according to federal or state law.

4.8.3 Existing Residences, Commercial and Industrial Facilities, and Planned Developments

4.8.3.1 Existing Residential, Commercial and Industrial Facilities

As currently designed, about 18.1 acres of residential land would be affected by construction of the pipeline and use of access roads. Construction work areas would be within 50 feet of 70 occupied and unoccupied residential structures (including homes, mobile homes, and cabins). In addition to these residential structures, 143 other associated structures such as sheds and barns, would be within 50 feet of the Project, including 43 structures that would be within construction work areas. Mountain Valley would work with landowners to either protect, purchase or relocate structures within the proposed construction right-of-way. No occupied residences would be removed to construct the pipeline. Appendix E.2 lists residences and other associated structures within 50 feet proposed construction work areas.

Residences within 50 feet of construction work areas would be affected by equipment noise and vibration, potential access delays, potential impacts on septic systems, and other general construction inconveniences (dust). In addition to the previously described impacts, the driveways of several residences would be partially or wholly within the construction work area. In order to ensure access to these homes during construction, Mountain Valley would provide access through the safety fencing. As described previously, operation of the Project would preclude the placement of many permanent structures within the permanent easement. In general, as the distance to the construction work area increases, the impacts on residences decrease.

Septic systems are self-contained, underground wastewater treatment systems that dispose of household wastewater on-site. Septic systems are common in rural areas, including those crossed by the Project. The locations of existing and planned septic systems are not available in a public database. Mountain Valley is conducting landowner interviews on all affected properties to identify septic systems. Landowner interviews, to date, have identified one septic tank and one septic tank water line within the Project workspace. The septic tank location would be avoided with an adjustment to the construction workspace. The water line cannot be avoided and would be protected with matting during construction.

Septic systems could be damaged by heavy equipment operating above the system or through accidental contact with machinery during excavation activities. Mountain Valley would attempt to avoid and minimize impacts on any septic systems in the construction workspace. Mountain Valley has provided minor pipeline deviations to avoid septic systems and would continue to work with landowners to avoid septic systems as they are identified. Specific alternative routes proposed to avoid septic systems thus far are detailed in section 3.0. If avoidance is not possible, Mountain Valley would work with individual landowners to relocate or replace septic systems prior to construction. In the event that a septic system is damaged during construction, Mountain Valley would repair or replace the septic system. Surveys are ongoing for septic systems in the Project area.

To reduce impacts on residences within 50 feet of construction work areas, Mountain Valley would implement numerous measures including:

- notifying residents in advance of construction activities;
- installing temporary safety fencing for at least 100 feet on either side of the residence and maintaining it while the trench is open;
- preserving as many trees and as much landscaping as possible;
- segregating topsoil where appropriate or as negotiated with landowner;
- maintaining utility service during construction activities;
- constructing only during daylight hours, except where special conditions require otherwise; and
- restoring lawn areas and landscaping after backfill.

Additionally, Mountain Valley prepared and would adhere to site-specific *Residential Construction Plans* (see appendix B.7) for 24 residential structures (9 of which are occupied residences) currently identified as within 25 feet of construction work areas (including those within the construction workspace) or where a plan was requested by a landowner or agency. Table 4.8-2 lists all occupied residences within 25 feet of construction workspace. A complete list of structures within 50 feet of the Project can be found in appendix E.2.

TABLE 4.8-2

Occupied Residences within 25 feet of Southgate Project Workspace a/

Milepost	Building Type	Closest Feature	Distance from workspace limit (feet)	Residential Construction Plan Number a/
Pittsylvania County, Virginia				
0.0	House	Temporary Access Road (Existing)	22	RSS-H650-045
Rockingham County, North Carolina				
32.5	House	Temporary Access Road (Existing)	20	RSS-H650-025
39.6	House	Temporary Access Road (Existing)	12	RSS-H650-046
44.1	House	Temporary Access Road (Existing)	3	RSS-H650-026

Alamance County, North Carolina				
67.1 RR	House	Construction Workspace	16	RSS-H650-051
67.3 RR	House	Temporary Access Road (New)	18	RSS-H650-028
67.3 RR	House	Temporary Access Road (New)	8	RSS-H650-028
69.6 RR	House	Construction Workspace	13	RSS-H650-050

a/ Residential Construction Plans are provided in appendix B.7.

Because of the increased potential for construction of the Project to disrupt these residences and to ensure that property owners have adequate input to a construction activity occurring so close to their homes, in the draft EIS we requested that a signed site-specific residential plan be provided for all residences within 10 feet of construction workspace or new access roads. Mountain Valley made several route modifications that resulted in three of the residences to be located farther than 10 feet of construction work space. A signed plan was provided for the remaining residence at MP 67.3.

We have reviewed the site-specific plans, mitigation, and associated workspace justifications, and have found them acceptable. Our experience has shown that when Project sponsors maintain communication with landowners during construction and restoration phases, issues in and near residential areas can be effectively managed and resolved. Mountain Valley has developed landowner complaint resolution process as part of its *Public, Stakeholder, and Agency Participation Plan* that it would implement during Project construction and restoration. Mountain Valley would track all calls and/or emails that it receives including the individuals name and details of the issues or problems. Mountain Valley would contact the landowner to understand the issue and if possible, resolve the problem. Otherwise, the issue will be elevated to a Project representative, who will contact the landowner within 3 business days. All complaints and follow-up correspondence would be documented, and any action required to resolve the issue would be discussed with the affected landowner and/or complainant. We find these procedures to be

acceptable and to ensure proper documentation of landowner concerns, we are recommending in section 5.2 that Mountain Valley file weekly reports with us to document complaints and resolution status.

Commercial structures in close proximity to pipeline construction could also experience short-term disruptions as a result of in-street construction, detours, or restricted access due to lane closures. These impacts and corresponding mitigation measures are discussed in more detail in section 4.9.4. Implementation of Mountain Valley's general construction methods for working near residences and commercial areas, such as boring of public roadways, avoidance of road closures, development of Mountain Valley's *Traffic Mitigation Plan*, and the landowner complaint resolution process would minimize disruption to residential and commercial areas to the extent practicable. With the implementation of the mitigation measures outlined in this section, as well as the implementation of the measures within the residential site-specific plans, we conclude construction impacts would be adequately minimized.

4.8.3.2 Planned Developments

Mountain Valley contacted local planning agencies and identified one planned residential and commercial development within 0.25 mile of the Project. The Granite Mill Project includes the redevelopment of an abandoned mill to include new apartments and commercial space. Mountain Valley proposed to use access road TA-AL-187, an existing road through the redevelopment site. However, after the issuance of the draft EIS, Mountain Valley determined that there were other available access points to the right-of-way and therefore determined that the access road was no longer needed. Therefore, no direct impacts on the Granite Mill Project site are expected.

4.8.4 Recreation and Special Interest Areas

The Project would not cross any federally designated or managed lands. The Project is outside of any Coastal Zone Management Act areas. However, portions of the Project would cross and would be located within 0.25 mile of state and municipal recreation or special interest areas (see table 4.8-3 below).

Construction of the Project could alter the visual character of a recreational or special interest area by removing existing vegetation and disturbing soils; these potential impacts are discussed in section 4.8.6. Construction could also generate dust and noise, which could be a nuisance to recreational users. Construction could also interfere with or diminish the quality of the recreational experience by affecting wildlife movements or disturbing hikers while using trails.

In general, impacts on recreational and special interest areas would be temporary and limited to the period of active construction, which typically would only last a few days to several weeks in any one area. These impacts would be minimized by implementation of Mountain Valley's Plan and Procedures. In addition, Mountain Valley has proposed specific mitigation measures and is continuing to consult with the owners and managing agencies of recreation and special interest areas regarding the need for specific construction mitigation measures.

TABLE 4.8-3

State and Municipal Recreational and Special Interest Areas within 0.25 mile of the Southgate Project

Name of Area	Land Ownership and Management	MP	County	State	Pipeline Crossing Length (feet)	Distance From Project (feet)	Area Affected (Acres)		Crossing Method / Special Construction
							Constr	Oper	
Designated Banister River Segment / Future Blueway	State Designated	4.3	Pittsylvania	VA	N/A	1,162 feet southeast of MP 4.3	N/A	N/A	N/A
Banister River Future Blueway	Upper Reach Roanoke River Basin Association	4.9	Pittsylvania	VA	48	0	0.1	0.0	Dry Crossing – Dam-and-pump, Flume
Easement	Virginia Outdoors Foundation	14.1	Pittsylvania	VA	N/A	914 feet southeast of MP 14.0	N/A	N/A	N/A
Designated Sandy River Segment	State Designated	17.7	Pittsylvania	VA	85	0	0.2	0.0	Dry Crossing – Dam-and-pump Flume
Berry Hill Industrial Park	Pittsylvania Regional Industrial Facility Authority (i.e., Commonwealth of Virginia)	22.3 – 24.8	Pittsylvania	VA	13,608	0	41.2	15.2	Conventional open-cut
Dan River Trail / Nationwide Rivers Inventory	North Carolina Watercraft Trail	30.1	Rockingham	NC	N/A (HDD)	0	0.0	0.0	HDD
Draper Landing River Access Site	City of Eden	30.1	Rockingham	NC	N/A	0.0	0.0	0.0	N/A
Conservation Easement	Piedmont Land Conservancy	37.7 – 38.0	Rockingham	NC	139	0	0.3	0.1	Conventional open-cut
Ace Speedway	Private	56.9	Alamance	NC	N/A	94 feet west of MP 56.9	N/A	N/A	N/A
Area of Interest (AOI) Study Area – Land being considered during the master planning process	North Carolina Division of Parks and Recreation	58.7	Alamance	NC	N/A	1,134 feet southwest of MP 58.7	N/A	N/A	N/A

TABLE 4.8-3

State and Municipal Recreational and Special Interest Areas within 0.25 mile of the Southgate Project

Name of Area	Land Ownership and Management	MP	County	State	Pipeline Crossing Length (feet)	Distance From Project (feet)	Area Affected (Acres)		Crossing Method / Special Construction
							Constr	Oper	
Mitigation Easement	North Carolina Division of Mitigation Services	60.7	Alamance	NC	N/A	551 feet north of MP 60.7	N/A	N/A	N/A
Planned Regional Trail	North Carolina Division of Parks and Recreation	68.6	Alamance	NC	Unknown	0	Unknown	Unknown	Conventional open-cut
Mountains-To-Sea Trail	North Carolina Division of Parks and Recreation	68.9 – 69.3	Alamance	NC	0	450 feet northwest of MP 69.1	N/A	N/A	N/A
Mountains-To-Sea Trail	North Carolina Division of Parks and Recreation	69.6	Alamance	NC	N/A (conventional bore)	0	0.0	0.0	Conventional Bore
Planned Haw River Trail / Nationwide Rivers Inventory	Haw River Trail Partnership	69.7 – 73.1	Alamance	NC	N/A	190 feet west of MP 71.6	N/A	N/A	N/A
Challenge Golf Club	Private	70.0 – 71.3	Alamance	NC	N/A	440 feet west of MP 71.3	N/A	N/A	N/A
Haw River Sanitary District Facility	Town of Haw River	70.2	Alamance	NC	186	0	0.3	0.2	Conventional open-cut
Easement	North Carolina Clean Water Trust Fund	71.4 – 71.7	Alamance	NC	N/A	177 feet west of MP 71.6	N/A	N/A	N/A
Easement	North Carolina Clean Water Trust Fund	71.8	Alamance	NC	N/A	446 feet west of MP 71.8	N/A	N/A	N/A
Graham Paddle Access – Haw River Trail	City of Graham	72.9	Alamance	NC	N/A	220 feet northwest of ATWS 1692 near MP 72.9	N/A	N/A	N/A

If an area is not physically crossed by the pipeline the crossing length and impact acreages are listed as N/A (Not Applicable)

Construction periods could coincide with a variety of hunting seasons in Virginia and North Carolina. Hunting may occur on public and private lands throughout the Project area. During construction, hunting would not be permitted within construction workspaces. Mountain Valley would coordinate with landowners regarding any conflicts with planned hunting activities. Additionally, all workers would be required to wear high visibility vests and hardhats. Workers would be trained regarding hunting season. Once construction is complete, all hunting activities would be permitted to resume. Impacts on hunting and hunting areas would be temporary and minor.

4.8.4.1 Other Special Use Lands

Several trails and special use lands were identified as being within 0.25 miles of the Project, but not crossed by the Project. These include an area of interest (AOI) being studied by the North Carolina Division of Parks and Recreation, a planned Haw River Trail/Nationwide Rivers Inventory, a Virginia Outdoors Foundation easement, two North Carolina Clean Water Trust Fund Easements, a mitigation easement, and the Graham Paddle Access – Haw River Trail. These areas range from 170 feet to more than a 1,000 feet from the construction workspace. No direct impacts are anticipated to these areas due to construction. Some areas may experience minor noise, air, and visual impacts, depending on their proximity to the work areas. However, these would be temporary and minor.

The Dan River would be crossed by the Project near MP 30 and the Haw River would be within 0.25 mile of the Project. Both rivers are candidates to be added as a National Wild and Scenic River. Mountain Valley would cross the Dan River using an HDD. Mountain Valley also plans to use the Dan River as a source of water for construction. However, mitigation measures would be put in place to limit the volume and impacts on aquatic life. No impacts on recreational activities are anticipated based on water withdrawal activities. There may be temporary noise or visual impacts on recreationalists using the river within close proximity to the Project; however, these impacts would be temporary (HDD typically takes 3 to 6 months to complete) and minor. The Haw River is 190 feet west of the Project, so we do not anticipate there would be impacts on the river or its users.

We received comments regarding potential impacts on the Draper Landing River Access Site, a recently built boat ramp site in the City of Eden near the Dan River HDD site. The boat ramp would be about 0.25 miles west of the proposed HDD crossing site, near the Route 700 Bridge. While the boat ramp itself would not be affected by the Project, access to the boat ramp may be hindered. A portion of the gravel road leading to the boat ramp would also be used as a temporary access road by the Project (TA-RO-081). Additionally, Mountain Valley proposes to use a 4.3 acre area as an ATWS, a portion of which includes the road leading the Draper Landing Boat Ramp. This could hinder the public's ability to access the boat ramp. This is the only major boat and recreational access to the Dan River in this area. Since this ATWS is part of the HDD construction workspace, work in this area could occur over several weeks or months.

To avoid adverse impacts on public accessibility to the Dan River in this area, Mountain Valley has reduced the ATWS at this location to remove the Draper Landing Boat Ramp access road, and the associated split-rail fence from the Project workspace. Mountain Valley would install temporary signage during construction to alert construction personnel that access to the Draper Landing Boat Ramp must remain open while utilizing access road TA-RO-081. In addition,

Mountain Valley would utilize jersey barriers, if needed, to ensure that access to the Draper Landing Boat Ramp is not inhibited during construction.

Segments of the Banister River are identified as a VADCR scenic river. The segment of the Banister River crossed by the Project at MP 4.9 is listed as a future Blueway (a designated recreational water trail). However, the current construction schedule anticipates that the Project would be complete prior to Blueway status. The Banister River would be crossed using a dry crossing method (e.g. dam-and-pump or flume). The Project would also cross the Sandy River at MP 17.7 using an open-cut dry crossing method. As previously stated in section 4.3.2, Mountain Valley would reduce permanent visual impacts at the crossing by using native seed mixes and hand planting riparian vegetation. We find these measures acceptable. In addition, Mountain Valley would coordinate with the VADCR to determine if the state may recommend any additional mitigation measures.

While there would be minor impacts on the rivers during construction, these impacts would be short-term with the implementation of Mountain Valley's Procedures for the stream crossing. Boaters would be temporarily restricted from traversing sections of a river during construction. Mountain Valley would notify users of any closings through websites, at upstream access areas, and/or using other methods based on recommendations from the VADCR and would establish a temporary path around the construction site for users of the rivers. The river crossings would take 5 to 10 days to complete. No boat ramps are within close proximity to the crossings. It is not anticipated that the river crossings would impact a significant number of boaters. Overall, the crossings of the Banister River and Sandy River is expected to have temporary minor impacts on recreational use. No impacts on the rivers would be expected during operation and Mountain Valley would restore the area and riparian vegetation crossed to pre-construction conditions except for a 10 foot-wide herbaceous strip over the centerline.

The Project would cross a planned regional trail in Alamance County, North Carolina at MP 68.6 using the open-cut method. No information was available on the timing of construction for the regional trail. However, if the trail is completed prior to the start of construction of the Project, impacts associated with the crossing would include temporary closure of the trail during the open-cut crossing (typically 3 to 7 days), construction noise and dust, and a visual change to trail users since the area is currently a mix of forest and open land. The effects on trail users would be limited to the period of active construction and would be minor. Permanent visual impacts associated with tree clearing is discussed further in section 4.8.6.

The Project would also cross the North Carolina state hiking trail, the Mountains-to-Sea Trail, at MP 69.6. At this crossing location, the trail is a paved road (Stone Street) in the town of Haw River. The trail/road would be crossed by conventional bore resulting in no direct impacts on the trail or its use. However, users would experience some impacts from construction noise and dust and visual impacts associated with personnel and equipment.

The Ace Speedway is 94 feet west of the Project right-of-way near MP 56.9. The facility hosts various events including stock car racing from March through September, as well as other special events and races throughout the year. A private gravel road provides access to the speedway from Altamahaw Racetrack Road. Mountain Valley would also use this road as a temporary access road (TA-AL-159A). Based on the Ace Speedway 2019 Racing Schedule, races typically take place on Friday and Saturday nights with gates opening at 4:00 pm (Ace Speedway

2019). As previously stated, a typical construction workday would end around 7:00 pm, on average. This would result in overlap for use of the road between construction crews and attendants of the speedway. Temporary effects on the facility include additional traffic along the access road that could result in delays for racers and attendants of the racetrack. Road maintenance may also be required more often due to Project-related equipment. In order to minimize impacts on the facility and its users, Mountain Valley would coordinate with the landowner regarding timing and use of the road. Mountain Valley would also maintain the road and restore it as necessary to maintain its condition.

The Challenge Golf Club is 0.1 mile west of MP 71.3 and Project-related impacts are not anticipated for the golf club. Temporary impacts on the golf club's viewshed would be minimal due to the contours of the area and surrounding vegetation.

In general, recreation areas and special use areas crossed by the Project are expected to experience some temporary impacts during construction, such as clearing of trees, noise, dust, and limited access which may prevent or curtail recreational activities. Users of these areas such as hikers, wildlife enthusiasts, sightseers, bikers, and other recreationalists may be prevented from use of the immediate area around the temporary right-of-way during construction. Nearby recreation areas and special use areas are expected to experience similar temporary impacts as areas are crossed, but as the distance to the construction work area increases, these impacts would generally decrease.

Mountain Valley would continue to consult with the appropriate federal, state, and managing agencies to develop and implement measures to mitigate and reduce impacts on these areas as needed. Direct access to some entry points within these areas may be temporarily limited or restricted due to increased traffic or road closures during construction. For further discussion of transportation impacts and mitigation measures, refer to section 4.9.4.

4.8.4.2 Specialty Crops

Several pine plantations were identified by Mountain Valley as being crossed by the Project and are discussed in section 4.8.1. Mountain Valley has not identified any specialty crop farms within the Project area.

4.8.5 Hazardous Waste Sites

Using data from the EPA, the VADEQ, and NCDEQ, Mountain Valley identified 30 sites of potential contamination concern within 0.25 mile of the Project.[25] None of the sites would be crossed by the proposed Project. The nearest site with an active or unresolved status, Midway Auto Sales, is approximately 100 feet from the Project workspaces near MP 43.6. This site is listed for a release of gasoline to groundwater that was identified during the removal of an underground storage tank in 1994. Given the nature and the age of the release and because the site

[25] The list of hazardous sites within 0.25 mile of the Project was included as part of Mountain Valley's March 05, 2019 response to our February 13, 2019 environmental information request, accession number 20190305-5214.. Additional information was provided in Mountain Valley's December 16, 2019 supplemental filing, accession number 20191216-5158. The information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field.

is topographically downgradient of the alignment, the potential for Project activities to encounter associated groundwater contamination, if still present, is negligible. While Mountain Valley does not anticipate any concerns associated with the hazardous sites, if any hazardous materials are encountered during construction, Mountain Valley would implement its Project-specific SPCC Plan and *Unanticipated Discovery of Contamination Plan*. See section 4.2.7 and 4.3.1.5 for a more detailed discussion of potential hazardous waste sites.

4.8.6 Visual Resources

Visual resources represent the aesthetic quality of the landscape as perceived subjectively by the viewer. Visual resources within the Project areas are a function of geology, climate, and historical processes, and include topographic relief, vegetation, water, wildlife, land use, and human uses and development.

4.8.6.1 Pipeline Facilities

Visual impacts associated with the construction right-of-way and extra workspaces include the removal of existing vegetation and the exposure of bare soils, as well as earthwork and grading scars associated with heavy equipment tracks, trenching, blasting (if required), and machinery and tool storage. Other visual effects could result from the removal of large individual trees that have intrinsic aesthetic value (e.g., loblolly pines); the removal or alteration of vegetation that may currently provide a visual barrier; or landform changes that introduce contrasts in visual scale, spatial characteristics, form, line, color, or texture.

Visual impacts would be greatest where the pipeline route parallels or crosses roads and the pipeline right-of-way may be seen by passing motorists; from residences within close proximity to the construction workspace or where vegetation used for visual screening or for ornamental value is removed; and viewsheds where the pipeline is routed through forested areas. Portions of the pipeline would be collocated or adjacent to existing pipeline and/or utility rights-of-way. As a result, the visual aesthetic along those portions of the Project route have been previously affected by other similar activities. As stated above, there are residences that would be within 25 feet of pipeline construction workspace (including access roads). Visual impacts on these residents would be more noticeable given their close proximity to construction activities, including clear views of equipment and personnel. The greatest potential visual impact would result from the removal of large specimen trees, which would take longer than other vegetation to regenerate and would be prevented from re-establishing on the permanent right-of-way.

The areas that would be crossed by the pipeline are predominately agricultural land and forested lands. The duration of visual impact from clearing would be shortest in open areas where the re-establishment of vegetation following construction would be relatively rapid (generally less than 3 years). The duration would be greater in forested land, which would take many years or decades to regenerate. The forested setting would also help to minimize the number of visual receptors along the forested portion of the right-of-way. After construction, all areas disturbed by the pipeline would be restored, and areas outside of the permanent right-of-way would be returned to pre-construction conditions in compliance with federal, state, and local permits; landowner agreements; and Mountain Valley's easement requirements.

4.8.6.2 Aboveground Facilities

The most visible features of the Project would be the aboveground facilities. A typical compressor station would consist of five structures (compressor unit-turbines building, two electrical control buildings, air compressor building, and an office), pig launchers/receivers, electric utilities, lighting fixtures, graveled yard with piping, surrounded by a chain-link security fence. Interior yard equipment would include gas filter/separators, gas coolers, inlet air filters, exhaust silencers, tanks, blowdown silencers, hears, and auxiliary micro-turbines. The equipment at a typical interconnect and interconnection would consist of custody-transfer flow meter, pressure/flow regulator, over pressure protection, isolation block valves, and associated instrumentation and control devices. The meter runs would be within a graveled yard surrounded by a fence. There would also be an electric utility hook-up.

Most of the MLVs would be within the permanent right-of-way easement for the pipeline. Usually, the valves are buried, with aboveground extensions. The MLVs would be equipped with valve actuators for remote operation.

The new Lambert Compressor Station would be within an area that is currently a mix of agriculture and forested land. Once constructed, the compressor station would be surrounded by trees on three sides shielding the compressor station from public view. Additionally, there are no homes or major roadways within 0.5 mile of the station. The closest residence is about 0.6 miles southeast of the compressor station site. This residence would not have direct views of the site during construction or operation due to existing vegetation around the compressor station site and near the residence. There are several other homes southwest of the compressor station that are about 500 feet from the pipeline right-of-way. The compressor station would not be visible from these residences due to natural vegetative screening. Given that views of the compressor station would be limited and there are no direct views of the site from residences, construction of the compressor station is not expected to result in any significant permanent impacts on visual resources.

Out of the four new interconnects, one would be within the footprint of the Lambert Compressor Station and visual impacts would be the same as described above for the compressor station. The LN 3600 Interconnect would be constructed at MP 28.2 in an area that is currently open and forested uplands. The closest residence is about 0.7 mile southeast of the interconnect with forested vegetation preventing views of the interconnect from the residence. The Willow Oaks Plantation, a meeting and wedding venue site, is less about 0.2 mile north of the interconnect; however, existing forested vegetation would prevent any direct views of the Project facility. No significant visual impacts are anticipated from construction and operation of the interconnect. The T-15 Dan River Interconnect would be constructed near MP 30.4 within an area that is currently open land. There are two residences less than 0.1 mile south of the interconnect; however, the land use between is predominantly forested and would provide a natural visual screening of the interconnect site and it would not be visible to the residents. The interconnect is about 180 feet east of South Fieldcrest Road and would be visible to motorists along the road; however, there are several other developed areas adjacent to the interconnect site, and the addition of the interconnect site would not represent a significant change to the existing viewshed. The T-21 Haw River Interconnect at MP 73.1 would be constructed within open land, 160 feet south east of an existing industrial site, and adjacent to Route 54. There are two residences that could have direct views of

the interconnect site. An additional residence is also across the road (about 250 feet north) from the interconnect site; however, that residence has an existing tree line screening it from the road and the proposed interconnect site. The first residence is about 180 feet to the east of the site. The existing terrain on the edge of the property will likely shield the interconnect site from being in direct view from the residence; therefore, no significant impacts are anticipated. The other home is across the road, about 310 feet northeast of the proposed location. Given the flat terrain of the area, and the lack of trees or other potential natural screens, this residence is likely to have direct views of the interconnect site and result in a minor change to the viewshed of the residents.

In general, the impacts on visual resources resulting from the construction and operation of the MLVs would be minimal as each site is small (typically less than 0.1 acre) and would be operated within the pipeline operational right-of-way or within a proposed aboveground facility (e.g., interconnect sites). MLVs along the operational right-of-way would be enclosed in a chain-link security fence. For ease of access, most of the MLV sites are near public roads and would be visible to passing motorists. However, given the small size of these sites, this change to the viewshed would be minor. One MLV site (MLV 6) near MP 55.1 would be within 400 feet of several residences, with the closest home about 140 feet to the east. Given the existing land use (agricultural and open land) and the existing terrain, the MLV site would be visible to these residences. However, the surrounding landscape also includes other homes, sheds, and residential fences. Therefore, the addition of the MLV is not likely to cause a significant visual impact.

4.8.6.3 Contractor Yards

The contractor yards would be located on agricultural, open, industrial, and forested lands. Minor grading and addition of gravel may occur at the contractor yards. Minor tree clearing would be required at three of the contractor yards (CY-03, CY-22, and CY-26B); however, these clearing activities would not represent a significant visual change. Contractor yards would be used to store trailers, vehicles, pipe, and other construction-related materials during construction. Six of the nine yards currently proposed are within 0.25 miles of residences. However, while CY-26A, CY-26B, and CY-25 are located within 0.25 miles of residences, existing trees lines and topography would result in no visual impacts to those residents. The CY-08 site is located along Barnes Street in Reidsville, North Carolina. There are two industrial commercial sites located on either side of the proposed contractor yard site. Additionally, there are several residences and small businesses across the street from the contractor yard site. While most of the contractor yard would be screened from the road and residences because of existing trees, some tree clearing is proposed, which would result in views of portions of the contractor yard to drivers and residences. However, given the existing industrial facilities already in these areas, the changes would be minor. There are four residences across the road from and with a direct view of the CY-22 site and there are two residences across the road about 200 feet south of the CY-19 site with direct view of the site. While residents would be able to observe the activities at these locations, the contractor yards would only be used during construction. Once construction is complete, the contractor yard sites would be returned to their pre-construction conditions. Therefore, any impacts associated with the contractor yards would be temporary and minor.

4.8.6.4 Access Roads

Most of the existing roads are currently paved, graveled, or have dirt surfaces and would require minor improvements, and would not have a significant impact on aesthetics. Several of

the temporary access roads and permanent access roads that Mountain Valley proposes to construct or modify would require extensions of existing roads. Construction of these roads would require some tree clearing in addition to grading and graveling. Temporary access roads would be returned to pre-construction conditions unless another arrangement is mutually agreed upon with the landowner. For access roads that require tree clearing, there would be a long-term localized visual change to the landscape. Several access roads would be in close proximity to homes and the homeowners may notice an increase in traffic from construction vehicles, including worker vehicles are larger construction equipment.

Given the limited amount of clearing (11.8 acres) that would be needed, as well as the limited footprint (typically 25 feet in width) of any single access road, and the temporary nature of increase traffic along these roads, we conclude that visual impacts from access roads would be minor.

4.8.6.5 Scenic Byways

The Project route would cross the Virginia Scenic Byway (Route 58) at MP 20.0 in Pittsylvania County. The byway would be crossed using a bore. Construction equipment and personnel would be visible to passing motorists during construction of the pipeline. While this would be a temporary impact, clearing of trees within the right-of-way and along the edge of the road would be a permanent change in the view by motorists traveling along the roadway. However, tree clearing would be adjacent to an open field; therefore, this change would be minor.

The Colonial Heritage Byway (Route 150) would be crossed at MP 48.4 in Rockingham County, North Carolina. The road would be crossed using a bore. Personnel and equipment would be visible to passing motorists during construction. A forested area about 190 feet from the roadway edge would be cleared for the pipeline right-of-way leading to the crossing, which would cause a long-term and permanent change to the viewshed visible to motorists traveling along the road. However, given the existing open areas, this would not represent a significant impact.

4.8.7 Land Use, Special Interest Areas, and Visual Resources Conclusions

Land use-related impacts associated with the Project would include the disturbance of existing uses within the rights-of-way during construction and maintenance of new permanent right-of-way for operation of the Project. Additional land would be disturbed by construction of the aboveground facilities, and land within the facility footprints would be permanently retained for operation. The primary land use types affected would be forested, agricultural land, and open lands. In forested areas, trees and shrubs would be removed from the construction work areas and the maintained portion of the right-of-way would be permanently converted to a non-forested condition. Land outside of the permanent pipeline easement would be allowed to revert to its prior condition, although this process would take many years. Impacts on agricultural lands would be short-term and limited to the growing season concurrent with construction. Following construction, agricultural practices within the pipeline right-of-way would be allowed to resume. Impacts on open land areas would be temporary and short-term, and would be minimized by the implementation of Mountain Valley Plan. Open land areas within the temporary and permanent right-of-way are expected to revert to their pre-construction land use after completion of construction. However, some activities, such as the building of new structures, would be prohibited on the permanent right-of-way.

4.9 SOCIOECONOMICS

Constructing and operating the Project may affect the socioeconomic character of communities near the proposed facilities. These potential impacts include temporary population increases and new employment opportunities, increased demand for housing and public services, impacts on tourism and local businesses, transportation impacts, environmental justice, and revenues associated with sales and payroll taxes. For the purposes of our socioeconomic analysis, the Project area consists of the three counties crossed by the Project.

4.9.1 Population and Employment

Table 4.9-1 provides information on population levels and trends for counties that would be affected by Project.

TABLE 4.9-1

Population Levels and Trends in the Southgate Project Area a/

Project/Location	2017 Population Estimate	2010 Population Density (persons/sq. mi.)	Change in Population (2000-2010) Percent	Change in Population (2010-2017) percent

a/ U.S. Census Bureau, 2017a

Mountain Valley estimates that it would take 10 to 12 months to construct the Project and an additional 2 years to complete restoration. Mountain Valley estimates that the peak construction workforce would be 860 people for the pipeline and 185 people for construction of the aboveground facilities (see table 4.9-2). Mountain Valley estimates that 55 percent of the workforce would be local hires, while the remaining workforce would relocate from outside the Project area.

TABLE 4.9-2

Estimated Workforce for the Southgate Project

Construction Spread	County/State	Peak Construction Workforce	Peak Local Workers	Peak Non-local Workers
Pipelines				
Spread 1	Pittsylvania, VA Rockingham, NC	485	267	218
Spread 2	Rockingham, NC Alamance, NC	375	206	169
Pipeline Subtotal		*860*	*473*	*387*
Aboveground Facilities				
Lambert Compressor Station/Lambert Interconnect /MLV 1	Pittsylvania, VA	110	61	49
Interconnects **a/**	Rockingham, NC Alamance, NC	75	442	33
Aboveground Facility Subtotal		*185*	*103*	*82*
Project Total		***1,045***	***576***	***469***

a/ Mountain Valley estimates a workforce of about 25 workers per interconnect

We estimate that during construction there could be a maximum of 469 non-local workers that would relocate into the Project area. This represents a total population increase of less than 1 percent within the Project area. Due to the relatively short duration of Project construction, most non-local workers are not expected to bring their families with them to the Project area. Since the Project construction workers would be spread out along two separate pipeline spreads within three counties, we conclude that the Project would not have a significant effect on any one counties' population. Additionally, Mountain Valley would hire four new permanent employees to operate and maintain the Project facilities. The effects of these permanent employees would be minor in regard to population levels within the counties crossed by the Project.

In Virginia, the unemployment rate in Pittsylvania County (4.5 percent) is slightly higher than the state rate of 3.2 percent (BLS, 2018). In North Carolina, the unemployment rates in Rockingham County is higher than (5.2 percent) and Alamance County is equal to (4.3 percent) the state rate of 4.3 percent. During peak construction, up to 589 local workers could be employed on the Project. This represents 0.4 percent of the total civilian workforce in the affected counties. Given the short duration of construction, any increase in local employment rates from construction of the Project in these counties or the surrounding areas would be temporary and minor, and the Project is unlikely to noticeably affect local unemployment rates.

4.9.2 Housing

Based on U.S. Census Bureau data, there are about 3,213 units available for rent in the affected counties (U.S. Census Bureau, 2016b) and there is a vacancy rate of 3.6 percent in Pittsylvania County, 7.5 percent in Alamance County, and 8.9 percent in Rockingham County. In

2017, there were about 2,118 hotel and motel rooms and an additional 407 recreational vehicle (RV) and campground spaces available in the Project area (see table 4.9-3).

TABLE 4.9-3

Existing Housing Accommodations in the Southgate Project Area

Project/ County	Rental Vacancy Rate (percent) a/	Units Available for Rent b/	Units for Seasonal Recreation b/	Hotel/ Motel Facilities c/	Hotel/ Motel Rooms c/	RV and Campground Locations d/	RV and Campground Spaces d/

Mountain Valley would not provide or construct any housing during construction. Instead, non-local construction workers would find housing in vacant rental units, including houses, apartments, mobile home parks, hotels/motels, campgrounds, and RV parks. The influx of about 469 non-local construction workers would represent a 5.8 percent increased demand for available accommodations in the Project area. Local workers would not need housing, as they would commute from their existing homes. Given the relatively short duration of construction and the number of housing units available, we conclude that the Project would not have significant adverse impacts on housing.

4.9.3 Public Services

Constructing the Project would increase demands on local public services and facilities. Local police may be needed to assist in maintaining traffic flow during construction or may need to respond to emergencies associated with pipeline construction. Fire departments may be needed in response to Project-related emergencies. Increased need for medical services would be mainly due to any illness or injury of workforce personnel. Additionally, police, fire, or medical service needs may also increase due to the influx in personnel (e.g. increase in traffic stops, traffic accidents, general medical needs). Table 4.9-4 summarizes the medical, police, and fire protection facilities in the counties within the study area.

TABLE 4.9-4

Public Services in the Counties Affected by the Southgate Project

d/ AHD (American Hospital Director), 2018.

All of the counties affected by the Project contain areas that are designated as health professional shortage areas (HPSA) and as medically underserved areas/populations (MUA/P). HPSA or MUA/P designation indicates a shortage of health care professionals or facilities (primary care, dental, and mental health) at either the county level as a whole or for particular census tracts within the county that contain low-income populations who are underserved by primary medical care. There are several larger metropolitan areas in adjacent counties such as Martinsville, Virginia, Dansville, Virginia, and Greensboro, North Carolina that have additional hospitals and medical facilities and are within a 40 to 60 minute drive from the Project. Given the number of hospital beds available in the Project area and the surrounding areas, there are sufficient medical services to serve the proposed peak construction workforce of 1,045 workers.

Each county within the Project area has numerous fire and police departments. Mountain Valley would work with local fire departments, police departments, and emergency first responders to address any Project impacts.

Few non-local workers are expected to relocate their families to the Project area. Given the low number of children expected to relocate, local schools should be able to absorb any additional children moving to the area because of the Project.

The communities in the Project area have adequate public service infrastructure to meet the potential needs of non-local workers who relocate temporarily. Therefore, we conclude that the Project would not significantly impact public services.

4.9.4 Transportation and Traffic

Constructing the pipeline route would require crossing 74 public roadways and 4 railroads. A complete list of roads and railroads affected by the Project, including proposed crossing methods, is provided in appendix E.1.

Most paved roads and all railroads crossed by the Project would be crossed by conventional bore. Where roads are bored, impacts on users would be minimal since there would be no direct impacts on the road surface. Some gravel or grass/dirt two-track roads crossed would be open-cut (see appendix E.1). Use of the open-cut method across a road generally requires a temporary road closure and establishment of detours. If no detour is feasible, Mountain Valley would create temporary travel lanes or install steel plates over the open-cut area to ensure continued traffic flow during construction. At least one lane of the road being crossed would be kept open to traffic except for brief periods when it would be essential to close the road to install the pipeline. Mountain Valley would coordinate with local police departments in areas of high traffic volume to avoid traffic flow interruptions and ensure the safety of pedestrians and vehicles and passing emergency vehicles. Mountain Valley would also employ traffic control measures, such as flagmen and signs. After pipeline installation, all roads crossed would be returned to their pre-construction condition and use.

Construction impacts on Project area roads would include disruption to traffic flow due to the movement of construction equipment, materials, and crew members and damage to local roads from the movement of heavy construction equipment and materials. Additionally, traffic and commute times may increase due to construction of the Project. The primary impact would occur as workers and equipment move into the Project area at the beginning of the day and leave the area at the end of the day. Specifically, slow moving or large construction equipment may cause delays throughout the day when moving into the Project area or moving between sites; however, these delays would be temporary. Public roads used by construction vehicles to get to and from workspaces could experience increase sediment tracking/build-up and surface damage. Mountain Valley would minimize and mitigate the trackout of sediment from the access roads or workspaces onto paved roads using rock construction entrances. If sediment or other loose material is tracked onto paved roads, Mountain Valley contractors would sweep or vacuum to remove from the road. During construction, Mountain Valley would inspect roads periodically and, if damages occur as a direct result of Project-related activities, would repair them as appropriate and in accordance with the applicable permit. Following construction, roads would be restored to their original conditions unless otherwise directed by the landowner, county, or state agency. Therefore, we conclude that construction activities would result in temporary to short-term impacts on transportation infrastructure.

During the draft EIS comment period, we received comments expressing concern that a cleared right-of-way would result in increased use of ATVs. Mountain Valley would address unauthorized off-road vehicle and ATV use on Project rights-of-way by adhering to Section VI of its Plan, which includes measures such as signs, fences/gates, and slash, timber, and boulder barriers.

4.9.5 Property Values and Insurance

We received several comments during the scoping period regarding the potential effect of the Project on property values and home insurance. Specific issues mentioned include devaluation of property if encumbered by a pipeline easement; being the responsible party for property taxes within a pipeline easement; paying increased landowner insurance premiums for Project-related effects; the inability to obtain home insurance or charges of higher premiums if the property is

encumbered by a pipeline easement; and negative economic effects resulting from changes in land use (e.g., loss of timber production within the permanent right-of-way).

To address these comments, we conducted a review of available literature to assess potential Project impacts. A 1994 paper compared data from nine towns in Connecticut traversed by natural gas pipelines operated by Algonquin and Tennessee Gas Pipeline companies since the 1960s, with a Southwestern pipeline through a planned community near a major city. The Connecticut study assessed 1,171 home sales between 1986 and 1991. The Southwestern study looked at 2,212 home sales between 1988 and 1991. The results of the studies for both Connecticut and the Southwestern pipeline were essentially the same. No systematic pattern of measureable or significant negative impacts on home sale prices were observed for residences close to a natural gas pipeline (Kinnard et al., 1994). Portland State University evaluated the impact of the South Mist Pipeline Extension (SMPE) in Clackamas and Washington Counties, Oregon on residential sales between 2004 and 2008. Based on sales price data for 10,642 single-family residential properties located within 1 mile of the pipeline, the study found that proximity to the pipeline had no statistically or economically significant impact on residential property values (Fruits, 2008). A 2011 study analyzed sales data from approximately 1,000 residential properties in Arizona to test whether proximity to a natural gas pipeline had an effect on real estate sales prices. The study compared sales prices for properties encumbered by or adjacent to a natural gas transmission pipeline with comparable properties not along a pipeline right-of-way. The study was unable to identify a systematic relationship between proximity to a pipeline and sales price or property values (Diskin et al., 2011). Lastly, Wilde et al. (2014) published a study of the effects the Kern River Pipeline had on property values within the subdivision of Summerlin near Las Vegas, Nevada, based on home sales and data reviewed at the Clark County Assessor's office. Looking at sales between 1991 and 1996 of representative three bedroom single-family houses, the study found that properties closest to the pipeline sold on average for higher prices than properties farther away.

Generally, the value of a tract of land, with or without a dwelling, is dependent on many variables, including the size of the tract, improvements, land use, views, location, and nearby amenities, and the values of adjacent properties. The presence of a pipeline, and the restrictions associated with an easement, may influence a potential buyer's decision whether or not to purchase that property. If a buyer is looking for a specific use, which the presence of the pipeline renders infeasible, then the buyer may decide against purchasing that property in favor of another tract without a pipeline and more suitable to their objectives. This would be similar to other buyer-specific preferences, such as nearby shopping centers, relative seclusion, or access to a high quality school district. Based the studies we reviewed, we conclude that the specific preferences of the buyer would determine if the presence of a natural gas pipeline would or would not significantly reduce property values. Further, for the studies we reviewed, the presence or proximity of a natural gas pipeline did not exert a systemic negative effect on housing resale prices.

Negotiated easement agreements compensate landowners and generally establish terms for addressing damages caused by Project construction and operation. These easement agreements can also include indemnification language, which means that the company, not the landowner, would be responsible for any damages or injuries resulting from pipeline construction and operation. If the applicants cannot reach agreements with landowners, and the Commission authorizes the projects and issues Certificates, the applicants may use the power of eminent

domain, granted by the U.S. Congress under Section 7(h) of the NGA, to obtain easements. However, in those cases, a local court would decide on the value of the easements.

Regarding the potential for insurance premium adjustments associated with pipeline proximity, on other projects, we have examined concerns that insurance premiums would increase and/or insurance companies would not insure properties due to pipeline proximity. These concerns were examined by contacting insurance offices to pose the question. We asked whether the presence of a utility crossing would change the terms of an existing or new residential insurance policy, which types of utilities may cause a change, how a policy might change, and what factors would influence a change in the policy terms, including the potential for a policy to be dropped completely. Results of this initial investigation suggested that the potential for a residential insurance policy to be affected could exist, but the extent of any action and corresponding corrective action would depend upon several factors, including the terms of the individual landowner's policy and the terms of the pipeline company's own policy. Insurance company contacts were not able to speak directly to the potential factors that could cause a change in a policy (e.g., type of utility, proximity of residence to utility), or provide quantitative information on the potential change in a policy premium (in dollars or percent). Further, we have requested in some previous projects, including the Atlantic Sunrise Project, FERC Docket No. CP15-138-000 (FERC, 2016b), PennEast Pipeline Project, FERC Docket No. CP15-558-000 (FERC, 2017), and Constitution and Wright Interconnect Projects, FERC Docket Nos. CP13-499-000 and CP13-502-000 (FERC, 2014), that the pipeline company notify us of any landowner-reported instances where property insurance was either dropped, denied, or had rates affected due to the presence of a pipeline. To date, the only project that has completed construction is the Atlantic Sunrise Project, and there have been no such reports. In 2016, INGAA released a study, conducted by Integra Reality Resources (IRR), of selected FERC-jurisdictional natural gas transmission pipelines throughout the county and their impact on property values and insurance rates (INGAA, 2016). IRR contacted the corporate offices of State Farm, Allstate, and Farmers, the three largest home insurers in the nation. Representatives of all three companies indicated that proximity to a pipeline was not taken into consideration when underwriting a homeowner's policy. In addition, premiums would not increase because a pipeline was installed on a property. There is no evidence that insurance companies view properties with pipeline easements any different than properties without easements. As such, there is no conclusive evidence indicating that insurance premiums would be affected by the presence of a natural gas pipeline easement.

We conclude that the Project would not have a significant adverse impact on property values; and would not affect the ability of homeowners to obtain fair market base priced insurance.

4.9.6 Tourism

Tourism opportunities occurring in the Project area include state and local special interest areas discussed in section 4.8, as well as other tourism-dependent businesses including agro- (small farms, seasonal farm stands, pumpkin patches, etc.) and hiking, boating, and other outdoor recreation) activities. We received several comments during scoping expressing concern that construction of the Project would impact tourism, particularly outdoor recreation. Travel-related spending supports local economies, and many people are employed by activities related to tourism (see table 4.9-5).

TABLE 4.9-5

Travel-Related Economic Contributions in the Southgate Project Area

State / County	Travel-Related Expenditures ($ million)	Travel-Related Local Tax Receipts ($ million)	Travel-Related Employment	Percent of Total Employment
Virginia				
Pittsylvania a/	73.3	2.14	660	2.2
North Carolina

Project Area Total	**324.2**	**6.9**	**2,630**	**1.7**

a/ VATC, 2016
b/ VisitNC, 2016

Scheduled construction of the Project would overlap with the peak tourism season and could impact public access to tourist attractions and accommodations. Construction contractors could increase competition for vacant rental units, hotel/motel rooms, and camping spots that would otherwise be procured by visitors to the Project area. However, as explained above in section 4.9.2, we conclude that available temporary housing is sufficient to accommodate the expected influx of workers and other housing needs.

As discussed in section 4.8.2, the Project is not expected to result in significant impacts on any recreation areas. No significant impacts on hunting, fishing, hiking, and other similar outdoor recreation are anticipated. Any impacts on recreation during construction would be temporary. Overall, impacts on tourism are expected to be minor and limited to the period of construction.

4.9.7 Economy and Tax Revenue

Table 4.9-6 below summarizes the economic characteristics of the counties affected by the Project.

TABLE 4.9-6

Existing Economic Conditions in the Southgate Project Area

Project/Location	Per capita income (dollars) a/	Civilian Workforce b/	Unemployment Rate (percent) b/	Top Three Industries a/
Project Totals		**150,415**		

a/ U.S. Census Bureau 2017a
b/ BLS 2018

Mountain Valley estimates that the total capital cost of the Project would be about $464 million. About $68 million would be spent directly in Virginia and $113 million in North Carolina. The remaining expenditures would occur outside of the Project area. Mountain Valley estimates that the total construction payroll would be $38.7 million in Virginia and $65.6 million in North Carolina. Based on workforce projections, Mountain Valley estimates that $0.9 million in income tax revenues would be generated by construction payroll in Virginia and $1.5 million in income tax revenues in North Carolina. Mountain Valley also estimates that during the peak of construction, the Project would create about 1,020 direct jobs, and an additional 680 indirect and induced jobs (FTI, 2019). Construction of the Project would also generate an aggregate total of $4.1 million in state and local taxes (income, sales, property, and other taxes) in Virginia and $6.3 million in North Carolina.

Operation of the Project would result in long-term ad valorem property tax benefits for the counties crossed by the Project in Virginia and North Carolina. These property taxes would be paid for the life of the Project. Mountain Valley estimates that it would pay a total of up to $1.2 million in property of ad valorem taxes in Virginia annually and a total of up to $1.7 million in property of ad valorem taxes in North Carolina annually.

During operation of the Project, a total of about six direct and indirect jobs would be supported in Virginia, with average annual salaries of about $79,000. In North Carolina, a total of about six direct and indirect jobs would be supported, with average annual salaries of about $71,000 (FTI, 2019).

Based on available economic data and the expected impacts of the Project, we conclude the Project would result in temporary beneficial impacts on the state and local economies by creating a short-term stimulus to the affected areas through payroll expenditures, local purchases of consumables Project-specific materials, room rentals, and sales tax.

4.9.8 Environmental Justice

Executive Order 12898 *Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations* requires federal agencies to consider if impacts on human health or the environment (including social and economic aspects) would be disproportionately high and adverse for minority and low-income populations and appreciably exceed impacts on the general population or other comparison group.

Consistent with EO 12898, the EPA's Environmental Justice Policies focus on enhancing opportunities for residents to participate in decision-making. The EPA (2011) states that Environmental Justice involves meaningful involvement so that:

> (1) potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health;
>
> (2) the public's contributions can influence the regulatory agency's decision;
>
> (3) the concerns of all participants involved will be considered in the decision-making process; and
>
> (4) the decision-makers seek out and facilitate the involvement of those potentially affected."

As discussed in sections 1.1 and 1.4 of this EIS, there have been many opportunities for public involvement during the Commission's environmental review process. The FERC has issued multiple notices regarding the Project that were posted on the Commission public dockets, published in the Federal Register, and sent to our environmental mailing list that included local libraries and newspapers. The FERC also held multiple public scoping meetings in the Project area.

All documents that form the administrative record for these proceedings are available to the public electronically through the internet on the FERC's web page (www.ferc.gov). Anyone, at any time, may comment to the FERC about the Project, either in writing or electronically.

We recognize that not everyone has internet access or is comfortable or adept at filing electronic comments. For this reason, each notice and Project Update brochure was physically mailed to all parties on the environmental mailing list. Further, FERC staff has consistently emphasized in meetings with the public that all comments, whether spoken or delivered in person at meetings, mailed in, or submitted electronically, receive equal weight by FERC staff for consideration in the EIS. In addition, Mountain Valley sent copies of its FERC applications in hard copy and/or digital format to the local libraries in the Project area.

4.9.8.1 Minority and Low-income Populations

According to CEQ environmental justice guidance under NEPA (CEQ, 1997) and EPA's Environmental Justice Interagency Working Group's *Promising Practices for Environmental Justice Methodologies in NEPA Reviews* (EPA, 2016), minorities are those groups that include American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic. The guidance also directs low-income populations to be identified based on the annual statistical poverty thresholds from the U.S. Census Bureau. In this EIS, low-income populations are defined as those individuals with reported income below the poverty level.

To determine if the Project would result in disproportionately high and adverse impacts on minority or low-income populations, we used the following criteria to identify potential environmental justice communities:

a. census block groups that have a minority population of more than 50 percent or a minority population that is 10 percentage points higher than their respective county; and

b. census block groups that have a household poverty rate of more than 20 percent or a household poverty rate that is 10 percentage points higher than their respective county.

Table 4.9-7 provides a summary of the minority or low-income percentage of county populations within 1.0 mile of the proposed compressor station and those crossed by the pipeline. The Project pipeline route would cross 35 census block groups, including 5 that are associated with contractor yards only. Of the 35 block groups, 15 contain environmental justice populations as previously defined. Figure 4.9-1 depicts the Project route, the census block groups assessed, and those block groups that have been identified as containing environmental justice communities.

Two block groups containing environmental justice populations as defined above are located within 1 mile of the Lambert Compressor Station. We received a general comment on the draft EIS regarding siting of compressor stations near environmental justice populations. In general, the siting of compressor stations is based on engineering factors associated with the design of a pipeline system. Compressor stations are anchored by the pipeline corridor and hydraulically bound to a specific segment of the pipeline, with some flexibility within the segment (depending on project-specific conditions). Additionally, the collocation of natural gas pipelines and associated facilities with existing rights-of-way is frequently a consideration to avoid and minimize impacts on the environment. The siting of the Lambert Compressor Station was based on engineering constraints of the pipeline system as well as collocation with existing facilities. Potential impacts from operation of the compressor station on nearby environmental justice communities are further discussed below.

Impacts on the natural and human environment from construction and operation of Project facilities are identified and discussed throughout this document. Factors that could affect environmental justice communities include air and noise impacts from construction and operation (see section 4.11), visual impacts (section 4.8), and socioeconomic impacts such as traffic, loss of tourism, and crop loss (section 4.9). Potentially adverse environmental effects on surrounding communities associated with the Project, including environmental justice communities, would be minimized and/or mitigated, as discussed in those sections.

We received multiple comments regarding air quality related disparate health impacts on more vulnerable environmental justice populations. As discussed in section 4.11, construction and operation of the compressor station would result in long-term impacts that would degrade air quality in the area surrounding the Lambert Compressor Station. During construction, Mountain Valley would use water trucks and road construction entrances to decrease the amount of dust during construction as well as potentially use other optional mitigation measures identified in section 4.11.1.7. For pipeline construction, the emissions should only occur for short periods as the construction progresses. For residents near the Lambert Compressor Station (about 48 people per square mile [U.S. Census Bureau, 2010]), the construction emission impacts would last longer. However, the magnitude of the emissions would not be large and we conclude that construction air quality impacts and air quality-related health impacts would not be significant.

For operation emissions from the Lambert Compressor Station, we recognize that modeled ambient air quality concentrations in the vicinity of the Lambert Compressor Station would not exceed the National Ambient Air Quality Standards (NAAQS) as well as VADEQ limits for ambient formaldehyde concentrations. In addition, the incremental air quality degradation due to emissions from the Lambert Compressor Station would be a relatively small increase in ambient air concentrations in criteria pollutants such as oxides of nitrogen, carbon monoxide, sulfur dioxide, particulate matter, as well as volatile organic compounds and hazardous air pollutants. These results can be seen in the air quality tables 4.11-6 and 4.11-7. Again, we determined that while there would be some degradation of air quality, it would be limited to the immediate area around the compressor station, and not be significant.

Mountain Valley would use water trucks and road construction entrances to decrease the amount of dust during construction. In addition, potential pollution emissions from the Project, when considered with background concentrations, would be below the NAAQS, which are designated to protect public health. Vulnerable populations may exist within the study area and disproportionate impacts on these populations could occur as they would be affected more than the general population due to air quality impacts during construction and operation.[26] However, our analysis determined that the air quality impacts on all populations, including environmental justice communities, would not be significant. Therefore we conclude that there would be no high and adverse impacts to the local environmental justice communities.

As discussed in section 4.11, noise levels resulting from construction would vary over time and would depend upon the number and type of equipment operating, the level of operation, and the distance between sources and receptors. Alternatively, operational noise associated with the new compressor station be persistent; however, Mountain Valley would be required to meet sound level requirements. With Mountain Valley's proposed mitigation measures, the Project would not result in significant noise impacts on local residents and the surrounding communities, including environmental justice populations.

[26] It has been noted that asthma rates in African American populations tend to be higher than in white populations (U.S. Department of Health & Human Services 2020); therefore, due to demographics, populations vulnerable to asthma may exist in proximity to the compressor station.

h/ After the draft EIS, Mountain Valley added several new contractor yards, resulting in three new census block groups added to the table.

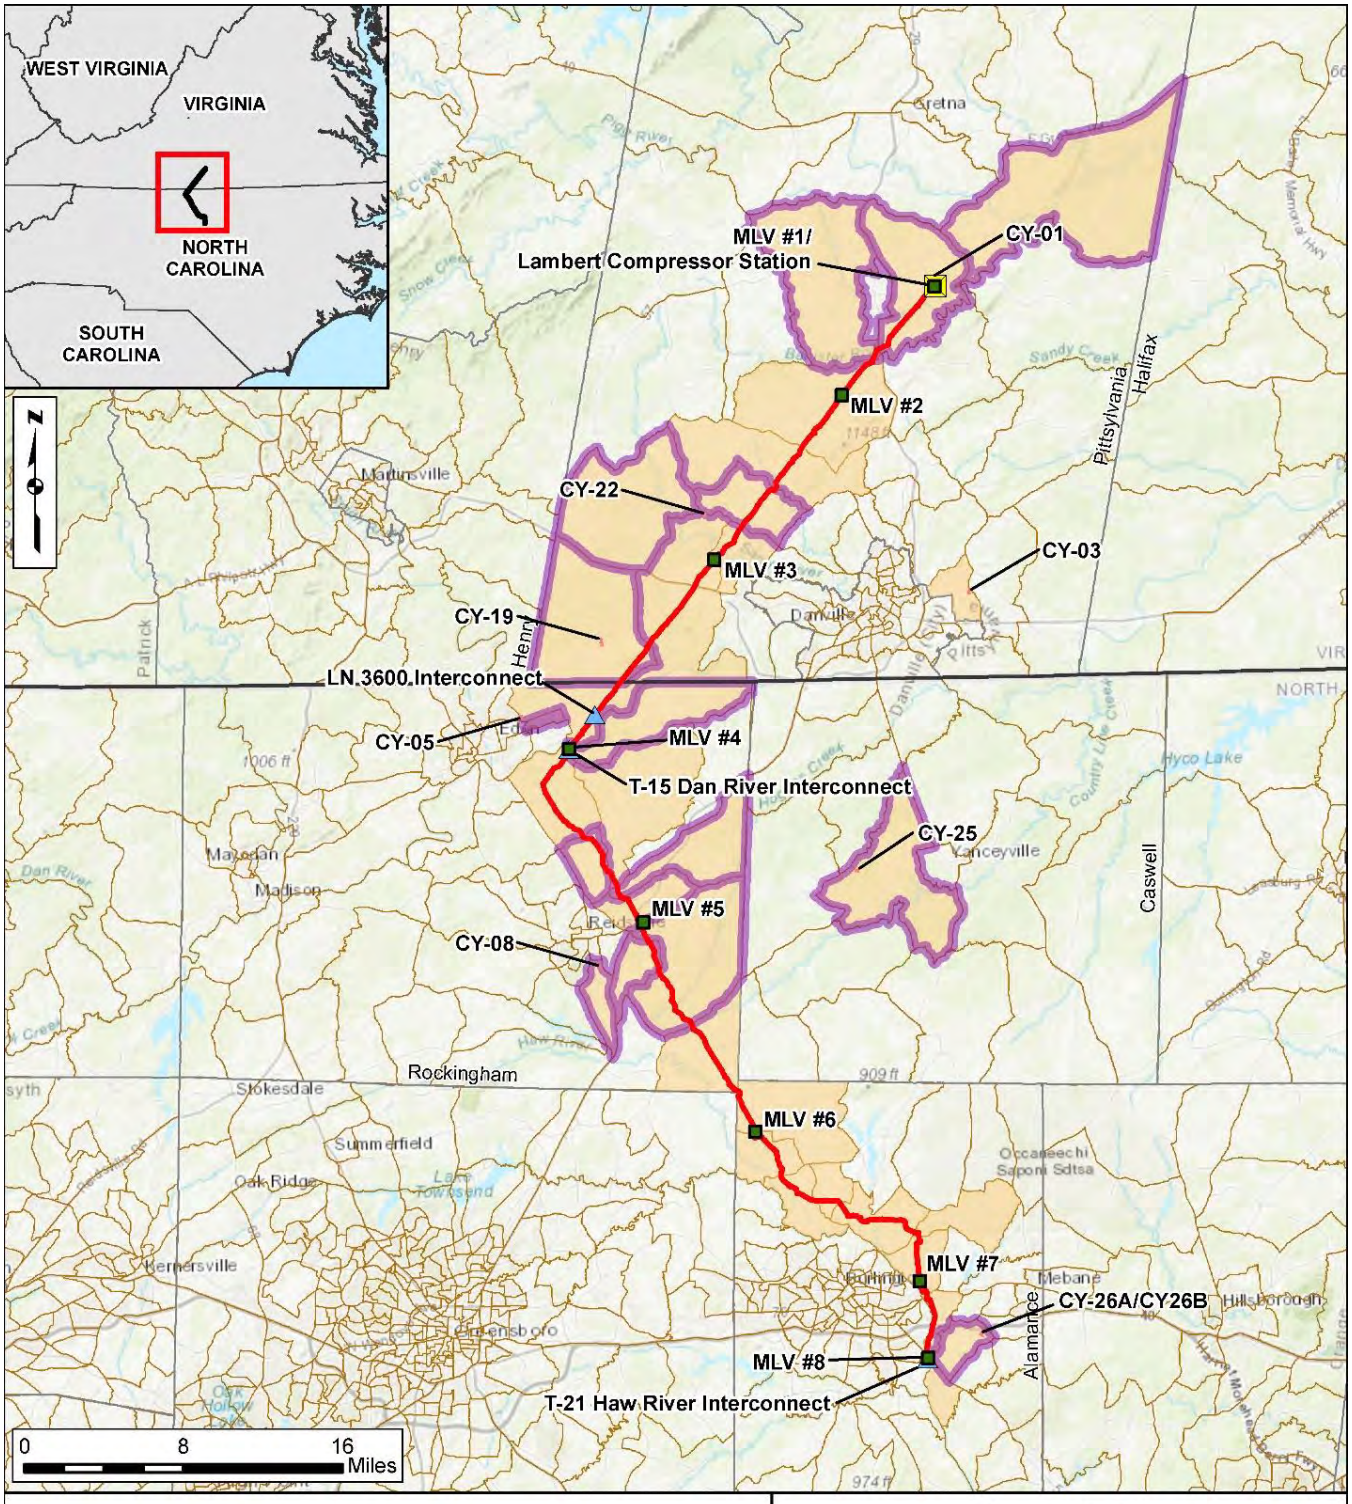

Figure 4.9-1

Southgate Project

Potential Environmental Justice Communities Based on Minority Populations and Poverty

Affects to visual resources (see section 4.8) would be Project wide and would not be concentrated in any single area or community. After construction, all disturbed areas associated with pipeline construction would be restored and areas outside of the permanent right-of-way would be returned to pre-construction conditions. In addition, given that views of the compressor station would be limited and there are no direct views of the site from residences, construction of the compressor station is not expected to result in any significant permanent impacts on visual resources. Therefore, the Project would not have significant visual impacts on environmental justice populations in the Project area.

Socioeconomic impacts that could affect environmental justice communities include traffic, loss of income due to crop loss and decreases in tourism and associated income. Area residents may be affected by traffic delays during construction of the Project. However, mitigation measures would be implemented to alleviate any potential road congestion during construction through the establishment of temporary travel lanes, the use of steel plates, and the use of flagmen and signs, as necessary, to ensure safety of local traffic. After pipeline installation, all roads crossed would be returned to their pre-construction condition and use. Mountain Valley would compensate landowners for any crop loss that occurs during construction of the Project. Mountain Valley would also monitor agricultural areas post-construction to ensure the areas within the right-of-way return to pre-construction yields. Additionally, no significant impacts on tourism are anticipated from the Project.

During the draft EIS comment period, we received a comment concerning access to the Draper Landing boat access site. The comment raised a concern that residents of the community, including nearby environmental justice communities, would be unable to access the Dan River through use of the recently installed Draper Landing due to construction of the pipeline. Potential impacts on accessibility to Draper Landing are discussed in section 4.8. To avoid adverse impacts on public accessibility to the Dan River in this area, Mountain Valley has reduced the ATWS at this location to remove the Draper Landing Boat Ramp access road, and the associated split-rail fence from the Project workspace. Mountain Valley would install temporary signage during construction to alert construction personnel that access to the Draper Landing Boat Ramp must remain open while utilizing access road TA-RO-081. In addition, Mountain Valley would utilize jersey barriers, if needed, to ensure that access to the Draper Landing Boat Ramp is not inhibited during construction.

We also received a comment during the draft EIS comment period concerning potential impacts on English-limited populations. Individuals who lack a fluent knowledge of the English language may have difficulty in understanding the Project and available information provided to the public from Mountain Valley and the FERC. However, the number of English-limited households in the Project area ranges from 0.0 to 7.6 percent (table 4.9-7 and figure 4.9-2). Only two of the census block groups have more than 6 percent of households that are defined as English-limited. Overall, out of the 14,608 households in the census block groups crossed by the Project, 315 households are defined as being English-limited.

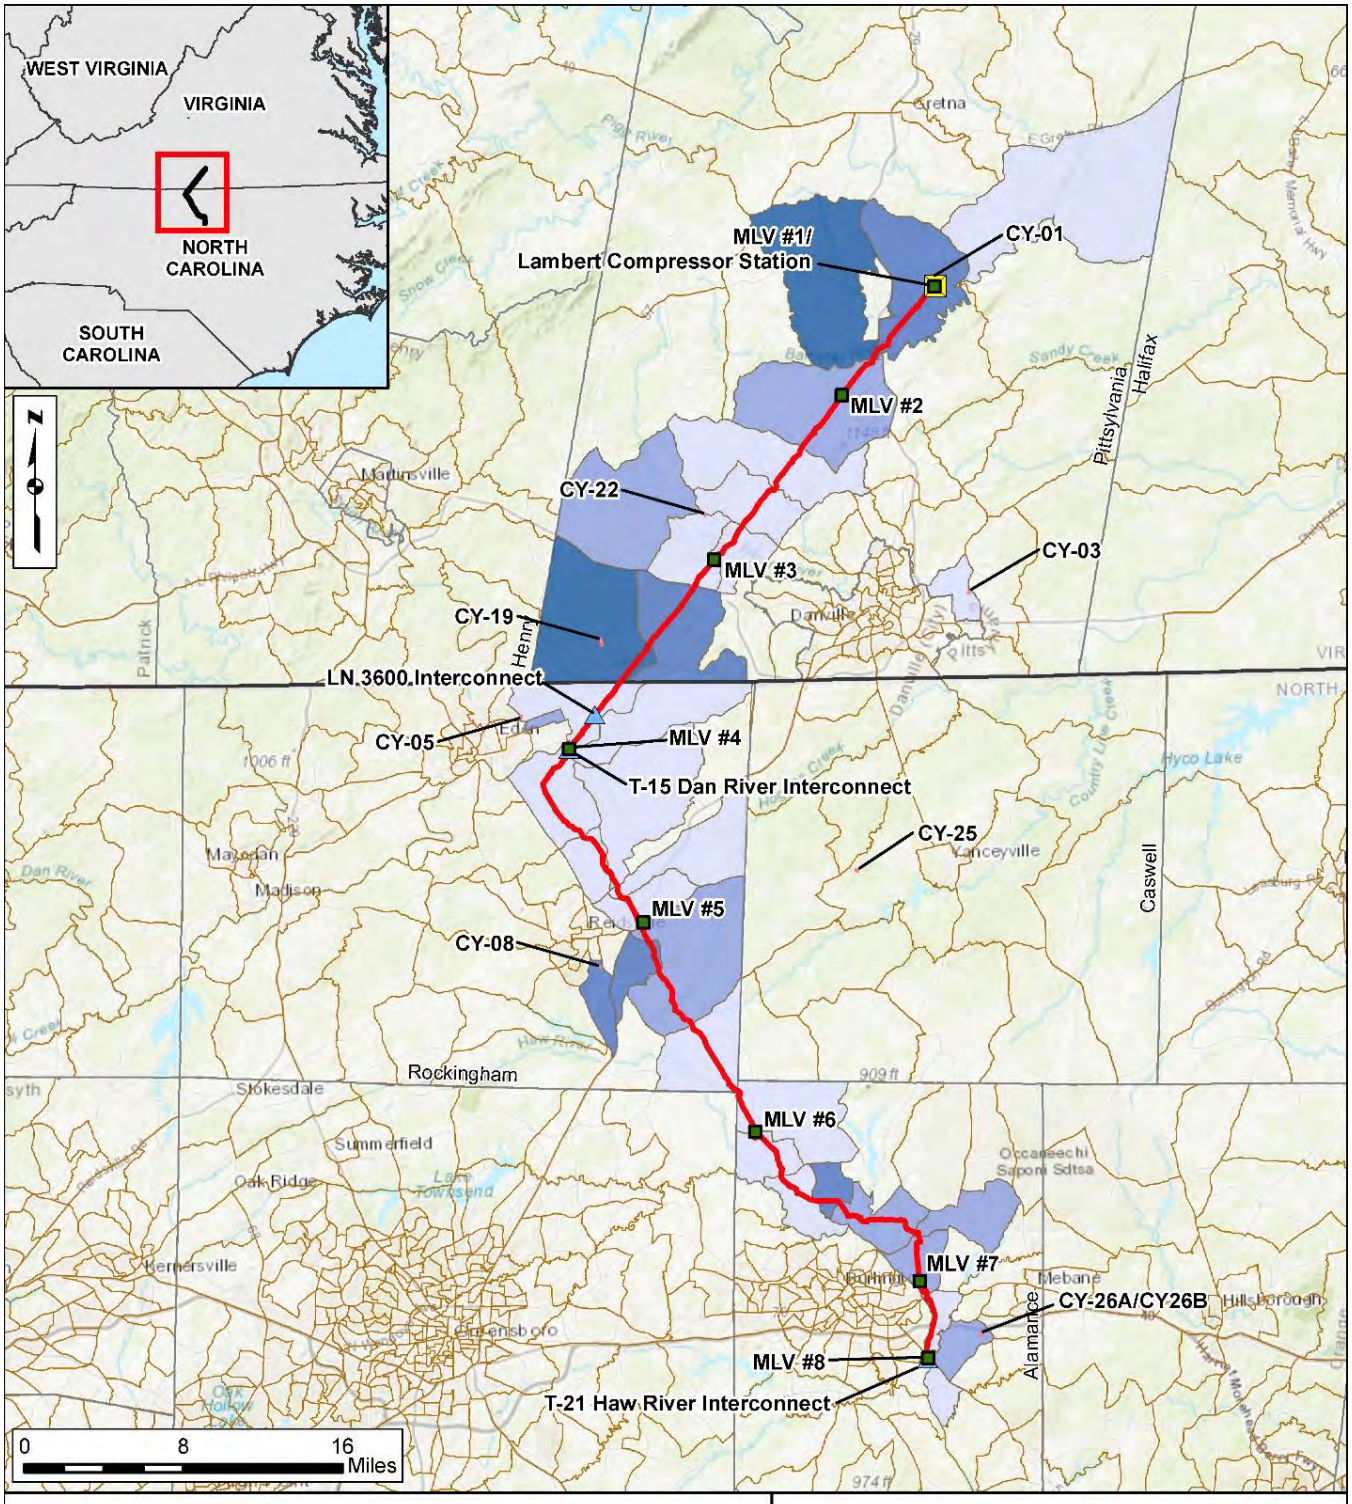

Figure 4.9-2

Southgate Project

Percent of Households that are English Limited

In conclusion, as highlighted in table 4.9-7, 15 block groups containing environmental justice populations would be crossed by the Project pipeline and 2 block groups containing environmental justice populations are located within 1 mile of the Lambert Compressor Station. Potentially adverse environmental effects on surrounding communities, including environmental justice populations, would be minimized and/or mitigated, as applicable, and would not be high and adverse. As previously discussed, vulnerable populations (i.e. groups with high asthma rates) may exist within the study area and disproportionate impacts on these populations could occur as they would be affected more than the general population due to air quality impacts during construction and operation. In consideration of all of these factors, we conclude that the Project would not result in high and adverse impacts on vulnerable populations and would not have a disproportionately high and adverse impact on the remaining environmental justice populations within the study area.

4.9.9 Socioeconomics Conclusions

Impacts on socioeconomic factors associated with construction and operation of the proposed Project are expected to be minor. The limited workforce and short duration of construction would result in a temporary, but minor impact on population, local unemployment levels, and housing available. Since there is plenty of available housing within the Project area, we do not anticipate that the Project would displace any tourists during the construction period. Additionally, no large tourist areas (including state or local parks, fishing areas, piers, etc.) would be crossed or affected by the Project. The communities in the Project area have adequate infrastructure to meet the potential needs of non-local workers who relocate temporarily. Community services would be supported by additional tax revenues generated by the Project. There may be a minor increase in the use of community/public services due to both construction activities (traffic control or medical needs) as well as a result of the increase in general population due to the influx of non-local workers to the area. The increase in traffic due to transportation of equipment and personnel would be mitigation using the measures outlined in Mountain Valley's *Traffic Mitigation Plan*. The Project would not have a significant adverse impact on property values; and would not affect the ability of homeowners to obtain fair market base priced insurance. There may be a potential benefit to the state and local economies by creating a short-term stimulus to the affected areas through payroll expenditures, local purchases of consumables Project-specific materials, room rentals, and sales tax. However, these benefits would generally be temporary and minor. Overall, socioeconomic impacts from the Project on the local communities would be minor.

Although low-income and minority populations exist within the Project area, based on our environmental analysis, the Project would not have a disproportionately high and adverse environmental or human health impact on minority or low-income populations.

4.10 CULTURAL RESOURCES[27]

The NHPA is the cornerstone of the federal government's historic preservation program. Section 101(d)(6) of the NHPA states that properties of traditional religious and cultural importance to Indian tribes[28] may be determined eligible for the NRHP. In carrying out our responsibilities under Section 106 of the NHPA, on behalf of all the federal cooperating agencies, and as the lead federal agency, the FERC conducted government-to-government consultations with Indian tribes that may attach religious and cultural importance to properties in the APE, in accordance with the implementing regulations at Title 36 Code of Federal Regulations (CFR) 800.2(c)(2)(ii). Consultations with Indian tribes are detailed below.

Section 106 of the NHPA requires that the FERC take into account the effect of its undertakings[29] (including authorizations under Section 7 of the NGA) on historic properties,[30] and afford the ACHP an opportunity to comment. Mountain Valley, as a non-federal applicant, is assisting the FERC staff in meeting our obligations under Section 106 by providing data, analyses, and recommendations in accordance with Part 800.2(a)(3) and the FERC's regulations at 18 CFR 380.12(f). Information about cultural resources in the APE was gathered for Mountain Valley by its consultant, TRC Solutions, Inc. (TRC). The FERC remains responsible for all findings and determinations under the NHPA. As the lead federal agency for the Project, the FERC will address compliance with the NHPA on behalf of all the federal cooperating agencies in this EIS.[31]

The regulations for implementing Section 106 of the NHPA, at Part 800.9, encourages the integration of the 106 compliance process with the NEPA process; and we have done that in this section of the EIS below. This section is broken into several subsections that mirrors the Section

---

[27] Cultural resources are locations of human activity, occupation, or use. According to the FERC's Office of Energy Projects "Guidelines for Reporting on Cultural Resources Investigations for National Gas Projects" (July 2017), "cultural resources include any prehistoric or historic archaeological site, district, object, cultural feature, building or structure, cultural landscape, or traditional cultural property." Although "cultural resources" are not defined in 36 CFR 800, it is a "term-of-art" in the field of historic preservation and archaeological research. Indian tribes believe that cultural resources could include natural resources, such as plants and animals of traditional importance to tribes, and topographic features and viewsheds that may be sacred.

[28] Indian tribes are defined in Part 800.16(m) as: "an Indian tribe, band, nation, or other organized group or community, including a Native village, Regional Corporation, or Village Corporation, as those terms are defined in Section 3 of the Alaska Native Claims Settlement Act (43 U.S.C. 1602), which is recognized as eligible for the special programs and services provided by the United States to Indians because of their special status as Indians."

[29] "Undertaking means a project activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; those requiring a Federal permit, license or approval; and those subject to state or local regulation administered pursuant to a delegation or approval by a Federal agency," as defined in Part 800.16(y).

[30] Historic properties include any prehistoric or historic district, site, building, structure, or object, and properties of traditional religious or cultural importance to Indian tribes, listed on or eligible for listing on the NRHP, as defined in Part 800.16(l).

[31] Pursuant to Part 800.2(a)(2), the EPAct, and the May 2002 "Interagency Agreement on Early Coordination of Required Environmental and Historic Preservation Reviews Conducted in Conjunction With the Issuance of Authorizations to Construct and Operate Interstate Natural Gas Pipelines Certificated by the Federal Energy Regulatory Commission," signed by the FERC, Advisory Council on Historic Preservation, Council on Environmental Quality, Environmental Protection Agency, Department of the Army, Department of Agriculture, Department of Commerce, Department of Energy, Department of the Interior, and Department of Transportation.

106 compliance process. This process includes consultations; identification of historic properties; assessment of effects; and resolution of adverse effects, if necessary. Then we discuss the *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* (Unanticipated Discovery Plans [UDP]) produced by Mountain Valley for this Project,[32] and reviews by consulting parties.[33] Lastly, we reach conclusions about the status of our compliance with the NHPA.

4.10.1 Consultations

In compliance with Section 106 and its implementing regulations, at 36 CFR 800, the FERC, on behalf of all of the federal cooperating agencies, consulted with other federal agencies; the SHPOs of Virginia and North Carolina;[34] interested Indian tribes; Certified Local Governments (CLG), and local historical societies; and other consulting parties, prior to making our determinations of NRHP eligibility and Project effects for all cultural resources identified in the APE. We also consulted with the SHPOs, interested Indian tribes, and other consulting parties to determine the resolution of adverse effects on historic properties that cannot be avoided. Those consultations are summarized below.

The FERC sent copies of our August 9, 2018, NOI for the Project to a wide range of stakeholders, including other federal agencies such as the ACHP, COE, EPA, DOI Bureau of Indian Affairs (BIA), and NPS; state and local government agencies, such as the SHPOs for Virginia and North Carolina; affected landowners; regional environmental groups and non-governmental organizations; and Indian tribes that may have an interest in the Project area. The NOI contained a paragraph about compliance with Section 106 of the NHPA, which stated that we use the notice to initiate consultations with the SHPOs as well as to solicit their views and those of other government agencies, interested Indian tribes, and the public on the Project's potential effects on historic properties. Comments from the SHPOs, interested Indian tribes, other government agencies, and the public, in response to the NOI, are summarized below.

4.10.1.1 Consultations with the State Historic Preservation Offices

FERC Consultations

Neither the Virginia nor North Carolina SHPOs commented directly to the FERC in response to our August 9, 2018 NOI. FERC staff had a telephone conversation with representatives of the Virginia Department of Historic Resources (VADHR) about the Project on August 7, 2018. A September 11, 2019 letter to the FERC from the VADEQ, commenting on our draft EIS, requested continued coordination with the VADHR. The North Carolina Department of Natural and Cultural Resources (NCDNCR) commented to the FERC about the cultural

[32] Mountain Valley's *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* (UDP) was included as appendix 4-C to Resource Report 4 in its November 6, 2018 application. The UDP can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field.

[33] "Consulting parties" are defied in Part 800.2(c).

[34] The Virginia SHPO is represented by the VADHR; while the North Carolina SHPO is housed within the NCDNCR which also includes the t NCOSA.

resources section (4.10) of our draft EIS in a letter dated September 17, 2019.[35] We address comments on the draft EIS in appendix I.

Communications between Mountain Valley and the SHPOs

Communications between Mountain Valley and the SHPOs are listed in table 4.10-1 located in appendix E.3.

Mountain Valley presented its Project information packages to the Virginia and North Carolina SHPOs on April 27, 2018. On May 17, 2018, Mountain Valley met with VADHR staff, and on May 10, 2018, it met with staff of the NCDNCR. On June 4, 2018, Mountain Valley provided both the Virginia and North Carolina SHPOs with GIS shape files for its proposed facilities, and protocols for the identification and assessment of historic architectural sites. The North Carolina SHPO accepted the protocols on July 6, 2018, but requested additional data about protecting graveyards. Mountain Valley provided the NCDNCR with revised protocols for archaeological survey and testing in North Carolina on August 13, 2018. Mountain Valley's protocols for recording and assessing archaeological sites and a deep testing plan for Virginia, was submitted to the VADHR on July 2, 2018. On August 13, 2018, Mountain Valley submitted copies of a draft Resource Report (RR) 4 (Cultural Resources) and UDP to the Virginia and North Carolina SHPOs. The Virginia SHPO commented on draft RR 4 in a letter to Mountain Valley dated September 14, 2018. The North Carolina SHPO commented on draft RR 4 in a letter to Mountain Valley's cultural resources consultant, TRC, dated September 6, 2018. NCDNCR staff visited the Project area on August 21, 2018; conducted a visit of archaeological field work in Alamance County, North Carolina on January 25, 2019; and visited site 31RK217 on April 24, 2019.

On November 6, 2018, TRC, on behalf of Mountain Valley, provided the Virginia and North Carolina SHPOs with copies of its draft Phase I archaeological survey reports and draft historic architectural survey reports. The North Carolina SHPO commented on those first draft reports in letters dated December 20, 2018. The Virginia SHPO commented on the first draft survey reports on February 13, 2019.

On February 22 and March 25, 2019, TRC submitted to the VADHR copies of draft Phase II testing reports for Virginia. The VADHR provided comments on those reports in letters to TRC dated May 10 and 16, 2019.

On March 13, 2019, TRC submitted to the NCDNCR a copy of its draft Phase II testing report for two sites in North Carolina. The NCDNCR provided comments on that report to TRC in a letter dated April 15, 2019.

On March 28, 2019, TRC submitted to the NCDNCR a copy of its draft Phase I archaeological survey addendum report for North Carolina. The NCDNCR commented on that archaeological addendum report in a May 7, 2019 letter to TRC. On May 13, 2019, TRC provided the NCDNRC with its first draft addendum I report of its historic architectural survey in North

[35] This information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190930-0218 in the "Numbers: Accession Number" field.

Carolina (Karpynec, 2019a). The NCDNRC commented on that structure addendum report in a letter dated July 22, 2019.

On October 2, 2019, TRC, on behalf of Mountain Valley, conveyed to the NCDNCR copies of a draft Treatment Plan for site 31RK259 and draft Avoidance Plans for sites 31RK216, 31RK228, 31RK230, 31RK237, 31RK239, and 31RK261. TRC provided the NCDNCR with copies of Avoidance Plans for sites 31AM441 and 31AM443 on October 14, 2019. The NCDNCR commented on those plans in a letter to TRC dated November 18, 2019.

On October 14, 2019, TRC provided the VADHR with copies of draft Preservation Plans and Avoidance Documentation for multiple sites (44PY281, 44PY358, 44PY375, 44PY445, 44PY447, 44PY449, 44PY451, 44PY452, and 44PY454) and 10 historic period cemeteries (71-5033, 71-5224, 71-5225, 71-5226, 71-5525, 71-5593, 71-5596, 71-5621, 71-5622, and 71-5623).

4.10.1.2 Consultations with Indian Tribes and Other Native Americans

The unique and distinctive political relationship between the U.S. government and Indian tribes is defined by treaties, statutes, executive orders, judicial decisions, and agreements, which differentiates tribes from other entities that deal with, or are affected by, the federal government. This relationship has given rise to a special federal trust responsibility, involving the legal obligations of the U.S. government toward Indian tribes, and the application of fiduciary standards of due care with respect to Indian lands, tribal trust resources, and the exercise of tribal rights.

The FERC acknowledges that it has trust responsibilities to Indian tribes, and so, on July 23, 2003, it issued a "Policy Statement on Consultations with Indian Tribes in Commission Proceedings" in Order 635. That policy statement included the following key objectives:

- The Commission will endeavor to work with Indian tribes on a government-to-government basis, and will seek to address the effects of proposed projects on tribal rights and resources though consultations; and
- The Commission will ensure that Tribal resources and interests are considered whenever the Commission's actions or decisions have the potential to adversely affect Indian tribes or Indian trust resources.

On October 17, 2019, the Commission revised its policy statement.[36] The revision included two new items. In one, the Commission stated that it will set forth in its environmental documents and orders how tribal input resulting from consultations was considered in agency decisions for infrastructure projects. In the other, the Commission stated that it will consider the effect of its actions on treaty rights in its NEPA and decision documents. This EIS discusses treaties, and consultations with interested Indian tribes.

The FERC contacted Indian tribes that may attach religious or cultural significance to sites in the region or may be interested in potential Project impacts on cultural resources. We identified Indian tribes that historically used or occupied the Project area through basic ethno-historical sources such as the Handbook of North American Indians (Trigger, 1978; Fogelson, 2004);

[36] 169 FERC ¶ 61,063, Docket No. PL20-1-000, Order 863, 18 CFR Part 2, *Federal Register* October 24, 2019, vol. 84, no 206: 56940-56943.

communications with the SHPOs and other state agencies such as the North Carolina Commission on Indian Affairs; information provided by Mountain Valley and its cultural resources consultants; and scoping responses to our NOI, including letters from interested Indian tribes.

In a letter to the FERC, dated September 10, 2018, Appalachian Mountain Advocates requested that we consult with the state-recognized Sappony Tribe of North Carolina, and also independently determine if the Project would affect the ancestral lands of any other tribes. As discussed below, Mountain Valley did communicate with the Sappony Tribe. A private citizen of Virginia, Ann Rodgers, suggested that we consult with the Cheyenne River Sioux Tribe and the Rosebud Sioux Tribe of South Dakota about the Project. However, when Mountain Valley reached out to the Cheyenne River Sioux Tribe and the Rosebud Sioux Tribe, these two tribes did not respond to correspondence.

FERC Consultations with Indian Tribes and Other Native Americans

Government-to-government consultations between the FERC and Indian tribes were initiated for this Project when we issued our NOI on August 9, 2018. We sent our NOI to 33 federally-recognized Indian tribes, and 3 other Native American organizations or state-recognized tribes in Virginia and 7 state-recognized tribes in North Carolina. On October 16, 2018, we sent out individual letters to 25 Indian tribes. These consultations are listed in table 4.10-2 located in appendix E.3.

In response to our NOI, we received comments from five federally-recognized tribes, one state-recognized Native American organization in Virginia, and two North Carolina state-recognized Native American organization. In response to our October 16, 2018 individual letters to tribal leaders, we received comments from five federally-recognized tribes. The Absentee Shawnee Tribe of Oklahoma made of finding of no adverse effects on historic properties, and has no objections to the Project. The Cherokee Nation of Oklahoma and Choctaw Nation of Oklahoma indicated that the Project area is outside of the tribes' AOI.

The Monacan Indian Nation, Nansemond Indian Tribe, and Upper Mattaponi Indian Tribe all requested meetings and site visits with FERC staff. FERC staff participated in a meeting with representatives of the Monacan Indian Nation in Richmond, Virginia on January 17, 2019.[37] On February 1, 2019, FERC staff participated in a telephone conference call with representatives of the Nansemond Indian Tribe.[38] FERC staff met with leaders of the Upper Mattaponi Tribe at their tribal office in King William, Virginia on April 24, 2019.[39]

[37] The notes for the Monacan Indian Nation meeting can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190129-3045 in the "Numbers: Accession Number" field.

[38] The notes for the Nansemond Tribe meeting can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190207-3104 in the "Numbers: Accession Number" field.

[39] The notes for the Upper Mattaponi Tribe meeting can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190429-4000 in the "Numbers: Accession Number" field.

In its February 20, 2019, letter to the FERC, the Monacan Indian Nation reiterated previous requests. The Nation asked for copies of cultural resources reports, and GIS shapefiles. Mountain Valley provided representatives of the Monacan Nation with a map of the pipeline centerline on October 18, 2018, and copies of survey reports on February 21, 2019.[40] The Nation questioned the number of cemeteries that may be affected by the Project. FERC staff, in an email to representatives of the Monacan Indian Nation, indicated that there are about 12 cemeteries located along the pipeline route that are documented in the inventory reports, and should be avoided. In October 2019, Mountain Valley filed with the FERC copies of draft Avoidance Plans for historic cemetery sites 71-5224, 71-5225, 71-5226, 71-5593, 71-5596, 71-5621, and 71-5623 in Virginia and cemetery sites 31AM443, 31RK216, 31RK228, and 31RK237 in North Carolina.[41] The Nation requested that Mountain Valley's consultants become familiar with texts that cover Monacan history and culture; and Mountain Valley responded that they had reviewed the recommended texts. Mountain Valley representatives also visited the Monacan Museum. The Nation offered suggestions for revisions to the UDP; and requested the opportunity to further review the plan. As indicated in the notes on the meeting with the Nation, a copy of the UDP was included as part of Mountain Valley's application to the FERC, and is available for public review. Mountain Valley addressed the comments of the Monacan Nation in an October 18, 2019 filing with the FERC.[42]

In a letter to the FERC dated July 1, 2019, the Monacan Nation offered comments on cultural resources reports. The Monacan Nation provided the FERC with its comments on the draft EIS in a letter dated September 16, 2019. We respond to comments on the draft EIS in appendix I.

In letters dated August 2 and November 16, 2018, and February 25, 2019, the North Carolina state-recognized Sappony Tribe requested that FERC staff conduct meetings with the tribe. In a letter to the FERC dated July 1, 2019, the Sappony Tribe provided their comments on cultural resources reports. The Sappony Tribe provided the FERC with its comments on the draft EIS in two letters, dated September 16 and December 12, 2019. We respond to comments on the draft EIS in appendix I.

The North Carolina state-recognized Occaneechi Band of the Saponi Nation, in a letter to FERC, dated October 15, 2018, also requested meetings with FERC staff. In a letter to FERC, dated April 11, 2019, the state-recognized Nottoway Indian Tribe of Virginia expressed interest in the review of the Project.

We believe that the Nottoway Tribe, Sappony Tribe, and Occaneechi Band have a demonstrated interest in the cultural resources of the Project area; and, therefore, they could be consulting parties. We requested that Mountain Valley provide the Nottoway Tribe, Sappony Tribe, and Occaneechi Band with copies of archaeological investigation reports for the Southgate Project. The company provided reports to the Sappony Tribe and Occaneechi Band on February 21, 2019.

---

40 See Mountain Valley's March 5, 2019 responses to the FERC staff's February 13, 2019, EIR which can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190305-5214 in the "Numbers: Accession Number" field.

41 Mountain Valley claimed that historic cemetery sites 31RK234 and 31RK236 in North Carolina are far enough away from the LOD they would not be affected by the Project, and do not require site-specific Avoidance Plans. Mountain Valley promised to file avoidance plans for cemetery site 71-5227 in the future.

42 Accession No. 20191018-5168. Response to FERC staff's October 3, 2019 environmental information request question 26.

On April 23, 2019, Mountain Valley contacted the Nottoway Indian Tribe about receiving copies of cultural resources reports relating to the Project. Those Native American organizations can file their comments with the FERC, for consideration by staff.

Communications between Mountain Valley and Indian Tribes and Other Native Americans

Mountain Valley communicated with 26 federally-recognized Indian tribes and 11 state-recognized Native Americans organizations, as listed in table 4.10-3 located in appendix E.3. Six federally-recognized Indian tribes responded back to Mountain Valley. Two North Carolina state-recognized Native American organizations responded to Mountain Valley's contact program. Mountain Valley sent an email dated November 2, 2018 to tribes or Native American organizations informing them about the Project. Mountain Valley provided copies of cultural resources survey reports to Indian tribes and Native American organizations that requested them. Mountain Valley organized a site visit for certain tribes and Native American organizations on March 14, 2019.

4.10.1.3 Communications with Other Agencies, Local Governments, and Historical Organizations

FERC Staff Consultations with Other Agencies, Local Governments, and Historical Organizations

In a filing on October 15, 2018, the NCDEQ provided the FERC with its comments on Mountain Valley's draft RR 4 (Cultural Resources).

We sent our NOI for the Project to nine local governments; three of which are CLGs,[43] listed in table 4.10-4. Only Alamance County, North Carolina and City of Burlington, North Carolina provided the FERC with their comments on cultural resources issues.

TABLE 4.10-4

Local Governments Sent the FERC's August 9, 2018 NOI for the Southgate Project

Local Government/State	Responses to the NOI
Pittsylvania County, Virginia	None filed to date
City of Danville, Virginia (CLG)	None filed to date
Alamance County, North Carolina (CLG)	October 23, 2018 letter to FERC included a Resolution requesting that the EIS discuss the protection of cultural resources and historic structures
Rockingham County, North Carolina	None filed to date
City of Burlington, North Carolina	September 16, 2019 motion to intervene. September 16, 2019 comments on draft EIS and request for a route re-alignment to avoid Stony Creek Reservoir
Town of Eden, North Carolina (CLG)	None filed to date

[43] A local government can work through a certification program, jointly administered by the NPS and SHPOs, to become recognized as a CLG, and thus be eligible for federal and state historic preservation funds and technical assistance.

TABLE 4.10-4

Local Governments Sent the FERC's August 9, 2018 NOI for the Southgate Project

Local Government/State	Responses to the NOI
City of Graham, North Carolina	September 7, 2018 letter to FERC did not raise any cultural resources issues
Town of Haw River, North Carolina	None filed to date
City of Reidsville, North Carolina	None filed to date

Our NOI also went out to nine local historical organizations, listed in table 4.10-5. Preservation Virginia and the Pittsylvania Historical Society responded with concerns.

TABLE 4.10-5

Local Historical Organizations Sent the FERC's August 9, 2018 NOI for the Southgate Project

Local Historical Organization/State	Responses to the NOI
Preservation Virginia	September 6, 2018 letter to FERC raised concerns about potential impacts on Little Cherrystone east of town of Chatham, and the plantations of Bachelors Hall, Oak Ridge, Oak Hill, Windsor, and Berry Hill along the Dan River near Berry Hill Road
Pittsylvania County Historical Society, Virginia	July 21, 2018 email to TRC expressing interest in the project, request for more detailed mapping, and updated contact information
Alamance County Historical Museum, North Carolina	None filed to date
Graham Historical Museum, North Carolina	None filed to date
Haw River Historical Society and Museum, North Carolina	None filed to date
Haw River Heritage, North Carolina	None filed to date
Haw River Historical Development, North Carolina	None filed to date
Mebane Historical Society and Museum, North Carolina	None filed to date
Rockingham County Historical Society, North Carolina	None filed to date
Textile Heritage Museum, North Carolina	None filed to date

Appalachian Mountain Advocates wrote a letter to the FERC, dated September 10, 2018, which requested that our EIS should address "cultural attachment" to land.[44] In addition, it was suggested that the FERC should assess impacts on historic places and structures. Impacts on historic places and structures are addressed in this section of the EIS below. A number of stakeholders also commented about a wide variety of cultural resources issues to the FERC during the scoping period, including at the public scoping meetings, and at the public sessions to take comments on the draft EIS as listed in table 4.10-6 in appendix E.3.

Communications between Mountain Valley and Local Governments and Historical Organizations

Mountain Valley communicated with three CLGs about cultural resources issues related to the Project, together with nine other local historical organizations, listed in table 4.10-7.

TABLE 4.10-7

Communications between Mountain Valley and CLGs and Local Historical Organizations for the Southgate Project

Organization/State	Date of Communication	Type of Communication	Response
City of Danville, Virginia (CLG)	July 6, 2018	Letter	None filed to date
Town of Eden, North Carolina (CLG)	July 6, 2018	Letter	None filed to date
Alamance County Historical Properties Commission (CLG), and Alamance County, North Carolina	July 6, 2018	Letter	July 30, 2018 email request for GIS data
	August 3, 2018	Telephone call and email	Mountain Valley provided shapefile
Danville Historical Society	October 4, 2019	Email to Mark Joyner	Mountain Valley conveyed confidentiality agreement
Danville Historical Society	October 18, 2019	Email to Mark Joyner	Arranged a meeting at Cherrystone Manor
Pittsylvania Historical Society, Virginia	July 6, 2018	Letter	July 21, 2018 email request for additional mapping data
	August 17, 2018	Email	Mountain Valley followed up about mapping review
Preservation Virginia	August 27, 2019	Email to Sonja Ingram	Mountain Valley provided confidentiality agreement
Rockingham County Historical Society, North Carolina	July 6, 2018	Letter	October 2, 2018 telephone request for additional mapping data

[44] Cultural attachment "…is demonstrated in the intimate relationship (developed over generations of experiences) that people of a particular culture share with their landscape – for example, the geographic features, natural phenomena and resources, and traditional sites, etc., that make up their surroundings. This attachment to environment bears direct relationships to the beliefs, practices, cultural evolution, and identify of a people…." (Maly, 1999:27). Appalachian Mountain Advocates did not identify a community or cultural group along the Southgate pipeline route that for generations held specific beliefs and practices tied to any regional landscape features. There are no federal laws or regulations that require that cultural attachment should be addressed by an agency in the analysis of an undertaking. Therefore, we did not conduct a study of cultural attachment in this EIS.

TABLE 4.10-7

Communications between Mountain Valley and CLGs and Local Historical Organizations for the Southgate Project

Organization/State	Date of Communication	Type of Communication	Response
	October 3, 2018	Email	Mountain Valley provided more detailed mapping data
Alamance County Historical Museum, North Carolina	July 6, 2018	Letter	None filed to date
Textile Heritage Museum, North Carolina	July 6, 2018	Letter	None filed to date
Haw River Historical Association Museum, North Carolina	July 6, 2018	Letter	None filed to date
Graham Historical Museum, North Carolina	July 6, 2018	Letter	July 21, 2018 email provided updated contact information
Mebane Historical Society and Museum, North Carolina	July 6, 2018	Letter	None filed to date
Virginia-North Carolina Piedmont Genealogical Society	August 19, 2018	Letter	None filed to date
Afro-American Historical and Genealogical Society of North Carolina	August 21, 2018	Letter	None filed to date

4.10.2 Identification of Historic Properties

4.10.2.1 Area of Potential Effect

As stated in our NOI, we define the direct APE as all areas subject to ground disturbance, including the construction right-of-way, additional temporary extra workspaces, contractor/pipe storage yards, staging areas, disposal areas, aboveground facilities, and new or to-be-improved access roads. As indicated on table 2.3-1 of this EIS, construction of all elements of this Project would impact a total of about more than 1,500 acres. An indirect APE was also established by Mountain Valley based on viewsheds around proposed Project facilities. The indirect APE should include all areas potentially subjected to the introduction of visual, atmospheric, or audible elements from the Project that may diminish the integrity or character of a nearby historic property.

Mountain Valley stated[45] that it provided Project work plans, including its definition of the APE, that were accepted by the North Carolina SHPO in letters dated May 21 and July 5, 2018. On June 4, 2018, Mountain Valley submitted work plans to the Virginia SHPO that included its definition of the APE. On February 2, 2019, the Virginia SHPO commented on draft inventory reports submitted by Mountain Valley that also included its definition of the APE. We agree with the SHPOs that Mountain Valley's definition of the APE is acceptable.

Direct Area of Potential Effect

Mountain Valley defined the direct APE to be a 300-feet-wide corridor where the pipeline would not be collocated with an existing right-of-way, and a 400-feet-wide corridor where it would be collocated. The direct APE also includes a 50-foot-wide corridor centered along the proposed access roads, additional workspaces, staging areas, yards, and the limits of proposed compressor station site and other aboveground facilities.

Indirect Area of Potential Effect

Mountain Valley defined the indirect APE to minimally be a 450-foot-wide corridor centered on the H-605 and H-650 pipeline routes, a 250-foot-wide corridor centered on access roads, and a maximum 0.5-mile area around aboveground facilities. However, in its architectural survey reports, Mountain Valley's consultant (TRC, Karpynec et al., 2018a; Karpynec et al., 2018b) expanded the indirect APE to a maximum 0.5-mile along the pipeline, or where vegetation and/or topography obstructed lines of sight.

4.10.3 Results of Cultural Resources Investigations

Below is a brief summary of cultural resources overviews, inventories, and evaluations that contribute to the identification of historic properties in the APE. Mountain Valley submitted copies of reports of investigation results with the FERC, SHPOs, interested Indian tribes, and other consulting parties.

4.10.3.1 Cultural Context

Native Americans occupied North America for many thousands of years before European exploration and settlement. The archaeological expression of the Late Woodland/Protohistoric period in the Project area is known as the Dan River Phase, characterized by Dan River ceramics (ca. AD 1000 – 1450; Eastman, 1999). In Virginia, the Dan River Phase was found at Belmont (44HR3), Box Plant (44HR2), Dallas Hylton (44HR20), Gravely (44HR29), Koehler (44HR6), Leatherwood Creek (44HR1), Stockton (44HR35), Wells (44HR9), 44FR370, and 44FR372 (Hornum et al., July 2019) archaeological sites. During the surveys for the Project in Virginia, Dan River ceramics were recovered at archaeological sites 44PY270, 44PY447, 44PY449, 44PY479, and isolated find VA-FS-31 (Blood et al., 2019; Millis, November 2019). In North Carolina, Hairston (31SK1) is an example of an archaeological site with a Dan River Phase component. Project surveys and testing found Dan River ceramics at archaeological sites

[45] See November 13, 2019 response by Mountain Valley to FERC staff's November 6 environmental information request Question 8.

31AM428, 31RK97, 31RK217, 31RK222, and 31RK259 in North Carolina (Johnson et al., 2019; Johnson, 2019a).

The permanent European settlement of Virginia was initiated with the establishment of Jamestown by the English in 1607. Pittsylvania County was created in 1767, and the county seat moved to Chatham in 1777.

At the beginning of the contact period, tidewater Virginia was dominated by the Algonquin Powhatten confederacy (Roundtree, 1990). In the piedmont of Virginia, other Indian tribes included the Manahoac, Monacan, Tutelo, Sapponi, and Occaneechi (Demallie, 2004).[46] In 1608, John Smith, one of the original Jamestown leaders, met the Manahoac and Monacan and mapped their village locations (Hantman, 2018). John Lederer, a German explorer, encountered the Monacan, Saponi, and Occaneehee in 1670. The Virginian traders Thomas Batts and Robert Fallon in 1671 reached the Tutero village (Briceland, 1987). Monacan chiefs signed the Treaty of Middle Plantation in 1680. Contact period archaeological sites in Virginia include 44AB416, Hurt Power Plant (44PY144), Philpott (44HR4), and Graham-White (44RN21).[47]

The archaeological expression of the contact period in North Carolina is known as the Saratown Phase (ca. AD 1450 to 1710). Contact period aboriginal archaeological sites in North Carolina are characterized by Oldtown, Jenrette, and Hillsboro ceramics (Millis, 2019a). Archaeological sites along the Dan River which informed this period include Upper Saratown (31SK1a), Lower Saratown (31RK1), Madison (31RK6), and William Kluttz (31SK6) (Eastman, 1999). John Lederer visited the Sara Indians in 1670, and the locations of Upper Saratown and Lower Saratown were illustrated on the Fry and Jefferson map of 1751. Lederer also met with the Shakori. The Jenrette site on the Eno River may represent the Shakori village visited by Lederer.

In the piedmont of northcentral North Carolina during the contact period, the Saxapahaw (or Sissipahaw) were said to be on the Haw River, with the Eno, Shakori, and Shoccoreeon on the Eno River and head of the Neuse River. John Lawson encountered the Eno, Keyauwee, and Sissipahaw Indians in North Carolina during his travels in 1700-1701. The Fredericks site on the Eno River may represent one of the villages visited by Lawson, while the Mitchum site on the Haw River may be the remains of a Sissipahaw village (Millis, 2019a). These groups later amalgamated with the Catawba Indians, who were focused mostly on the Catawba River (Rudes et al., 2004).

The permanent English colonization of North Carolina began with the establishment of the Albemarle District, with settlements on the Chowan and Roanoke Rivers, beginning in 1653. After 1728, William Byrd, who surveyed the Virginia-North Carolina border, enticed settlement of his 20,000 acre grant near Eden. The region's first Euro-American settlers came from the Mid-Atlantic colonies, and were of German, English, Scottish, and Irish descent. Rockingham County was created in 1785, with the county seat established at Wentworth in 1798. Alamance County was

[46] The Saponi and Tutelo probably spoke similar dialects within the Siouan-Catawban language family, The Monacan and Manahoac had no demonstrated linguistic affiliation with the Siouian language family, but did have political and trade associations with the Tutelo, Sapponi, and Occaneechi (Woodard et al., 2017). In a letter to the FERC dated July 1, 2019, the Monacan Indian Nation asserts that the Occaneechi Path trade route connected Monacan villages with Tutelo-Sapponi communities such as Occaneechi Town.

[47] The Monacan Indian Nation asserts that Hantman (2018) believes that the Hurt Power Plant site (44PY144) and the Graham-White site (44RN21) are probably associated with the Monacan.

created out of Orange County in 1849. This area was first settled by religious dominations, with Quakers at Cane Creek, German Reformed and Lutherans near Stinking Quarter Creek, and Presbyterians at Hawfields. A tax revolt by small landowners, known as "regulators," was suppressed by the North Carolina colonial militia under Governor William Tryon in the Battle of Alamance in May 1771.

In the discussion below, we refer to Native American archaeological sites as "prehistoric" or "pre-contact," while non-native colonial and more recent archaeological remains are called "historic," and post-contact buildings and structures are labeled "historic architectural" sites.

4.10.3.2 Overview

Mountain Valley stated that site file searches were conducted by TRC at the VADHR and the NCDNCR and North Carolina Office of State Archaeology (NCOSA) in April and September 2018.

Literature Reviews and Site File Searches in Virginia

In Virginia, Mountain Valley identified 82 previously recorded archaeological sites and 79 previously recorded historic architectural sites within 0.5 mile of Project facilities. Thirty-two of the previously recorded archaeological sites were mapped within 200 feet of facilities (roughly corresponding to the direct APE); however, only 7 of these were relocated during the Project surveys.

Forty of the previously recorded historic architectural sites in Pittsylvania County, Virginia, were determined to be inside the direct APE and 69 were determined to be within 0.5 mile of centerline (roughly corresponding to the indirect APE). Mountain Valley field survey crews revisited 17 of the previously recorded historic architectural sites for the Project in Virginia, of which 16 are within the direct APE and one is within the indirect APE.

Literature Reviews and Site File Searches in North Carolina

Mountain Valley identified 68 previously recorded archaeological sites, and 104 previously recorded historic standing structures within 0.5 mile of the proposed Project facilities in North Carolina. Sixteen of the previously recorded archaeological sites were mapped within 200 feet of facilities (e.g., direct APE); however, only two of these were relocated during the Project surveys (31RK44 and 31RK97).

Twenty-seven of the previously recorded historic architectural sites were identified by Mountain Valley to be within the direct APE and 103 were determined to be within 0.5 mile of centerline (e.g., indirect APE) in North Carolina. Mountain Valley field survey crews revisited 30 previously recorded historic architectural sites, of which 17 are in the direct APE and 13 are in the indirect APE.

4.10.3.3 Inventories

As the end of October 2019, Mountain Valley conducted cultural resources inventories of a total of about 70.5 miles of pipeline route (94 percent); 30.3 acres at aboveground facilities

(100 percent); 119.2 acres at yards (68 percent); 1.1 acres at cathodic protection beds (66 percent); and 29.9 miles of access roads (93 percent). During those inventories, Mountain Valley recorded 81 archaeological sites and 241 historic architectural sites in the direct APE.

North Carolina SHPO made determinations of NRHP eligibility for most of the resources and we agree with those determinations. These findings are discussed below, as documented in letters from the SHPOs filed with the FERC by Mountain Valley. The Project would have no effect on sites found to be not eligible to the NRHP; and those sites require no further work.

Investigations in Virginia

In Virginia, Mountain Valley inventoried about 26.7 miles of the Project pipeline route (99 percent), all proposed aboveground facilities (Lambert Compressor Station, interconnects, and three MLVs), 67.2 acres at four yards (69 percent), 0.5 acre at cathodic protection beds (46 percent), and 11.5 miles of access roads (94 percent) by the end of October 2019. These surveys resulted in the recordation of 30 archaeological sites and 78 historic architectural sites in the direct APE. The individual survey reports filed to date for Project components in Virginia and SHPO reviews are discussed below.

As of September 2018, Mountain Valley conducted archaeological surveys in Virginia that covered about 26 miles of the Southgate pipeline route (98 percent); the Lambert Compressor Station; two MLV sites (MLV-2 and MLV-3); one contractor yard (CY-1); and approximately 22 miles of access roads (Blood et al. February 2019). A total of 17,810 shovel tests were excavated as part of the 2018 archaeological surveys; of which 124 probes produced artifacts. Mountain Valley identified 22 archaeological sites and 19 isolated finds in the direct APE in 2018. The archaeological sites include 14 prehistoric, 5 historic, and 3 multi-component resources. The isolated finds consist of 18 prehistoric artifacts and 1 historic item. After its 2018 surveys, TRC recommended that 15 of the isolated finds and 11 archaeological sites are not eligible for listing on the NRHP. TRC indicated that four isolated finds and 11 archaeological sites in Virginia were unevaluated (Blood et al., 2019).

In a letter dated February 13, 2019, reviewing TRC's first draft Phase I archaeological survey report for Virginia, the VADHR evaluated all the isolated finds but one as not eligible; with additional work required at one resource (VA-FS-30). The VADHR concurred with TRC that 11 archaeological sites are not eligible for the NRHP. The VADHR found nine archaeological sites to be potentially eligible for the NRHP, and two sites as unevaluated.

Between July and September 2018, TRC tested six sites in Virginia. After testing, TRC changed its evaluations, and assessed five sites that were formerly of unknown status (44PY271, 44PY375, 44PY445, 44PY451, and 44PY455) as being not eligible for the NRHP (Millis 2019b, 2019c). Site 44PY449 was reassessed to be eligible and should be avoided.

In letters to TRC dated May 10 and May 16, 2019, the VADHR concurred that site 44PY271 is not eligible for nomination to the NRHP; however, site 44PY449 is eligible for the NRHP. Furthermore, the VADHR deferred their NRHP eligibility determination for sites 44PY375, 44PY445, 44PY451, 44PY455 because the sites extend outside the APE and have not been fully delineated. However, the VADHR determined that the portions of 44PY375, 44PY445,

44PY451, and 44PY455 within the APE are not significant and no further investigations for the portions within the APE are warranted.

Additional cultural resources surveys were conducted by TRC between August 2018 and May 2019 for the Project in Pittsylvania County, Virginia. The additional surveys examined parcels previously inaccessible, as well as proposed route modifications and work space changes located outside of the original study corridor reported by Blood et al. (2019). These areas included 37 pipeline corridor segments, 3 yards, 7 workspaces, and 27 access roads. The additional surveys covered about 6.3 miles of pipeline route; 74.4 acres at yards; 2.6 acres of workspaces; and 2.6 miles of access roads. A total of 2,476 shovel tests were excavated during the additional surveys.

The survey addendum report identified ten new or revisited archaeological resources, including four prehistoric isolated finds, three prehistoric lithic scatters, one multi-component site with a prehistoric lithic scatter and historic artifact scatter, one historic farmstead, and one historic house (Johnson, 2019b). Of these, nine are in the direct APE, all of which are recommended not eligible for listing in the NRHP (table 4.10-8). One site, 44PY477 (historic farmstead), was recommended potentially eligible and should be avoided. The Virginia SHPO reviewed the first addendum archaeological survey report in a letter to TRC dated November 6, 2019, and concurred with its recommendations. An avoidance plan for 44PY477 has not yet been filed.

Mountain Valley filed draft protection or avoidance plans for six archaeological sites (44PY281, 44PY358, 44PY447, 44PY449, 44PY452, and 44PY454). The Virginia SHPO has not yet reviewed those plans. On December 16, 2019, Mountain Valley filed the results of archaeological testing of sites 44PY270 and 44PY479. Both sites were found eligible for the NRHP. No further work at site 44PY270 in the APE was recommended, except fencing to avoid impacts on the eligible portion of the site outside the APE. It was recommended that site 44PY479 should be avoided or mitigated (Millis, 2019h). The Virginia SHPO has not yet commented on the testing report.

Table 4.10-8 in appendix E.3 lists the archaeological sites identified by TRC for Mountain Valley in the direct APE in Virginia and their evaluations.

Based on Mountain Valley's survey reports dated through September 2019, we identified a total of 78 historic architectural sites in the direct APE in Pittsylvania County, Virginia. Twenty-two of those were previously recorded. Thirty-eight historic architectural sites were found by Mountain Valley's contractor along the proposed pipeline route, 16 were found at yards, and 24 were found along proposed access roads. Combined, the historic architectural sites identified for the Project in Virginia include 37 houses, 17 farms with houses, 8 barns and sheds, 9 cemeteries, 2 churches with cemeteries, 2 commercial/industrial buildings, 1 building ruins, and 2 railroad crossings (Karpynec et al., 2018a; 2019c).

TRC evaluated 69 historic architectural sites in the direct APE in Virginia as being not eligible for the NRHP. In a letter dated February 13, 2019, the VADHR disagreed with TRC and found site 71-5212 eligible. The VADHR concurred with the other sites that TRC recommended in 2018 as not eligible for the NRHP.

Two previously recorded historic architectural sites along the pipeline route in Virginia (71-25 and 36) are listed in the NRHP. TRC recommended that seven other historic architectural sites (71-4, 5222, 5227 5598, 5620, 5727, and 5732) should be considered eligible or potentially eligible for listing in the NRHP. The VADHR concurred with the recommendations for sites 71-5222, 5227, 5598, and 5620. Mountain Valley intends to avoid historic architectural sites 71-4, 25, 36, 5212, 5222, 5227, 5598, 5620, 5727, and 5732. In addition, Mountain Valley intends to avoid historic cemetery sites 71-5225, 5226, 5525, 5596, 5621, 5623, and 5735 in the direct APE. Historic period cemetery sites 71-5224 and 5593 are outside the direct APE; however, Mountain Valley produced an avoidance plan for them.

Table 4.10-9 located in appendix E.3 lists the historic architectural sites identified by TRC for Mountain Valley in the direct APE in Virginia and their evaluations.

Investigations in North Carolina

By the end of October 2019, Mountain Valley surveyed about 43.8 miles of pipeline route in North Carolina (90 percent). All of the aboveground facilities proposed for North Carolina were inventoried, including the LN 3600 and T-15 Dan River Interconnections, and two MLVs (4 and 5) in Rockingham County, and the T-21 Haw River Interconnect and three MLVs (6, 7, and 8) in Alamance County. Surveys also covered 52 acres of yards in North Carolina (68 percent). All 0.62 acres of cathodic protect beds in North Carolina were inventoried. About 18.4 miles of access roads were surveyed (92 percent). The survey and testing reports filed to date for Project components in North Carolina and SHPO reviews are discussed below.

In its initial 2018 archaeological surveys in North Carolina, Mountain Valley documented inventories of about 36 miles of proposed pipeline route, the T-15 Dan River Interconnect, five MLVs (4, 5, 6, 7, and 8), one contractor yard (CY-4), and approximately 21 miles of access roads. A total of 7,802 shovel tests were excavated during the original 2018 surveys in North Carolina; with 90 probes producing artifacts (Johnson et al., 2019). The surveys identified 61 archaeological resources (32 archaeological sites and 29 isolated finds), including 42 with prehistoric components only, 13 with historic components only (including five cemeteries), and six multi-component sites consisting of both historic and prehistoric components.

In a letter dated December 20, 2018, reviewing Mountain Valley's first survey report for North Carolina, the NCDNCR found 44 archaeological resources to be not eligible for the NRHP. According to the NCDNCR, two archaeological sites (31AM435 and 31RK244) are not eligible within the direct APE, but are unassessed outside.

Between October 2018 and February 2019, TRC conducted additional surveys in North Carolina, covering a total of 9.4 miles of pipeline route in 53 segments. Also inventoried were a total of about 49 acres at 3 yards; 2 acres at 2 anode beds; 13 acres at 14 workspaces; and 37 access roads totaling about 10 miles. Additionally, 1,392 shovel tests were excavated during the first addendum surveys. The report of the first addendum surveys documented the recordation of seven prehistoric archaeological sites, two historic sites, one multi-component site, and four prehistoric isolated finds. TRC recommended that three prehistoric archaeological sites (31RK97, 31AM441, and 31AM442) and three isolated finds (31RK263, 31AM264, and 31RK265) were unassessed; while the other resources were not eligible for the NRHP within the APE (Johnson, 2019a).

In a letter to TRC, dated May 7, 2019, reviewing the first draft addendum archaeological survey report for North Carolina, the NCDNCR stated that sites 31AM438, 31AM439, and 31AM440, and 31RK262, 31RK266, 31RK267, and 31RK269 are not eligible within the APE. Site 31AM219 was not relocated in the APE. Site 31AM443 is a historic cemetery that is not eligible for the NRHP, but should be avoided. Sites 31RK263 and 31RK265 are outside the APE and should be avoided. Sites 31AM441, 31AM442, 31RK97, and 31RK264 require additional investigations to determine their NRHP eligibility.

Two additional archaeological survey addenda were conducted by TRC between January and May 2019 (Addendum 2; Johnson 2019c) and between May and August 2019 (Addendum 3; Johnson 2019d) for the Project in Alamance, Caswell, and Rockingham Counties, North Carolina. For Addendum 2, the surveyed areas included four pipeline corridor segments, two yards, the T-21 Haw River Interconnect, two workspaces, and two access roads. These surveys examined about 0.76 mile of newly accessible tracts located along the pipeline route, including minor line adjustments; 70.1 acres at yards; 1.56 acres for the T-21 Haw River Interconnect; 0.36 acre for workspaces; and 0.04 miles of access roads extending outside of the original study corridor. A total of 609 shovel tests were excavated for Addendum 2. The surveys identified or revisited five archaeological resources (two prehistoric isolated artifacts, two prehistoric artifact scatters, and a multi-component site with a prehistoric isolated find and historic artifact scatter). Three of these resources (31AM445, 31AM446, and 31CS82) were recommended to be not eligible for the NRHP. Two sites (31AM442 and 31AM447) were considered unassessed during the survey (Johnson 2019c). The North Carolina SHPO reviewed the Addendum 2 report in a letter dated September 19, 2019, and found sites 31AM442 and 31AM447 to be potentially eligible.

For Addendum 3, the surveyed areas included 30 pipeline corridor segments, 11 workspaces, and portions of 30 access roads. These surveys covered about 4.34 miles of pipeline route, including minor line adjustments; 7.01 acres at workspaces; and 9.24 miles of access roads. A total of 755 shovel probes were excavated for Addendum 3 surveys. The study identified eight new archaeological resources including four prehistoric isolated artifacts, three prehistoric artifact scatters of unknown, and one prehistoric lithic scatter. Six resources (31AM449, 31AM450, 31AM453, 31AM454, 31AM455, and 31AM456) was recommended not eligible, and two sites (31AM451 and 31AM452) were unassessed (Johnson 2019d). On November 18, 2019, the North Carolina SHPO provided its review of the Addendum 3 report to TRC. It found sites 31AM451 and 31AM452 potentially eligible for the NRHP, and suggested those sites be avoided.

After archaeological testing at sites 31RK221 and 31RK238, TRC recommended them to be not eligible for the NRHP (Millis 2019d). In a letter to TRC dated April 15, 2019, the NCDNCR agreed that the portions of those sites in the APE are ineligible.

TRC conducted testing at archaeological sites 31RK222, 31RK259, and 21RK261, and additional deep testing along Town Creek in Rockingham County, North Carolina in 2018. Sites 31RK222 and 31RK259 were evaluated to be eligible for the NRHP, and avoidance for 32RK222 and mitigation for 31RK259 was recommended. Site 31RK261 was also evaluated as eligible, but TRC believes the portion of the site within the direct APE does not contribute to its significance. The deep testing at Town Creek identified isolated finds 31RK258 and 31RK260, and a prehistoric component at site 31RK245. Site 31RK245, and isolated finds 31RK258 and 31RK260 were

evaluated as being not eligible for the NRHP (Millis, 2019a). The North Carolina SHPO concurred with these recommendations in its letter dated May 24, 2019.

On October 2, 2019, Mountain Valley submitted a Treatment Plan for site 31RK259, that was accepted by the SHPO on November 18, 2019. An avoidance plan for site 31RK222 has not yet been filed.

Between April and June 2019, TRC conducted testing at archaeological sites 31AM417, 31AM442, and 31AM447, and deep geomorphological testing at five locations along the Haw River floodplain in Alamance County, and testing of archaeological sites 31RK217, 31RK235, and 31RK247 in Rockingham County. Based on this work, TRC indicated that the portions of these sites in the APE do not qualify for the NRHP (Millis, October 2019). The North Carolina SHPO has not yet reviewed this testing report.

On October 22, 2019, Mountain Valley filed draft protection and avoidance plans for four archaeological sites (31AM441, 31RK230, 31RK239, and 31RK261), and avoidance plans for four historic period cemeteries (31AM443, 31RK216, 31RK228, and 31RK237) in North Carolina (Millis 2019f). The SHPO has not yet reviewed these plans.

As of the end of October 2019, Mountain Valley identified 51 archaeological sites in the direct APE in North Carolina. This includes 29 prehistoric sites, 13 historic sites (including six cemeteries), and nine multi-component sites. Future investigations are required at archaeological sites 31AM452, 31RK97, and 31RK229. Table 4.10-10 in appendix E.3 lists the archaeological sites identified in the direct APE in North Carolina and their evaluations.

As of the end of October 2019, Mountain Valley identified a total of 163 historic architectural sites in the direct APE in North Carolina. This includes 42 historic sites along the pipeline route, 12 along access roads, and 8 near yards in Rockingham County; 84 historic sites along the pipeline route, and 10 along access roads in Alamance County; and 7 historic sites near yards in Guilford County. In total, the historic architectural sites in the direct APE in North Carolina include 119 houses, 1 hunting cabin, 1 log cabin, 1 outbuilding, 6 farms with houses, 5 barns or agricultural outbuildings, 3 churches, 20 commercial or industrial structures, 1 culvert, and 4 railroad crossings.

In a letter dated December 20, 2018, reviewing Mountain Valley's first historic architectural survey report for North Carolina, the NCDNCR disagreed with TRC's recommendation of not eligible for two sites (AM2407/2408; and RK1704), believing them to be unevaluated until more information is provided. The NCDNCR concurred that one site (AM1520) was unassessed, and four sites may be potentially eligible for the NRHP (AM203/1516; AM266; AM350; and AM447).

In response to that SHPO letter, Mountain Valley had TRC revise its historic architectural survey report in April 2019. The SHPO reviewed that report, in a letter dated July 18, 2019, and agreed that the T.M. Holt Textile Mill (AM203), J.M. Jordan House (AM1520), Tabardrey Mill (AM2407), and American Tobacco Company Plant (RK1704) are not eligible for the NRHP. The Southgate Project should have no effects on the Jim McClure House (AM266), Robertson House (AM350), and Captain Sam Vest House (AM447). Between September 2018 and April 2019, Mountain Valley had its contractor conduct additional historic architectural surveys covering route

changes, new access roads, and yards. The results of those investigations were filed as an addendum report with the FERC and the SHPO in May 2019. The addendum survey identified 98 historic architectural resources in the indirect APE, and 29 sites in the direct APE. Of the sites in the direct APE, 23 are houses, 3 are commercial structures, 1 is a barn, and 2 are railroads. Nine of the sites in the direct APE are along the pipeline, 11 are along access roads, and 9 are in or near yards. All of the structures identified in the direct APE in the addendum report were evaluated as not eligible for the NRHP; requiring no further work (Karpynec, 2019a). The first addendum historic architectural survey report for North Carolina addendum has not yet been reviewed by the SHPO.

An additional historic architectural survey was completed by TRC in August 2019 for minor modifications to the pipeline route (Karpynec, 2019b). The August 2019 survey recorded two additional historic resources in Alamance County, both of which are recommended not eligible for listing in the NRHP. The North Carolina addendum 2 historic architectural survey report has not yet been reviewed by the SHPO. Table 4.10-11 in appendix E.3 lists the historic architectural sites identified in the direct APE in North Carolina and their evaluations.

4.10.4 Unanticipated Discovery Plan

It is possible that human remains, funerary objects, sacred objects, and objects of cultural patrimony[48] may be discovered during future cultural resources investigations (including data recovery excavations conducted under site-specific treatment plans). It is also possible that during Project construction, there could be unanticipated discoveries of previously unknown and unidentified cultural resources or human remains. To account for these possibilities, and provide for measures that could be implemented to reduce impacts and mitigate effects for those situations, Mountain Valley developed a Project-specific UDP for Virginia and North Carolina (filed as Appendix 4-C of RR 4 in its application to the FERC). The UDP was reviewed and approved by the SHPOs of Virginia and North Carolina (September 6 and 14, 2018, respectively),[49] and the Catawba Indian Tribe. On February 20, 2019, the Monacan Indian Nation filed with the FERC comments on the UDP (accession number 20190221-5108). Mountain Valley addressed the concerns of the Monacan Indian Nation, in filings with the FERC on October 18. 2019 and January 24, 2020.[50]

4.10.5 Compliance with the National Historic Preservation Act

We have not yet completed the process of complying with the NHPA. Additional investigations and/or plans remain outstanding. As of the end of October 2019, about 5 miles of proposed pipeline route, and about 2.5 miles of access roads have still not yet been surveyed. In

[48] "Funerary objects, sacred objects, and objects of cultural patrimony" are defined in the Native American Graves Protection and Repatriation Act (NAGPRA, 25 U.S.C. 3001-3013, 43 CFR Part 10).

[49] The Virginia and North Carolina SHPOs approvals of the UDP were filed by Mountain Valley in its November 6, 2018, application. This information can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20181106-5159 in the "Numbers: Accession Number" field. The NCDNCR reaffirmed its concurrence with the UDP in a letter to FERC dated September 17, 2019 (Accession No. 20190930-0238).

[50] Response to FERC staff's October 3, 2019 Environmental Information Request Question 26. Mountain Valley said it filed revised UDP on January 24, 2020 (Accession No. 20200127-5121).

addition, about 0.6 acres at cathodic protection beds, and 55.6 acres at proposed yards remain to be inventoried.

As of December 2019, we have identified one historic property (archaeological site 31RK259) that cannot be avoided and would likely be adversely affected by the Project. Mountain Valley has filed a Treatment Plan[51] to mitigate impacts on this site. SHPO approved the draft Treatment Plan in a letter dated November 18, 2019. Additional work at this site will be completed under a Programmatic Agreement for the Project (see below).

To outline a process to resolve adverse effects at affected historic properties, the FERC will produce a Programmatic Agreement (PA) for the current undertaking, to be circulated among the consulting parties. A draft PA was circulated among the consulting parties on January 8, 2020.

To ensure that the Commission's responsibilities under the NHPA and its implementing regulations are met, **we recommend that:**

- **Mountain Valley should <u>not begin</u> construction of facilities and/or use of all staging, storage, or temporary work areas and new or to-be-improved access roads <u>until</u>:**

  a. Mountain Valley files with the Secretary:

  i. remaining cultural resources survey reports;

  ii. site evaluation reports and avoidance or treatment plans, as required; and

  iii. comments on the cultural resources reports and plans from the Virginia and North Carolina SHPOs and interested Indian tribes.

  b. The ACHP is afforded an opportunity to comment if historic properties would be adversely affected; and

  c. The FERC staff reviews and the Director of OEP approves the cultural resources reports and plans, and notifies Mountain Valley in writing that treatment plans/mitigation measures (including archaeological data recovery) may be implemented and/or construction may proceed.

  All materials filed with the Commission containing location, character, and ownership information about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering: "<u>CUI//PRIV-DO NOT RELEASE</u>."

[51] TRC. October 2019. Treatment Plan for Archaeological Site 31RK259, Rockingham County, North Carolina, Draft Plan, filed with the FERC by Mountain Valley on October 23, 2019.

4.10.6 Cultural Resources Conclusions

We have not yet completed the process of complying with the NHPA. Additional cultural resources inventories and evaluations need to be completed. Consultations with the SHPOs and interested Indian tribes have also not been concluded. The Project would have adverse effects on some historic properties. Adverse effects on historic properties in the APE would be resolved through a PA, which is currently in draft form. Execution of the agreement document would satisfy compliance with Section 106 of the NHPA.

4.11 AIR QUALITY AND NOISE

4.11.1 Air Quality

This section describes existing air quality; identifies the construction and operating air emissions; summarizes methods that would be used to achieve compliance with regulatory requirements; and outlines projected air quality impacts for the Project.

The Project would include construction and operation of 75.1 miles of natural gas transmission pipeline, one new natural gas-fired compressor station (i.e., the Lambert Compressor Station), and other associated aboveground ancillary facilities (pig launchers/receivers, mainline valves, and meter stations/interconnects) within Pittsylvania County, Virginia and Rockingham and Alamance Counties, North Carolina. Temporary air emissions would be generated during Project construction, which would occur over a 2-year period; long-term air emissions would be generated during Project operation, most of which would be associated with operation of the new compressor station. Construction and operational air emissions as well as proposed mitigation measures are discussed in section 4.11.1.3.

4.11.1.1 Regional Climate

Air quality is substantially influenced by climate and meteorological conditions; therefore, prevalent weather patterns are a major factor in both short- and long-term air quality conditions. The south-central area of Virginia and the northcentral area of North Carolina have a humid subtropical climate. The winters are temperate and the summers long and hot.

Based on 1981 to 2010 climate data from the National Center for Environmental Information (NCEI), temperatures at the Chatham meteorological station in Pittsylvania County range from a monthly minimum average of 22.8 °F in January to a maximum average of 86.3 °F in July. Mean annual precipitation is 45.2 inches, while monthly average precipitation ranges from a minimum of 3.0 inches in February to a maximum of 4.5 inches in July. Mean annual snowfall is 4 inches, and average annual wind speed is 7.4 miles per hour with a prevailing wind direction from the west-southwest. At the Reidsville 2 northwest (NW) meteorological station in Rockingham County, temperatures range from a monthly minimum average of 28.0 °F in January to a maximum average of 87.6 °F in July. Mean annual precipitation is 46.4 inches, while monthly average precipitation ranges from a minimum of 3.3 inches in December to a maximum of 4.8 inches in July. Mean annual snowfall is 9 inches, and average annual wind speed is 7.1 miles per hour with a prevailing wind direction from the southwest (NCEI, 2018).

4.11.1.2 Ambient Air Quality Standards

Ambient air quality is protected by federal and state regulations. With authority granted by the CAA 42 U.S.C. 7401 et seq. as amended in 1977 and 1990, the EPA established NAAQS to protect human health (primary standards) and public welfare (secondary standards). The EPA codified NAAQS in 40 CFR 50 for the following "criteria pollutants:" NO_2, carbon monoxide (CO), ozone (O_3), SO_2, lead (Pb), particulate matter (PM) with an aerodynamic diameter equal to or less than 10 microns (PM_{10}), and PM with an aerodynamic diameter equal to or less than 2.5 microns ($PM_{2.5}$). These NAAQS reflect the relationship between pollutant concentrations and health and welfare effects. The NAAQS are summarized in table 4.11-1.

TABLE 4.11-1

National Ambient Air Quality Standards

Pollutant	Timeframe	Primary	Secondary	Form
PM_{10}	24-hour	150 µg/m^3	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
$PM_{2.5}$	Annual	12 µg/m^3	15 µg/m^3	Annual mean, averaged over 3 years
	24-hour	35 µg/m^3	35 µg/m^3	98th percentile, averaged over 3 years
SO_2	3-hour	NA	0.5 ppm	Not to be exceeded more than once per year
	1-hour	75 ppb	NA	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
CO	8-hour	9 ppm	NA	Not to be exceeded more than once per year
	1-hour	35 ppm	NA	Not to be exceeded more than once per year
NO_2	Annual	53 ppb	53 ppb	Annual mean
	1-hour	100 ppb	NA	98th percentile of 1-hour daily maximum concentration, averaged over 3 years
O_3	8-hour	0.070 ppm	0.070 ppm	Annual 4th highest daily maximum 8-hour concentration, averaged over 3 years
Pb	3-month rolling	0.15 µg/m^3	0.15 µg/m^3	Not to be exceeded

Source: EPA, 2016

Abbreviations:

NA = not applicable
µg = microgram(s)
ppb = part(s) per billion
ppm = part(s) per million

While states can promulgate more stringent standards than the NAAQS, the VADEQ has adopted the NAAQS in Title 9 of the Virginia Administrative Code (9VAC), Agency 5, Chapter 30; and the NCDEQ has adopted the NAAQS in Title 15A of North Carolina Administrative Code (15A NCAC), Subchapter 02D, Section 0400. Additional pollutants, such as volatile organic compounds (VOCs) and hazardous air pollutants (HAPs) would also be emitted during construction and operation. These pollutants are regulated through various components of the CAA.

GHGs produced by fossil fuel combustion are CO_2, methane (CH_4), and nitrous oxide (N_2O). The status of GHGs as a pollutant is not related to toxicity. GHGs are non-toxic and

nonhazardous at normal ambient concentrations. GHGs are gases that absorb infrared radiation in the atmosphere and anthropogenic sources of GHGs are the primary cause of warming of the global climate system since the 1950s. Emissions of GHGs are typically estimated as CO_2e, where the potential of each gas to increase heating in the atmosphere is expressed as a multiple of the heating potential of CO_2 over a specific timeframe, or its global warming potential (GWP).

4.11.1.3 Air Quality Control Regions and Attainment Status

The EPA has established Air Quality Control Regions (AQCR) in accordance with Section 107 of the CAA. AQCRs are defined as contiguous areas considered to have relatively uniform ambient air quality, and are treated as single geographical units for reducing emissions and determining compliance with the NAAQS. Areas where ambient air pollutant concentrations are below the NAAQS are designated as "attainment," while areas where ambient air concentrations are above the NAAQS are designated as "nonattainment." Areas previously designated as nonattainment that have subsequently demonstrated compliance with the NAAQS are designated as "maintenance" for a period of time (normally 20 years after the effective date of attainment); this time period assumes that the area remains in compliance with the standard. Areas that lack sufficient data to determine their designation are designated "unclassifiable," and are treated as attainment areas for the purpose of stationary source air permitting.

The Project would be constructed in Pittsylvania County, Virginia within the Central Virginia Intrastate AQCR and Rockingham and Alamance Counties, North Carolina within the Northern Piedmont Intrastate AQCR. Areas intersected by the Project are designated as attainment or unclassifiable for the criteria pollutants (EPA, 2018b; EPA, 2018c).

There are three attainment air quality classifications within each of the AQCRs of the United States. Class I areas are designated as pristine natural areas or areas of natural significance and receive special protections under the CAA based on good air quality. Class III areas are heavily-industrialized zones that are established only on request and must meet all requirements outlined in 40 CFR 51.166. The remainder of the United States is designated as Class II. If a new source or major modification of an existing source is subject to the Prevention of Significant Deterioration (PSD) program requirements and is within 62 miles (100 kilometers [km]) of a Class I area, the facility is required to notify the appropriate federal officials and assess the impacts of the proposed project on the Class I area.

The closest designated Class I areas to the Project's Lambert Compressor Station are the James River Face Wilderness Area about 50 miles (81 km) from the proposed site and the Shenandoah National Park about 89 miles (143 km) from the proposed site. However, emissions from the compressor station would not trigger a PSD review (see section 4.11.1.5), and therefore a Class I impact analysis would not be required.

4.11.1.4 Air Quality Monitoring and Existing Air Quality

Along with state and local agencies, the EPA created a network of ambient air quality monitoring stations that collect data on background concentrations of criteria pollutants across the United States. To characterize the existing ambient air quality for the Project, data were gathered from the closest monitoring stations to the Lambert Compressor Station in Pittsylvania County, Virginia:

- For NO_2, CO, $PM_{2.5}$, and SO_2, the closest monitoring site is in Vinton (Roanoke County, Virginia), about 43 miles (69 km) from the site (Site ID 51-161-1004);
- For PM_{10} and O_3, the closest site is in Reidsville (Caswell County, North Carolina) about 37 miles (59 km) from the site (Site ID 37-033-0001); and
- For Pb, the closest monitoring site is in Roanoke City (Roanoke County, Virginia), about 50 miles (80 km) from the site (Site ID 51-161-1004).

Table 4.11-2 shows monitoring data for criteria pollutants for 2016 and 2017 from the monitoring sites, along with the appropriate primary NAAQS standard. All monitored values were below the NAAQS.

TABLE 4.11-2

Baseline Ambient Air Quality

Pollutant	Time Period	Description of Monitored Value	2016	2017	Primary NAAQS
PM_{10}	24-hour	2nd high	38.0 µg/m³	23.0 µg/m³	150 µg/m³
$PM_{2.5}$	Annual	Arithmetic mean	6.7 µg/m³	6.6 µg/m³	12 µg/m³
	24-hour	98th percentile	15.0 µg/m³	14.0 µg/m³	35 µg/m³
SO_2	1-hour	99th percentile	4.0 ppb	3.0 ppb	75 ppb
CO	8-hour	2nd high	0.7 ppm	0.7 ppm	9 ppm
	1-hour	2nd high	1.1 ppm	1.0 ppm	35 ppm
NO_2	Annual	Arithmetic mean	5.7 ppb	5.2 ppb	53 ppb
	1-hour	98th percentile	37.0 ppb	32.0 ppb	100 ppb
O_3	8-hour	4th high	0.064 ppm	0.059 ppm	0.070 ppm
Pb	3-month rolling	1st high	0.01 µg/m³	0.02 µg/m³	0.15 µg/m³

4.11.1.5 Air Quality Regulatory Requirements

New Source Review/Prevention of Significant Deterioration

Federal pre-construction review of certain large proposed projects varies for attainment and nonattainment areas. Federal pre-construction review for sources in nonattainment areas is referred to as Nonattainment New Source Review, while federal pre-construction review for sources in attainment areas is formally referred to as PSD. The review process aids in preventing new sources and modifications to existing systems from causing existing air quality to deteriorate beyond acceptable levels.

A new source in attainment area is classified as PSD major if it has the potential-to-emit (PTE) more than 100 tons per year (tpy) of a pollutant regulated under the CAA and it is listed in one of the 28 named source categories in Section 169 of the CAA, or if it has the PTE more than

250 tpy and is not listed in one of the 28 named source categories in Section 169 of the CAA[52]. For a source that is major for at least one regulated pollutant (i.e., is subject to PSD review), all pollutants that are emitted in amounts equal to or greater than the significant emission rates are also subject to PSD review (i.e., 40 tpy NOx, 100 tpy CO, 40 tpy SO_2, 15 tpy PM_{10}, 10 tpy $PM_{2.5}$, 40 tpy VOCs, or 75,000 tpy GHGs in units of CO_2e).

Table 4.11-3 summarizes the PTE from operation of the Project's Lambert Compressor Station. Potential emissions assume 52 startup/shutdown events per year per combustion turbine (10 minute event duration). Furthermore, both combustion turbine would be equipped with Solar's Advanced SoloNOx combustor technology for NOx emissions control. Potential emissions include fugitives from incidental leaks or releases from valves, connectors, flanges, and seals, as well as emissions from two types of gas blowdown events that could occur at the compressor station: (1) maintenance gas blowdowns that occur when a compressor is stopped and gas between the suction/discharge valves and compressors is vented to the atmosphere; and (2) emergency full station shutdown (ESD) blowdowns that would only occur infrequently at required DOT test intervals or in an emergency situation. Potential emissions assume 16 blowdown events per year, although only 8 are expected for system testing and maintenance.

The natural gas compressor station is a non-listed source category and would be located in an attainment/unclassifiable area for all criteria pollutants. Consequently, because emissions are less than 250 tpy, the Lambert Compressor Station would not be subject to PSD review.

TABLE 4.11-3

Potential-to-Emit for the Lambert Compressor Station

Emission Unit	Annual Pollutant Emissions (tpy)							
	NO_X	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**	**VOCs**	**HAPs**	**GHGs**
Solar Taurus Turbine (11,792 hp)	13.2	17.3	2.1	4.0	4.0	2.2	1.6	47,063
Solar Mars Turbine (17,123 hp)	19.6	36.3	3.1	6.0	6.0	4.0	2.6	69,982
Capstone Micro-turbines (5 Units; 200 kW each)	1.8	4.8	0.2	0.3	0.3	0.4	0.2	5,847

a/ The highest individual HAP is formaldehyde with emissions of 3.5 tpy.

Abbreviations:

-- = no associated emission
kW = kilowatts
hp = horsepower
MMBtu/hr = million British thermal units per hour

[52] This summary reflects July 24, 2014 EPA Memorandum indicating that the EPA will no longer treat GHGs as an air pollutant for purposes of determining whether a source is a major source required to obtain a PSD or Title V permit (EPA, 2014).

New Source Performance Standards

The New Source Performance Standards (NSPS), codified in 40 CFR 60, regulate emission rates and provide requirements for new or significantly modified sources. NSPS requirements include emission limits, monitoring, reporting, and record keeping. Applicable NSPS for the Project, based on the types of emission units and the expected date of installation, would potentially include, but not be limited to, the subparts listed below.

- 40 CFR 60 Subpart A – General Provisions. Subpart A contains the general requirements applicable to all emission units subject to 40 CFR 60.
- 40 CFR Subpart KKKK – Standards of Performance for Stationary Combustion Turbines. This subpart applies to stationary combustion turbines that commenced construction, modification, or reconstruction after February 18, 2005 and have a heat input at peak load equal to or greater than 10.7 gigajoules per hour (10 MMBtu/hr [million British thermal units per hour]). The proposed Solar turbines at the Lambert Compressor Station would be subject to NSPS Subpart KKKK as their fuel heat input ratings would exceed 10 MMBtu/hr, and their manufacturing date would be after February 18, 2005. Subpart KKKK regulates emissions of NOx and SO_2. The turbines would be subject to a NOx emission limit of 25 ppm at 15 percent oxygen. The SO_2 requirement would be met through exclusive use of natural gas fuel with sulfur content at or below 0.060 pound of SO_2 per MMBtu. Mountain Valley would comply with all applicable Subpart KKKK standards and requirements for monitoring, recordkeeping, and reporting.
- 40 CFR 60 Subpart OOOOa – Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution. This subpart establishes standards for GHGs (in the form of limitations on CH_4), VOCs, and SO_2 from affected facilities that commenced construction, modification, or reconstruction after September 18, 2015. Affected facilities include centrifugal compressors, reciprocating compressors, pneumatic controllers, pneumatic pumps, storage vessels, and equipment leaks and sweetening units within the crude oil and natural gas sector. Fugitive emissions components at the Lambert Compressor Station would be subject to Subpart OOOOa. Mountain Valley would comply with all applicable leak detection and repair requirements of Subpart OOOOa, including the use of optical gas imaging (OGI) technology during its periodic surveys.

National Emissions Standards for Hazardous Air Pollutants

The National Emissions Standards for Hazardous Air Pollutants (NESHAPs), codified in 40 CFR 61 and 63, regulate the emissions of HAPs from new and existing sources. Part 61, promulgated before the 1990 CAA Amendments, regulates eight hazardous substances: asbestos, benzene, beryllium, coke oven emissions, inorganic arsenic, mercury, radionuclides, and vinyl chloride. The 1990 CAA Amendments established a list of 189 HAPs, resulting in the promulgation of Part 63, also known as the Maximum Achievable Control Technology (MACT) standards. Part 63 regulates HAPs from major sources of HAPs and specific source categories emitting HAPs. Some NESHAPs may apply to non-major sources (area sources) of HAPs. Major source thresholds for NESHAPs are 10 tpy of any single HAP or 25 tpy of total HAPs.

Potential HAP emissions from the Lambert Compressor Station would be below the major source thresholds. Consequently, it would be considered an area source of HAP emissions. However, there would be no applicable NESHAPs based on the types of emission units and the expected date of installation.

Title V Operating Permit

The required elements of Title V operating permit programs are outlined in 40 CFR 70 and 40 CFR 71. Title V operating permits may be referred to as "Part 70" or "Part 71" permits, or as Title V permits. A Title V permit should list all air pollution requirements that apply to the source, including emissions limits and monitoring, record keeping, and reporting requirements. Regulations also require that the permittee annually report the compliance status of its source with respect to permit conditions to the corresponding regulatory agency.

A Title V major source, as defined in 40 CFR 70.2, is a source or group of stationary sources (including new and existing sources) within a contiguous area and under common control, emitting or with the PTE of regulated pollutants or HAPs above threshold values. The Title V major source threshold is 100 tpy of CO, NOx, SO_2, VOC, PM_{10}, or $PM_{2.5}$; 10 tpy for any single HAP, and 25 tpy for any combination of HAPs.

Potential emissions from the Lambert Compressor Station would be below the Title V major source thresholds (see table 4.11-3). Consequently, a Title V operating permit would not be required.

General Conformity

The General Conformity Rule was designed to require federal agencies to ensure that federally-funded or federally-approved projects conform to the applicable State Implementation Plan (SIP). Section 176(c) of the CAA prohibits federal actions in nonattainment or PSD maintenance areas that do not conform to the SIP for the attainment and maintenance of NAAQS. General Conformity regulations apply to project-wide direct and indirect emissions of pollutants (and all precursors) for which the project areas are designated as nonattainment or maintenance that are not subject to New Source Review (NSR) and that are greater than the significance thresholds established in the General Conformity regulations or 10 percent of the total emissions budget for the entire nonattainment or maintenance area. Federal agencies are able to make a positive conformity determination for a proposed project if any of several criteria in the General Conformity Rule are met. These criteria include:

- emissions from the project that are specifically identified and accounted for in the SIP attainment or maintenance demonstration; or
- emissions from the action that are fully offset within the same area through a revision to the SIP, or a similarly enforceable measure that creates emissions reductions so there is no net increase in emissions of that pollutant.

The Project would be entirely within an attainment/unclassifiable area; consequently, it is not subject to General Conformity.

GHG Reporting Rule

The Mandatory Reporting of Greenhouse Gases Rule requires reporting of GHG emissions from suppliers of fossil fuels and facilities that emit greater than or equal to 25,000 metric tpy of GHGs (reported as CO_2e), which equates to 27,558 tpy. Onshore natural gas transmission compression facilities are considered part of the source category regulated by 40 CFR Part 98, Subpart W.

Potential GHG emissions from the Lambert Compressor Station would be greater than 25,000 metric tpy (see table 4.11-3). However, the rule establishes reporting requirements based on actual emissions. Mountain Valley would monitor emissions in accordance with the reporting rule. If actual emissions exceed the 25,000 metric tpy threshold, GHG emissions would be reported to the EPA as required.

Chemical Accident Prevention Provisions

The chemical accident prevention provisions, codified in 40 CFR 68, are federal regulations designed to prevent the release of hazardous materials in the event of an accident and minimize potential impacts if a release does occur. The regulations contain a list of substances and threshold quantities for determining applicability to stationary sources, including CH_4, propane, and ethylene in amounts greater than 10,000 pounds. If a stationary source stores, handles, or processes one or more substances on this list in a quantity equal to or greater than that specified in the regulation, the facility must prepare and submit a risk management plan (RMP). An RMP is not required to be submitted to the EPA until the chemicals are stored on-site at the facility.

If a facility does not have a listed substance on-site, or the quantity of a listed substance is below the applicability threshold, the facility is not required to prepare a RMP. In the latter case, the facility still must comply with the requirements of the general duty provisions in Section 112(r)(1) of the 1990 CAA Amendments if there is any regulated substance or other extremely hazardous substance on-site. The general duty provision is as follows: "The owners and operators of stationary sources producing, processing, handling and storing such substances have a general duty to identify hazards which may result from such releases using appropriate hazard assessment techniques, to design and maintain a safe facility, taking such steps as are necessary to prevent releases, and to minimize the consequences of accidental releases which do occur."

Chemicals regulated by this rule, including CH_4 and ethane, would be produced, processed, handled, or stored at the new compressor station. However, natural gas transmission facilities are not subject to the RMP regulations if they are subject to DOT requirements or to a state natural gas program certified by the DOT. As such, the Project would not be subject to the RMP regulations.

4.11.1.6 State Air Quality Regulations

Project activities undertaken within the state of Virginia would involve temporary construction, installation of pipelines, and operation of the Lambert Compressor Station. The applicable state air quality regulations, codified in 9VAC5, are listed below:

- 9VAC5-20 – General Provisions
- 9VAC5-30 – Ambient Air Quality Standards
- 9VAC5-50 – New and Modified Stationary Sources
- 9VAC5-50-80 – Standard for Visible Emissions
- 9VAC5-50-90 – Standard for Fugitive Dust/Emissions
- 9VAC5-50-260 – Best Available Control Technology (BACT)
- 9VAC5-60 – Hazardous Air Pollutant Sources
- 9VAC5-80 – Permits for Stationary Sources
- 9VAC5-80-1100 – Permits for New and Modified Stationary Sources
- 9VAC5-130 – Open Burning

Project activities undertaken within the state of North Carolina would involve temporary construction and installation of pipelines. The applicable state air quality regulations, codified in 15A NCAC 02D, would include 15A NCAC 02D.1900 to control air pollution resulting from the open burning. Mountain Valley has committed to comply with all applicable state requirements.

4.11.1.7 Air Emission Impacts and Mitigation

Construction Air Impacts and Mitigation

Air quality impacts associated with construction of the Project would include emissions from fossil fuel-fired construction equipment, deliveries, and worker commutes; fugitive dust from ground disturbance and transportation; and emissions associated with burning wood debris in construction work areas.

Fossil fuel-fired construction equipment, trucks, and delivery vehicles are a source of combustion emissions, including NOx, CO, VOC, SO_2, PM_{10}, $PM_{2.5}$, and small amounts of HAPs. Construction equipment, trucks, and delivery vehicles would also emit GHGs. Gasoline and diesel engines must comply with the EPA mobile source regulations in Title 40 CFR Part 85 for on-road engines and Title 40 CFR Part 89 for non-road engines. These regulations are designed to minimize emissions and require a maximum sulfur content in diesel fuel of 15 ppm. Mountain Valley has identified additional mitigation measures to minimize construction combustion emissions, including using newer model equipment that are equipped with the latest emissions reduction technologies when practical; following manufacturer's operating recommendations regarding good combustion practices; strict enforcement of idling limits for construction equipment; use of electric equipment where possible; and the use of clean diesel through add-on control technologies such as diesel particulate filters and diesel oxidation catalysts. However, this is not a commitment for use of these technologies and the use would be a voluntary option for Mountain Valley.

Fugitive dust is a source of respirable airborne PM, including PM_{10} and $PM_{2.5}$, which could result from land clearing, grading, excavation, and mobile source traffic on paved and unpaved roads. The amount of dust generated is a function of construction activity, silt and moisture content

of the soil, wind speed, frequency of precipitation, vehicle traffic, vehicle types, and roadway characteristics. During construction of the Lambert Compressor Station, Mountain Valley would comply with Virginia regulations requiring measures to prevent fugitive dust from becoming airborne and leaving the property boundary of an affected facility (9VAC5-50-90).

During construction, Mountain Valley would implement the following mitigation measures to minimize the generation of dust: minimizing disturbed areas as much as possible through construction sequencing; using wet suppression to control dust from motorized equipment and vehicle traffic; utilizing water trucks, power washers, sweepers, and/or vacuums on paved roads to control dust; and placing rock construction entrances on access roads that begin at a junction with paved roads to reduce track out of loose materials. Mountain Valley would also conduct daily inspections of dust control measures when environmental conditions are dry.

Ground-level open burning emissions are affected by many variables, including wind, ambient temperature, composition and moisture content of the debris burned, and compactness of the pile. In general, the relatively low temperatures associated with open burning increase emissions of NOx, CO, VOCs, PM_{10}, and $PM_{2.5}$. Mountain Valley may utilize open burning as a means of disposing of land clearing waste during construction of the Project. Any open burning would be conducted on a site-specific basis, and in accordance Mountain Valley's *Fire Prevention and Suppression Plan* and Virginia and North Carolina regulations (9VAC5-130; 15A NCAC 02D.1900). This would include burning only in approved burn areas and during appropriate weather conditions to avoid any impacts on nearby residences, and complying with the open burning prohibition in Virginia from May 1 through September 30.

Estimated construction emissions for the Project for years 2020 and 2021 are shown in table 4.11-4. Emissions would not typically be concentrated in any one location, but would occur incrementally along the pipeline route. Construction of the compressor station and aboveground ancillary facilities may occur at a single location for a longer duration.. Once the Project's construction phase is completed, fugitive dust and construction emissions would subside; thus, the length of time the area would be exposed to dust and emissions from construction activities would be limited. Consequently, air emissions from construction would result in localized, intermittent, and temporary impacts and would not be expected to impact regional air quality or result in any violation of applicable ambient air quality standards. As a result, we conclude the impacts on local air quality during construction of the Project would not be significant.

a/ Emission sources for each Project component are sorted by type of construction activity, as follows: Commuter transit includes tailpipe emissions from on-road and off-road vehicle travel; Construction equipment include tailpipe emissions from heavy equipment; Open burning includes fugitives from burning of brush and slash from clearing; and Fugitive dust includes dust from earthmoving fugitives and wind erosion.

b/ GHGs include CO_2 emissions only.

-- Indicates that the specific pollutant emissions are not expected from that source.

Operations Air Impacts and Mitigation

Operation of the Project would result in emissions from the Lambert Compressor Station, as well as emissions from maintenance and testing blowdowns and incidental leaks from the pipeline and four interconnects. Estimated operational emissions are shown in table 4.11-5.

TABLE 4.11-5

Estimated Operational Emissions for the Southgate Project

Emission Source	Annual Pollutant Emissions (tons per year)							
	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$	VOCs	HAPs	GHGs (CO_2e)
Lambert Compressor Station a/	34.9	58.6	5.4	10.4	10.4	8.4	4.5	126,442
Blowdowns	--	--	--	--	--	4.2	0.2	4,229

Total	**34.9**	**58.6**	**5.4**	**10.4**	**10.4**	**12.8**	**4.7**	**130,827**

a/ See table 4.11-3 for detailed information on emissions from each type of emission source for the compressor station.

Minor NSR permits are required for facilities that emit less than 100 tpy of any criteria pollutant (PM, PM_{10}, $PM_{2.5}$, CO, NOx, SO_2, and VOC) but more than the criteria pollutant exemption levels listed in 9VAC5-80-1105C (i.e., 40 tpy NOx, 100 tpy CO, 40 tpy SO_2, 15 tpy PM_{10}, 10 tpy $PM_{2.5}$, or 25 tpy VOCs). Minor NSR permits are also required for facilities that emit HAPs more than state toxic exemption levels listed in 9VAC5-60-300C and 9VAC5-80-1105E but less than 10 tpy of one HAPs or 25 tpy of a combination of HAPs. Operation of the Lambert Compressor Station would trigger air permitting as a minor source of air emissions, specifically as a result of emissions of $PM_{2.5}$ and formaldehyde. NOx emissions would not trigger minor

permitting due to installation of Solar's Advanced SoloNOx combustor technology on both combustion turbines. Mountain Valley submitted an air permit application to VADEQ in November 2018 with a revision in April 2019, which is pending review and issuance. Compliance with the applicable federal and state air quality standards and regulations would be addressed accordingly in the air quality permit. As a result, air quality impacts during operation of the compressor station would be minor.

Pursuant to 9VAC5-50-260B, minor sources in Virginia are required to undergo a BACT review for each pollutant greater than the levels in 9VAC5-80-1105C. For the proposed Lambert Compressor Station, BACT would be required for $PM_{2.5}$. The air permit application included a BACT assessment and Mountain Valley proposed the following:

- **$PM_{2.5}$ BACT for Solar Turbines.** For controlling emissions of $PM_{2.5}$, Mountain Valley proposed the use of clean-burning fuels and good combustion practices as BACT. The turbines would be equipped with self-cleaning inlet air filters to reduce the entrainment of PM into the turbine and to reduce the PM exhaust emissions. Mountain Valley would develop and implement an *Operation and Maintenance Plan* to ensure good combustion practices.

Furthermore, based on review of EPA's voluntary Natural Gas Star program, Mountain Valley identified several feasible mitigation measures for potential emission reduction. These measures include:

- replace gas starters with air or nitrogen;
- reduce natural gas venting with fewer compressor engine startups and improved engine ignition;
- test and repair pressure safety valves;
- eliminate unnecessary equipment and/or systems;
- install automated air/fuel ratio controls;
- install electric motor starters; and
- reduce emissions when taking compressors off-line.

The incorporation of these emission reduction measures would be voluntary; however, Mountain Valley has incorporated measures to control air/fuel ratios and use electric motor starters into the design of the Lambert Compressor Station.

Mountain Valley conducted air dispersion modeling of the Lambert Compressor Station to demonstrate compliance with the NAAQS using EPA's model atmospheric dispersion modeling system (AERMOD, version 18081). The modeling was conducted using emission rates from a range of combustion turbine operating scenarios for the Lambert Compressor Station including startup and shutdown, as well as three load and seven ambient temperature scenarios. A summary of the maximum (worst-case emissions from the various parameter combinations) modeling results of the Lambert Compressor Station alone are provided in table 4.11-6. Details of the operating scenarios, along with methodologies and results, can be found in the modeling protocol and

modeling results reports[53]. Results indicate that the maximum modeled concentrations would be less than the applicable NAAQS for all criteria pollutants modeled. The NO_2 results for the Lambert Compressor Station are predicted to be 15 percent of the annual standard and 9.5 percent of the one-hour standard. Mountain Valley submitted revised modeling results to VADEQ on January 31, 2020 to support updates in the April 2019 revised application.

TABLE 4.11-6

Criteria Pollutant Modeling Results for Lambert Compressor Station

Pollutant	Timeframe	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Total Concentration (µg/m³) a/	NAAQS (µg/m³)
PM_{10}	24-hour	1.3	31.0	32.3	150
$PM_{2.5}$	Annual	0.2 b/	7.2	7.4	12
	24-hour	0.8 bc/	17.0	17.8	35
SO_2	3-hour	3.7 d/	10.5 d/	14.2	1,300
	1-hour	4.1 d/	10.5 d/	14.6	196
CO	8-hour	105.1	1,380	1,485.1	10,000
	1-hour	498.2	2,300	2,798.2	40,000
NO_2	Annual	1.8 e/	13.2	15.0	100
	1-hour	17.9 e/	Variable f/	17.9	188

a/ Total concentration is the sum of the modeled and background concentration; this value is compared with the NAAQS.

b/ Value includes secondary impacts ($PM_{2.5}$ emissions formed in the atmosphere from precursor emissions [NO_X and SO_2]) from the Lambert Compressor Station.

c/ Based on maximum 98th percentile daily maximum modeled concentrations.

d/ Values from prior draft EIS.

e/ Based on EPA's Ambient Ratio Method 2 (ARM2) modeling guidance.

f/ Background varies by season and hour-of-day. The EPA guidance suggests the season and hour-of-day combination be based on the 3rd highest values to represent the 98th percentile. The resultant matrix of ninety-six (96) season and hour-of-day 1-hour NO_2 monitor values were used in the 1-hour NO_2 modeling analyses.

Because emissions of formaldehyde at the compressor station would be greater than the Virginia exemption threshold in 9VAC5-60-300C, Mountain Valley also conducted air dispersion modeling of formaldehyde emissions, which were included in the January 31, 2020 submission to VADEQ. Results were compared with the VADEQ's Significant Ambient Air Concentration (SAAC) for formaldehyde, which is the concentration of the pollutant in ambient air that, if exceeded, may have an adverse effect to human health. We note that there are no federal ambient

[53] Mountain Valley's Air Quality Dispersion Modeling Protocol was filed on January 28, 2020 (accession number 20200128-5024). Mountain Valley's Air Quality Dispersion Modeling Report was filed on February 3, 2020 (accession number 20200203-5194). These files can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter the accession number in the "Numbers: Accession Number" field.

air quality standards for formaldehyde. As shown in table 4.11-7, results indicate that the maximum modeled concentrations would be less than the Virginia formaldehyde SAAC.

TABLE 4.11-7

Formaldehyde Modeling Results for Lambert Compressor Station

Pollutant	Timeframe	Maximum Modeled Concentration ($\mu g/m^3$)	Significant Ambient Air Concentration ($\mu g/m^3$)
Formaldehyde	Annual	0.1	2.4
	1-hour	24.8	62.5

4.11.1.8 Conclusions Regarding Air Quality

Because pipeline construction moves through an area relatively quickly, air emissions are typically localized, intermittent, and temporary. Once construction activities in an area are completed, fugitive dust and construction equipment emissions would subside and the impact on air quality would diminish. Further, construction emissions would be minimized by mitigation measures described above. As a result, we conclude that the Project's construction-related impacts are not expected to result in a significant impact on local or regional air quality, although residents near the pipeline right-of-way, compressor station, and other associated aboveground ancillary facilities may experience intermittent elevated levels of fugitive dust and smoke-dust from nearby open burning.

Operational emissions would be a result of emissions from the Lambert Compressor Station, as well as minimal emissions from maintenance blowdowns and incidental leaks from the pipeline and four interconnects. The Lambert Compressor Station would be considered a minor source of criteria and HAP air pollutants according to Virginia regulations. Using advanced low NOx turbine combustors, clean-burning fuels, and self-cleaning turbine inlet air filters, low emission levels would be achieved with normal engine operation and good maintenance practices. Air quality dispersion modeling confirmed that emissions due to the compressor station's operations would not exceed the NAAQS or the Virginia formaldehyde SAAC. Therefore, although ambient air quality in the area near the compressor station would degrade, we conclude that criteria pollutant and formaldehyde emissions from operations would not result insignificant impacts on local or regional air quality.

4.11.2 Noise

The existing noise environment would be affected by construction and operation of the Project. Temporary noise would be generated during Project construction, and long-term noise would be generated during operation. Construction and operational noise impacts as well as proposed mitigation measures are discussed in section 4.11.2.3.

4.11.2.1 Noise Levels and Terminology

Sound is mechanical energy transmitted by pressure waves in media such as air or water (FTA, 2006). When sound becomes excessive, annoying, or unwanted, it is referred to as noise.

Noise levels are quantified using decibels (dB), which are units of sound pressure. Noise may be continuous (constant noise with a steady decibel level), steady (constant noise with a fluctuating decibel level), impulsive (having a high peak of short duration), stationary (occurring from a fixed source), intermittent (at intervals of high and low sound levels), or transient (occurring at different rates).

The A-weighted sound level, expressed as dBA, is an expression of the relative loudness of sounds in air as perceived by the human ear. Therefore, A-weighted sound levels are usually used to quantify audible sound and its effect on people (EPA, 1978). On the dBA scale, normal conversation falls at about 60 to 65 dBA, and sleep disturbance occurs at about 40 to 45 dBA. Table 4.11-8 contains examples of common activities and their associated noise levels in dBA.

TABLE 4.11-8

Typical Noise Levels for Common Activities

Activity	Noise Level (dBA)
Rock band	110
Gas lawnmower at 3 feet	95
Diesel truck at 50 feet at 50 miles per hour	85
Vacuum cleaner at 10 feet	70
Normal speech at 3 feet	65
Heavy traffic at 300 feet	60
Dishwasher in next room	50
Large conference room (background)	40
Bedroom at night	25
Broadcast/recording studio	15

Source: Caltrans, 2013

Existing ambient noise levels, or background noise levels, are the current sounds from natural and artificial sources at the receptors. The magnitude and frequency of background noise at any given location may vary considerably over the course of a day or night and throughout the year. The variations are caused in part by weather conditions, seasonal vegetative cover, and human activity. Two common measures used to relate the time-varying quality of environmental noise levels to known effects on people are the 24-hour equivalent sound level ($L_{eq(24)}$) and the day-night sound level (L_{dn}). The $L_{eq(24)}$ is the level of steady sound with the same total energy as the time-varying sound, averaged over a 24-hour period. The L_{dn} is the $L_{eq(24)}$ with 10 dBA added to the nighttime sound levels between the hours of 10:00 p.m. and 7:00 a.m. to account for people's tendency to be more sensitive to sound during nighttime hours.

The potential for noise impacts are assessed by evaluating noise levels at the nearest noise sensitive areas (NSAs) such as residences, schools and day-care facilities, hospitals, long-term care facilities, places of worship, and libraries. Where the nature of a new sound is similar to the ambient noise level, an increase of 3 dBA is barely detectable by the human ear and an increase of 5 dBA is considered clearly noticeable. Increases of 10 dBA are perceived as a doubling of noise (i.e., twice as loud). Furthermore, noise levels typically decrease by approximately 6 dBA every

time the distance between the source and receptor is doubled, depending on the characteristics of the source and the conditions over the path that the noise travels. The reduction in noise levels can be increased if a solid barrier or natural topography blocks the line of sight between the source and receptor.

Existing Sound Levels and Noise Sensitive Areas

Mountain Valley conducted baseline noise surveys at the nearest NSAs to the proposed Lambert Compressor Station and meter stations (referred to as interconnects) in July 2018. Figures 4.11-1 through 4.11-4 show the proximity and direction of the NSAs to the respective facility. Noise survey results are summarized in table 4.11-9, and indicate that existing ambient background noise levels range from 44.8 to 65.0 dBA L_{dn}. The existing land uses on and adjacent to these locations include upland forest/woodland, agricultural land, upland open land, and commercial/industrial land.

TABLE 4.11-9

Mountain Valley also conducted baseline noise surveys of potential HDD and conventional bore (railroad crossing) sites in July 2018. Figures 4.11-5 through 4.11-10 show the proximity and the direction of the NSAs to the respective activity. Noise survey results are summarized in table 4.11-10, and indicate that existing ambient background noise levels range from 39.7 to 58.9 dBA L_{dn}.

4.11.2.2 Noise Regulatory Requirements

The states of Virginia and North Carolina do not have regulations that would limit noise from construction or operation of the Project. While Rockingham and Alamance Counties have only nuisance-based regulations; Pittsylvania County has a numerical-based noise ordinance. The ordinance contains an exemption for sound generated by the Project construction provided such sound is limited between the hours of 7:00 a.m. and 10:00 p.m. Mountain Valley continues to coordinate with Pittsylvania County regarding the Pittsylvania County Noise Ordinance noise limits at the Lambert Compressor Station.

In 1974, the EPA published its *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*. This document provides information for state and local governments to use in developing their own ambient noise standards. The EPA has indicated that an Ldn of 55 dBA protects the public from indoor and outdoor activity interference (EPA, 1974). We have adopted this criterion and have used it to evaluate the potential noise impacts from construction and operation of the Project. The potential for noise impacts are assessed by comparing the proposed Project's noise levels with the 55 dBA noise level criterion at the nearest NSA. For nighttime noise where the background ambient noise levels are already above the 55 dBA noise level criterion, all efforts should be made to restrict noise level increases to less than 10 dBA over background.

With regards to compressor stations, the FERC regulations at 18 CFR 380.12(k)(4)(v)(A) state that the noise attributed to any new compressor station must not exceed an L_{dn} of 55 dBA at any pre-existing NSA such as schools, hospitals, and residences. Due to the 10 dBA nighttime penalty added prior to calculation of the L_{dn}, for a facility to meet the L_{dn} 55 dBA limit, the facility must be designed such that a constant noise level on a 24-hour basis does not exceed 48.6 dBA L_{eq} at any NSA.

4.11.2.3 Noise Impacts and Mitigation

Construction Noise Impacts and Mitigation

Construction noise levels are rarely steady; instead, they fluctuate depending on the number and type of equipment in use at any given time. There would be times when no large equipment is operating and noise would be at or near existing ambient levels. In addition, construction-related sound levels experienced by a noise sensitive receptor in the vicinity of construction activity would be a function of distance, other noise sources, and the presence and extent of vegetation and intervening topography between the noise source and the sensitive receptor.

Noise level increases during construction would be intermittent and would generally occur during daylight hours, with the possible exception of HDD and conventional bore activities. Construction of the compressor station and other associated aboveground ancillary facilities would represent more localized noise sources and are discussed in conjunction with each component of the Project below.

Pipeline

Pipeline construction would result in noise along the entire length of the Project; however, noise impacts would be transient as construction progresses from one location to the next along the pipeline corridor. It is expected that construction-related noise would last for only a few days to weeks at any one location. Prevalent noise sources would come from internal combustion engines used by construction equipment (e.g., trucks, backhoes, excavators, loaders, cranes).

Construction equipment noise levels would typically be about 85 dBA at 50 feet when the equipment is operating at full load. There are about 45 occupied residences within 50 feet of the Project construction work areas. For the worst-case scenario (i.e., assuming no noise shield or barrier between the noise source and sensitive receptor), the nearest distance at which a sound level of 85 dBA attenuates to the 55 dBA noise criterion would be about 1,600 feet. Therefore, sensitive receptors within 1,600 feet of the construction equipment could be affected by the noise. However, construction noise would be intermittent and temporary, and no NSA would be expected to be exposed to significant noise levels for an extended period of time. Mountain Valley would mitigate pipeline construction-related noise by limiting most pipeline construction in residential areas to daytime hours (7:00 a.m. to 7:00 p.m) when ambient noise levels are often higher and most individuals are less sensitive to noise. In non-residential areas, Mountain Valley proposes to conduct construction activities from 7:00 a.m. to 7:00 p.m., or sunrise to sunset whichever is longer. In addition, certain construction activities may extend typical workhours, such as tie-ins, operation of pumps at waterbody crossings, and hydrostatic testing, as these activities require extended and continuous operation until the activity is complete. Low noise generating activities (e.g., x-rays, inspections, drying, etc.) may occur during limited nighttime hours. Mountain Valley would also notify local residents in advance of construction activities.

Compressor Station and Meter Stations

Construction activities for aboveground facilities would be primarily limited to daytime hours; however, specific situations related to safety, permit compliance, or other non-typical circumstances may necessitate limited nighttime work. The expected duration of construction is 18 months for the Lambert Compressor Station and 5 months for the meter stations. Mountain Valley used the FHWA Roadway Construction Noise Model (RCNM) (version 1.1) to calculate noise generated from construction of the Lambert Compressor Station and meter stations. The noisiest construction stage was determined to occur during the early earthmoving phase. Daytime work would include the use of up to three excavators, three bulldozers, three dump trucks, one generator, three drill rigs, two pile augers, and one roller (i.e., total sound power level of 129.9 dBA). Mountain Valley has indicated that they would conduct night time (24-hour) construction at certain locations, as indicated further below. Mountain Valley's noise assessment assumed the use of up to two excavators, two bulldozers, two dump trucks, three light plants, and one roller (i.e., total sound power level of 120.2 dBA).

Table 4.11-11 shows the predicted noise impacts on the worst-case NSAs from construction of the new compressor station and meter stations during the typical 12-hour daytime shift (7:00 a.m. to 7:00 p.m.). As shown in the table, noise levels due to daytime construction of the Lambert Compressor Station and LN 3600 Interconnect would be below the FERC 55 dBA L_{dn} criterion at the nearest NSAs. As a result, noise impacts from daytime construction of the

Lambert Compressor Station and LN 3600 Interconnect would be localized, temporary, and less than significant. Mountain Valley has indicated that construction at the Lambert Compressor Station may occur at night. The nighttime and 24-hour L_{dn} impacts are identified in table 4.11-12. The noise impacts are estimated to be below 55 L_{dn}; however, considering the length construction at the Lambert Compressor Station, nighttime noise may be disruptive to nearby residents due to the equipment usage and vehicle back-up alarms.

TABLE 4.11-11

Estimated Noise Levels at Nearby Noise Sensitive Areas from Construction of Aboveground Facilities (12-Hour Daytime Shift)

Station / NSA	Ambient Noise Levels (dBA)		Construction Noise (dBA)		Construction + Ambient (dBA)		Increase over Ambient (dBA)	
	L_d	L_{dn}	L_d a/	L_{dn}	L_d	L_{dn}	L_d	L_{dn}
Lambert Compressor Station/Interconnect								
NSA 1	36.8	46.8	48.7	46.6	49.0	49.7	12.2	2.9
NSA 2	36.8	46.8	46.5	44.4	46.9	48.8	10.2	2.0
NSA 3	60.4	62.8	43.8	41.7	60.5	62.8	0.1	0.0
NSA 4	38.6	44.8	42.7	40.7	44.1	46.3	5.5	1.4
LN 3600 Interconnect								
NSA 1	47.2	49.7	51.2	49.1	52.7	52.4	5.4	2.7
T-15 Dan River Interconnect								
NSA 1	63.1	65.0	64.7	**62.7**	67.0	67.0	3.9	2.0
T-21 Haw River Interconnect								
NSA 1	62.8	65.0	67.1	**65.1**	68.5	68.1	5.6	3.1

Noise levels due to daytime construction of the T-15 Dan River and T-21 Haw River Interconnects would be above the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. At these sites, the existing ambient noise levels are already above the 55 dBA noise level criterion. At the T-15 Dan River Interconnect, the noise increase above the existing day ambient noise level would be 3.9 dBA. While local residents may notice a new noise source, the overall noise increase would be barely detectable to the human ear. At the T-21 Haw River Interconnect, the noise increase above the existing day ambient noise level would be 5.6 dBA and clearly noticeable to local residents.. Although these increases would be noticeable, the noise impacts would be localized, temporary, and occurring during daytime only.

Nighttime work would be conducted for specific situations. Table 4.11-12 shows the predicted noise impacts on the worst-case NSAs from construction of the new compressor station and meter stations during a 24-hour shift.

TABLE 4.11-12

Estimated Noise Levels at Nearby Noise Sensitive Areas from Construction of Aboveground Facilities (24-Hour Shift)

Station / NSA	Ambient Noise Levels (dBA)		Construction Noise (dBA)		Construction + Ambient (dBA)		Increase over Ambient (dBA)	
	L_n	L_{dn}	L_n a/	L_{dn}	L_n	L_{dn}	L_n	L_{dn}
Lambert Compressor Station/Interconnect

T-21 Haw River Interconnect								
NSA 1	57.2	65.0	64.4	**71.5**	65.2	72.4	8.0	7.4

Mountain Valley has indicated that construction at the LN 3600, T-15 Dan River, and T-21 Haw River Interconnects may occur at night. Noise levels due to 24-hour construction of the LN 3600, T-15 Dan River, and T-21 Haw River Interconnects would all be above the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. The noise increases above the existing day-night ambient noise levels would be 5.5 to 7.4 dBA and clearly noticeable to the human ear. Although these increases would be noticeable, the noise impacts would be intermittent and temporary. Furthermore, because of the uncertainty of the equipment operating during night construction, Mountain Valley has committed to develop a *Nighttime Construction Noise Management Plan.* Mountain Valley stated that it would include specific noise mitigation, such as noise barriers, quieter equipment, or partial equipment enclosures to ensure that sound levels at the NSAs do not exceed 48.6 dBA at night or 55 dBA L_{dn} overall, or 10 dBA over the ambient for the T-15 Dan River and T-21 Haw River Interconnects with ambient levels that exceed 55 dBA L_{dn}. We agree that the plan should list the noise levels from the selected nighttime equipment at the nearest NSAs as well as site-specific mitigation measures such as noise walls, notification of residents, and indicate the resulting impacts on the NSAs.

Nighttime construction has the potential to disrupt local residents. To ensure that residents and sensitive receptors near the Lambert Compressor Station, LN 3600, T-15 Dan River, and T-21 Haw River Interconnects would not be significantly affected by the noise levels from 24-hour/nighttime construction, **we recommend that:**

- **Prior to construction, Mountain Valley should file its *Nighttime Construction Noise Management Plan* with the Secretary, for review and written approval by the Director of OEP, that demonstrates noise levels would be reduced below 48.6 dBA at night and 55 dBA L_{dn} overall at the nearest NSA, or not exceed 10 dBA over the ambient at the nearest NSA where ambient noise levels are already above 55 dBA. This plan should indicate site-specific mitigation measures and indicate resulting noise impacts on NSAs.**

Blasting

Mountain Valley would conduct blasting to excavate where shallow bedrock is encountered. Noise and vibration impacts produced during blasting would be instantaneous and would vary based on a number of factors, such as the type and amount of explosives used, distance of the receptor to the blast site, below-ground depth of explosives, and minimization measures applied. At a distance of 50 feet, typical construction blasting noise levels have been documented at about 94 dBA and vibration at about 100 vibration decibels (VdB). If the vibration level at a structure reaches 90 to 102 VdB depending on the building type, there may be damage effects (FHWA, 2006b; FTA, 2006). Mountain Valley would conduct a noise and vibration assessment for nearby structures once blasting locations are identified.

Mountain Valley would conduct blasting operations in accordance with its *General Blasting Plan* and applicable regulations. Furthermore, before any blasting occurs, Mountain Valley's contractor would complete a Project/site-specific blasting plan for approval. If blasting is necessary within 150 feet of an occupied building, store, residence, business, farm, or other occupied area, Mountain Valley would perform pre- and post-blast inspections, and provide at least a 24-hour notice prior to initiating blasting operations. Mountain Valley would control vibration by limiting the size of charges and by using charge delays, which stagger each charge in a series of explosions. In the event of a landowner complaint regarding damage from blasting, Mountain Valley would negotiate a settlement with the landowner that may include repair or replacement. With implementation of these mitigation measures, significant noise and vibration impacts from blasting are not anticipated.

Horizontal Direction Drilling

Mountain Valley would use the HDD method to install the pipeline beneath the Dan River in Rockingham County, North Carolina and the Stony Creek Reservoir, in Alamance County, North Carolina. The expected drilling duration is 8 to 12 weeks for each crossing, under normal circumstances. Noise impacts at the nearest NSAs due to 24-hour HDD activities were calculated using the computer aided noise abatement (CadnaA) noise model (version 2018, build 161.4801). The model assumed slight shielding and screening effects from the tanks and trailers on-site. Noise would be generated by HDD equipment at the entry point and at the exit point, and assumed equipment would operate simultaneously at both locations. Since Mountain Valley has yet to

decide the drilling direction, two models were constructed for each HDD (i.e., each side modeled as both entry and exit) in order to identify the work-case scenario.

HDD equipment at the entry point includes a drill rig and engine-driven hydraulic power unit, engine-driven mud pump(s) and other engine-driven generator set(s); mud mixing/cleaning equipment and associated fluid systems shale shakers; crane(s), forklift(s), front-end loader(s), and/or truck(s); and engine-driven light plants (i.e., total sound power level of 115 dBA). HDD equipment at the exit point includes a backhoe or bulldozer; engine-driven generator set and small engine-driven pump; and engine-driven light plant (i.e., total sound power level of 103 dBA).

As shown in table 4.11-13, the worst-case noise level from the Dan River HDD would be below the FERC criterion of 55 dBA L_{dn} at the nearest NSA. HDD activities at the Stony Creek Reservoir would generate noise above the 55 dBA L_{dn} criterion. At this site, Mountain Valley would implement noise mitigation as follows: (1) use residential-grade exhaust mufflers on exhaust of all engines; and (2) use of a series of 12 to 14 foot tall noise barriers located 20 feet from the primary noise source. Based on modeling conducted by Mountain Valley, the use of the proposed mitigation would reduce the estimated noise level from Stony Creek Reservoir HDD below the 55 dBA L_{dn} criterion for the nearest NSA. As such, noise impacts associated with HDD activities would be localized,temporary, and mitigated where necessary.

TABLE 4.11-13

Estimated Worst-Case Noise Levels at Nearby Noise Sensitive Areas Due to Horizontal Directional Drilling (24-Hour Shift)

HDD	Closest NSA Distance and Direction from HDD	Sound Levels (dBA)			Increase over Ambient (dBA)
		Ambient Noise Level (L_{dn})	HDD Noise (L_{dn})	HDD + Ambient (L_{dn})	
Without Mitigation					
Dan River HDD	1,400 feet N	42.8	52.9	53.3	10.5
Stony Creek Reservoir HDD	300 feet NW	39.7	**60.6**	**60.6**	20.9
With Mitigation					
Stony Creek Reservoir HDD	300 feet NW	39.7	48.6	49.2	9.5

Conventional Bore

Pipeline would be installed beneath railroad at four locations utilizing the conventional bore construction method with the following equipment: an auger boring machine, six light plants, and two backhoes. Mountain Valley expects that each railroad crossings would require 24-hour construction activities for 2 to 3 days. If problems are encountered, construction could be extended for up to 14 days.

Mountain Valley used the CadnaA noise model (version 2018 build 161.4801) to estimate noise impacts at the nearest NSAs to the railroad crossings. The model assumed slight shielding and screening effects from the tanks and trailers on-site. Table 4.11-14 shows the predicted noise impacts on the worst-case NSAs due to construction from railroad crossings during a 24-hour shift.

As shown in the table, noise levels would be below the FERC criterion of 55 dBA L_{dn} at the nearest NSAs to Railroad Crossings 1 and 2.

Noise levels from Railroad Crossings 3 and 4 would be above the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. At these two locations, Mountain Valley would implement the following noise mitigation: (1) use residential-grade exhaust mufflers on exhaust of all engines; and (2) use of a series of 12 to 14 foot tall noise barriers located 20 feet from the primary noise source. As an alternative to the noise mitigation at Railroad Crossing 3 and/or 4, Mountain Valley may consider offering the residents compensation or temporary housing as a means of reducing the temporary construction noise impact. If all affected residents choose to accept compensation or temporary housing for the duration of the work (2 to 3 days), then the mufflers and barriers would not be necessary.

As shown in table 4.11-14, with mufflers and barriers as mitigation, noise levels from Railroad Crossing 3 remain above the FERC criterion of 55 dBA L_{dn} at the nearest NSA. In the event that sensitive receptors near Railroad Crossing 3 find the noise levels to be disruptive after proposed mitigation, Mountain Valley would also offer compensation or temporary housing (e.g., hotel or motel) accommodations as warranted, until the noise levels are remedied. As such, noise impacts associated with railroad crossings activities would be localized, temporary, and mitigated where necessary.

TABLE 4.11-14

Estimated Noise Levels at Nearby Noise Sensitive Areas Due to Railroad Crossings (24-Hour Shift)

Railroad Crossing	NSA Distance and Direction from Crossing	Sound Levels (dBA)			Increase over Ambient (dBA)
		Ambient Noise Level (L_{dn})	Crossing Noise (L_{dn})	Crossing + Ambient (L_{dn})	
Without Mitigation					
Railroad Crossing 1	3,550 feet E	58.9	45.1	59.0	0.2
Railroad Crossing 2	3,000 feet S	41.1	38.3	42.9	1.8
Railroad Crossing 3	250 feet NW	45.5	**69.5**	69.5	24.0
Railroad Crossing 4	500 feet N	48.9	**65.2**	65.3	16.4
With Mitigation					
Railroad Crossing 3	250 feet NW	45.5	**57.5**	57.8	12.3
Railroad Crossing 4	500 feet N	48.9	**53.2**	54.6	5.7

Operational Noise Impacts and Mitigation

Normal operations noise from the pipeline would be negligible. The only potential sound level increases associated with operation would be noise from vehicle and equipment use during maintenance and inspection activities. However, these activities would be transient, temporary, and not significantly more audible than normal vehicle traffic at the nearest NSAs along the pipeline right-of-way.

Noise from the Lambert Compressor Station would be generated from continuous operation of the equipment listed in table 4.11-3. The increase in noise would be sustained for the life of the Project. The CadnaA noise model (version 2018 build 161.4801) was used to estimate noise impacts at the nearest NSAs to the compressor station.

The data used for modeling included available data from equipment manufacturers and noise level measurements from other similar compressor stations. The models assumed an exhaust height of 45.5 feet per the planned turbine installations and vendor proposal. Certain noise mitigation measures, such as compressor building walls, roof, doors, and ventilation; turbine exhaust silencers and breakout (capable of meeting 45 dBA at 200 feet); turbine intake silencers and breakout (capable of meeting 73 dBA at 50 feet); underground suction and discharge piping; and acoustically lagged aboveground main gas piping were included as part of the noise modeling. Further, the compressor station would be located in an area with foliage ranging from grass and crops to areas of dense woods. For a conservative assumption, no foliage shield factor was applied.

Table 4.11-15 summarizes modeled noise levels on worst-case NSAs due to typical operation of the Lambert Compressor Station. As shown in the table, noise levels at each NSA due to typical compressor station operation would be below the FERC noise limit of 55 dBA. Noise increases over the existing ambient noise levels of 0.0 dBA to 3.7 dBA would range from not detectible to barely detectible to the human ear.

TABLE 4.11-15

Estimated Noise Levels at Nearby Noise Sensitive Areas Due to Operation of the Lambert Compressor Station

NSA	NSA Distance and Direction from Station	Sound Levels (dBA)			Increase over Ambient (dBA)
		Ambient Noise Level (L_{dn})	Compressor Noise (L_{dn})	Compressor + Ambient (L_{dn})	
NSA 1	3,480 feet WSW	46.8	48.0	50.5	3.7
NSA 2	3,500 feet SW	46.8	41.6	47.9	1.1
NSA 3	3,290 feet SE	62.8	40.7	62.8	0.0
NSA 4	3,800 feet N	44.8	39.4	45.9	1.1

Once the compressor station design is finalized, Mountain Valley would finalize and modify as needed the noise mitigation to ensure compliance with the FERC requirements.. To verify that the actual noise levels resulting from operation of the Lambert Compressor Station would comply with these noise limits and would not result in significant noise impacts, **we recommend that:**

- **No later than 60 days after placing the Lambert Compressor Station (including the Interconnect) into service, Mountain Valley should file a noise survey with the Secretary. If a full load condition noise survey is not possible, Mountain Valley should provide an interim survey at the maximum possible load within 60 days of placing the station into service and provide the full load survey within 6 months. If the noise attributable to the operation of the**

equipment at the station under interim or full load conditions exceeds an L_{dn} of 55 dBA at the nearest NSA, Mountain Valley should file a report on what changes are needed and should install the additional noise controls to meet the level within 1 year of the in-service date. Mountain Valley should confirm compliance with the above requirement by filing a second noise survey with the Secretary no later than 60 days after it installs the additional noise controls.

Compressor Station Maintenance Blowdowns/Venting

A maintenance blowdown would occur at the Lambert Compressor Station when a unit is shut down for an extended period. It entails releasing of high pressure gas in the system in a controlled fashion (through a blowdown silencer capable of meeting 85 dBA at 3 feet) causing a temporary increase of noise level lasting approximately 5 minutes.

During a maintenance blowdown event, the worst-case predicted noise level (i.e., during nighttime) at the worst-case NSA would be below the FERC 55 dBA limit as shown in table 4.11-16. The noise increase above the existing nighttime ambient noise level would be 0.6 dBA and likely not detectible to the human ear. As a result, noise impacts from maintenance blowdowns would be negligible.

TABLE 4.11-16

Estimated Noise Levels at Nearby Noise Sensitive Areas Due to Maintenance Blowdown at the Lambert Compressor Station

NSA	NSA Distance and Direction from Station	Sound Levels (dBA)			Increase over Ambient (dBA)
		Ambient Noise Level (L_n)	Blowdown Noise (L_n)	Blowdown + Ambient (L_n)	
NSA 1	3,480 feet WSW	44.5	36.8	45.1	0.6

Compressor Station Emergency Shutdown

An ESD blowdown event would occur at the Lambert Compression Station when the ESD system senses irregularity in operation and automatically shuts down the whole station. This would cause elevated noise due to the release of gas from all of the station's piping through a series of silencers. The estimated noise from the discharge, suction, and fuel gas vents are 138, 133, and 120 dBA, respectively, which would be high enough to be audible within a 1-mile radius. However, these noise levels would occur only during the first few seconds of ESD venting, during the period with the highest upstream pressure. Thereafter, the noise levels would drop quickly over the 10-minute venting period as the upstream pressure decreases.

Table 4.11-17 shows the estimated maximum noise level (L_{max}) and 10-minute average noise level (L_{eq}) on worst-case NSAs from an emergency shutdown of the Lambert Compressor Station. As shown in the table, the noise levels would be below the FERC noise limit of 55 dBA for all NSAs during a 24-hour average period. Because ESD blowdown events are extremely rare and would take place only in the event of an emergency or when the system is tested once every

year, impacts on NSAs would not be considered significant. Mountain Valley is in discussion with Pittsylvania County to assess applicability of the Pittsylvania County Noise Ordinance with regards to ESD blowdown events. Information will be updated in the final EIS.

TABLE 4.11-17

Estimated Noise Levels at Nearby Noise Sensitive Areas Due to Emergency Shutdown of the Lambert Compressor Station

NSA	NSA Distance and Direction from Station	Sound Levels (dBA)					
		Ambient Noise Level (L_{dn})	Maximum ESD Noise (L_{max})	10-Minute Average ESD Noise (L_{eq})	24-Hour Average ESD Noise (L_{dn})	ESD + Ambient (L_{dn})	Increase over Ambient (dBA)
NSA 1	3,480 feet WSW	46.8	63.9	58.9	47.3	50.1	3.3
NSA 2	3,500 feet SW	46.8	63.4	58.4	46.8	49.8	3.0
NSA 3	3,290 feet SE	62.8	56.1	51.1	39.5	62.8	0.0
NSA 4	3,800 feet N	44.8	55.5	50.5	38.9	45.8	1.0

Compressor Station Vibration

Mountain Valley conducted an analysis of the impacts of low-frequency[54] noise at Lambert Compressor Stations to assess the potential for vibration at nearby NSAs. Pursuant to ANSI 12.2-2008 Criteria for Evaluating Room Noise, low-frequency noise can result in acoustically induced vibrations if the sound pressure level (SPL) is above 65 dB in the 31.5 Hertz (Hz) octave band or above 70 dB in the 63 Hz octave band. The Lambert Compressor Station would generate approximately 50 dB at 31.5 Hz and 50 dB at 63 Hz at the closest NSA. Consequently, we conclude there would be no adverse low-frequency noise induced vibration at any NSA from operation of compressor station.

Meter Stations

Noise from the associated meter stations would be generated mainly by flow control valves installed at each interconnect. The increase in sound would be for the life of the Project. Table 4.11-18 shows the predicted operational worst-case noise levels at the nearest NSAs. As shown in the table, the noise levels contributed by operations of the interconnects would not exceed the FERC noise criterion of 55 dBA. Noise level increases over the existing ambient at NSAs would be 0.0 to 0.1 dBA, which is likely not detectible to the human ear. As a result, noise impacts from meter stations would be negligible.

[54] Frequency is the number of times sound fluctuation occurs measured in cycles per second called Hertz (Hz). Human hearing covers the frequency range of 20 Hz to 20,000 Hz (FTA, 2006).

TABLE 4.11-18

Estimated Noise Levels at Nearby Noise Sensitive Areas Due to Operation of the Meter Stations

Meter Station a/	NSA Distance and Direction from Station	Sound Levels (dBA)			Increase over Ambient (dBA)
		Ambient Noise Level (L_{dn})	Station Noise (L_{dn})	Station + Ambient (L_{dn})	
LN 3600 Interconnect	1,700 feet NNW	49.7	27.7	49.7	0.0
T-15 Dan River Interconnect	750 feet S	65.0	46.8	65.1	0.1
T-21 Haw River Interconnect	550 feet N	65.0	41.8	65.0	0.0

a/ Noise levels for the Lambert Interconnect are included with the Lambert Compressor Station; see table 4.11-15.

4.11.2.4 Conclusions Regarding Noise Impacts and Mitigation

Noise generated during the construction phase would cause noise levels above the FERC noise criterion at certain NSAs. Construction noise would be heard by members of the public and residents near to the construction areas. However, construction noise is typically temporary and localized. With implementation of the measures proposed by the Mountain Valley and recommended by FERC, construction noise impacts would be minimized or mitigated to the extent practicable. Similarly, operational noise impacts would be limited to areas near the aboveground facilities. Considering Mountain Valley's proposed mitigation measures and our recommendations, all aboveground facilities would comply with our noise criteria of 55 dBA L_{dn} and they should cause no adverse noise vibration. Therefore, we conclude that the noise associated with construction and operation of the Project would not result in a significant impact on the local noise environment and residents.

4.12 RELIABILITY AND SAFETY

The transportation of natural gas by pipeline involves some incremental risk to the public due to the potential for an accidental release of natural gas. In the unlikely event of a leak, natural gas, which is lighter than air, should dissipate into the atmosphere. However, a spark or ignition at the point of the release could result in a fire or explosion following a major pipeline rupture. Those risks are ameliorated by pipeline design and safety regulations mandated by the DOT, and measures that would be implemented by Mountain Valley as part of its *Emergency Response Plans*[55]. Below we discuss historic incidents, in order to quantify risks.

The primary component of natural gas, CH_4, is colorless, odorless, and tasteless. It is not toxic, but is classified as a simple asphyxiate, possessing a slight inhalation hazard. If breathed in high concentration, oxygen deficiency can result in serious injury or death. To reduce the hazards release of natural gas compressor station's pneumatic control systems are designed to use

[55] Mountain Valley's Emergency Response Plan was included as Attachment 1d-1 to Mountain Valley's March 5, 2019 response to the February 13, 2019 FERC EIR. The Emergency Response Plan can be viewed on the FERC website at http://www.ferc.gov. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20190305-5214 in the "Numbers: Accession Number" field.

compressed air rather than natural gas, which minimizes any venting or leaking at stations. Further, the use of turbine compressors instead of reciprocating compressors and micro-turbines for on-site power instead of reciprocating compressor generators act to prevent or minimize leakage.

Natural gas is buoyant at atmospheric temperatures and disperses rapidly in air. An unconfined mixture of CH_4 and air is not explosive; however, it may ignite if there is an ignition source. Methane has an auto-ignition temperature of 1,000°F and is flammable at concentrations between 5.0 percent and 15.0 percent in air. A flammable concentration of natural gas within an enclosed space in the presence of an ignition source can explode.

4.12.1 Safety Standards

The DOT is mandated to regulate pipeline safety under 49 U.S.C. 601. The DOT's PHMSA administers the national regulatory pipeline safety program for the nation's interstate and intrastate pipelines and requires that pipeline operators design, construct, test, operate, and maintain their pipeline facilities in compliance with the federal pipeline safety regulations. Many of the regulations are written as performance standards, which set the level of safety to be attained and allow the pipeline operator to use various technologies to achieve safety.

PHMSA works closely with state pipeline safety programs. The DOT provides for a state agency to assume all aspects of the safety program for intrastate facilities by adopting and enforcing, at a minimum, the federal standards. A state may also act as the DOT's agent to inspect interstate facilities within its boundaries; however, the DOT is responsible for enforcement actions.

The DOT pipeline standards are published in 49 CFR 190-199. Part 192 specifically addresses the minimum federal safety standards for transportation of natural gas by pipeline.

Under a *Memorandum of Understanding on Natural Gas Transportation Facilities* dated January 15, 1993, between the DOT and the FERC, the DOT has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. Section 157.14(a)(9)(vi) of the FERC's regulations require that an applicant certify that it would design, install, inspect, test, construct, operate, replace, and maintain the facility for which a Certificate is requested in accordance with federal safety standards and plans for maintenance and inspection, or certify that it has been granted a waiver of the requirements of the safety standards by the DOT in accordance with Section 3(e) of the Natural Gas Pipeline Safety Act. The FERC accepts this certification and does not impose additional safety standards other than the DOT standards. If the Commission becomes aware of an existing or potential safety problem, there is a provision in the Memorandum to promptly alert the DOT. The Memorandum also provides for referring complaints and inquiries made by state and local governments and the public involving safety matters related to pipelines under the Commission's jurisdiction.

The FERC also participates as a member of the DOT's Technical Pipeline Safety Standards Committee, which determines if proposed safety regulations are reasonable, feasible, and practicable. The pipeline and aboveground facilities associated with the Project must be designed, constructed, operated, and maintained in accordance with the DOT's *Minimum Federal Safety Standards* in 49 CFR 192. The regulations are intended to ensure adequate protection for the

public and to prevent natural gas facility accidents and failures. The DOT regulations specify material requirements and qualification; minimum design requirements; and protection from internal, external, and atmospheric corrosion.

The federal pipeline safety regulations also define area classifications, based on population density near pipeline facilities, and specify more rigorous safety requirements for populated areas. The class location unit is an area that extends 220 yards on either side of the centerline of any continuous 1-mile length of pipeline.

The four area classifications are defined below:

- Class 1 – Location with 10 or fewer buildings intended for human occupancy;
- Class 2 – Location with more than 10 but less than 46 buildings intended for human occupancy;
- Class 3 – Location with 46 or more buildings intended for human occupancy or where the pipeline lies within 100 yards of any building, or small well-defined outside area occupied by 20 or more people on at least 5 days a week for 10 weeks in any 12-month period; and
- Class 4 – Location where buildings with four or more stories aboveground are prevalent.

Class locations representing more populated areas require higher safety factors in pipeline design, testing, and operation. For example, pipelines constructed on land in Class 1 locations must be installed with a minimum depth of cover of 30 inches in normal soil and 18 inches in consolidated rock. Class 2, 3, and 4 locations, as well as drainage ditches of public roads and railroad crossings, require a minimum cover of 36 inches in normal soil and 24 inches in consolidated rock.

Class locations also specify the maximum distance to a sectionalizing block valve (i.e., 10.0 miles in Class 1, 7.5 miles in Class 2, 4.0 miles in Class 3, and 2.5 miles in Class 4 locations). Pipe wall thickness and pipeline design pressures; hydrostatic test pressures; MAOP; inspection and testing of welds; and frequency of pipeline patrols and leak surveys must conform to higher standards in more populated areas. Class locations for the Project have been determined based on the relationship of the pipeline centerline to other nearby structures and manmade features. Table 4.12-1 summarizes the class locations for the Project. The majority of the pipeline routes would be in Class 1 areas.

TABLE 4.12-1

Lengths of Area Classifications Crossed by the Southgate Project

Mountain Valley Southgate Project Total	**51.49**	**25.41**	**1.78**

Mountain Valley has procedures in place to monitor for changes in population density. If a subsequent increase in population density adjacent to the right-of-way results in a change in class location for the pipeline, Mountain Valley would revise the MAOP to conform to the new class. This would be achieved by reducing the MAOP or replacing the segment with pipe of sufficient grade and wall thickness, if required to comply with DOT requirements for the new class location. Mountain Valley has stated that it would also increase pipeline patrol frequency and pressure testing, or would decrease the percent specified minimum yield strength (pipeline stress) of a pipe segment in areas where population densities change.

The DOT Pipeline Safety Regulations require operators to develop and follow a written Integrity Management Program (IMP) that contain all the elements described in 49 CFR 192.911 and address the risks on each transmission pipeline segment. Specifically, the rule establishes an IMP that applies to all High Consequence Areas (HCA).

We received comments about the potential effects of a pipeline rupture and natural gas ignition. It should be noted that if a pipeline rupture does occur, the natural gas does not necessarily ignite. However, the DOT has published rules that define HCAs where a gas pipeline accident could do considerable harm to people and their property and requires an IMP to minimize the potential for an accident. This definition satisfies, in part, the Congressional mandate for the DOT to prescribe standards that establish criteria for identifying each gas pipeline facility in a high-density population area.

The HCAs may be defined in one of two ways. In the first method, an HCA includes:

- current Class 3 and 4 locations;
- any area in Class 1 or 2 where the potential impact radius is greater than 660 feet and there are 20 or more buildings intended for human occupancy within the potential impact circle[56]; or

[56] The potential impact circle is a circle of radius equal to the potential impact radius.

- any area in Class 1 or 2 where the potential impact circle includes an identified site.

An "identified site" is an outside area or open structure that is occupied by 20 or more persons on at least 50 days in any 12-month period; a building that is occupied by 20 or more persons on at least 5 days a week for any 10 weeks in any 12-month period; or a facility that is occupied by persons who are confined, are of impaired mobility, or would be difficult to evacuate.

The PIR for the 16- and 24-inch-diameter Project with a MAOP of 1,440 psig is 419 feet and 628 feet, respectively.

In the second method, an HCA includes any area within a potential impact circle that contains:

- 20 or more buildings intended for human occupancy; or
- an identified site.

Once a pipeline operator has determined the HCAs along its pipeline, it must apply the elements of its IMP to those sections of the pipeline within HCAs. The DOT regulations specify the requirements for the integrity management plan in Subpart O of Part 192, Gas Transmission Pipeline Integrity Management. Table 4.12-2 lists the HCAs for the Project, which have been determined based on the relationship of the pipeline centerline to nearby structures.

The pipeline and aboveground facilities for the Project would be designed, constructed, operated, and maintained in accordance with the DOT's *Minimum Federal Safety Standards* in 49 CFR 192. The general construction methods that Mountain Valley would implement to ensure the safety of the Project are described in section 2.0, including welding, inspection, and integrity testing procedures.

The DOT prescribes the minimum standards for operating and maintaining pipeline facilities, including the requirement to establish a written plan governing these activities. Each pipeline operator is required to establish an emergency plan that includes procedures to minimize the hazards in a natural gas pipeline emergency. Key elements of the plan include procedures for:

- receiving, identifying, and classifying emergency events, gas leakage, fires, explosions, and natural disasters;
- establishing and maintaining communications with local fire, police, and public officials, and coordinating emergency response;
- emergency system shutdown and safe restoration of service;
- making personnel, equipment, tools, and materials available at the scene of an emergency; and
- protecting people first and then property, and making them safe from actual or potential hazards.

In addition to adhering to the requirements described above, the integrity of completed welds would be visually inspected and tested using non-destructive methods such as x-ray radiography or ultrasound. Any unacceptable welds would be repaired and re-welded. Mountain Valley has also stated that it would meet or exceed pipeline safety regulations including installing remote controlled vales, which are not currently required by PHMSA.

The DOT requires pipeline operators to place pipeline markers at frequent intervals along the pipeline rights-of-way, such as where a pipeline intersects a street, highway, railway, or waterway, and at other prominent points along the route. Pipeline right-of-way markers can help prevent encroachment and excavation-related damage to pipelines. Because the pipeline right-of-way is much wider than the pipeline itself, and a pipeline can be anywhere within the right-of-way, state laws require excavators to call their state One Call center well in advance of digging to locate underground utilities and ensure it is safe for the contractor to dig in that location. Pipeline markers identifying the owner of the pipe and a 24-hour telephone number would be placed for

"line of sight" visibility along the entire pipeline length, except in active agricultural crop locations and in waterbodies in accordance with the DOT's requirements.

In accordance with DOT regulations, the proposed facilities would be regularly inspected for leakage and potential pipeline hazards such as construction activity, encroachments, and evidence of recent unmonitored excavations as part of scheduled operations and maintenance, including:

- physically walking and inspecting the pipeline corridor periodically;
- conducting fly-over inspections of the right-of-way as required;
- inspecting and maintaining MLVs and meter stations; and
- conducting leak surveys at least once every calendar year or as required by regulations.

Cathodic protection would be installed along the entire length of the new pipelines to prevent corrosion. Mountain Valley personnel would check the voltage and amperage at regular intervals as well as the pipe-to-soil potentials and rectifiers. In addition, annual surveys are completed, as described above.

The DOT regulations specified in Part 192 require that the applicant establish and maintain liaison with appropriate fire, police, and public officials to learn the resources and responsibilities of each organization that may respond to a natural gas pipeline emergency, and to coordinate mutual assistance. Mountain Valley would utilize the emergency procedures contained in the Project *Emergency Response Plan*, which require communication with emergency responders on an annual basis. Local contact phone numbers, external contact information, equipment or resources available for mobilization, and any specific procedures to be followed for Mountain Valley would be incorporated into the *Emergency Response Plan* prior to commencement of pipeline operations. The fire departments of the states of Virginia and North Carolina have specific requirements for staffing, training, and equipment that allow them to fight pipeline related fires. The locations of fire stations in proximity to the Project are provided in section 4.9.3.

Mountain Valley would also establish a continuing education program to enable customers, the public, government officials, and those engaged in excavation activities to recognize a gas pipeline emergency and report it to appropriate public officials.

Mountain Valley would establish and maintain liaison with appropriate fire, police, and public officials in a variety of ways. Mountain Valley's annual communications would include the following information:

- the potential hazards associated with Project facilities located in their service area and prevention measures undertaken;
- the types of emergencies that may occur on or near the Mountain Valley's facilities;
- the purpose of pipeline markers and the information contained on them;

- pipeline location information and the availability of the National Pipeline Mapping System;
- recognition of and response to pipeline emergencies; and
- procedures to contact Mountain Valley for more information.

Mountain Valley's communications with local emergency responders may involve individual meetings, group meetings, or direct mailings to build and maintain a relationship with the appropriate emergency personnel and ensure their knowledge and familiarity with ESD and isolation systems and protocol. In addition, Mountain Valley would perform and financially support periodic emergency exercises and mock emergency drills with local government, law enforcement, and emergency response agencies, subject to agency availability and willingness to participate. Additional training materials, including the PHMSA – Emergency Response Guidebook, National Association of State Fire Marshals – Pipeline Emergencies textbook, would also be made available to emergency personnel.

On October 1, 2019 the PHMSA issued new regulations modifying and expanding the standard pipeline safety standards under 49 CFR Parts 191 and 192. These regulations, in part, established: new standards for in-line inspections; requirements for newly established moderate consequence areas (MCA); explicitly requires consideration of seismicity and geotechnical risks in its integrity management plan for the pipeline; new regulations on pipeline patrol frequency HCAs, MCAs and grandfathered pipelines; a policy to reconfirm MAOP for certain pipelines; installation of pressure relief for pig launcher/receivers, and report exceedances of MAOP to PHMSA. These regulations go into effect on July 1, 2020.

4.12.2 Pipeline Accident Data

The DOT requires all operators of natural gas transmission pipelines to notify the National Response Center at the earliest practicable moment following the discovery of an incident and to submit a report within 30 days to PHMSA. On January 19, 2017, PHMSA issued a final rule entitled, "Operator Qualification, Cost Recovery, Accident and Incident Notification, and Other Pipeline Safety Changes." The rulemaking lays out a specific timeframe requirement for telephonic or electronic notifications of accidents and incidents. The rule also amends drug and alcohol testing requirements, and incorporates consensus standards by reference for inline inspection and Stress Corrosion Cracking Direct Assessment. The rule addresses mandates included in the Pipeline Safety, Regulatory Certainty, and Job Creation Act of 2011. Incidents are defined as any leaks that:

- caused a death or personal injury requiring hospitalization; or
- involve property damage, including cost of gas lost, of more than $50,000, in 1984 dollars (approximately $115,499.04 in 2016 [Bureau of Labor and Statistics, 2016]).

During the period from 1999 through 2018, 2,119 significant incidents were reported on the more than 301,000 total miles of natural gas transmission pipelines nationwide (PHMSA, 2017).

Additional insight into the nature of service incidents may be found by examining the primary factors that caused the failures. Table 4.12-3 provides a distribution of the causal factors as well as the number of each incident by cause from 1999 to 2018.

TABLE 4.12-3

Natural Gas Transmission Dominant Incident Causes, 1999 – 2018

Incident	Number of Incidents	Percentage
Corrosion	410	19.3
Excavation **a/**	340	16.0
Pipeline material, weld, or equipment failure	704	33.2

Outside force **b/**	148	7.0
Incorrect operation	85	4.0
All other causes **c/**	203	9.6
Total	**2,119**	**100**

a/ Includes third-party damage
b/ Fire, explosion, vehicle damage, previous damage, and unintentional damage
c/ Miscellaneous causes or other unknown causes
Source: PHMSA, 2019

The dominant causes of pipeline incidents from 1999 to 2018 were corrosion and pipeline material, weld, or equipment failure, constituting 33.2 percent of all significant incidents. The pipelines included in the data set in table 4.12-3 vary widely in terms of age, diameter, and level of corrosion control. Each variable influences the incident frequency that may be expected for a specific segment of pipeline.

The frequency of significant incidents is strongly dependent on pipeline age. Older pipelines have a higher frequency of corrosion incidents because corrosion is a time-dependent process. Jones et al. (1986) compared reported incidents with the presence or absence of cathodic protection and protective coatings. The results of that study, summarized in table 4.12-4, indicated that corrosion control was effective in reducing the incidence of failures caused by external corrosion. The use of both an external protective coating and a cathodic protection system, required on all pipelines installed after July 1971, significantly reduces the corrosion rate compared to unprotected or partially protected pipe. The data also indicate that cathodically protected pipe without a protective coating actually has a higher corrosion rate than unprotected pipe. This anomaly reflects the retrofitting of cathodic protection to actively corroding spots on pipes.

TABLE 4.12-4

Incidents Caused by External Corrosion and Level of Protection (1970 – June 1984)

Corrosion Control	Incidents per 100 Miles per Year
None – bare pipe	0.42
Cathodic protection only	0.97
Coated only	0.40
Coated and cathodic protection	0.11

Source: Jones et al., 1986

Older pipelines also have a higher frequency of outside forces incidents partly because their location may be less well known and less well marked than newer lines. In addition, the older pipelines contain a disproportionate number of smaller-diameter pipelines, which are more easily crushed or broken by mechanical equipment or earth movements (Jones et al., 1986).

Outside force, excavation, and natural forces were the cause in 33.8 percent of significant pipeline incidents from 1999 to 2018. These result from the encroachment of mechanical equipment such as bulldozers and backhoes; earth movements due to soil settlement, washouts, or geological hazards; and weather effects such as winds, storms, and thermal strains; and willful damage. Table 4.12-5 provides a breakdown of outside force incidents by cause.

Since 1982, operators have been required to participate in "One Call" public utility programs in populated areas to minimize unauthorized excavation activities in the vicinity of pipelines. The One Call program is a service used by public utilities and some private sector companies (e.g., oil pipelines and cable television) to provide pre-construction information to contractors or other maintenance workers on the underground location of pipes, cables, and culverts.

TABLE 4.12-5

Outside Forces Incidents by Cause (1999 – 2018) a/

Cause	Number of Incidents	Percent of All Incidents
Operator excavation damage	48	2.3

4.12.3 Impacts on Public Safety

The service incident data summarized in table 4.12-3 include pipeline failures of all magnitudes with widely varying consequences. Table 4.12-6 presents the average annual fatalities that occurred on natural gas transmission lines between 2010 and 2018. The data have been separated into employees and nonemployees to better identify a fatality rate experienced by the general public. Fatalities among the public averaged three per year over the 20-year period from 1999 to 2018.

TABLE 4.12-6

Injuries and Fatalities – Natural Gas Transmission Pipelines

	Injuries		Fatalities	
Year	Employees	Public	Employees	Public
2010 a/	3	58	0	10
2011	1	0	0	0
2012	1	6	0	0
2013	0	2	0	0
2014	1	0	1	0
2015	1	13	4	2

2017	1	2	1	2
2018	2	5	0	1

a/ All of the public injuries and fatalities in 2010 were due to the Pacific Gas and Electric pipeline rupture and fire in San Bruno, California on September 9, 2010.
Source: PHMSA, 2019a

The majority of fatalities from natural gas pipelines are associated with local distribution pipelines. These pipelines are not regulated by the FERC; they distribute natural gas to homes and businesses after transportation through interstate transmission pipelines. In general, these distribution lines are smaller-diameter pipes and/or plastic pipes that are more susceptible to damage. In addition, local distribution systems do not have large rights-of-way and pipeline markers common to the FERC-regulated interstate natural gas transmission pipelines. Therefore, incident statistics inclusive of distribution pipelines are inappropriate to use when considering natural gas transmission projects.

The nationwide totals of accidental fatalities from various anthropogenic and natural hazards are listed in table 4.12-7 in order to provide a relative measure of the industry-wide safety of natural gas transmission pipelines. Direct comparisons between accident categories should be made cautiously because individual exposures to hazards are not uniform among all categories. As indicated in table 4.12-7, the number of fatalities associated with natural gas facilities is much lower than the fatalities from natural hazards such as lightning, tornados, floods, earthquakes, etc.

The available data show that natural gas transmission pipelines continue to be a safe, reliable means of energy transportation. From 1999 to 2018, there were an average of 106 significant incidents and 3 fatalities per year. The number of significant incidents distributed over the more than 300,000 miles of natural gas transmission pipelines indicates the risk is low for an incident at any given location. The rate of total fatalities for the nationwide natural gas transmission lines in-service is approximately 0.01 per year per 1,000 miles of pipeline. Thus, operation of the Project would represent only a slight increase in risk to the nearby public.

TABLE 4.12-7

4.12.4 Terrorism and Security Issues

Safety and security concerns have changed the way pipeline operators as well as regulators must consider terrorism, both in approving new projects and in operating existing facilities. The U.S. Department of Homeland Security is tasked with the mission of coordinating the efforts of all executive departments and agencies to detect, prepare for, prevent, protect against, respond to, and recover from terrorist attacks within the United States. Among its responsibilities, the U.S. Department of Homeland Security oversees the Homeland Infrastructure Threat and Risk Analysis Center, which analyzes and implements the National Critical Infrastructure Prioritization Program that identifies and lists Tier 1 and Tier 2 assets. The Tier 1 and Tier 2 lists are key components of infrastructure protection programs and are used to prioritize infrastructure protection, response, and recovery activities. The Commission, in cooperation with other federal agencies, industry trade groups, and interstate natural gas companies, is working to improve pipeline security practices, strengthen communications within the industry, and extend public outreach in an ongoing effort to secure pipeline infrastructure.

The Commission, like other federal agencies, is faced with a dilemma in how much information can be offered to the public while still providing a significant level of protection to the facility. Consequently, the Commission has taken measures to limit the distribution of information to the public regarding facility design to minimize the risk of sabotage. Facility design and location information has been removed from the FERC's website to ensure that sensitive information filed as Critical Energy Infrastructure Information is not readily available to the public (Docket No. RM06-23-000, issued October 30, 2007 and effective as of December 14, 2007).

The likelihood of future acts of terrorism or sabotage occurring along the Project or at any of the myriad natural gas pipeline or energy facilities throughout the United States is unpredictable given the disparate motives and abilities of terrorist groups. Further, the Commission, in cooperation with other federal agencies, industry trade groups, and interstate natural gas companies, is working to improve pipeline security practices, strengthen communications within the industry, and extend public outreach in an ongoing effort to secure pipeline infrastructure.

In accordance with the DOT surveillance requirements, Mountain Valley would incorporate air and ground inspection of its proposed facilities into its inspection and maintenance program. Security measures at the new aboveground facilities would include secure fencing.

Despite the ongoing potential for terrorist acts along any of the nation's natural gas infrastructure, the continuing need for the construction of these facilities is not eliminated. Given the continued need for natural gas conveyance and the unpredictable nature of terrorist attacks, the efforts of the Commission, the DOT, and the U.S. Department of Homeland Security to continually improve pipeline safety would minimize the risk of terrorist sabotage of the projects to the maximum extent practical, while still meeting the nation's natural gas needs. Moreover, the unpredictable possibility of such acts does not support a finding that these particular projects should not be constructed.

4.12.5 Reliability and Safety Conclusion

The pipeline and aboveground facilities associated with the Project will be designed, constructed, operated, and maintained to meet the DOT *Minimum Federal Safety Standards* in 49 CFR 192 and other applicable federal and state regulations. These regulations include specifications for material selection and qualification; minimum design requirements; and protection of the pipeline from internal, external, and atmospheric corrosion. The DOT rules require regular inspection and maintenance, including repairs as necessary, to ensure the pipeline has adequate strength to transport natural gas safely.

We received several comments about the potential effects of a pipeline rupture and natural gas ignition (the area of potential effect is sometimes referred to as the potential impact radius). While a pipeline rupture does not necessarily ignite, the DOT does publish rules that define HCAs where a gas pipeline accident could do considerable harm to people and their property and requires an IMP to minimize the potential for an accident. Mountain Valley would follow federal safety standards for pipeline class locations based on population density. The DOT regulations are designed to ensure adequate safety measures are implemented to protect all populations. We conclude that Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety.

4.13 CUMULATIVE IMPACTS

Cumulative impacts are those that result from adding a project's impacts on a specific resource to the impacts of other past, present, and reasonably foreseeable projects' impacts on that same resource. We identified other projects near the Southgate Project to determine whether the Southgate Project's impacts would result in a cumulative impact on the environment when combined with other projects' impacts. Although the individual impact of each separate project may be minor, the additive effects of multiple projects could be significant.

The environment that would be affected by the Southgate Project, as it exists today reflects the impacts of natural processes, human influences, and other innumerable activities occurring over thousands of years. Beginning with the original settlement of North America by Native Americans, the Southgate Project area has been affected by human activities for over 15,000 years. European settlers arriving in the 17th Century further affected the environment through increased agricultural and timbering activities. As the human population grew, resources such as wetlands and forests were modified or converted to satisfy growing demand for land and timber. Since 1977, the annual loss of forested land in Virginia is estimated to be 16,000 acres per year (VADOF, 2018). The majority of this loss has been attributed to urban development, followed by agriculture (VADOF, 2019). Similarly, it is estimated that at least half of the wetlands in North Carolina have been lost since pre-Colonial times (Dahl, 1990); however, it is difficult to determine an exact figure given the lack of reliable historical data. Wetland loss is attributed to changes in land use practices such as farming and residential development (USGS, 1996). Forested land in North Carolina has declined by approximately 1.6 million acres since the mid-1960's (NCFS, 2017b). Today approximately 19 million people reside in Virginia and North Carolina combined.

Although the region has been substantially affected by human activity, natural resources remain throughout the landscape. Based on USGS data, Virginia and North Carolina currently have a total of approximately 1.0 and 5.7 million acres of wetlands, respectively. In 2018, the

VADOF estimated more than 62 percent of the state, approximately 16 million acres, qualified as forestland (VADOF, 2018). North Carolina's forests were estimated to cover 18.8 million acres as of 2017, or 60 percent of the land area in the state (NCFS, 2017b).

As described in the previous sections, the existing environment is representative of the impacts of past projects and actions. In this analysis, we consider the impacts of past projects to have become part of the affected environment (environmental baseline), which is described and evaluated in the preceding environmental analyses; however, ongoing effects of past actions that are relevant to the analysis are also considered. Furthermore, the CEQ in a memorandum regarding analysis of past actions issued on June 24, 2005, stated: "agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." (CEQ, 2005). "Present" projects are those currently ongoing (either being constructed or are in operation) and affecting the environment in such a manner that could contribute to a cumulative impact. "Reasonably foreseeable" projects are proposed projects or developments that have applied for a permit from a local, state, or federal authority or planned projects, which have been publicly announced.

For a cumulative impact to occur, another project(s) must impact the same resource(s) as the Southgate Project. Impacts often vary in extent and duration. For example, a project's impact on cultural resource sites is localized in nature, with some exceptions, and typically not affecting other sites. Whereas, a project's impact on air quality could be measured over a relatively large distance. We account for this variation by considering resource-specific geographic scopes. Within each geographic scope, other projects' impacts when combined with those of the Southgate Project could result in a cumulative impact. Continuing the use of cultural resources and air quality as examples, the geographic scope for cultural resources is limited to the area within which sites could be directly or indirectly affected by another project(s) and would be significantly smaller than the geographic scope for air quality. Projects located outside a geographic scope are not evaluated because their potential to contribute to a cumulative impact diminishes with increasing distance from the Southgate Project. Table 4.13-1 describes the resource-specific geographic scopes for this cumulative impact analysis.

When determining the significance of a cumulative impact, we consider the duration of the impact; the geographic, biological, and/or social context in which the impact would occur; and the magnitude and intensity of the impact. For the purposes of this analysis, we are including the following resources: soils, groundwater, surface water, and wetlands; vegetation; wildlife; fisheries and aquatic resources; land use, recreation, special interest areas, and visual resources; socioeconomics and environmental justice; cultural resources; and air quality and noise. Most of the impacts resulting from construction and operation of the Southgate Project would be temporary and localized, would be contained within the right-of-way and extra workspaces, and when added to the impacts of other projects are not expected to result in significant cumulative impacts. Exceptions to the limited nature of cumulative impacts exist where the impacts may migrate outside of designated work areas, such as turbidity and sedimentation, air emissions, and noise. Impacts geological resources are localized, temporary, and limited to the immediate Southgate Project workspace, and therefore, we determined that cumulative impacts would not occur on geological resources. For each environmental resource, the potential direct and indirect impacts associated with the Southgate Project are discussed in relation to the cumulative effects that may occur when they are added to other past, present, or reasonably foreseeable projects within the geographic scope of analysis, as described below.

TABLE 4.13-1

Geographic Scope for Cumulative Impact Analysis

Resource(s)	Cumulative Impact Geographic Scope	Justification for Geographic Scope
Soils	Construction workspaces	Impacts on soils would be highly localized and primarily limited to the Southgate Project footprint during active construction. Cumulative impacts would only occur if other geographically overlapping or abutting projects were constructed at the same time as the Southgate Project.
Groundwater, Wetlands, Vegetation, Wildlife	Hydrologic Unit Code (HUC) 12 Watershed	A HUC-12 watershed is a natural boundary to appropriately assess impacts on most biological resources including wetlands, vegetation, and wildlife. The HUC-12 sub-basin also accounts for the potential of inadvertent spills that could affect groundwater. Cumulative effects on biological resources typically are assessed within watershed boundaries due to the connectivity between biotic and abiotic resources that occurs within a drainage system. We chose the HUC-12 sub-level watershed for these resources because of the small scale of the Southgate Project's ground disturbance in relation to the area encompassing surrounding watersheds.
Surface Water Resources, Fish, and Aquatic Life	HUC-10 Watershed. Includes potential overlapping impacts from sedimentation, turbidity, and water quality for direct in-water work.	Based on our findings throughout the previous sections of this EIS and given the anticipated scale of impacts the Southgate Project would have on surface water resources, fish, and aquatic life, the natural, ecological boundaries of a HUC-10 watershed is the appropriate geographic scope for this analysis.
Cultural Resources	Overlapping impacts within the APE	The APE for direct effects (physical) includes areas subject to ground disturbance, while the APE for indirect effects (visual or audible) includes aboveground ancillary facilities or other Southgate Project elements that are visible from historic properties in which the setting contributes to their NRHP eligibility.

TABLE 4.13-1

Geographic Scope for Cumulative Impact Analysis

Resource(s)	Cumulative Impact Geographic Scope	Justification for Geographic Scope
Land Use	1-mile radius	Impacts on general land uses would be restricted to the construction workspaces and the immediate surrounding vicinity; therefore, the geographic scope for land use and recreation is a 1.0-mile radius from the centerline of the Southgate Project pipeline and aboveground facility sites.
Visual	Viewshed: Includes distance that the tallest feature at the planned facility would be visible from neighboring communities for aboveground facilities. For pipelines, a distance of 0.25 mile and existing visual access points (e.g., road crossings).	Assessing the impact based on the viewshed allows for the impact to be considered with any other feature that could have an effect on aesthetic quality.
Noise - Operations	NSAs located within 1 mile of the Southgate Project's noise-emitting permanent aboveground facilities.	Noise from the Southgate Project's permanent facilities is not anticipated to have an impact beyond 1.0 mile.
Noise - Construction	0.25 mile from pipeline or aboveground facilities. 0.5 mile from HDD installation	Areas in the immediate proximity of pipeline or aboveground facility construction activities (within 0.25 mile) would have the potential to be affected by construction noise. NSAs within 0.5 mile of an HDD installation could be cumulatively affected if other projects had a concurrent impact on the NSA.
Air Quality - Operations	50 km (about 31.1 miles) from compressor station	The geographic scope adopted the distance used by the EPA for cumulative modeling of large PSD sources during permitting and following 40 CFR 51, appendix W, section 4.1. We consider 50 km a conservative geographic scope for the purpose of identifying other projects which could contribute to a cumulative impact on air quality.
Air Quality - Construction	0.25 mile from pipeline or aboveground facilities	Air emissions during construction would be limited to vehicle and construction equipment emissions and dust, and would be localized to the Southgate Project construction sites. About 0.25 mile conservatively captures the distance these emissions would travel before becoming negligible and unlikely to contribute to a cumulative impact.

TABLE 4.13-1

Geographic Scope for Cumulative Impact Analysis

Resource(s)	Cumulative Impact Geographic Scope	Justification for Geographic Scope
Socioeconomics	Affected counties and municipalities	Affected counties would experience the greatest impacts associated with employment, housing, public services, transportation, traffic, property values, economy, and taxes.
Environmental Justice	Census tracts that contain or are adjacent to Southgate Project facilities	Projects within the census tracts directly affected by and adjacent to the proposed Southgate Project facilities could contribute to cumulative impacts on environmental justice communities.

The Southgate Project would affect 9 HUC-10 watersheds and 22 HUC-12 watersheds during construction. These watersheds vary in size depending on topography. The average size of the affected HUC-10 watersheds is about 130,000 acres, while the average size of the HUC-12 watersheds is approximately 19,000 acres. The total area included in our consideration of cumulative impacts on these resources covers more than 1 million acres. Tables 4.13-2 and 4.13-3 list all the HUC-10 and HUC-12 watersheds affected during construction and operation of the Southgate Project, their size in acres, the acres affected by other projects considered in this analysis within each watershed, and the acres affected by the Southgate Project within each watershed.

TABLE 4.13-2

HUC-10 Watersheds Affected by the Southgate Project and Other Projects

a/ Includes estimated values.

b/ Construction acres includes the area affected by construction (i.e., temporary and additional temporary workspace, contractor yards, and access roads) and the area affected by operation of the Southgate Project.

c/ Percent of watershed affected is based on the acres of the HUC-12 watershed in the applicable state, and the construction acres for the Southgate Project and the other relevant projects within the applicable HUC-12 watershed.

4.13.1 Other Projects within the Geographic Scope of Analysis

In accordance with the CEQ regulations, we identified other projects (and actions) located in the resource-specific geographic scope of the Southgate Project and evaluated the potential for a cumulative impact on the environment. These projects are described in the following sections and are depicted on maps and summarized in appendix F. Actions were identified by reviewing a variety of publicly available information, including but not limited to pending or approved permit information from federal, state, and local agencies; various organizations' websites; commercial company websites; news outlets; and desktop and field review. We have identified five types of projects that could contribute to a cumulative impact. These are:

- FERC-jurisdictional natural gas interstate transportation projects;
- non-jurisdictional Southgate Project-related facilities;
- other energy projects;
- mining operations;
- transportation or road projects; and
- commercial/residential/industrial and other development projects.

Development of other projects would likely result in permanent impacts on vegetation and associated wildlife habitat; displacement of wildlife; loss of soil and land use; alteration of surface and groundwater flow, and visual resources; as well as temporarily and/or permanently increase dust, and impact noise levels and air quality. Approximate locations of the other projects in relation to the Southgate Project are shown in figures 1 through 4 in appendix F.1. Additional details on each project are also described in appendix F.2.

Due to concerns raised during public scoping, the ACP Project (CP15-554) was considered but not included because the closest ACP Project facility is located approximately 100 miles from the Southgate Project and is outside of the defined geographic scopes considered in this analysis. As previously described, projects located outside a geographic scope are not evaluated because their potential to contribute to a cumulative impact diminishes with increasing distance from the Project.

4.13.1.1 FERC-jurisdictional Natural Gas Interstate Transportation Projects

There are three FERC-regulated natural gas transmission pipeline projects within proximity to the Southgate Project: Virginia Southside Expansion (CP13-30-000), Virginia Southside Expansion II (CP15-118), Southeastern Trail (CP18-186-000), and Mountain Valley Pipeline (CP16-10-000).

Virginia Southside Expansion

Transco's Virginia Southside Expansion went into service in September 2015. The project extended the Transco pipeline system from Transco Station 165 in Pittsylvania County, Virginia 98 miles to Brunswick County, Virginia through the counties of Halifax, Charlotte, and Mecklenburg. Upgrades in New Jersey, North Carolina, Maryland, and Pennsylvania were also included as part of the project. A new compressor station, Transco Station 166, was constructed in Pittsylvania County, Virginia, approximately 600 feet northeast from the boundaries of proposed Lambert Compressor Station site. The project affected a total of 1,454.3 acres during construction of which 199 acres is being maintained for operation. Approximately 51 acres of wetlands and 63.4 acres of prime farmland were affected during construction and 4.8 acres of wetlands and 10 acres of prime farmland were permanently affected by operation of the project. Construction of the Virginia Southside Expansion project disturbed approximately 160 acres of silviculture forest and 322 acres of non-silviculture forest. However, only a fraction of these total acreages occurred in the geographic scopes of the Southgate Project. As shown in appendix F.2, this project is within the geographic scopes for all resources. The project affected about 18 acres within the Cherrystone Creek-Banister River HUC-10 watershed and 63.2 acres within the

Stinking River-Banister River HUC-10 watershed (watersheds affected by the Southgate Project shown in table 4.13-2 above). The only ongoing impacts from this project within the Southgate Project geographic scopes are forest regeneration, air emissions and noise, socioeconomics, and visual impacts.

Virginia Southside Expansion Project II

In December 2017 Transco's Virginia Southside Expansion Project II went into service. This project included the following construction and upgrade activities:

- new 4.19-mile-long 24-inch-diameter lateral pipeline in Brunswick and Greensville Counties, Virginia, referred to as the Greensville Lateral;
- new building containing a pig launcher and a new block valve assembly at the Greensville Lateral's connection to the existing Brunswick Lateral in Brunswick County, Virginia;
- new building containing the proposed Greensville Meter and Regulator (M&R) Station, a pig receiver, heaters, and a block valve assembly at the end of the Greensville Lateral in Greensville County, Virginia;
- new 25,000 horsepower electric-driven compressor unit at compressor station (CS) 185 in Prince William County, Virginia;
- addition of 21,830 horsepower of gas-driven compression at CS 166 (including piping, valve modification, gas cooling, and the re-wheeling of two existing compressor units) and a 1,208 brake-horsepower emergency generator in Pittsylvania County, Virginia; and
- modifications to 19 existing facilities on Transco's existing pipeline (mainlines and the Tryon Lateral) in North Carolina and South Carolina.

The Virginia Southside Expansion Project II affected 180.1 acres of land during construction and 29.3 acres during operation. The project crossed 1.3 miles of prime farmland during construction and returned these areas to agricultural land use following construction. Approximately 0.8 acre of wetlands and 30.0 acres of forest was affected for construction; the project's operation permanently affected 0.4 acres of wetlands and 12.4 acres of forest. However, only a fraction of these total acreages occurred in the geographic scopes of the Southgate Project. This project falls within the geographic scopes for all resources as shown in appendix F.2. Approximately 27.4 acres of the Cherrystone Creek-Banister River HUC-10 watershed and 1.8 acres of the Stinking River – Banister River HUC-10 watershed were affected by construction of the Virginia Southside Expansion II Project. Impacts associated with operation of this project within the Southgate Project geographic scopes include forest regeneration, air emissions and noise, socioeconomics, and visual impacts.

Southeastern Trail

Transco filed its application for the Southeastern Trail Project (CP18-186-000) with the FERC on April 11, 2018. This project would include construction of approximately 8 miles of pipeline along the existing Transco mainline in Fauquier and Prince William Counties, Virginia between Station 180 and 185. Compressor station horsepower additions were also proposed at Stations 165, 175, and 185 in Virginia. Compressor Station 165 is located in Pittsylvania County,

Virginia, less than 5 miles from the Southgate Project, and falls within the geographic scope for cumulative impacts on air quality. Only a portion of the total impacts of this project falls within the geographic scopes of the Southgate Project. This project falls within the geographic scopes for all resources as shown in appendix F.2 and could contribute to cumulative impacts on all resources. Approximately 19.2 acres of the Cherrystone Creek-Banister River HUC-10 watershed and 62.9 acres of the Stinking River – Banister River HUC-10 watershed would be affected by the Southeastern Trail Project. Transco projected an in-service date of November 1, 2020, with construction to begin August 2019.

Mountain Valley Pipeline Project

Mountain Valley filed an application with the FERC on October 23, 2015 for the Mountain Valley Pipeline Project in Docket No. CP16-10. Approximately 303 miles of 42-inch pipeline, 3 new compressor stations, and associated facilities were proposed for construction in West Virginia and Virginia. Construction for the Mountain Valley Pipeline Project began in the first quarter of 2018. The project's total construction disturbance footprint is about 6,362.5 acres, and it would affect about 2,116.5 acres when operational. Construction of the Mountain Valley Pipeline Project would affect 31 acres of wetlands and 4,453.1 acres of upland forest. Operation of the project would affect 7.9 acres of wetlands and 1,596.9 acres of upland forest. Construction and operation of the project would affect 23.5 acres of prime farmland within the Southgate Project workspace. The Mountain Valley Pipeline Project is within the geographic scopes for all resources, but only a small portion at the southern end of the project falls within Southgate Project's resource-specific geographic scopes.

There would be 182.3 acres constructed for the Mountain Valley Pipeline Project in the Cherrystone Creek-Banister River HUC-10 watershed and 49.3 acres constructed in the Stinking Rover–Banister River HUC-10 watershed. The Mountain Valley Pipeline Project and Southgate Project would cross two of the same perennial streams and one intermittent stream within the Cherrystone Creek-Banister River HUC-10 watershed. These stream crossings for each project are located at least 3.5 miles from one another and would not occur on the same timeline.

4.13.1.2 Non-jurisdictional Southgate Project-related Facilities

Non-jurisdictional facilities associated with the Southgate Project would include installation of aboveground and underground powerlines and telecommunications from existing nearby power poles to the interconnects, cathodic protection sites, and MLVs. All of the MLVs associated with the Southgate Project would require the local electric distributor to extend aboveground power and telecommunications from an existing power pole to the MLV site. These extensions would range from 50 feet to 1,684 feet in length. Impacts from these non-jurisdictional facilities are included in appendix F.2. Although these facilities fall within several of Southgate's resource-specific geographic scopes, impacts associated with these non-jurisdictional facilities are expected to be minimal due to the limited footprint of these projects and potential mitigation measures required by permitting agencies.

4.13.1.3 Other Energy Projects

Reidsville Energy Center Project

In January of 2017, NTE Energy received siting authority from the North Carolina Utilities Commission for the Reidsville Energy Center proposed to be constructed in Rockingham County starting mid- to late-2019 with a commercial operation date of October 1, 2021 with an expected final completion date of January 1, 2022. The 500 MW natural gas-fired combined cycle generating facility would be interconnected with the Duke Energy Carolinas, LLC transmission system and is proposed to be located approximately 12 miles from the Southgate Project. Approximately 20 acres of forest land would be disturbed for construction and operation of the project. As shown in appendix F.2, this project is within the geographic scope for socioeconomics.

Solar Energy Generation Projects

We identified 15 solar generation facilities in various stages of development in Rockingham and Alamance Counties, affecting approximately 1,808 acres of land. Details on the solar generation facilities can be found in appendix F.2. As shown in appendix F.2, these projects are within the geographic scopes for the following resources: groundwater, surface waters, wetlands, vegetation, wildlife, air quality (operation), and socioeconomics. An estimated 1,782 acres are located within HUC-10 watersheds and 708 acres are located within HUC-12 watersheds affected by the Southgate Project. Development of all 15 solar facilities is likely to affect a total of approximately 385 acres of forest land within HUC-12 watersheds. The solar facilities would affect 0.9 acres of mapped Prime Farmland within the Southgate Project workspace. The Bakatsias Solar Farm, Green Level – Charles Drew Solar Farm, Husky Solar Farm, and Cypress Creek Renewables Solar Farm are located less than 1 mile from the Southgate Project and are within the geographic scopes for the following resources, in addition to the resources previously mentioned: cultural resources, land use, recreation, visual resources, noise (construction and operation), and air quality (construction). The Old Road Solar Farm, Kimery Road Solar Farm, and Necal Solar Farm are located within the geographic scope for environmental justice communities, described in section 4.13.2.7.

Both the Cypress Creek Renewables Solar Farm and the Husky Solar Farm are located directly adjacent to the existing Transco right-of-way between MP 48.7 to 51. Construction on the Cypress Creek Renewables Solar Farm is anticipated to begin in the summer or fall of 2019 with project operation commencing in 2020. The project would include construction of an 80 MW facility between MP 49 and 51 on 341 acres of land shared with the Headwaters Haw River HUC-10 watershed. An estimated total of 229 acres of upland forest would be affected by this project. About 0.4 acres of prime farmland within the Southgate Project workspace would be affected by construction and operation of the Cypress Creek Renewables Solar Farm. The 7 MW Husky Solar Farm is located between MP 48.7 and 49.0, occupying space on both sides of NC Highway 87, and is currently in operation. This facility occupies 29 acres of land within the Headwaters Haw River HUC-10 watershed and affects 0.5 acres of prime farmland within the Southgate Project workspace.

The Husky Solar Farm and Bakatsias Solar Farm are both in operation. Ongoing impacts from these projects within the Southgate Project geographic scopes include forest regeneration, prime farmlands soils (Husky Solar Farm only), socioeconomics, and visual impacts.

4.13.1.4 Mining Operations

We identified 22 facilities, including quarries, mines, pits, and a brick plant, through the USGS Mineral Resources Data System located within 7 shared HUC-10 watersheds. The East Alamance Quarry is the only active mining operation located within 0.25 miles of the Southgate Project as listed in appendix F.2 and described in section 4.1.2.

Ongoing activities at these facilities could affect an estimated 6,540 acres within the geographic scopes of the Southgate Project. Operating these facilities requires surface clearing, excavation, mineral extraction, and reclamation in accordance with state or local permit requirements. Activities at these facilities are presently ongoing and affect different sites and acreages as resource-extraction activities change over time. Resource-extraction operations requires land to be disturbed, which could result in impacts on water resources, vegetation, air quality, and noise. Depending on the facility operator (and the resources present), we expect future activities to occur incrementally. No significant cumulative impacts are anticipated from these facilities as operational activities would be subject to state and local permit requirements, such as erosion and sediment control plans.

4.13.1.5 Transportation and Road Improvement Projects

The Virginia Department of Transportation (VADOT) and North Carolina Department of Transportation (NCDOT) are overseeing nine infrastructure projects in the range of geographic scopes for the proposed Southgate Project. These include widening of local routes, bridge replacement, and other road improvements and treatment projects.

According to available information, the size of many of the transportation and road improvement projects identified is less than 20 acres. All of the projects were considered minor, as they were generally localized road improvements rather than larger road projects encompassing many miles. Construction timeframes for eight of the transportation and road improvement projects are currently unknown.

Of the remaining transportation and road improvement projects in the Southgate Project geographic scope, U.S. Route 29 South over Norfolk Southern Railroad, was completed in 2017 and construction for the Route 311 Connector Road project is expected to be constructed between September 2022 and May 2025. The U.S. Route 29 South over Norfolk Southern Railroad project is located approximately 4.4 miles from the Southgate Project. It affected approximately 0.4 acres within the Cherrystone Creek HUC-12 watershed. The Route 311 Connector Road project would be located approximately 3.5 miles from the Southgate Project within the Trotters Creek-Dan River HUC-12 watershed. As the Route 311 Connector Road project is still in the planning stages, the area of impact is unknown at this time. Both of these transportation projects are within the geographic scope for all resources except cultural, noise, and land use/visual. Construction for the Southgate Project is anticipated to begin at least 3 years after the U.S. 29 South over Norfolk Southern Railroad was completed. Short-term impacts on surface water resources, such as

increased turbidity, would have returned to baseline levels over a period of days or weeks following construction the U.S. 29 South over Norfolk Southern Railroad and disturbed areas were likely stabilized through revegetation. The Route 311 Connector Road project is planned to begin construction over 2.5 years after the Southgate Project in-service date (currently projected as December 2021). Any impacts from the Southgate Project that could potentially create cumulative impacts within the geographic scope for the Route 311 Connector Road project would be under restoration before September 2022. Construction activities associated with both transportation projects were, and would be, conducted in accordance with all applicable state, federal, and local permit requirements. Cumulative impacts could result on resources such as forest that take a longer time to restore. Additionally, the projects would result in several acres of permanent land conversion to industrial use within the geographic scope. Given the relatively small footprint of each project, these projects in combination could have minor cumulative impacts on forest habitat as well as permanent conversion of land to industrial use.

4.13.1.6 Commercial, Industrial, and Residential Projects

There are seven commercial, industrial, and residential development projects that have been identified within the watersheds used in our analysis. From the available data we gathered, these projects may impact 421 acres of land within HUC-10 watersheds and 309 acres within HUC-12 watersheds affected by the Southgate Project, including 38.5 acres of upland forest. Each of these developments, with the exception of the Berry Hill Industrial Park and Granite Mill Project, would likely be completed by the time the Southgate Project would be under construction. Mixed-use portions of the Granite Mill Project may be constructed in 2021 and 2022 and while sites are available for development at the Berry Hill Industrial Park site, no construction is scheduled at this time Mountain Valley would coordinate with developers of the Granite Mill Project and Berry Hill Industrial Park if construction schedules were to coincide with the Southgate Project.

Due to the speculative nature of the housing and development markets and funding mechanisms for other projects listed in appendix F.2, it is difficult to determine the amount of land that would ultimately be affected by these projects and, therefore, contribute to a cumulative impact with the Southgate Project. Based on the largely temporary impacts associated with the Southgate Project, we have determined that impacts associated with the Southgate Project when assessed with the other commercial, industrial, and residential projects would not result in a significant cumulative impact.

4.13.2 Cumulative Impacts on Specific Environmental Resources

Data for specific environmental resources were identified by reviewing a variety of publicly available information, as discussed in the introduction. In some instances, resource-specific impact data in the geographic scopes of analysis were lacking for projects, including for FERC-regulated projects. For these circumstances we either used Project-specific data to estimate quantitative resource impacts using scaling and assumptions, or have noted where information is unavailable where appropriate. Therefore, conclusions regarding cumulative impacts on specific environmental resources are limited only to available data on other projects and the contribution of the Southgate Project to potential resource impacts.

4.13.2.1 Soils

With the exception of prime farmland soils, we determined that the Southgate Project when considered with other projects would not have cumulative impacts on all other types of soils because of the site-specific nature of the soils crossed and the fact that implementation of FERC's Plan would keep soils within the construction right-of-way. As previously mentioned, three projects would overlap with the Southgate Project's workspace: the Mountain Valley Pipeline Project, Cypress Creek Renewables Solar Farm, and the Husky Solar Farm. The Husky Solar Farm is in operation, therefore no construction activities would occur within the same timeframe as the Southgate Project. Construction activities for both the Mountain Valley Pipeline Project and Cypress Creek Renewables Solar Farm are planned for 2019. It is unknown whether construction activities for these two projects would extend into 2020 or coincide with the Southgate Project. FERC requires the project proponents to follow the FERC Plan to keep soils in the construction right-of-way and fully restore soils to pre-construction condition immediately after construction. We assume other non-FERC-regulated projects would follow similar requirements set by the permitting agencies. Therefore, although soils would be temporarily disturbed from the combination of these projects occurring within similar timeframes and adjacent workspaces, ultimately, after project completion and restoration there would not be any discernable cumulative impact on soils.

Construction and operation of projects within the geographic scope for soils (Southgate Project construction workspace) would cumulatively affect 24.4 acres of prime farmland soils. Approximately 23.5 acres of prime farmland soils would be affected by the Mountain Valley Pipeline Project, 0.4 acres would be affected by the Cypress Creek Renewables Solar Farm, and 0.5 acres are affected by the Husky Solar Farm.

As a FERC-regulated project, the Mountain Valley Pipeline Project would be required to return soils and agricultural land in temporary workspaces and the pipeline right-of-way to pre-construction conditions. These areas would be able to be farmed after restoration is complete. We assume that the 0.9 acres of prime farmland affected by the Cypress Creek Renewables Solar Farm, and Husky Solar Farm would also be required to return these areas to pre-construction conditions, unless there is a permanent aboveground facility or access road located in the area. Due to impacts being temporary on prime farmland soils for most projects in the area, we conclude that a small but not significant cumulative impact on these resources would occur.

4.13.2.2 Water Resources

The cumulative impact geographic scope for water resources varies according to the water source. As stated in table 4.13-1, we consider the HUC-12 watershed as the geographic scope for groundwater. Projects could contribute to impacts on groundwater quality within a HUC-12 sub-basin due to the fact that shallow groundwater features generally follow natural drainage boundaries. We determined that the larger HUC-10 watershed was appropriate to analyze cumulative impacts on surface water resources based on our findings throughout the previous sections of this EIS and given the anticipated scale of impacts the Southgate Project would have on surface water resources.

Other projects within the affected HUC-10 watersheds include 4 FERC-jurisdictional natural gas projects, 4 non-jurisdictional facilities associated with the Southgate Project, 15 non-natural gas energy projects, 1 resource-extraction projects, 10 transportation projects, 2 commercial/industrial projects, and 5 residential projects. Other projects within the affected HUC-12 watersheds include the same FERC-jurisdictional and non-jurisdictional facilities and residential projects. A smaller number (8) non-natural gas energy projects, 8 transportation projects, 1 commercial/industrial projects, and 1 resource-extraction projects fall within the HUC-12 watersheds.

Groundwater

Water wells and springs in the vicinity of the Southgate Project are described in section 4.3.1.3. We were unable to quantitatively determine the number of these features on a HUC-12 watershed basis. Given the relatively shallow (typically less than about 8 feet) nature of pipeline trenching and the often deep depths at which water wells are drilled to reach aquifers, in general it is unlikely that pipeline activities would negatively affect groundwater supplies from wells. Springs may be more subject to disruption as there is greater connectivity at the ground surface.

The 31 other projects listed in appendix F.2 located in the affected HUC-12 watersheds would disturb surface conditions and could result in minor effects on groundwater resources. There could be a cumulative impact if multiple projects affected the same groundwater source (aquifer, well, or spring) through spills of hazardous substances or temporary increased turbidity from trench dewatering; however, it is unlikely that impacts would be significant because most projects would involve shallow ground disturbance and proponents would be required to implement spill prevention and immediate remediation plans if a spill of hazardous substances were to occur. There are no known wells or springs near the areas where there are overlapping impacts from multiple projects within the Southgate Project workspace (Mountain Valley Pipeline Project, Cypress Creek Renewables Solar Farm, and the Husky Solar Farm).

Surface Water

The Southgate Project would cross 123 perennially flowing waterbodies in Virginia and North Carolina. Details on the Southgate Project's crossing procedures and impacts on waterbodies are discussed in section 2.4.1.10. Table 4.13-4 provides details on the number of waterbodies crossed by the Southgate Project and other projects within affected HUC-10 watersheds.

TABLE 4.13-4

Waterbodies Crossed in HUC-10 Watersheds for the Southgate Project and Other Projects

	Number of Waterbodies Crossed by the Southgate Project a/				Number of Waterbodies Crossed by the Other Projects b/

Abbreviations:

Ephem = Ephemeral

Interm = Intermittent

Peren = Perennial

Minor cumulative impacts on surface waters are possible when considering the total contributions of all 41 projects located within the affected HUC-10 watersheds. In-stream activities, such as dredging, open-cut pipeline crossing techniques, and other in-stream activities have the greatest potential to contribute to cumulative impacts on surface water resources through increased turbidity. These impacts are typically minor due to the short duration of in-water activities. Turbidity plumes may travel downstream for a few miles, but typically the plume would disperse and become diluted to background levels within several days. Projects involving in-water work would have to occur within similar timeframes within close distance to have a cumulative effect on turbidity within the waterbody or watershed. Clearing, grading, or other earthwork within the watershed may also increase the potential for cumulative impacts on water quality from increased stormwater runoff and sedimentation. Because FERC projects and most other projects would be required (by permit) to install erosion and stormwater control devices to minimize runoff,

any cumulative impacts from upland construction of multiple projects occurring with a watershed would not likely be significant.

The Mountain Valley Pipeline Project would cross two of the same waterbodies as the Southgate Project; however, the crossing locations are different, at least 3.5 miles apart and there would be no overlapping workspace between the projects. In addition, the stream crossings would not occur within the same time frame due to the construction schedules for both projects. Therefore, it is unlikely that cumulative impacts would be significant because the geographic and temporal separation of the crossings would limit the potential additive impacts from turbidity. Sedimentation impacts could be additive, if turbidity plumes settled within common stream segments. Given the spatial separation of the projects, this is unlikely.

The Southgate Project would contribute little to the long-term cumulative impacts on waterbodies because the majority of the potential impacts are short-term. Each of the 41 projects within the HUC-10 watershed, such as FERC-jurisdictional, solar energy, and transportation projects, would likely have similar impacts on surface waters due to increased turbidity and sedimentation during construction. These projects would likely be required to install and maintain BMPs similar to those proposed for the Southgate Project as required by federal, state, and local permitting requirements so as to minimize impacts on waterbodies. In addition, any projects crossing Waters of the United States would have to obtain permits from the COE. Therefore, the cumulative effect on surface waterbody resources would be minor.

4.13.2.3 Wetlands

As stated in table 4.13-1, potential cumulative impacts on wetlands are evaluated within the HUC-12 watershed as projects could contribute to impacts on wetlands within the natural boundaries of a drainage basin. As described section 4.13.2.2, the Southgate Project would affect 22 HUC-12 watersheds during project construction. Of the projects listed in appendix F.2, 31 would occur within the affected HUC-12 watersheds.

Construction of the Southgate Project would affect approximately 25.7 acres of wetlands during construction and about 5.6 acres of wetlands during operation. About 4.2 acres of PFO wetlands and 0.2 acres of PSS wetlands would be affected over the long-term. About 4.2 acres of forested wetland would be converted to emergent and scrub-shrub conditions.

The Mountain Valley Pipeline Project would affect 0.7 acres of PFO wetlands and 0.1 acres of PEM wetlands within HUC-12 watersheds. None of the other FERC-jurisdictional projects would affect wetlands within HUC-12 watersheds shared with the Southgate Project. For other projects located in the geographic scope of the Southgate Project we found no wetlands would be affected or have been affected within HUC-12 watersheds or data was unavailable. For most projects where data was unavailable, only a portion of these impacts would occur in the watersheds affected by the Southgate Project.

All FERC-jurisdictional projects would comply with COE 404 permit requirements regarding potential wetland impacts and mitigation. Given the relatively small total of wetland acres affected by the Southgate Project, and information available on other projects listed in

appendix F.2, we conclude that cumulative impacts on wetlands within the HUC-12 watersheds when considered with the projects identified in this analysis would not likely be significant.

4.13.2.4 Vegetation

Similar to wetlands, the geographic scope for vegetation is the HUC-12 watershed. There are 31 projects located within the HUC-12 watersheds affected by the Southgate Project, which could contribute to impacts on vegetation. Constructing the Southgate Project would impact 1,392.6 acres of vegetated lands. Details about specific vegetation types affected by the Southgate Project are provided in section 4.5.4.

Although we do not have exact data on vegetation impacts for the other projects within the geographic scope, the overall impact (disturbance footprint) data for the 31 other projects located within the affected watersheds may be used as a proxy for vegetation impacts. The other 31 projects account for 1,660.8 acres, or 0.4 percent of the HUC-12 watersheds affected by the Southgate Project as shown in table 4.13-5. Projects with permanent aboveground facilities (such as industrial developments), solar energy projects, and roads would have greater impacts on vegetation than buried utilities, which allow for restoration of vegetation following construction. However, these projects would also likely be required to implement measures designed to minimize the potential for long-term erosion and resource loss, increase the stability of site conditions, and revegetate disturbed soils, thereby minimizing the degree and duration of the impacts of these projects.

With the exception of forest clearing, most impacts on vegetation from construction of the Southgate Project would be short-term. In general, we do not anticipate long-term cumulative impacts on upland herbaceous/scrub-shrub areas as most vegetative cover would regenerate within 1 to 3 years. Therefore, we focused our analysis more on the potential for cumulative forest impacts.

Approximately 50 percent of the Southgate Project is collocated with existing right-of-way; however, construction of the Southgate Project would result in the clearing of about 48.6 acres of interior forest and 569 acres of forested edge. In general, from the data we were able to obtain, about 447.7 acres of forest has been affected or would be affected by the projects in the geographic scope of the Southgate Project.

Constructing the Southgate Project, would create a new, cleared corridor in areas of interior forest where the rights-of-way would not be collocated with existing linear corridors. These activities, in conjunction with other projects that have permanent maintained areas within the geographic scope, would create permanent, long-term cumulative impacts on interior forest areas. Forested areas within the other project facility footprints would remain cleared for the lifetime of the facility, while other areas cleared for temporary workspaces would take 20 to 50 years or more to recover. Clearing and fragmentation of interior forests creates more edge habitat and smaller forested tracts.

a/ Includes estimated acreages of upload forest/woodland area within shared HUC-12 watersheds where data is available.

Cumulative impacts on vegetation resulting from nearby projects considered along with the Southgate Project are expected to be minor, considering the limited area affected within the geographic scope, as compared to the large amount of similar communities remaining in each watershed (see table 4.13-5). The Southgate Project would restore areas of temporary impact in accordance with the FERC Plan and minimize the potential introduction of non-native invasive species through their Invasive Species Plan. Some of the other 31 projects located within HUC-12 watersheds could be required to develop similar plans to restore areas and minimize the spread of invasive plant species. For these reasons and based on the available data in our analysis, we conclude that the cumulative effect on vegetation would not likely be significant.

4.13.2.5 Wildlife, Fisheries, and Federally Listed Threatened or Endangered Species

Similar to vegetation, the HUC-12 watershed is the geographic scope of analysis for cumulative impacts on wildlife and federally listed threatened or endangered species where we determined that natural drainage basins are appropriate biological boundaries to assess potential cumulative impacts. Cumulative impacts on fisheries were assessed within the larger HUC-10 watershed for reasons described for surface water sources in section 4.13.2.2.

Wildlife

Constructing and operating the Southgate Project, as well as any of the 31 projects located in the affected HUC-12 watersheds, would temporarily increase the rates of stress, injury, and mortality experienced by wildlife. Wildlife would avoid construction activities by using adjacent habitats, but are expected to resume use of affected lands following construction and restoration. The construction of Southgate Project aboveground facilities as described in appendix F.2 would result in the permanent loss of habitat. However, this is not a large impact, as the Southgate Project would affect 13.3 acres total of vegetated habitat occupied operationally for aboveground facilities.

As discussed previously, constructing the Southgate Project would result in habitat fragmentation and "edge" effects. However we conclude that impacts on most non-special status wildlife species would not result in long-term or significant population-level effects, given the stability of local populations and the abundance of available adjacent habitat.

The construction of 31 other projects located in HUC-12 watersheds within the geographic scope of the Southgate Project would result in similar cumulative fragmentation and removal of habitat. While exact schedules are not known, we anticipate some of the other projects construction activities would occur within the same time frame as the Southgate Project. These include Southeastern Trail and the Granite Mill residential project. Operations at the East Alamance Quarry are expected to continue to operate during construction of the Southgate Project.

Cumulative impacts on wildlife as a result of increased noise, lighting, road traffic, and general human activity, would be greatest during concurrent construction of the Southgate Project and other projects. Quantitative cumulative noise impacts are further discussed in section 4.13.2.9. While noise contributions from the Southgate Project would not directly affect wildlife beyond the geographic scope for cumulative noise impacts, an overall increase in noise associated with projects located throughout the HUC-12 watershed could limit the available habitat not affected by noise to which disturbed wildlife can relocate. Wildlife that cannot relocate away from noise-emitting sources could be adversely affected by increasing stress levels and masking auditory cues necessary to avoid predation or hunt prey and find mates.

The overall footprint of the other identified projects within the defined geographic scope when combined with the Southgate Project would result in the disturbance of wildlife habitat that would either be converted to industrial use or revegetate over time. However, there are just under 400,000 acres of land area, much of which provides habitat for wildlife, within the HUC-12 watersheds comprising our geographic scope, and only about 0.3 percent of that area would be disturbed by the Southgate Project**.** Herbaceous vegetation and adjacent edge areas provide habitat

for numerous wildlife species more suited to human-caused modifications. This suite of species would utilize the habitats converted from forested areas that formerly may have been inhabited by certain forest-dwelling migratory bird species. In general, most of the wildlife inhabiting the affected watersheds are human commensal species or individuals that have otherwise become acclimated to human activity.

Overall, cumulative impacts on wildlife would be greatest during the concurrent construction of the other projects considered, and would continue to a lesser extent during operation. Given the large amount of wildlife habitat that would remain undisturbed within the geographic scope, we conclude that any resulting cumulative impacts on wildlife from the combined projects occurring in the common HUC-12 watersheds would not be significant.

Fisheries and Aquatic Resources

Cumulative impacts on aquatic life was assessed using HUC-10 watersheds for the same reasons we stated for surface water resources. Potential cumulative impacts on fisheries and aquatic resources resulting from the Southgate Project and the projects in the affected HUC-10 watersheds identified in appendix F.2 include aquatic habitat alteration, spills and releases of hazardous materials into waterways, water depletions, and entrainment or entrapment of aquatic wildlife due to water withdrawals or construction crossing operations. As described in section 4.3.2.2, constructing, and operating the Southgate Project would require 224 waterbody crossings, many of which provide aquatic habitat and support fisheries. In addition, the Southgate Project would cross 21 perennial waterbodies containing fisheries of special concern; 8 in Virginia, and 13 in North Carolina. The 41 other projects in the affected HUC-10 watersheds would cross multiple waterbodies as shown in table 4.13-4. We assume that these waterbodies contain fisheries and aquatic resources. As discussed in section 4.13.2.2, only the Mountain Valley Pipeline Project would cross two of the same waterbodies as the Southgate Project; however the crossing locations are different and there would be no overlapping workspace between the Mountain Valley Pipeline Project and the Southgate Project.

Cumulative impacts on fisheries and aquatic resources could occur if other projects occur within the same segment of a waterbody and/or have similar construction time frames as the proposed Southgate Project. Additionally, cumulative impacts could occur could result where permanent or long-term impact on the same or similar habitat types occurs. We expect that most of the projects in the geographic scope that are subject to permitting approval would be designed to minimize impacts on fisheries and aquatic resources and that the VADEQ and NCDEQ would require any other projects to adhere to state-mandated or recommended timing windows for construction within waterbodies containing sensitive fish species. However, until permits and authorizations are finalized, the extent of avoidance, minimization, and mitigation is speculative and we have not used this information to determine significance.

Impacts on fisheries and aquatic resources would be temporary and mostly limited to construction activities associated with the other 41 projects located within HUC-10 watersheds. As such, none of these impacts are expected to be cumulatively significant because of their limited scope and temporary nature.

Federally Listed Threatened and Endangered Species

Effects on federally listed wildlife and aquatic species could occur where other projects would result in permanent or long-term loss of habitat types important to wildlife. These include transportation projects, residential development projects, and solar projects located in HUC-12 watersheds as listed in appendix F.2.

Section 7 of the ESA specifically requires "major federal actions" to have separate ESA consultations, so the impacts on all federally listed and proposed species within the geographic scope of the identified projects would be assessed. Further, because protection of threatened, endangered, and other special status species is part of the various state permitting processes or resource reviews, cumulative impacts on such species would be specifically considered and reduced or eliminated through conservation and mitigation measures identified during those relevant processes and consultations. Other companies who have constructed, are constructing, or are proposing other projects are required to consult with the appropriate federal, state, and local agencies to evaluate plant and animal species that may be found in the area. Additionally, they are required to identify potential impacts from construction and operation of the projects to any special status species identified, and implement measures to avoid, minimize, or mitigate impacts on those species.

Consultation with the FWS, pursuant to section 7 of the ESA, is ongoing. We expect all other activities (federal, state, and private) would comply with the ESA, thereby also preventing or appropriately minimizing or mitigating for impacts. Consequently, we conclude that projects in the geographic scope in combination with the Southgate Project could have minor cumulative effects on special status species, including federally listed threatened and endangered species.

4.13.2.6 Land Use, Recreation, Special Interest Areas, and Aesthetic Quality

Impacts on general land uses would be restricted to the construction workspaces and the immediate surrounding vicinity; therefore, the geographic scope for land use and recreation is a 1-mile radius from the centerline of the Southgate Project pipeline and aboveground facility sites. The cumulative impact geographic scope for aesthetics includes the viewshed or distance that the tallest feature at the planned facility would be visible from neighboring communities for aboveground facilities. For pipelines, this is typically a distance of 0.25 mile and existing visual access points.

Construction of the Southgate Project would disturb about 1,466 acres of land affecting a variety of land uses as discussed in section 4.8. Approximately 450 acres would remain in use for Southgate Project operations. The projects listed in appendix F.2 would disturb a total of approximately 10,956 acres of land affecting a variety of land uses, but only 873.03 acres is within the 1-mile geographic scope of analysis for land use impacts. All of the projects within a 1-mile radius of the Southgate Project have the potential to contribute to cumulative impacts on land use. This includes all 4 FERC-jurisdictional projects, 4 non-jurisdictional facilities, 1 resource-extraction operations, 2 transportation projects, 1 industrial project, 1 residential/commercial project, and 4 solar projects. Projects with permanent aboveground components (e.g., buildings), solar energy projects, transportation projects, and industrial/commercial projects would generally

have greater impacts on land use than the operational impacts of a pipeline, which would be buried and thus allow for most uses of the land following construction.

Some lands near the Southgate Project site are largely undeveloped, providing a variety of recreational activities. Special interest and other recreation areas crossed by the Southgate Project are discussed in section 4.8.4. None of the projects listed in appendix F.2 are located within a 1-mile radius of these areas; therefore, no cumulative impacts on special interest and recreational areas are anticipated.

Visual Setting

Aboveground facilities associated with the Southgate Project, including the Lambert Compressor Station and meter stations, would have the most impact on a visual setting. Other projects located within 0.25 mile of the Southgate Project include the Virginia Southside Expansion, Virginia Southside Expansion II, Mountain Valley Pipeline Project, Berry Hill Road project, Cypress Creek Renewables Solar Farm, Husky Solar Farm, the Granite Mill Project, East Alamance Quarry, and all 4 non-jurisdictional facilities associated with the Southgate Project. Within this context, the two solar projects would have the greatest cumulative impact on visual resources. Whereas visual impacts may be locally noticed, generally they would not be inconsistent with the existing visual character of the area. In many cases, views of the facilities and pipeline right-of-way against the landscape background are from highways, with viewers located in moving vehicles, reducing the time of the view. Those views may also be shielded by topography, perspective (angled crossings would typically be less visible than perpendicular crossings), and vegetation. The Lambert Compressor Station has been sited adjacent to an existing industrial area and would be screened from view from the nearest public roadway through graded terrain and existing wooded vegetation.

Transco Compressor Station 165 is located approximately 0.62 mile (1 km) from the Lambert Compressor Station in an adjacent industrial area. Transco Compressor Station 166 is located in the same industrial area as Transco Compressor Station 165 and is situated approximately 600 feet northeast of the Lambert Compressor Station. There are trees and vegetation in place along adjacent roadways that buffer the views from both compressor stations from passersby. The addition of the Lambert Compressor Station to the existing industrial area would not result in significant changes to the visual landscape of the area. Revegetation as required by federal and state agencies would reduce visual impacts for most projects located within 0.25 mile of the Southgate Project.

Given the reasons described above, we conclude that the Southgate Project's contribution to cumulative impacts on these land use, recreation and visual resources, when considered with the other projects included in our analysis, would not be significant.

4.13.2.7 Socioeconomics

The socioeconomic cumulative impact geographic scope for the Southgate Project includes all 3 affected counties and municipalities. A county-wide geographic scope for socioeconomics was selected because the primary economic and fiscal effects of projects are generally discernable or measurable at the county level, and the affected counties would experience the greatest impacts

associated with employment, housing, public services, transportation, traffic, property values, economy, and taxes.

The projects considered in this section would have cumulative effects on employment during construction if more than one project is built at the same time. Most of the projects listed in appendix F.2 occur within the 3 counties crossed by the Southgate Project. Transco Southeastern Trail and several solar and transportation projects listed in appendix F.2 may be under construction concurrently with the Southgate Project or in the foreseeable future. Cumulative impacts on population, employment, public services, transportation and traffic would be limited to the Southgate Project construction time frame. State, county, and local economies would experience cumulative impacts from the Southgate Project and other projects during both construction and operational time frames.

It is assumed that the future projects listed in appendix F.2 would employ workers from the same labor pool in the Southgate Project counties and surrounding areas, with the exception of specialized construction crafts or trades. Given the available labor pool, we conclude that there is likely to be sufficient available labor in these counties to meet cumulative, construction and operational requirements. If construction occurs concurrently with other projects, particularly during peak tourist periods, temporary housing would still be available but may be slightly more difficult to find and/or more expensive to secure in the short-term. These effects would be temporary, lasting only for the duration of construction, and there would be no long-term cumulative impact on housing.

The incremental demands of several projects taking place at the same time could strain the ability of some police, fire, and emergency service departments, particularly in rural areas. The impact would be temporary, occurring only for the duration of cumulative construction activities, and could be mitigated by the various project sponsors providing their own personnel to augment the local capacity or by providing additional funds or training for local personnel.

Construction of the Southgate Project could result in temporary impacts on road traffic in some areas and could contribute to cumulative traffic, parking, and transit impacts if other projects, such as the Cypress Creek Renewables Solar Farm and Granite Mill Project are scheduled to take place at the same time and in the same area. Increased use of local roadways from multiple projects could accelerate degradation of roadways and require early replacement of road surfaces. However, Mountain Valley, and the other project sponsors in the geographic scope of influence would be required to adhere to local road permit requirements (which may have provisions for road damage repairs or compensation) and road weight restrictions.

As detailed in section 4.9.7, the Southgate Project would provide an increase in tax revenue for the states, counties, and other local economies through the payment of payroll tax, sales tax, property tax, and other taxes and fees. Other present and foreseeable future projects would also be expected to contribute to a net increase in payroll and tax revenues. Therefore, we conclude that the Southgate Project, in combination with the projects listed in appendix F.2, would have both short- and long-term beneficial cumulative impacts on state, county, and local economies.

Environmental Justice

Census block groups that contain or are adjacent to Southgate Project facilities were determined to be the geographic scope for potential cumulative impacts on environmental justice communities. Figure 4.13-1 shows the locations of potential environmental justice communities within census block groups located within 1 mile of the Lambert Compressor Station, crossed by the project, and census block groups containing other relevant projects as listed in appendix F.2.

As discussed in section 4.9.8 the Southgate Project crosses two census block groups in Pittsylvania County and one census block in Rockingham County where minority populations exceed 50 percent. Additionally, low-income communities exist along the Southgate Project route within two census blocks in Pittsylvania County and six census blocks in Rockingham County. The primary impacts associated with the construction of the Southgate Project would include temporary noise, fugitive dust, and traffic during construction. Long-term effects include visual, air quality, and noise impacts from the operation of aboveground facilities. As discussed throughout this draft EIS, Mountain Valley would implement various measures to minimize impacts and, as detailed in section 4.9.8, we conclude that the Southgate Project would not have a disproportionately high and adverse environmental or socioeconomic impact on environmental justice populations

The projects listed in appendix F.2 were evaluated for potential impacts on environmental justice communities within the census tract block groups shared by and adjacent to the Southgate Project. Of the projects identified in appendix F.2, the following are located within census block groups where minority populations exceed 50 percent (or a minority population that is 10 percentage points higher than their respective county) and/or the household poverty rate is more than 20 percent (or a household poverty rate that is 10 percentage points higher than their respective county):

- **Pittsylvania County, Virginia and the city of Danville, Virginia**: Virginia Southside Expansion, Virginia Southside Expansion II, Southeastern Trail, U.S. 29 Bridge Replacement, Mount Cross Road Widening, Lambert Interconnect, Stony Mill and Tunstall High transportation project;
- **Rockingham County, North Carolina**: Old Road Solar, Carter Ridge Homes, and the T-15 Dan River Interconnect;
- **Alamance County, North Carolina**: LGI Homes Bedford Hills, Necal Solar Farm, Brassfield Meadows, and Kimery Road Solar Farm.

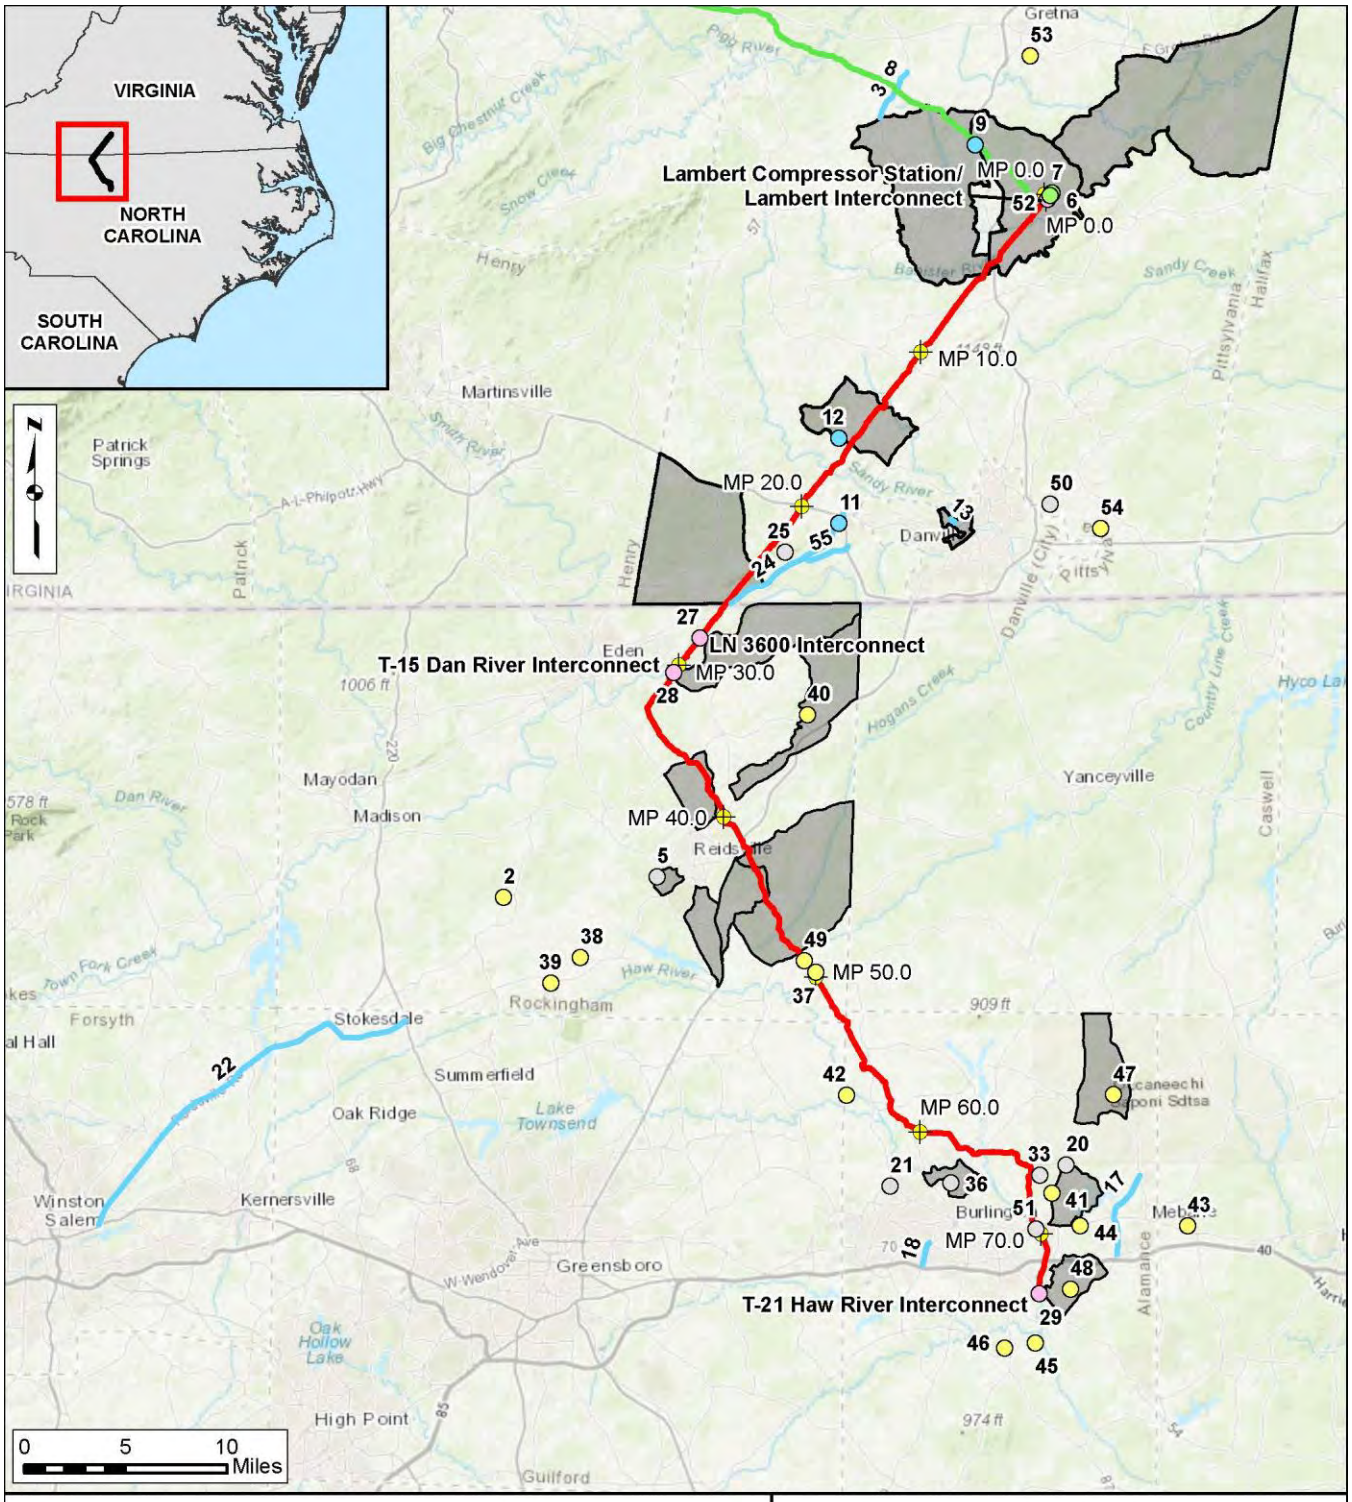

Figure 4.13-1

Southgate Project

Potential Environmental Justice Areas near Other Relevant Projects

Developers of the FERC-regulated projects listed above would be required to implement various measures to minimize impacts similar to the Southgate Project and would not have a disproportionately high and adverse environmental or socioeconomic impact on environmental justice populations. The Southeastern Trail Project would include horsepower additions to Transco Compressor Station 165, located approximately 0.62 miles from the Lambert Compressor Station. Similarly, the Virginia Southside Expansion Project II included horsepower additions to Transco Compressor Station 166, which is located approximately 600 feet northeast of the Lambert Compressor Station in the same industrial area as Transco Compressor Station 165. Both compressor stations were constructed more than 3 years ago and annual emissions from each facility are discussed in section 4.13.2.9.

As discussed below in section 4.13.2.9, no significant cumulative impacts are anticipated to surrounding communities, including environmental justice populations, based on the modeled air quality impacts associated with operation of the Southgate Project and Transco's Compressor Station 165 (CS 165) and Transco's Compressor Station 166 (CS 166). Upgrades to Transco CS 165 as part of the Southeastern Trail Project would be in compliance with NAAQS and required air quality permits. Additionally, we looked at the latest modeling from the VADEQ permit modification to CS 165 which showed that the cumulative impacts of all three stations would be limited to the area near the fence line and directly north-northeast of Transco's facilities. These incremental impacts, all below the NAAQS, would not be large, nor would they affect any clusters of homes in the wider rural EJ community. In addition, as indicated in section 4.13.2.9, as a condition of the VADEQ permit for Transco CS 165, Transco is required to install an ambient NO_2 air monitor to ensure impacts would not exceed the NAAQS.

Similarly, construction of the proposed Lambert Compressor Station and pipeline would generate a minor impact to air quality from the additional dust and fossil-fueled equipment emissions during construction. Although we acknowledge that air quality in the area would degrade slightly. We conclude that construction and operation of the Project would not result in disproportionate cumulative impacts on air quality and environmental justice populations.

Potential traffic impacts associated with the transportation projects and solar projects listed above could occur during construction. The transportation projects consist of improvements to existing transportation infrastructure and are anticipated to be temporary and minor. As construction timelines for the transportation and solar projects are unknown, schedules would likely not coincide with the Southgate Project and would not contribute to cumulative traffic impacts on environmental justice populations.

Continued development of the Carter Ridge, Brassfield Meadows, and LGI Homes Bedford Hills residential projects would create temporary noise, fugitive dust, and traffic during construction; however, these impacts would be minor and temporary and would not disproportionately impact environmental justice populations.

Minor cumulative impacts on air quality and noise would likely affect environmental justice communities within the geographic scope, but these cumulative impacts on environmental justice communities would not be disproportionately adverse given the modeling analysis and air monitoring required by the VADEQ for the Transco Compressor Station 165.

4.13.2.8 Cultural Resources

The geographic scope for potential cumulative impacts on cultural resources was limited to overlapping impacts within the APE. The direct APE for the Southgate Project was defined as a 400-foot-wide corridor centered on the pipeline; while the indirect APE would extend out 0.5-mile from the centerline.

Mountain Valley has surveyed about 941 percent of the Southgate Project pipeline routes for cultural resources by October 2019. This resulted in the identification of 86 archaeological resources and 186 historic architectural sites in the direct APE. Of the archaeological resources, 66 were evaluated as not eligible for listing in the NRHP, 10 of which extend beyond the APE and are considered unevaluated for the portions outside the APE. Additionally, there are 16 potentially eligible or unassessed sites, and 4 are eligible for listing in the NRHP in the direct APE. Of the historic architectural sites, 172 were evaluated as not eligible for the NRHP, 10 are potentially eligible or unevaluated, 1 is eligible, and 3 are listed in the NRHP in the direct APE.

No further work was recommended for the not eligible sites. The Southgate Project would have no effect on the ineligible resources. Avoidance or additional evaluation investigations were recommended for the potentially eligible or unevaluated sites. Avoidance or mitigation was recommended for the listed or eligible sites.

We identified 4 FERC-regulated projects, 3 non-natural gas projects, one commercial/residential project, 1 transportation project, and one mineral extraction operation within the geographic scope for cultural resources. The currently proposed projects listed in appendix F.2 that are defined as federal actions would have to comply with Section 106 of the NHPA. The federal agencies that would manage those projects would have to follow the regulatory requirements of 36 CFR 800. Under those regulations, the lead federal agency, in consultation with the SHPO, would have to identify historic properties in the APE, assess potential impacts, and resolve adverse effects through an agreement document that outlines a treatment plan. Non-federal actions would need to comply with any mitigation measures required by the SHPOs of the affected states. We can conclude that given the state and federal laws and regulations that protect cultural resources, mentioned above, it is not likely that there would be significant cumulative impacts on historic properties, resulting from the Southgate Project in addition to other projects that may occur within the defined geographic scope.

4.13.2.9 Air Quality and Noise

Air Quality

Cumulative impacts on air quality associated with Southgate Project construction activities were evaluated within a geographic scope of 0.25 mile from the pipeline or aboveground facilities. Air emissions during construction would be limited to vehicle and construction equipment emissions and dust and would be localized to the Southgate Project construction sites. A range of approximately 0.25 mile conservatively captures the distance these emissions would travel before becoming negligible and unlikely to contribute to a cumulative impact. Traditional air pollutants such as criteria pollutants, VOCs, and HAPs were listed for chronic and acute health impacts due to inhalation, as well as secondary environmental effects. For these pollutants, we can consider a

geographic scope for cumulative impacts up to 31.1 miles (50 km). GHGs were identified by the EPA as pollutants in the context of climate change. GHG emission do not cause local impacts, it is the combined concentration in the atmosphere that causes global climate (see Climate Change below) and these are fundamentally global impacts that feedback to localized climate change impacts. Thus, the geographic scope for cumulative analysis of GHG emissions is global rather than local or regional. For example, a project 1 mile away emitting 1 ton of GHGs would contribute to climate change in a similar manner as a project 2,000 miles distant also emitting 1 ton of GHGs. Cumulative impacts on air quality as a result of Southgate Project operation were evaluated from a radius of 31.1 miles (50 km) from the Lambert Compressor Station.

The Southgate Project would be located in counties in Virginia and North Carolina that are in attainment/unclassifiable for all criteria pollutants. Mountain Valley would minimize potential impacts on air quality caused by construction and operation of the Project by adhering to applicable federal and state regulations to minimize emissions as described in section 4.11.

Construction

Other projects/actions within the 0.25 mile geographic scope for cumulative impacts on air quality during Southgate Project construction would involve the use of heavy equipment that would produce dust and increase traffic and resultant air emissions. Other projects within this geographic scope include Virginia Southside Expansion, Virginia Southside Expansion II, Mountain Valley Pipeline Project, Berry Hill Road Project, the 4 non-jurisdictional facilities associated with the Southgate Project, the Granite Mill Project, the Cypress Creek Renewables Solar Farm, and the Husky Solar Farm. Additionally, when completed, certain projects in the geographic scope would increase air emissions by varying amounts through increased traffic and operation of any fossil-fueled industrial equipment. The combination of these effects would cumulatively add to the air impacts in the area.

Emissions from construction equipment would be primarily restricted to daylight hours and would be minimized through applicable equipment emission standards and by mitigation measures such as using properly maintained vehicles and commercial gasoline and diesel fuel products with specifications to control pollutants. Because the construction emissions would be short-term, intermittent, and highly localized (essentially limited to within 0.25 mile of the activity), cumulative impacts would depend on the type and location of construction activities occurring at the same time. Pipeline construction moves and would not spend long amounts of time at any one location thus the possibility of any two (or more) projects overlapping construction emissions are reduced. Emissions during construction of the Lambert Compressor Station, which would be stationary (in contrast to pipeline construction which proceeds as a moving assembly line), would take place for many months but would be minimized by mitigation measures described in section 4.11.1.5. Ongoing activities of other projects in the area, such as non-jurisdictional Southgate Project-related facilities (see appendix F.2), also would involve the use of heavy equipment that would generate tailpipe emissions of air contaminants and fugitive dust during construction.

The combined effect of multiple construction projects occurring in the same time frame as the Southgate Project could temporarily add to the ongoing air quality effects of existing activities. However, we conclude that construction of the Southgate Project combination with other projects would not result in significant cumulative impacts on air quality.

Operation

We attempted to identify any other projects that may be located within 31.1 miles of the compressor station proposed by Mountain Valley to ensure that other nearfield facilities relevant to air quality were adequately considered. This resulted in the identification of two projects, the proposed upgrade to Transco Compressor Station 165 (20,500 hp) as part of the Southeastern Trail Project and the upgrade to Transco Compressor Station 166 (21,830 hp) as part of the Virginia Southside Expansion Project II.

Operation of the Southgate Project and other nearby projects would contribute cumulatively to existing air emissions. Each of the projects would need to comply with federal, state, and local air regulations, which may require controls to limit the emission of certain criteria pollutants or HAPs.

Operation of both CS 165 and CS 166 would result in long-term, stationary sources of criteria pollutant air emissions. Operation of these facilities would generate primarily NO_x, CO, and PM emissions, with lesser amounts of SO_2 and VOCs. However, none of the major source thresholds would be exceeded, and the facilities would continue to operate in compliance with all permitting requirements, including the CAA. In addition, while both facilities were constructed over three years ago, recent modifications to the VADEQ air permit for CS 165 were approved on January 28, 2020 under Registration no. 30864. CS 165 and CS 166 emissions are considered part of the ambient air quality within the Southgate Project geographic scope and are accounted for in existing facility permits. Dispersion modeling for the Lambert Compressor Station was submitted to VADEQ on January 31, 2020. The modeling included the Transco Compressor Stations 165/166 as nearby sources along with 24 additional facilities located within a 50 km radius of the proposed Lambert Compressor Station (see table 4.13-6). Details of the methodologies used can be found in the modeling protocol report (see section 4.11.1.7). Cumulative results from the dispersion modeling were reviewed and determined to be in compliance with NAAQS.

While the NO_2 levels for the combined facilities were within the NAAQS, the VADEQ is requiring Transco install ambient air quality monitoring for NO_2 at a location to be approved by the VADEQ. This ambient monitoring should ensure that if NO_2 impacts exceed the NAAQS, mitigation measures would be taken. We also received air quality modeling data that shows the estimated impacts of the combined facilities. As the modeled pollutant closest to the NAAQS, we are including an isopleth (figure 4.13-2) showing the location of the highest impacts for NO_2. Figure 4.13-2 shows that the highest impacts are limited to the area very close to the CS 165 fence line with elevated levels decreasing to the north-northeast and do not extend into denser communities. In addition, a cause and contribute (aka culpability analysis) submitted to the VADEQ demonstrated that the Lambert Compressor Station does not significantly contribute to the higher impacts. This is also demonstrated in figure 4.13-2 where you can see the impacts immediately around the Lambert Compressor Station are substantially below the NAAQS for NO_2.

For these reasons, we conclude that operation of the Southgate Project in combination with other projects would not result in significant cumulative impacts on air local or regional air quality.

TABLE 4.13-6

Cumulative Criteria Pollutant Modeling Results

Pollutant	Timeframe	Maximum Modeled Concentration (µg/m³) a/	Background Concentration (µg/m³)	Total Concentration (µg/m³) b/	NAAQS (µg/m³)
PM_{10}	24-hour	7.9	31.0	38.9	150
$PM_{2.5}$	Annual	1.0 **c/**	7.2	8.2	12
	24-hour	6.0 **cd/**	17.0	23.0	35
CO	8-hour	1,106	1,380	2,486	10,000
	1-hour	2,151	2,300	4,451	40,000
NO_2	Annual	22.0 **e/**	13.2	35.2	100
	1-hour	117.94	60.86	178.8e/	188

a/ Includes Lambert Compressor Station and nearby sources (Transco Stations 165/166 and 24 other facilities were included as nearby sources).

b/ Total concentration is the sum of the modeled and background concentration; this value is compared with the NAAQS.

c/ Value includes secondary impacts ($PM_{2.5}$ emissions formed in the atmosphere from precursor emissions [NO_X and SO_2]) from Lambert Compressor Station and Transco Stations 165/166.

d/ Based on maximum 98th percentile daily maximum modeled concentrations.

e/ Based on EPA's Ambient Ratio Method 2 (ARM2) modeling guidance.

Southgate Project

Air Quality Modeling Results
for 1 Hour NO_2

Noise

Construction activities associated with the Southgate Project would result in perceptible noise within 0.25 mile from pipeline or aboveground facility construction activities during daylight hours, and at nearby NSAs within 0.5 mile of an HDD location. Noise from HDD operations would be temporary but might occur around the clock at certain points in the HDD process. Noise associated with pipeline and aboveground facility construction would also be temporary and would be mostly limited to daytime hours. This, along with our recommendation for a nighttime noise mitigation plan, would minimize the impact on nearby NSAs. The geographic scope for cumulative impacts from noise associated with project operation is limited to any facilities that could impact NSAs located within 1 mile of the Southgate Project's noise-emitting permanent aboveground facilities.

The impact of noise is highly localized and attenuates quickly as the distance from the noise source increases. Other projects located within 0.25 mile from the Southgate Project include Virginia Southside Expansion, Virginia Southside Expansion II, Mountain Valley Pipeline Project, Berry Hill Road Project, the 4 non-jurisdictional facilities associated with the Southgate Project, the Granite Mill Project, the Cypress Creek Renewables Solar Farm, and the Husky Solar Farm. The T-15 Dan River Interconnect is the only project located within 0.5 mile of an HDD location, the Stoney Creek Reservoir HDD. The nearest NSA to the T-15 Dan River Interconnect is a residence located 750 feet south from the site. Based on the schedule and proximity of the other projects to the pipeline route, there could be some cumulative noise impacts. However, the majority of noise impacts associated with the projects would be limited to the period of construction. The majority of Southgate Project construction activities would occur during daytime hours and be intermittent rather than continuous; therefore, the proposed contribution from the Southgate Project to cumulative noise impacts would primarily be for only short periods of time when the construction activities are occurring at a given location.

Operation of the Southgate Project would have a long-term effect on noise levels in proximity to the proposed Lambert Compressor Station and meter stations. Operation of the Lambert Compressor Station would not exceed our noise thresholds, nor would any of the other FERC-regulated projects. We did not identify any other stationary sources of long-term noise impacts within the geographic scope for the Lambert Compressor Station that would affect their associated NSAs. The Mountain Valley Pipeline Project would be located within 1 mile of the Lambert Compressor Station; however, no noise-emitting facilities associated with the Mountain Valley Pipeline Project would be located within one mile of the Lambert Compressor Station.

A cumulative assessment of noise to include the Lambert Compressor Station, CS 165, and CS 166 was developed to address the combined noise from all three facilities because of their proximity to NSAs and each other. Table 4.13-7 summarizes the results of this assessment.

Table 4.13-7

Cumulative Noise Assessment for Lambert Compressor Station and Transco Compressor Stations 165 and 166

Southgate Project NSA	CS 165 NSA	Distance/ Direction from CS 165 to NSA, feet	Current Sound Level (including CS165 remaining equipment & CS166), dBA L_{dn}	Estimated Sound Level of New CS165 Compressor Units, dBA L_{dn}	Estimated Sound Level of Lambert CS Equipment, dBA L_{dn}	Combined Sound Level Lambert, CS165, & CS166, dBA L_{dn}	Potential Cumulative Increase Over Existing Level dBA L_{dn}
N/A	1	1150, SE	48.8 a/	40.4	40.2	49.9	1.1
4	2	2500, NW	44.8 b/	45.4 c/	39.4 d/	48.7	3.9

a/ As provided in Mountain Valley's Southgate Project Application

b/ As measured for the Southgate Project

c/ Calculated from the previously reported CS165 contribution at location of NSA 2 using a hemispherical spreading factor of 20*(1800/2500) or -2.9 dB. The residence designated as NSA 2 in the CS 165 noise analysis has been purchased by Mountain Valley as part of the Southgate Project and is no longer an NSA.

d/ Calculated from the noise model for the Southgate Project

The cumulative analysis indicates that modest increases in the cumulative noise levels, as compared to the existing levels, could occur. These increases are well below FERC's standard for all receiving land use levels (see section 4.11.2.2). Therefore, noise impacts from all three compressor stations would not be significant.

Noise from blowdown events, would be audible NSAs, but are typically infrequent, of short duration, and occur during daytime hours. Based on the analyses conducted and mitigation measures proposed, we conclude that the Southgate Project along with other projects in the geographic scope would not result in significant cumulative noise impacts on residents or the surrounding communities.

Climate Change

Climate change is the variation in climate (including temperature, precipitation, humidity, wind, and other meteorological variables) over time, whether due to natural variability, human activities, or a combination of both, and cannot be characterized by an individual event or anomalous weather pattern. For example, a severe drought or abnormally hot summer in a particular region is not a certain indication of climate change. However, a series of severe droughts or hot summers that statistically alter the trend in average precipitation or temperature over decades may indicate climate change. Recent research attributes certain extreme weather events to climate change (U.S. Global Change Research Program [USGCRP], 2017 and 2018).

The leading U.S. scientific body on climate change is the U.S. Global Change Research Program (USGCRP), composed of representatives from 13 federal departments and agencies.[57] The Global Change Research Act of 1990 requires the USGCRP to submit a report to the President and Congress no less than every 4 years that "1) integrates, evaluates, and interprets the findings of the Program; 2) analyzes the effects of global change on the natural environment, agriculture, energy production and use, land and water resources, transportation, human health and welfare, human social systems, and biological diversity; and 3) analyzes current trends in global change, both human induced and natural, and projects major trends for the subsequent 25 to 100 years." These reports describe the state of the science relating to climate change and the effects of climate change on different regions of the U.S. and on various societal and environmental sectors, such as water resources, agriculture, energy use, and human health. In 2017 and 2018, the USGCRP issued its Climate Science Special Report: Fourth National Climate Assessment, Volumes I and II (Fourth Assessment Report) (USGCRP, 2017; and USGCRP, 2018, respectively). The Fourth Assessment Report states that climate change has resulted in a wide range of impacts across every region of the country. Those impacts extend beyond atmospheric climate change alone and include changes to water resources, transportation, agriculture, ecosystems, and human health. The U.S. and the world are warming; global sea level is rising and acidifying; and certain weather events are becoming more frequent and more severe. These changes are driven by accumulation of GHG in the atmosphere through combustion of fossil fuels (coal, petroleum, and natural gas), combined with agriculture, clearing of forests, and other natural sources. These impacts have accelerated throughout the end 20th and into the 21st century (USGCRP 2018).

Climate change is a global phenomenon; however, for this analysis, we will focus on the existing and potential cumulative climate change impacts in the Southgate Project area. The USGCRP's Fourth Assessment Report notes the following observations of environmental impacts are attributed to climate change in the Southeast region of the United States (USGCRP, 2017; USGCRP, 2018):

- The region has experienced an increase in annual average temperature of 0.46 degrees Fahrenheit (°F) since the early 20th century, with the greatest warming during the winter months;
- The region has experienced more frequent and longer heat waves and a greater number of days with nighttime temperatures above 75 °F;
- Over the past 50 years, there has been an overall increase in extreme rainfall events in the region, except in some areas near the Appalachian Mountains and Florida where there has been a downward trend;
- The number of strong (Category 4 and 5) hurricanes has increased since the early 1980s;

[57] The USGCRP member agencies are: Department of Agriculture, Department of Commerce, Department of Defense, Department of Energy, Department of Health and Human Services, Department of the Interior, Department of State, Department of Transportation, Environmental Protection Agency, National Aeronautics and Space Administration, National Science Foundation, Smithsonian Institution, and U.S. Agency for International Development.

- As average global sea level rise over the past century averaged approximately 8 to 9 inches; in some low lying areas of the Southeast region, the combination of vertical land motion and changing currents has resulted in as much as 1 to 3 feet of local relative sea level rise. This recent rise in local relative sea level has caused normal high tides to reach critical levels that result in flooding in many coastal areas in the region.

The USGCRP's Fourth Assessment Report notes the following projections of climate change impacts in the project region with a high or very high level of confidence[58] (USGCRP, 2018):

- The frequency and severity of extreme precipitation events are projected to increase, with up to double the number of heavy rainfall events by the end of the century.
- The Southeast region's coastal plain and inland low lying areas are projected to experience daily high tide flooding by the end of the century due to sea level rise and extreme rainfall events.
- Rising temperatures and increases in the duration and intensity of droughts are expected to increase wildfire occurrence and also reduce the effectiveness of prescribed fire.
- The region is projected to experience an increase in economic vulnerabilities in the agricultural, timber, and manufacturing sector as well as exposure-linked health impacts due to changing seasonal climates and more frequent extreme heat episodes.
- Tropical storms are projected to be fewer in number globally, but stronger in force, exacerbating the loss of barrier islands and coastal habitats.

It should be noted that while the impacts described above taken individually may be manageable for certain communities, the impacts of compound extreme events (such as simultaneous heat and drought, wildfires associated with hot and dry conditions, or flooding associated with high precipitation on top of saturated soils) can be greater than the sum of the parts (USGCRP 2018).

The GHG emissions associated with construction and operation of the Southgate Project are discussed in section 4.11.1. The construction and operation of the Southgate Project would increase the atmospheric concentration of GHGs, in combination with past, current, and future emissions from all other sources globally and contribute incrementally to future climate change impacts.

[58] The report authors assessed current scientific understanding of climate change based on available scientific literature. Each "Key Finding" listed in the report is accompanied by a confidence statement indicating the consistency of evidence or the consistency of model projections. A high level of confidence results from "moderate evidence (several sources, some consistency, methods vary and/or documentation limited, etc.), medium consensus." A very high level of confidence results from "strong evidence (established theory, multiple sources, consistent results, well documented and accepted methods, etc.), high consensus" (https://science2017.globalchange.gov/chapter/front-matter-guide/).

We have not been able to find any GHG emission reduction goals established at the federal level.[59] At the state level, Virginia established the "Governor's Commission on Climate Change" (GCCC) in 2007 (The Center for Climate Strategies, undated). Governor Terry McAuliffe issued Executive Order 19 on July 1, 2014 convening the Governor's Climate Change and Resiliency Update Commission. The Commission provided a report dated December 21, 2015. The Report built upon previous work and included an inventory of contributors of GHG, evaluation of impacts, approaches used by other federal or non-federal governmental agencies, needed adaptation and resilience preparations, and recommended a renewable electric portfolio percentage and actions to mitigate climate change impacts. The plan called for a reduction of GHG emissions 30% below a "business as usual scenario" by 2025. We do not have the data that identified the "business as usual" scenario. In April 2019, the VADEQ issued a final carbon trading regulation that would commence trading in 2020; however, this would only apply to electric generation units in excess of 25 MW. As the Southgate Project is intended to serve end users in North Carolina, we cannot determine Southgate Project effects, if any, on Virginia's GHG goals.

On October 29, 2018, North Carolina Governor Roy Coopers signed EO No. 80 "North Carolina's Commitment to Address Climate Change and Transition to a Clean Energy Economy". The EO mandated a statewide reduction of greenhouse gas emissions by 2025 to 40 percent below 2005 levels. Mountain Valley has indicated that the currently subscribed volume of natural gas, 300 MMcf/d, would be used in North Carolina, primarily by residential and small and medium-sized commercial customers for heating, cooking, and other end-uses. The remaining 75 MMcf/d could be utilized in either North Carolina or Virginia. The end use of this gas is not known. For both the subscribed and unsubscribed volumes, we cannot determine Southgate Project effects on the states' goals.

Currently, there is no universally accepted methodology to attribute discrete, quantifiable, physical effects on the environment to the Southgate Project's incremental contribution to GHGs. We have looked at atmospheric modeling used by the EPA, National Aeronautics and Space Administration, the Intergovernmental Panel on Climate Change, and others and we found that these models are not reasonable for project-level analysis for a number of reasons. For example, these global models are not suited to determine the incremental impact of individual projects, due to both scale and overwhelming complexity. We also reviewed simpler models and mathematical techniques to determine global physical effects caused by GHG emissions, such as increases in global atmospheric CO_2 concentrations, atmospheric forcing, or ocean CO_2 absorption. We could not identify a reliable, less complex model for this task and we are not aware of a tool to meaningfully attribute specific increases in global CO_2 concentrations, heat forcing, or similar global impacts on Southgate Project-specific GHG emissions. Similarly, it is not currently possible to determine localized or regional impacts from GHG emissions from the Southgate Project. Absent such a method for relating GHG emissions to specific resource impacts, we are not able to assess potential GHG-related impacts attributable to the Southgate Project. Without

[59] The national emissions reduction targets expressed in the EPA's Clean Power Plan were repealed, Greenhouse Gas Emissions From Existing Electric Utility Generating Units; Revisions to Emissions Guidelines Implementing Regulations, 84 Fed. Reg. 32,250, 32,522-32, 532 (July 8, 2019). In November 2019, formal notification was sent to the United Nations of the U.S.'s withdrawal from the Paris climate accord.

the ability to determine discrete resource impacts, we are unable to determine the significance of the Southgate Project's contribution to climate change.

4.13.3 Conclusion

Construction of the Southgate Project, in addition to other projects within geographic scopes of analysis, could have minor cumulative impacts on a range of environmental resources, as discussed above. The majority of the cumulative impacts associated with the Southgate Project and with the projects listed in appendix F.2 would be minor and temporary during construction. However, some long-term cumulative impacts would occur in forested wetlands and forested uplands regarding vegetative communities and associated wildlife habitats. Some cumulative long-term benefits include new jobs and wages, purchases of goods and materials, and tax revenues. For the federal projects listed in appendix F.2, there are laws and regulations in place that protect waterbodies and wetlands, threatened and endangered species, and historic properties, and limit impacts from air and noise pollution. We only have limited information about potential or foreseeable private projects in the region. For some resources, there are also state laws and regulations that apply to private projects as listed in appendix F.2. Given the Southgate Project BMPs, design features, and mitigation measures that would be implemented; and the federal and state laws and regulations protecting resources, and permitting requirements that would apply to the other projects listed in appendix F.2, we conclude that when added to other past, present, and reasonably foreseeable future actions, cumulative impacts on environmental resources within the geographic scopes affected by the Southgate Project would not be significant.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 SUMMARY OF THE ENVIRONMENTAL ANALYSIS

The conclusions and recommendations presented in this section are those of the FERC environmental staff. Our conclusions and recommendations are based on input from the COE and the FWS, as cooperating agencies in the preparation of this EIS. The federal cooperating agencies may adopt this EIS per 40 CFR 1501.3 if, after an independent review of the document, they conclude that their requirements and/or regulatory responsibilities have been satisfied. However, the cooperating agencies will issue subsequent decisions, determinations, permits, or authorizations for the Project in accordance with each individual agency's regulatory requirements..

We conclude that construction and operation of the Southgate Project would result in limited adverse environmental impacts. Most adverse environmental impacts would be temporary or short-term during construction, but some long-term and permanent environmental impacts would occur on forest and wetlands. This determination is based on a review of the information provided by Mountain Valley and further developed from data requests; field investigations; scoping; literature research; alternatives analysis; and contacts with federal, state, and local agencies as well as individual members of the public. As part of our analysis, we developed specific mitigation measures that we determined would appropriately and reasonably reduce the environmental impacts resulting from construction and operation of the Project. We are, therefore, recommending that these mitigation measures be attached as conditions to any authorization issued by the Commission. If the Project is constructed and operated in accordance with the mitigating measures discussed in this EIS, and our recommendations, adverse environmental impacts would be reduced to less than significant levels. A summary of the Project impacts and our conclusions regarding impacts are provided below by resource area.

5.1.1 Geologic Resources

The overall effects of Project construction and operation on topography and existing geologic conditions would be minor. Primary impacts would be limited to construction activities and would include temporary disturbance resulting from grading and trenching operations. After completion of construction activities, topography and associated drainages in areas of temporary disturbance would be returned to pre-construction contours and elevations to the extent practicable.

The Project permanent easement would be an average of 100 feet from parcels owned by the East Alamance Quarry, and approximately 28.5 feet away at nearest distance. Based on a review of the East Alamance Quarry mining permit revision (dated April 2019), Mountain Valley understands there to be a 25-foot buffer inside of the property line of Martin Marietta Materials, Inc.-owned parcels that includes all aspects of activity related to mining (e.g. berms, drains, basins, erosion devices etc.). This permit also depicts active mining as occurring another 200 feet inside of the property line, thus increasing the distance between the pipeline and mining activity. Therefore, we conclude that the Project would not significantly impact or be impacted by the East Alamance Quarry.

We received comments regarding the presence of uranium deposits in the Project vicinity in Pittsylvania County. The nearest commercially viable uranium deposit is 3.5 miles north of the Lambert Compressor Station and concentrations of uranium in sediment, soils, shallow bedrock, and groundwater near the Project workspace are comparable to concentrations in the conterminous U.S. Further, uranium is generally not highly mobile in the environment, and Mountain Valley would implement its E&SC Plan to address fugitive dust mitigation, stormwater control, and erosion and sediment control measures.

The removal of bedrock, by blasting or other means, may be required if bedrock is encountered within the pipeline trench or at aboveground facility sites. Blasting events would be designed to break up only the amount of bedrock needed for construction, and impacts on bedrock would be minor and limited to the immediate area of construction. Mountain Valley would comply with all federal, state, and local blasting regulations and has developed a *General Blasting Plan* that describes measures that would be implemented to minimize potential blasting-related impacts. We have included a recommendation in section 4.1.4.6 that Mountain Valley should file a revised *General Blasting Plan* that clarifies it will not bury excess rock fragments generated during trenching or blasting in any location other than where the rock originated.

The Project would cross about 2.0 miles of slopes over 30 percent. Mountain Valley completed additional field assessment and assigned site-specific control measures to these areas in their *Landslide Mitigation Report*. Although not currently identified, construction could cross karst sensitive areas. Mountain Valley would implement the measures outlined in its *Karst Hazard Assessment* to reduce the potential for subsidence if karst terrain is encountered.

Mountain Valley has proposed the use of the HDD method to cross sensitive resources at two separate locations (Dan River and Stony Creek Reservoir). Mountain Valley's *HDD Contingency Plan* would ensure that drill operations are monitored and adjusted to avoid potential IRs, and if one should occur, that the release would be contained and remediated. We have reviewed Mountain Valley's *HDD Contingency Plan* and find it acceptable. Mountain Valley's geotechnical boring and hydrofracture analysis for the Dan River and Stony Creek Reservoir HDD crossings have been completed and we conclude that subsurface conditions identified would not render the HDD's infeasible.

With the implementation of the measures outlined in Mountain Valley's *Landslide Mitigation Report*, *General Blasting Plan*, *HDD Contingency Plan,* E&SC Plan*,* and *Karst Hazard Assessment*, we conclude that impacts on geological resources would be adequately minimized.

5.1.2 Soils

Construction of the Project facilities would temporarily and permanently disturb soils, resulting in increased potential for erosion, compaction, and reduced revegetation following construction. Mountain Valley indicates that the potential for soil erosion would be minimized through the use of erosion controls and revegetation measures described in Mountain Valley's Plan.

Permanent impacts on prime farmland and farmland of statewide importance would be limited to soils within the footprint of new aboveground facilities (about 10.8 acres total) and new

permanent access roads (5.6 acres total), where soils would be permanently converted to industrial use. Agricultural activities would not be precluded within the permanent pipeline right-of-way; therefore, impacts on prime farmland and farmland of statewide importance within temporary work areas would be limited to the construction phase. Within these areas, impacts on prime farmland would be minimized by implementing BMPs included in Mountain Valley's Plan.

A total of 30 sites of potential contamination concern within 0.25 mile of the Project area were identified. The nearest site with an active or unresolved status, Midway Auto Sales, is approximately 100 feet from the proposed Project workspace near MP 43.6. This site is down-gradient of the Project alignment, and available information describes groundwater contamination only. Mountain Valley has prepared an *Unanticipated Discovery of Contamination Plan*, which would be used in the event that unknown areas of contaminated soils are encountered during construction of the Project. The Project is not anticipated to be affected by any identified sites based on distance from the construction work area and regulatory status (i.e., closed status, no violations found), and/or media impacted (i.e., groundwater only).

We conclude that Mountain Valley's implementation of the its Plan and Procedures, E&SC Plan, SPCC Plan, and *Unanticipated Discovery of Contamination Plan*, during construction and restoration, in combination with our recommendations, would adequately minimize impacts on soils, and no significant impacts on soils as a result of the Project would occur.

5.1.3 Water Resources

Groundwater

The Project would not cross any sole source aquifers or principal source aquifer areas. No wellhead protection areas were identified within the Project area. Landowner surveys by Mountain Valley to identify any private wells and springs that are used for potable water are not complete. Therefore, we are recommending that, prior to construction, Mountain Valley file the locations of all private water wells and springs identified within 150 feet of the Project work areas, including the well's or springs' status, use, direction, and distance from construction workspace, and any proposed mitigating actions to minimize or avoid impacts on the private water wells or springs. As described in the Project's *Water Resources Identification and Testing Plan*, Mountain Valley would offer to conduct pre-construction and post-construction water quality testing for all water supply wells located within 150 feet of Project workspaces.

One site of potential concern for groundwater contamination was identified about 100 feet from the Project work areas. Additional existing contaminated groundwater resources may be encountered during construction of the Project. If contaminated groundwater is encountered during construction, Mountain Valley would implement the measures outlined in its *Unanticipated Discovery of Contamination Plan*. The Project's SPCC Plan addresses the prevention and mitigation measures that would be implemented to avoid or minimize the potential impacts of a spill during construction.

We conclude that the groundwater mitigation measures proposed by Mountain Valley would adequately avoid or minimize potential impacts on groundwater resources. Therefore, we

do not anticipate long-term or significant impacts on groundwater resources as a result of construction or operation of the Project.

Surface Water

In general, the watersheds crossed by the Project contain development consistent with a rural environment. We expect that the water quality and biota within the Project area streams is largely reflective of the degree of upstream development. One public water supply intake is located within 3 miles downstream of the Project. This intake is located in the Stony Creek Reservoir 1.8 river miles downstream from an HDD crossing and serves the City of Burlington. Based on the use of an HDD and the distance to the intake, we conclude that the Project would not affect the intake.

The Project would require 223 crossings of waterbodies, 4 of which are major waterbodies. The Project crossings would follow Mountain Valley's Procedures and E&SC Plan. Mountain Valley would use HDD crossings at the Dan River and the Stony Creek Reservoir. Conventional bore crossings are proposed at Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek due to the potential presence of federal or state listed aquatic species in these systems. All other crossing would be completed using dry-ditch crossing methods (dam-and-pump or flume method) to minimize in-stream construction and surface water impacts. Mountain Valley stated they would use enhanced erosion control to protect waterbodies where the pipeline would parallel within 15 feet; and where workspaces would be within 50 feet of a waterbody or wetland. We are recommending that Mountain Valley provide specific details about these enhanced erosion control measures for our review and approval, prior to construction.

Mountain Valley would cross impaired waters using a dry-ditch crossing technique (e.g. flume or dam-and-pump) if there is flowing water at the time of construction. Mountain Valley would use BMPs and measures outlined in its Plan and Procedures, as well as the project-specific E&SC Plan to maintain stream conditions and minimize further impairment. We do not anticipate that a pipeline installed underneath waterbodies would contribute to the impairment of streams for *E. coli* and therefore would not contribute to the further impairment of Little Cherrystone Creek, White Oak Creek, and Sandy Creek in Virginia. VADEQ commented that hydroseeding could be a contributing factor to PCB concentrations in the Dan River (VADEQ 2018e). The Project would avoid hydroseeding within 100 feet of direct tributaries to the Dan River.

The segment of the Dan River crossed by the Project is included in the NRI list, but not designated as a National Wild and Scenic River. The NPS consultation indicated that an HDD crossing of the Dan River and implementation of appropriate BMPs would reduce potential impacts on the river and the surrounding landscape. Mountain Valley would install applicable BMPs outlined in the E&SC Plan and would implement the *HDD Contingency Plan.*

The Sandy River is a major waterbody crossed by the Project and qualifies for a potential designation in the Virginia Scenic River Program that may result in a scenic river designation in the future. The segment of the Banister River crossed by the Project at MP 4.9 is listed as a future Blueway (a designated recreational water trail). The Sandy and Banister Rivers would be crossed using a dry-ditch method (e.g. dam-and-pump or flume). While there would be minor impacts on the rivers during construction, these impacts would be short-term with the implementation of

Mountain Valley's Procedures for the stream crossing. Boaters would be temporarily restricted from traversing sections of the Sandy River during construction. Mountain Valley would notify users of any closings through websites, at upstream access areas, and/or using other methods based on recommendations from the VADCR. The river crossing would take 5 to 10 days to complete. It is not anticipated that the river crossing would affect a significant number of boaters.

All waterbodies crossed by the Project are designated warmwater fisheries. The FERC requires all in-stream work, except the installation and removal of equipment bridges, to be completed in warmwater fisheries between June 1 and November 30 unless expressly permitted or further restricted by an appropriate federal or state agency in writing. Based on results of fish and mussel surveys and correspondence with VADGIF, Mountain Valley has adopted a construction window of July 16 through April 14 for surface waterbody crossings in Virginia. NCWRC has agreed that no construction window would be needed for waterbody crossings in North Carolina.

Mountain Valley would use a total of 5.9 million gallons of water withdrawn from the Dan River for hydrostatic test water, HDD process water, and dust suppression. Mountain Valley states that municipal water sources would be used if conditions in the Dan River were not suitable for water withdrawal. Mountain Valley would screen the intake hose to present entrainment of aquatic species and maintain intake rates appropriate to local conditions. Because Mountain Valley has yet to get permission from the FWS for use of the Dan River, we are recommending that, prior to construction, Mountain Valley file its final list of water sources to be used for the Project (dust control, hydrostatic testing, and HDD operations), for our review and approval, and provide written concurrence from the FWS for any water withdrawals from the Dan River.

Temporary and localized impacts on surface waters could result from in-stream construction activities and potential erosion and runoff from upland construction. Mountain Valley would implement its Plan, Procedures, and E&SC Plan to protect surface water resources, including restoring stream habitat and restoring riparian strips along streams. We conclude that the surface water mitigation measures proposed by Mountain Valley would adequately avoid or minimize potential impacts on surface water resources. Therefore, we do not anticipate long-term or significant impacts on surface water resources because of construction or operation of the Project.

5.1.4 Wetlands

Mountain Valley made numerous modifications to its proposed route to avoid and reduce wetland crossings and impacts; however, construction of the Project would affect 25.7 acres of wetlands. Most of these impacts would be temporary and short-term. The Project's 50-foot-wide operational right-of-way would affect about 5.6 acres of wetlands, including the conversion of 0.2 acre of PSS wetland to PEM wetland, and 4.2 acres of PFO wetlands to PSS and PEM wetlands. Permanent impacts on wetlands would include the conversion of forested wetlands to scrub-shrub or emergent wetlands within the pipeline permanent easement. The majority of wetland impacts would be from temporary construction work areas (21 acres) which would be allowed to revegetate following construction.

Construction and operation-related impacts on wetlands would be mitigated by Mountain Valley's proposed construction methods and restoration measures outlined in Mountain Valley'

Procedures; and compliance with the COE section 404 requirements. Mountain Valley would conduct annual post-construction monitoring of wetlands affected by construction to assess the condition of revegetation and the success of restoration until revegetation is successful. Mountain Valley identified site-specific conditions that do not allow for a 50-foot setback of ATWS from wetlands and requested approval to implement alternative measures. Based on our review, we conclude that those requests are justified. Based on Mountain Valley's efforts to route the pipeline facilities and site aboveground facilities to avoid and minimize impacts on wetlands, and by Mountain Valley's implementation of proposed construction and restoration plans, we conclude that impacts on wetland resources would be effectively minimized and mitigated. In addition, the COE could require Mountain Valley to offset unavoidable impacts on wetlands through implementation of an agency-approved *Compensatory Mitigation Plan*.

5.1.5 Vegetation

The Project is located wholly within the Piedmont Region and areas that have been heavily used as cropland; however, many of these areas have regrown into successional forests. Managed or developed land classes include agricultural land, commercial, industrial, and residential areas. These land classes represent about 21 percent of the proposed land that would be required for the Project. Of the about 94 percent of vegetated areas within the Project footprint, the majority (about 44 percent) consists of forested upland, followed by herbaceous/scrub-shrub upland (about 39 percent); less than 2 percent of the pipeline Project area is within wetland vegetation communities.

The primary effect of pipeline construction would be cutting, clearing, and/or removal of existing vegetation. Secondary impacts associated with disturbances to vegetation could include increased soil compaction and erosion, increased soil temperature and dryness, increased potential for the introduction and establishment of non-native and invasive species, and physical damage to nearby trees. Mountain Valley documented noxious weeds on accessible tracts during field surveys conducted in 2018 and 2019. To control the spread of noxious weed species within the Project area, Mountain Valley developed an *Exotic and Invasive Plant Species Control Plan* in coordination with state agencies. Once construction is complete, Mountain Valley would monitor and address occurrences of noxious and invasive weed species throughout restoration and for two years post-construction.

The majority of vegetation affected by construction of the Project would be upland forested land, which would result in long-term impacts. A total of 18.5 acres of interior forest would be permanently converted to an herbaceous state as part of the permanent right-of-way (1.3 acres in Virginia and 17.2 acres in North Carolina). The remaining acreage cleared during construction would revegetate as edge habitat. To minimize forest fragmentation and edge effects, Mountain Valley has collocated about 49 percent (37 miles) of the pipeline route with existing linear corridors.

The permanent footprint at the Lambert Compressor Station, and other aboveground facilities would be converted to developed land. Areas used for temporary and additional workspace at each facility would be restored and maintained as open land or allowed to revert to pre-construction land use cover.

Mountain Valley states that merchantable timber would be cut to useable lengths and stacked on the edge of the right-of-way to a maximum height of 4 feet with openings every 200 feet to allow the safe passage of wildlife. Mountain Valley further states that brush cleared from the construction corridor would be open burned, windrowed, chipped/mulched on the right-of-way, or hauled off for disposal at an approved location. Mountain Valley would determine methods and locations for the collection, containment, and disposal of brush and timber during construction in coordination with the landowner. Open burning would not be conducted without landowner approval. Disposal of brush and timber for beneficial reuse would be subject to landowner approval, and compliance with permit requirements and local regulations. To ensure that Mountain Valley's proposed timber and brush disposal methods comply with the FERC *Upland Erosion Control, Revegetation, and Maintenance Plan*, section III.E. and do not result in adverse environmental impact, we are recommending that any timber that remains on or adjacent to the right-of-way, as agreed to by the landowner, is located at access points where the landowner can reasonably retrieve timber without any inadvertent impacts on the restored right-of-way.

Following construction, Mountain Valley would seed the construction workspace and allow natural succession to revegetate workspaces disturbed by construction in accordance with the Mountain Valley's Plan and Procedures. Mountain Valley would use and apply a seed mix that incorporates recommendations from the local soil conservation authority, the landowner, or land management agency. Mountain Valley would mow or clear vegetation within the operational right-of-way every 3 years. However, Mountain Valley proposes to maintain an herbaceous corridor up to 10 feet wide centered on the pipeline to facilitate periodic corrosion/leak surveys.

Impacts on forested and non-forested vegetation types, as well as the potential introduction or spread of noxious weeds or invasive plant species, would be minimized through adherence to the measures outlined in Mountain Valley's Plan and Procedures, and other mitigation measures. Therefore, given the amount of collocation with existing, maintained rights-of-way and the presence of similar vegetation communities in Virginia and North Carolina, we conclude that impacts on vegetation, including forested areas, would not be significant.

5.1.6 Wildlife and Aquatic Resources

Constructing the Project would disturb about 1,300 acres of wildlife habitat, including agricultural lands. The temporary and permanent loss and/or conversion of habitat and the general disturbance created by the use of construction equipment would impact wildlife. This impact would vary depending on the type and quantity of habitat affected and the ability of species to leave Project work areas and successfully use adjacent habitats. Constructing the Project may result in limited mortality of less mobile animals, such as small rodents, reptiles, amphibians, and invertebrates, which may not be able to relocate from the immediate construction area.

To increase the speed and success of restoration of wildlife habitat, Mountain Valley would implement right-of-way restoration measures contained in the its Plan and Procedures and solicit guidance from the NRCS, VADCR, and NCWRC to restore the pipeline corridor using native seed mixes specific to the Project locations. Additionally, Mountain Valley would allow the right-of-way adjacent to a 10-foot-wide strip over the pipeline to grow as scrub-shrub habitat, which would provide a more gradual transition between the pipeline corridor and surrounding forested habitat.

The Project would not cross any National Wildlife Refuges, Wildlife Management Areas, or other federally protected lands. The Project would not come within 3 miles of any state Wildlife Management or Game Lands in North Carolina, but would pass within a mile of the White Oak Mountain Wildlife Management Area in Virginia between approximate MPs 0.0 and 1.3. The Project would also cross multiple state-managed or private conservation areas, including three North Carolina Forest Legacy Areas (MPs 26.1 to 36.3, MPs 42.2 to 48.4, and contractor yard CY25) and a Piedmont Land Conservancy Easement. The Project would also pass through about 3 miles of the Virginia Piedmont Forest Block Complex IBA between MPs 22.7 and 25.7.

Mountain Valley would attempt to minimize Project impacts on migratory birds by conducting construction-related vegetation clearing outside of the peak migratory bird nesting season within each state (March 15 through August 15 in Virginia and April 1 through August 31 in North Carolina). Conducting vegetation clearing outside of the peak migratory bird nesting season would minimize incidental take of nesting migratory birds. If avoiding the migratory bird nesting season during construction-related clearing becomes infeasible, Mountain Valley would consult with the FWS to identify measures to implement to minimize impacts on migratory birds.

Mountain Valley coordinated with the VADGIF, NCWRC, and local conservation districts to develop right-of-way mowing schedules and conservation practices beneficial to bird species (and other wildlife) that may use the Project right-of-way as nesting or foraging habitat. Based on recommendations from VADCR and NCWRC, Mountain Valley has proposed to not conduct maintenance clearing or mowing of the right-of-way between April 1 and October 15 of any year.

Mountain Valley has also minimized the impact on migratory bird habitat by collocating the Project route with existing rights-of-way or previously disturbed habitat. Given the steps Mountain Valley would take to attempt to minimize Project impacts on migratory birds, and the relatively low percentage of forested habitat generally and interior forest habitat specifically that would be affected in comparison with available forested habitat in the vicinity of the Project, we conclude Project impacts on migratory birds would be avoided or minimized to the extent practicable.

To account for the possibility of bald eagles building a nest in the vicinity of the Project, Mountain Valley would conduct bald eagle nest surveys during the winter prior to the beginning of construction within 0.5 mile of the Project. Mountain Valley also received a recommendation from the NCWRC in August of 2018 (NCWRC, 2018b) to avoid construction activities within 0.5 mile of any active colonial nesting bird rookeries. The NCWRC further recommended that Mountain Valley conduct surveys for rookeries within 0.5 mile of the Project rights-of-way during the winter months prior to construction. Mountain Valley has accordingly committed to conducting the rookery surveys concurrently with the bald eagle nest surveys. Additionally, Mountain Valley would maintain established landscape buffers between Project-related activities and active rookeries and would refrain from construction activities within 0.5 mile of any rookery between February 15 and July 31. Based on Mountain Valley's intent to conduct rookery and bald eagle surveys, and implement the noted protective measures, we conclude Project impacts on colonial nesting birds and bald eagles would be avoided or minimized to the extent practicable; however, to confirm whether Mountain Valley would need to implement the above-noted measures protective of nesting bald eagles and/or colonial rookeries, we are recommending that Mountain Valley should file the results of the pre-construction bald eagle nest and colonial rookery surveys.

The Project would cross 21 perennial waterbodies containing fisheries of special concern; 8 in Virginia, and 13 in North Carolina. Constructing and operating the Project could temporarily impact fisheries and aquatic resources. Sedimentation and turbidity, alteration or removal of in-stream and stream bank cover, stream bank erosion, introduction of water pollutants, water depletions, and entrainment of small fishes and fry during water withdrawals could increase the rates of stress, injury, and mortality experienced by fish and other aquatic life. In general, fish would migrate away from these activities.

Mountain Valley would implement erosion and sediment control BMPs described in its E&SC Plan at all crossings of waterbodies. The majority of waterbody crossings for the Project would be dry-ditch crossings (flume, dam-and-pump, or cofferdam). The Dan River and Stony Creek Reservoir are proposed to be crossed via an HDD; and three locations are proposed to be crossed via conventional bore including Cascade Creek/Dry Creek, Wolf Island Creek, and Deep Creek. Mountain Valley also would adhere to all federal and state permit conditions, including those regarding the minimization of impacts on fisheries of special concern adhering to the recommended work window for in-water construction in Virginia (North Carolina agencies have stated no work windows would be required for in-water construction in North Carolina). Mountain Valley would also attempt to minimize impacts on fisheries by relocating all aquatic species, including fishes, freshwater mussels, crayfish, reptiles, and amphibians, from the construction areas. All fish and freshwater mussel relocations would be supervised by qualified, professional biologists in possession of applicable federal and/or state permits

Based on our review of the potential impacts and mitigation measures, we conclude that constructing and operating the Project would not significantly impact wildlife, terrestrial habitats, migratory birds, or fisheries and aquatic resources.

5.1.7 Special Status Species

Federal agencies are required by the ESA Section 7(a)(2) to ensure that any action authorized, funded, or carried out by the agency would not jeopardize the continued existence of a federally listed threatened or endangered species or species proposed for listing, or result in the destruction or adverse modification of designated critical habitat. As the lead federal agency, the FERC is responsible for determining whether any federally listed endangered or threatened species or any of their designated critical habitats are near the proposed action, and to determine the proposed action's potential effects on those species or critical habitats. There are five federally listed threatened or endangered species, two species of concern, and one species that is proposed as threatened that could potentially be affected by the Project. We have determined that the Project is *not likely to adversely affect* these species, and we are asking the FWS to consider this EIS as our final Biological Assessment for the Project. We have included a recommendation that restricts construction until our ESA consultation with the FWS is completed.

5.1.8 Land Use, Recreation, and Visual Resources

The primary land uses affected by construction would be forested/woodland and open land. Agricultural, silviculture, industrial/commercial, and residential would make up the remaining land types affected during construction. Operating the Project would permanently impact about 450 acres. The permanent operational easement would account for 431.6 acres. The remaining

18.4 acres of permanent impact would be associated with aboveground facilities, cathodic protection beds, and permanent access roads.

Mountain Valley considered existing developed residential areas and planned residential developments, including short segments of the route at road crossings with homes near the route alignment, as residential land use. As currently designed, 18.1 acres of residential land would be affected by construction of the pipeline (8.9 acres) and access roads (9.2 acres). Mountain Valley prepared and would adhere to site-specific *Residential Construction Plans* for 24 residential structures currently identified within 25 feet of construction work areas or where a plan was requested by FERC. Mountain Valley would work with landowners to either protect, purchase or relocate structures within the proposed construction right-of-way. One residence at MP 67.3 would be within 10 feet of a new temporary access road due to the construction constraints along this portion of the Project route, and Mountain Valley provided documentation that the landowner has concurred with the site-specific construction plan in this area.

Mountain Valley contacted local planning agencies and identified one planned residential and commercial development within 0.25 mile of the Project. The Granite Mill Project includes the redevelopment of an abandoned mill to include new apartments and commercial space. Mountain Valley proposed to use access road TA-AL-187, an existing road through the redevelopment site. However, after the issuance of the draft EIS, Mountain Valley determined that there were other available access points to the right-of-way and therefore determined that the access road was no longer needed. Therefore, no direct impacts on the Granite Mill Project site are expected.

We received comments regarding potential impacts on the Draper Landing River Access Site, a recently built boat ramp site in the City of Eden near the Dan River HDD site. As this is the only major boat and recreational access to the Dan River in this area, access to the boat ramp could be hindered during Project construction. Mountain Valley has agreed to reduce workspace at this location and ensure public access is not inhibited.

5.1.9 Socioeconomics

The Project may affect the socioeconomic character of communities near the proposed facilities. These potential impacts include temporary population increases, new employment opportunities, increased demand for housing and public services, impacts on tourism and local businesses, transportation impacts, environmental justice, and revenues associated with sales and payroll taxes.

The Project construction workers would be spread out along two separate pipeline spreads within three counties over a short construction timeframe. Non-local construction workers could easily be absorbed within the populations of the affected counties. The Project would not have a significant effect on any one counties' population, nor would it have significant adverse impacts on housing. Also, any increase in local employment rates from construction of the Project in these counties or the surrounding areas would be temporary and minor, and the Project is unlikely to noticeably affect local unemployment rates.

Each county within the Project area has numerous fire and police departments. Mountain Valley would work with local fire departments, police departments, and emergency first responders to discuss any Project needs, including traffic assistance and emergency response preparedness. The communities in the Project area have adequate public service infrastructure to meet the potential needs of non-local workers who relocate temporarily. Therefore, we conclude that the Project would not significantly impact public services.

Mountain Valley would inspect roads periodically and, if damages occur as a direct result of Project-related activities, would repair them as appropriate and in accordance with the applicable permit. Following construction, roads would be restored to their original conditions unless otherwise directed by the landowner, county, or state agency. Construction activities would result in temporary to short-term impacts on transportation infrastructure.

The Project would not have a significant adverse impact on property values. Additionally, we conclude that homeowners' insurance rates are unlikely to change, and the Project would not affect the ability of homeowners to obtain fair market base priced insurance.

The Project would result in some beneficial impacts on the state and local economies by creating a short-term stimulus to the affected areas through payroll expenditures, local purchases of consumables Project-specific materials, room rentals, and sales tax. Operation of the Project would result in long-term ad valorem property tax benefits for the counties crossed by the Project.

Although low-income and minority populations exist within the Project area, the Project would not have a disproportionately high and adverse environmental or human health impact on minority or low-income populations.

5.1.10 Cultural Resources

Mountain Valley conducted cultural resources surveys through November 2019 and identified a total of 81 archaeological sites and 241 historic architectural sites within the direct APE. Of the archaeological sites, 55 were evaluated as not eligible for the NRHP, 23 were assessed as potentially eligible or unevaluated, and 3 were determined eligible. Of the historic architectural sites, 201 were evaluated as not eligible, 34 are potentially eligible or unevaluated, 2 should be treated as eligible, 1 is eligible, and 3 are listed in the NRHP. No further work was recommended for the sites not eligible for the NRHP. Avoidance or additional evaluation investigations were recommended for the potentially eligible or unevaluated sites, and avoidance or mitigation was recommended for the listed or eligible sites. The Project would have adverse effects on some historic properties. To outline a process to resolve adverse effects at affected historic properties, the FERC will produce a PA for the current undertaking, to be circulated among the consulting parties. A draft PA was circulated among the consulting parties on January 8, 2020. Execution of the PA document would satisfy compliance with Section 106 of the NHPA.

Because compliance with Section 106 of the NHPA is not complete, we recommend that Mountain Valley not begin construction until all outstanding archaeological and architectural surveys are complete; survey and evaluation reports and treatment or avoidance plans, if required, have been prepared and reviewed by the SHPOs; the ACHP is provided an opportunity to comment if historic properties would be adversely affected; and we provide written notice to proceed.

5.1.11 Air Quality and Noise

Air quality impacts associated with construction of the Project would include emissions from construction equipment and fugitive dust. Such air quality impacts would generally be temporary and localized and are not expected to cause or contribute to a violation of applicable air quality standards. Mountain Valley would implement mitigation measures to minimize the generation of dust and reduce construction impacts on air quality. Once construction activities in an area are completed, fugitive dust and construction equipment emissions would subside, and the impact on air quality due to construction would cease. As a result, we conclude that the Project's construction-related impacts would not result in a significant impact on local or regional air quality.

Operational emissions would be generated by the Lambert Compressor Station, as well as minimal emissions from maintenance blowdowns and incidental leaks from the pipeline and four interconnects. Mountain Valley submitted a minor NSR permit application for operation of the compressor station in accordance with Virginia regulations, including an assessment of BACT for $PM_{2.5}$ emissions. Minimization of operational air pollutant emissions would be achieved by using advanced low NOx turbine combustors, clean-burning fuels, and self-cleaning turbine inlet air filters. Air quality dispersion modeling, confirmed that the station's operational emissions would not exceed the air quality standards for all criteria pollutants modeled. As a result, we conclude that the Project's operational emissions would not result in a significant impact on local or regional air quality.

Residences near the construction areas may experience an increase in perceptible noise, but the effect would be temporary and localized. Noise mitigation would be implemented during construction as necessary including the use of residential-grade exhaust mufflers on engines and barriers between construction activity and NSAs, as well as, limiting some construction to daytime hours. For construction of the Project's proposed aboveground facilities, nighttime work would be conducted for specific situations related to safety, permit compliance, or other non-typical circumstances. Noise levels due to 24-hour construction of the Lambert Compressor Station would be below the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. However, noise levels due to 24-hour construction of the LN 3600, T-15 Dan River, and T-21 Haw River Interconnects would all be above the FERC criterion of 55 dBA L_{dn} at the nearest NSAs. Based on proposed nighttime construction activities at the aboveground facilities, we have recommended that prior to construction Mountain Valley file a *Nighttime Construction Noise Management Plan*, for our review and approval. If the resulting noise level is above 48.6 dBA at night and 55 dBA L_{dn} overall at the nearest NSA; or above 10 dBA over the ambient at the nearest NSA where ambient noise levels are already above 55 dBA L_{dn}, the plan would identify specific noise mitigation, such as noise barriers, quieter equipment, or partial equipment enclosures that would reduce noise levels. As a result, we conclude that construction of the Project would not result in significant noise impacts on residents and the surrounding communities.

Operational noise impacts would be limited to areas near the aboveground facilities, primarily the Lambert Compressor Station. Noise impacts on NSAs due to operation of the pipeline, meter stations, and compressor station would be negligible to barely perceptible. However, we have included a recommendation for Mountain Valley to verify the actual noise levels from operation of the compressor station at full load. Noise from planned or unplanned

blowdown events would be loud, but infrequent and of short duration. Based on the analyses conducted, mitigation measures proposed, and our recommendations, we conclude that operation of the Project would not result in significant noise impacts on residents and the surrounding communities.

5.1.12 Safety

The Project would be designed, constructed, operated, and maintained to meet the DOT *Minimum Federal Safety Standards* in 49 CFR 192 and other applicable federal regulations. These regulations include specifications for material selection and qualification; minimum design requirements; and protection of the pipeline from internal, external, and atmospheric corrosion. The DOT rules require regular inspection and maintenance, including repairs as necessary, to ensure the pipeline has adequate strength to transport natural gas safely.

The proposed facilities would be regularly inspected for leakage and potential pipeline hazards such as construction activity, encroachments, and evidence of recent unmonitored excavations as part of scheduled operations and maintenance, including: physically walking and inspecting the pipeline corridor periodically; conducting fly-over inspections of the right-of-way as required; inspecting and maintaining MLVs and meter stations; and conducting leak surveys at least once every calendar year or as required by regulations.

Mountain Valley has prepared an *Emergency Plan* that provides procedures to be followed in the event of an emergency that would meet the requirements of 49 CFR 192.615. The plan includes procedures to protect the safety of the public and employees; to prevent or minimize facility and property damage; to maintain continuity of service or re-establish service should an interruption occur; and to assure immediate reporting and investigation of emergencies.

Mountain Valley would follow federal safety standards for pipeline class locations based on population density. The DOT regulations are designed to ensure adequate safety measures are implemented to protect all populations. We conclude that Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety.

5.1.13 Cumulative Impacts

We analyzed cumulative impacts of the Southgate Project, in addition to other projects that may impact resources within the same geographic scope and timeframe. The other projects we examined include FERC-jurisdictional natural gas transportation projects; non-jurisdictional project-related facilities; other energy projects; mining operations; transportation or road projects; and commercial/residential/industrial and other development projects.

Most of the impacts resulting from construction and operation of the Southgate Project would be temporary and localized, contained within the right-of-way and extra workspaces, and when added to the impacts of other projects are not expected to result in significant cumulative impacts. However, some long-term cumulative impacts would occur in forested wetlands and forested uplands. Given the Southgate Project BMPs, design features, and mitigation measures that would be implemented; and the federal and state laws and regulations protecting resources,

and permitting requirements for the other projects evaluated, we conclude that when added to other past, present, and reasonably foreseeable future actions, cumulative impacts on environmental resources within the geographic scopes affected by the Southgate Project would not be significant.

5.1.14 Alternatives

As required by NEPA and Commission policy, we identified and evaluated reasonable alternatives to the Project to determine whether the implementation of an alternative would be environmentally preferable to the proposed action. The No Action Alternative was considered for the Project. While the No Action Alternative would eliminate the environmental impacts identified in the EIS, the stated objectives of Mountain Valley's proposal would not be met. Further, the natural gas shippers could seek alternative transportation infrastructure that would impact similar resources as the Project.

Our analysis of system alternatives included an evaluation of whether existing or proposed natural gas pipeline systems could meet the Project's objectives. We could not identify any existing and approved interstate natural gas transmission systems that have available individual capacity, combined available capacity, nor direct physical connection to transport the required volumes of natural gas to the delivery points proposed for the Project. Furthermore, modifications of existing and approved systems would result in environmental impacts similar to those that would occur as proposed by the Project.

During the pre-filing and environmental scoping process, Mountain Valley incorporated over 100 route variations into the Southgate route to avoid and/or minimize impacts on specific resources at the request of landowners and stakeholders. We evaluated three major route alternatives, including the Berry Hill Alternative, Lake Cammack East Alternative, and the North-South Alternative. We also evaluated six minor route alternatives and seven minor route variations. However, when considering all affected resources, theses route alternatives/variations do not offer a significant environmental advantage when compared to the proposed route.

We evaluated the feasibility of using electric motor-driven compressors at the proposed Lambert Compressor Station as an alternative to the proposed natural gas-fired reciprocating engines and natural gas-fired turbines. However, the use of electric-driven compressors was not considered environmentally superior to natural gas compressors in terms of reducing regional emissions. Although local air emissions from electric-driven compressors would be lower than those from natural gas driven compressors, use of electric-driven compressors would result in a higher load on the electric power grid and higher regional emissions from the electric power generating stations.

Based on our findings, we conclude that the proposed Project is the preferred alternative that can meet the Project purpose.

5.2 FERC STAFF'S RECOMMENDED MITIGATION

If the Commission authorizes the Project, we recommend that the following measures be included as specific conditions in the Commission's Order. We have determined that these

measures would further mitigate the environmental impacts associated with Project construction and operation as proposed.

We included recommendations that required Mountain Valley to provide updated information and/or documents prior to the end of the draft EIS comment period. As a result of Mountain Valley's supplemental filings, we removed recommended conditions where the information provided by Mountain Valley was adequate, and retained or modified recommendations where appropriate. The section number in parentheses at the end of a condition corresponds to the section number in which the measure and related resource impact analysis appears in the EIS.

1. Mountain Valley shall follow the construction procedures and mitigation measures described in its application, supplemental filings (including responses to staff data requests), and as identified in the EIS, unless modified by the Order. Mountain Valley must:

    a. request any modification to these procedures, measures, or conditions in a filing with the Secretary;

    b. justify each modification relative to site-specific conditions;

    c. explain how that modification provides an equal or greater level of environmental protection than the original measure; and

    d. receive approval in writing from the Director of OEP **before using that modification**.

2. The Director of OEP, or the Director's designee, has delegated authority to address any requests for approvals or authorizations necessary to carry out the conditions of the Order, and take whatever steps are necessary to ensure the protection of environmental resources during construction and operation of the Project. This authority shall allow:

    a. the modification of conditions of the Order;

    b. stop-work authority; and

    c. the imposition of any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the Order as well as the avoidance or mitigation of unforeseen adverse environmental impact resulting from Project construction and operation.

3. **Prior to any construction,** Mountain Valley shall file an affirmative statement with the Secretary, certified by a senior company official, that all company personnel, EIs, and contractor personnel will be informed of the EIs' authority and have been or will be trained on the implementation of the environmental mitigation measures appropriate to their jobs **before** becoming involved with construction and restoration activities.

4. The authorized facility locations shall be as shown in the EIS, as supplemented by filed alignment sheets. **As soon as they are available, and before the start of construction**, Mountain Valley shall file with the Secretary any revised detailed survey alignment maps/sheets at a scale not smaller than 1:6,000 with station positions for all facilities

approved by the Order. All requests for modifications of environmental conditions of the Order or site-specific clearances must be written and must reference locations designated on these alignment maps/sheets.

Mountain Valley's exercise of eminent domain authority granted under Natural Gas Act Section 7(h) in any condemnation proceedings related to the Order must be consistent with these authorized facilities and locations. Mountain Valley's right of eminent domain granted under Natural Gas Act Section 7(h) does not authorize it to increase the size of its natural gas facilities to accommodate future needs or to acquire a right-of-way for a pipeline to transport a commodity other than natural gas.

5. Mountain Valley shall file with the Secretary detailed alignment maps/sheets and aerial photographs at a scale not smaller than 1:6,000 identifying all facility relocations, and staging areas, construction support areas, new access roads, and other areas that would be used or disturbed and have not been previously identified in filings with the Secretary. Approval for each of these areas must be explicitly requested in writing. For each area, the request must include a description of the existing land use/cover type, documentation of landowner approval, whether any cultural resources or federally listed threatened or endangered species would be affected, and whether any other environmentally-sensitive areas are within or abutting the area. All areas shall be clearly identified on the maps/sheets/aerial photographs. All areas must be approved in writing by the Director of OEP **before construction in or near that area**.

   This requirement does not apply to extra workspace allowed by the Commission's *Upland Erosion Control, Revegetation, & Maintenance Plan* and/or minor field realignments per landowner needs and requirements that do not affect other landowners or sensitive environmental areas such as wetlands.

   Examples of alterations requiring approval include all facility location changes resulting from:

   a. implementation of cultural resources mitigation measures;

   b. implementation of endangered, threatened, or special concern species mitigation measures;

   c. recommendations by state regulatory authorities; and

   d. agreements with individual landowners that affect other landowners or could affect sensitive environmental areas.

6. **Within 60 days of the acceptance of the Certificate and before construction begins**, Mountain Valley shall file its Implementation Plan with the Secretary, for review and written approval by the Director of OEP. Mountain Valley must file revisions to its plans as schedules change. The plans shall identify:

   a. how Mountain Valley will implement the construction procedures and mitigation measures described in its application and supplements (including responses to staff data requests), identified in the EIS, and required by the Order;

b. how Mountain Valley will incorporate these requirements into the contract bid documents, construction contracts (especially penalty clauses and specifications), and construction drawings so that the mitigation required at each site is clear to on-site construction and inspection personnel;

c. the number of EIs assigned per spread and/or facility, and how Mountain Valley will ensure that sufficient personnel are available to implement the environmental mitigation;

d. company personnel, including EIs and contractors, who will receive copies of the appropriate materials;

e. the location and dates of the environmental compliance training and instructions Mountain Valley will give to all personnel involved with construction and restoration (initial and refresher training as the Project progresses and personnel change), with the opportunity for OEP staff to participate in the training session(s);

f. the company personnel (if known) and specific portion of Mountain Valley's organization having responsibility for compliance;

g. the procedures (including use of contract penalties) Mountain Valley will follow if noncompliance occurs; and

h. for each discrete facility, a Gantt or Program Evaluation Review Technique (PERT) chart (or similar Project scheduling diagram), and dates for:

the completion of all required surveys and reports;

the environmental compliance training of on-site personnel;

the start of construction; and

the start and completion of restoration.

7. Mountain Valley shall employ a team of EIs (i.e., two or more or as may be established by the Director of OEP) per construction spread. The EIs shall be:

a. responsible for monitoring and ensuring compliance with all mitigation measures required by the Order and other grants, permits, certificates, or authorizing documents;

b. responsible for evaluating the construction contractor's implementation of the environmental mitigation measures required in the contract (see condition 6 above) and any other authorizing document;

c. empowered to order correction of acts that violate the environmental conditions of the Order, and any other authorizing document;

d. a full-time position separate from all other activity inspectors;

e. responsible for documenting compliance with the environmental conditions of the Order, as well as any environmental conditions/permit requirements imposed by other federal, state, or local agencies; and

f. responsible for maintaining status reports.

8. Beginning with the filing of its Implementation Plan, Mountain Valley shall file updated status reports with the Secretary on a **weekly** basis until all construction and restoration activities are complete. On request, these status reports will also be provided to other federal and state agencies with permitting responsibilities. Status reports shall include the following:

    a. an update on Mountain Valley's efforts to obtain the necessary federal authorizations;

    b. the construction status of each spread, work planned for the following reporting period, and any schedule changes for stream crossings or work in other environmentally-sensitive areas;

    c. a listing of all problems encountered and each instance of noncompliance observed by the EIs during the reporting period (both for the conditions imposed by the Commission and any environmental conditions/permit requirements imposed by other federal, state, or local agencies);

    d. a description of the corrective actions implemented in response to all instances of noncompliance;

    e. the effectiveness of all corrective and remedial actions implemented;

    f. a description of any landowner/resident complaints which may relate to compliance with the requirements of the Order, and the measures taken to satisfy their concerns; and

    g. copies of any correspondence received by Mountain Valley from other federal, state, or local permitting agencies concerning instances of noncompliance, and Mountain Valley's response.

9. Mountain Valley shall implement its environmental complaint resolution procedure. The procedure shall provide landowners with clear and simple directions for identifying and resolving their environmental mitigation problems/concerns during construction of the Project and restoration of the right-of-way. **Prior to construction**, Mountain Valley shall mail the complaint procedures to each landowner whose property will be crossed by the Project.

    a. In its letter to affected landowners, Mountain Valley shall:

        i. provide a local contact that the landowners should call first with their concerns; the letter shall indicate how soon a landowner should expect a response;

        ii. instruct the landowners that if they are not satisfied with the response, they should call Mountain Valley's Hotline; the letter shall indicate how soon to expect a response; and

        iii. instruct the landowners that if they are still not satisfied with the response from Mountain Valley's Hotline, they should contact the Commission's Landowner Helpline at 877-337-2237 or at LandownerHelp@ferc.gov.

b. In addition, Mountain Valley shall include in its **weekly** status report a copy of a table that contains the following information for each problem/concern:

i. the identity of the caller and date of the call;

ii. the location by milepost and identification number from the authorized alignment sheet(s) of the affected property;

iii. a description of the problem/concern; and

iv. an explanation of how and when the problem was resolved, will be resolved, or why it has not been resolved.

10. Mountain Valley must receive written authorization from the Director of OEP **before commencing construction of any Project facilities**. To obtain such authorization, Mountain Valley must file with the Secretary documentation that it has received all applicable authorizations required under federal law (or evidence of waiver thereof).

11. Mountain Valley must receive written authorization from the Director of OEP **before placing the Project facilities into service**. Such authorization would only be granted following a determination that rehabilitation and restoration of the areas affected by the Project are proceeding satisfactorily.

12. **Within 30 days of placing the authorized facilities in-service**, Mountain Valley shall file an affirmative statement with the Secretary, certified by a senior company official:

a. that the facilities have been constructed in compliance with all applicable conditions, and that continuing activities will be consistent with all applicable conditions; or

b. identifying which of the conditions of the Order Mountain Valley has complied with or will comply with. This statement shall also identify any areas affected by the Project where compliance measures were not properly implemented, if not previously identified in filed status reports, and the reason for noncompliance.

13. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, a revised *General Blasting Plan* that clarifies it will not bury excess rock fragments generated during trenching or blasting in any location other than where the rock originated. Excess rock fragments not suitable for reburial at the point of origin should be considered construction debris and should be disposed of consistent with our Plan at sections III.E and V.A.3. (*section* 4.1.4.6)

14. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, the locations of all private water wells and springs identified within 150 feet of the Project work areas, including the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs. (*section* 4.3.1.2)

15. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, site-specific plans detailing the enhanced erosion

control measures and maintenance requirements for each location where the Project would parallel and remove vegetation within 15 feet of a waterbody. (*section* 4.3.2.2)

16. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, its final list of water sources to be used for the Project (dust control, hydrostatic testing, and HDD operations), including intake location, waterbody name, withdrawal rate and method, and measures to minimize entrainment of aquatic species. Mountain Valley shall also provide written concurrence from the FWS for any water withdrawals from the Dan River. (*section* 4.3.2.6)

17. **During construction and prior to any Project in-service approval,** Mountain Valley shall remove and dispose of timber and debris from the right-of-way. Mountain Valley must ensure that any beneficial reuse of timber that is not removed and remains on or adjacent to the right-of-way, as agreed to by the landowner, is located at access points where the landowner can reasonably retrieve timber without any inadvertent impacts on the restored right-of-way, in accordance with the FERC *Upland Erosion Control, Revegetation, and Maintenance Plan,* section III.E. (*section* 4.5.4.1)

18. In order to identify locations where additional protection measures will be needed, and to inform compliance monitoring, Mountain Valley shall file with the Secretary, the results of the pre-construction bald eagle nest and colonial rookery surveys **prior to construction.** (*section* 4.6.3.6)

19. Mountain Valley shall **not begin** construction activities **until**:

    a. Mountain Valley files with the Secretary the results of all outstanding biological surveys;

    b. the staff completes ESA consultation with the FWS; and

    c. Mountain Valley has received written notification from the Director of OEP that construction or use of mitigation may begin. (*section* 4.7.6)

20. Mountain Valley shall **not begin** construction of facilities and/or use of all staging, storage, or temporary work areas and new or to-be-improved access roads **until**:

    a. Mountain Valley files with the Secretary:

        i. remaining cultural resources survey reports;

        ii. site evaluation reports and avoidance or treatment plans, as required; and

        iii. comments on the cultural resources reports and plans from the Virginia and North Carolina SHPOs and interested Indian tribes.

    b. The ACHP is afforded an opportunity to comment if historic properties would be adversely affected; and

    c. The FERC staff reviews and the Director of OEP approves the cultural resources reports and plans, and notifies Mountain Valley in writing that treatment plans/mitigation measures (including archaeological data recovery) may be implemented and/or construction may proceed.

All materials filed with the Commission containing location, character, and ownership information about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering: "**CUI//PRIV- DO NOT RELEASE**." (*section* 4.10.5)

21. **Prior to construction**, Mountain Valley shall file its *Nighttime Construction Noise Management Plan* with the Secretary, for review and written approval by the Director of OEP, that demonstrates noise levels will be reduced below 48.6 dBA at night and 55 dBA L_{dn} overall at the nearest NSA, or not exceed 10 dBA over the ambient at the nearest NSA where ambient noise levels are already above 55 dBA. This plan should indicate site-specific mitigation measures and indicate resulting noise impacts on NSAs (*section* 4.11.2.3).

22. **No later than 60 days after placing the Lambert Compressor Station (including the Interconnect) into service**, Mountain Valley shall file a noise survey with the Secretary. If a full load condition noise survey is not possible, Mountain Valley shall provide an interim survey at the maximum possible load **within 60 days** of placing the station into service and provide the full load survey **within 6 months**. If the noise attributable to the operation of the equipment at the station under interim or full load conditions exceeds an L_{dn} of 55 dBA at the nearest NSA, Mountain Valley shall file a report on what changes are needed and shall install the additional noise controls to meet the level **within 1 year** of the in-service date. Mountain Valley shall confirm compliance with the above requirement by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls (*section* 4.11.2.3).

APPENDIX A

Southgate Project Distribution List for the Final Environmental Impact Statement

APPENDIX A: DISTRIBUTION LIST FOR THE FINAL ENVIRONMENTAL IMPACT STATEMENT

Table of Contents

Federal Agencies

Executive Office of the President of the United States

Edward Boling, Associate Director for NEPA Oversight, Council on Environmental Quality

Federal Regulatory Commission

Amanda Mardiney, Environmental Biologist

John Peconom, General Natural Resources Management and Biological Sciences

Kimberly D. Bose, Secretary

Nancy Fox-Fernandez, Environmental Biologist and Project Manager

Cardno

Allen Jacks, Senior Project Scientist

Office of Federal Agency Programs

John Eddins, Advisory Council on Historic Preservation

Office of U.S. Representative Mark Walker

Janine Osborne, Director if Constituent Services

Ryan Walker, Legislative Assistant

Office of U.S Representative Thomas Garrett

Tripp Grant, Legislative Assistant

Office of U.S .Senator Mark Warner

Kenneth S. Johnson, Jr., Senior Policy Advisor

Office of U.S. Senator Richard Burr

Ben Khouri, Press Secretary

Betty Jo Shepheard

Office of U.S. Senator Thom Tillis

Torie Ness, Legislative Assistant

Office of U.S. Senator Tim Kaine

Nick Barbash, Legislative Assistant

Mainline Construction
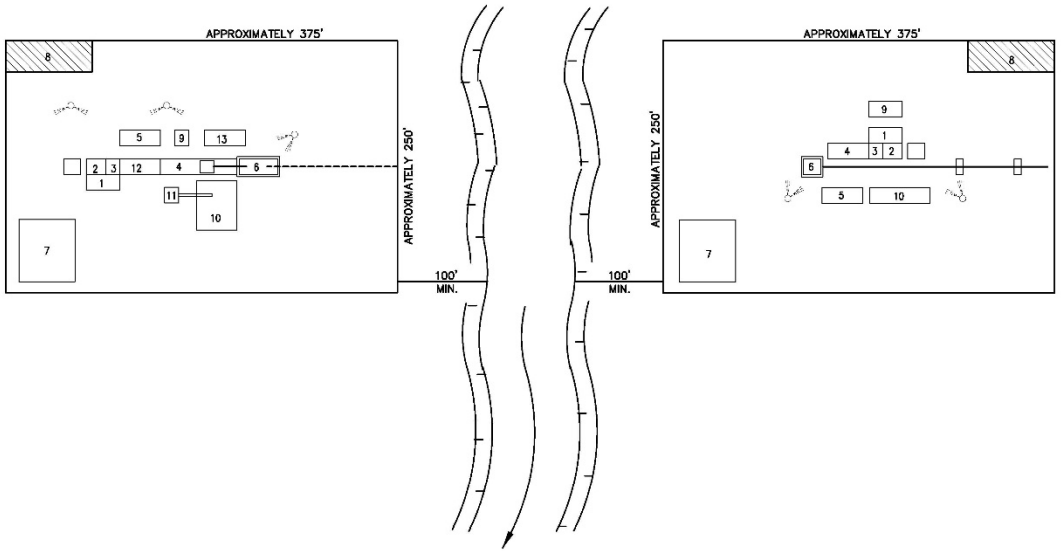
Waterbody Crossing
Open Cut – Flume

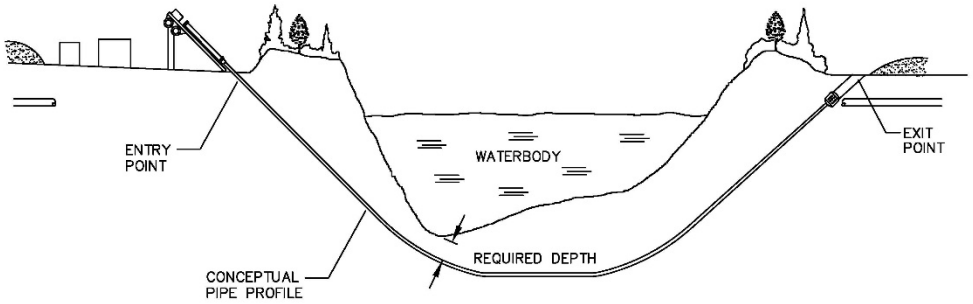
EQUIPMENT:

1. SPOIL CONTAINER: 8' X 20'
2. SHAKER: 8' X 12'
3. DESILTER: 8' X 8'
4. MUD RIG: 8' X 25'
5. SUPPLY TRAILER: 8' X 25'
6. EXIT PIT: 8' X 10'
7. STORAGE: 30' X 30'
8. VEHICLE PARKING: 15' X 50'
9. DEWATERING UNIT: 8' X 20'
10. PIPE TRAILER: 8' X 40'

HORIZONTAL DIRECTIONAL DRILL METHOD 7



PLAN



PROFILE

NOTES:

1. SET UP DRILLING EQUIPMENT A MINIMUM OF 100 FEET FROM THE EDGE OF THE WATERCOURSE. DO NOT CLEAR OR GRADE WITHIN THE 100 FOOT ZONE.
2. ENSURE THAT ONLY BENTONITE BASED DRILLING MUD IS USED. DO NOT ALLOW THE USE OF ANY ADDITIVES TO THE DRILLING MUD WITHOUT THE APPROVAL OF COMPANY INSPECTOR.
3. INSTALL SUITABLE DRILLING MUD TANKS OR SUMPS TO PREVENT CONTAMINATION OF WATERCOURSE.
4. INSTALL BERMS DOWNSLOPE FROM THE DRILL ENTRY AND ANTICIPATED EXIT POINTS TO CONTAIN ANY RELEASE OF DRILLING MUD.
5. DISPOSE OF DRILLING MUD IN ACCORDANCE WITH THE APPROPRIATE REGULATORY AUTHORITY REQUIREMENTS.
6. A SEDIMENT BARRIER SHALL BE PLACE ON THE DOWN SLOPE SIDE OF THE RIGHT-OF-WAY, PER THE PROJECT NARRATIVE.

NOTES:

1. EQUIPMENT ORIENTATION MAY VARY DEPENDING ON CONTRACTOR OR SITE CONDITIONS.
2. EQUIPMENT TO BE SUPPORTED ON THE GROUND SURFACE OR TIMBER MATS AS CONDITIONS DICTATE.
3. SILT FENCE, BERMS AND/OR STRAW BALE BARRIER TO BE USED AS REQUIRED TO PREVENT IMPACTS FROM OCCURRING OUTSIDE OF PROJECT LIMITS.
4. HAND CLEARED ACCESS PATH WILL BE USED TO OBTAIN WATER FROM SOURCE WHERE PERMITTED.
5. ENTRANCE & EXIT ANGLES VARY BY LOCATION. REFER TO BORE PROFILE FOR DETAILED INFORMATION.

THIS TYPICAL CONSTRUCTION DETAIL IS INTENDED TO PROVIDE GUIDANCE TO THE PIPELINE CONTRACTOR. THE ACTUAL CONSTRUCTION TECHNIQUES MAY DIFFER DEPENDING UPON FIELD CONDITIONS AND OR REGULATORY REQUIREMENTS.

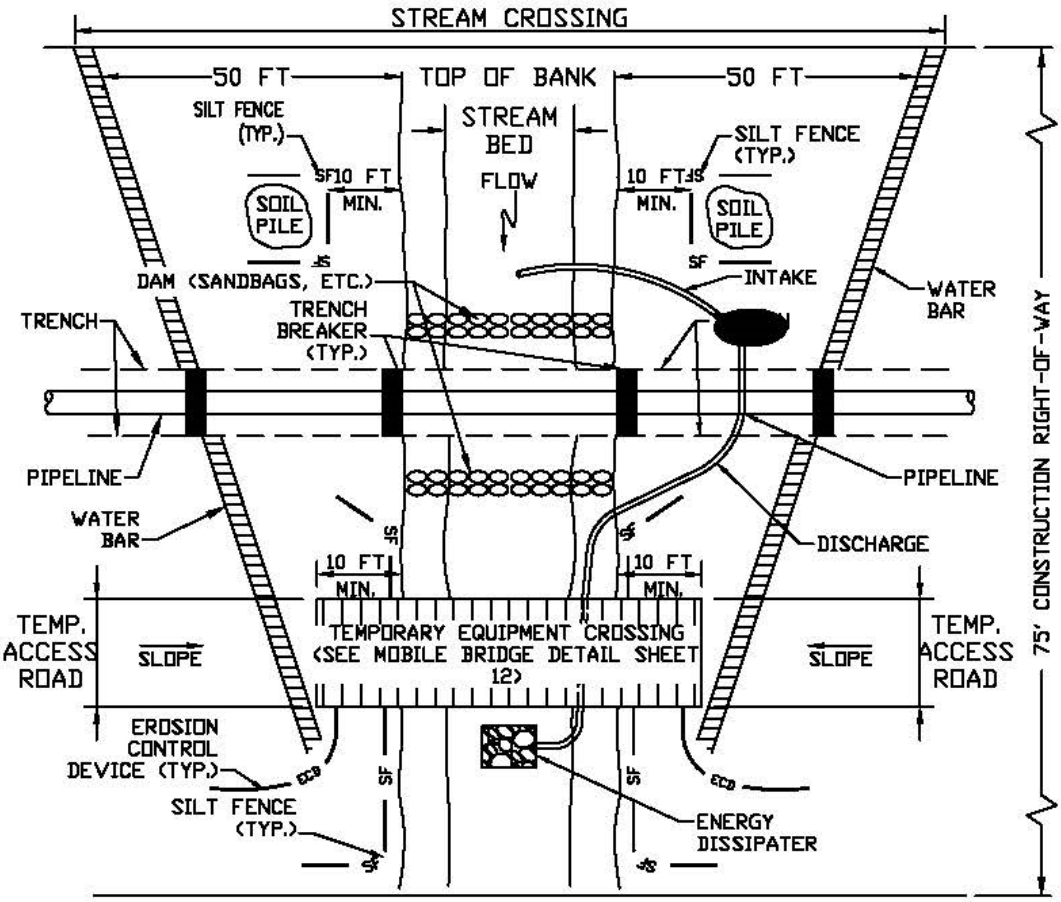
Southgate Project
Mainline Construction
Horizontal Directional Drill
(HDD)



PLAN VIEW

NOTES:

1. INSTALL EROSION CONTROL DEVICES, TRENCH BREAKERS, PUMP, ENERGY DISSIPATER, AND DAMS BEFORE TRENCHING STREAM.
2. PUMP MUST BE OF SUFFICIENT CAPACITY TO CONVEY NORMAL AND/OR EXISTING STREAM FLOW OVER TRENCH. A BACK-UP PUMP OF EQUAL CAPACITY MUST BE AVAILABLE ON-SITE DURING CONSTRUCTION OF THE PIPELINE CROSSING. PUMPS WILL BE PLACED WITHIN SECONDARY CONTAINMENT.
3. PLACE SOIL PILES A MINIMUM OF 10 FEET FROM TOP OF BANK.
4. INSTALL WATER BARS AT APPROACHES TO STREAM CROSSING AND EROSION CONTROL DEVICES, SILT FENCE, OR SUPER SILT FENCE (AS INDICATED ON PLAN SHEETS).
5. MAINTAIN SURFACE OF TEMPORARY EQUIPMENT CROSSING TO PREVENT SOIL DISCHARGES TO STREAM.
6. APPROACHES TO CROSSINGS ARE NOT TO EXCEED A DEPTH OF 6 INCHES ABOVE ORIGINAL GRADE.
7. RESTORE AREA TO ORIGINAL CONTOURS.

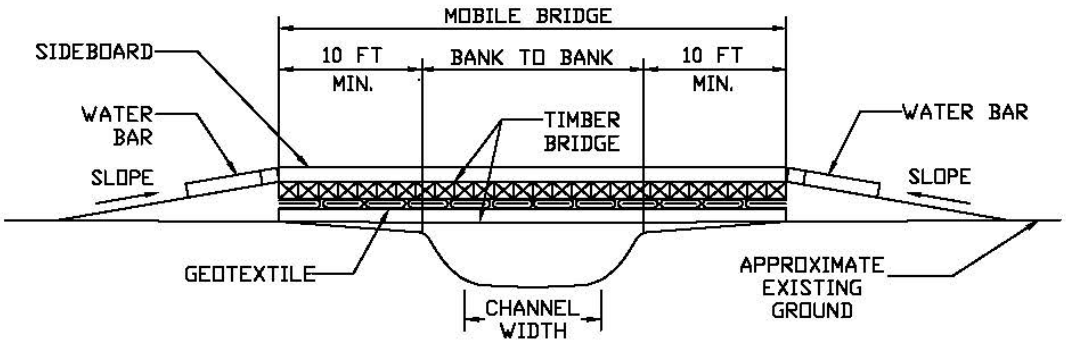
PLAN VIEW



CROSS SECTION - MOBILE BRIDGE

NOTES:

1. INSTALL WATER BARS OR SILT FENCE AT APPROACHES TO STREAM CROSSING AND COMPOST FILTER SOCKS ALONG STREAM BANKS. INSTALL COMPOST FILTER SOCK AT OUTLET OF WATER BARS.
2. MAINTAIN SURFACE OF TEMPORARY EQUIPMENT CROSSING TO PREVENT SOIL DISCHARGES TO STREAM.
3. APPROACHES TO CROSSINGS ARE NOT TO EXCEED A DEPTH OF 6 INCHES ABOVE ORIGINAL GRADE.
4. GEOTEXTILE LINER TO COME UP ON THE SIDES OF THE BRIDGE A MINIMUM OF 18".
5. SIDEBOARDS TO BE ATTACHED TO THE UPPER DECK. GEOTEXTILE TO BE WRAPPED AROUND SIDEBOARDS PRIOR TO FASTENING.

THIS TYPICAL CONSTRUCTION DETAIL IS INTENDED TO PROVIDE GUIDANCE TO THE PIPELINE CONTRACTOR. THE ACTUAL CONSTRUCTION TECHNIQUES MAY DIFFER DEPENDING UPON FIELD CONDITIONS AND OR REGULATORY REQUIREMENTS.

THIS TYPICAL CONSTRUCTION DETAIL IS INTENDED TO PROVIDE GUIDANCE TO THE PIPELINE CONTRACTOR. THE ACTUAL CONSTRUCTION TECHNIQUES MAY DIFFER DEPENDING UPON FIELD CONDITIONS AND OR REGULATORY REQUIREMENTS.

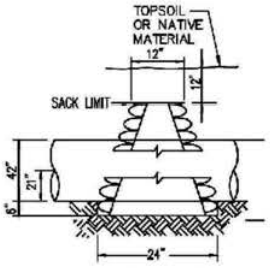
CROSS SECTION



SIDE VIEW

NOTES:

1. TRENCH BREAKERS SHALL BE INSTALLED:
   - ON SLOPES ALONG THE TRENCH LINE WHERE THE NATURAL DRAINAGE PATTERN, PROFILE, AND TYPE OF BACKFILL MATERIAL MAY RESULT IN LOSS OF BACKFILL MATERIAL OR ALTERATION OF THE NATURAL PATTERN;
   - AT THE BASE OF SLOPES ADJACENT TO WATERBODIES AND WETLANDS;
   - WHERE NEEDED TO AVOID DRAINING A WETLAND;
   - ON UPLAND SLOPES, AT THE SAME SPACING AS SLOPE BREAKERS AND UP SLOPE OF SLOPE BREAKERS;
   - IN CULTIVATED LAND AND RESIDENTIAL AREAS WHERE PERMANENT SLOPE BREAKERS ARE NOT TYPICALLY INSTALLED, AT THE SAME SPACING AS IF PERMANENT SLOPE BREAKERS WHERE REQUIRED.
2. MATERIALS APPROPRIATE FOR USE AS PERMANENT TRENCH BREAKERS INCLUDE SANDBAGS OR CONCRETE FILLED SACKS. TOPSOIL SHALL NOT BE USED FOR TRENCH BREAKERS.
3. TRENCH BREAKERS INSTALLED AT WATERBODY AND WETLAND CROSSINGS SHALL BE CONSTRUCTED OF IMPERVIOUS MATERIALS (CONCRETE FILLED SACKS).
4. BREAKER SPACING AND CONFIGURATION MAY BE CHANGED AS DIRECTED BY MVP. DEPTH OF DITCH MAY VARY WITH SITE CONDITIONS.
5. ALL MATERIALS SHALL BE SUPPLIED BY CONTRACTOR.
6. TRENCH BREAKERS ARE REQUIRED AT ALL WATERBODY CROSSINGS REGARDLESS OF TRENCH SLOPE. OTHERWISE NOTE REQUIRED AT SLOPES < 5%.
7. SINGLE TRENCH BREAKERS WILL BE A MINIMUM WIDTH OF 24" AND DOUBLE TRENCH BREAKERS WILL BE A MINIMUM WIDTH OF 36".
8. FOR SUBSURFACE AND TRENCH BREAKER DRAINAGE DETAILS INCLUDING THOSE FOR STEEP SLOPES, SEE LANDSLIDE MITIGATION TYPICAL DETAILS.
9. FOR SLOPES EXCEEDING 50%, CONCRETE FILLED SACKS ARE REQUIRED UNLESS OTHERWISE APPROVED BY MVP.

THIS TYPICAL CONSTRUCTION DETAIL IS INTENDED TO PROVIDE GUIDANCE TO THE PIPELINE CONTRACTOR. THE ACTUAL CONSTRUCTION TECHNIQUES MAY DIFFER DEPENDING UPON FIELD CONDITIONS AND OR REGULATORY REQUIREMENTS.

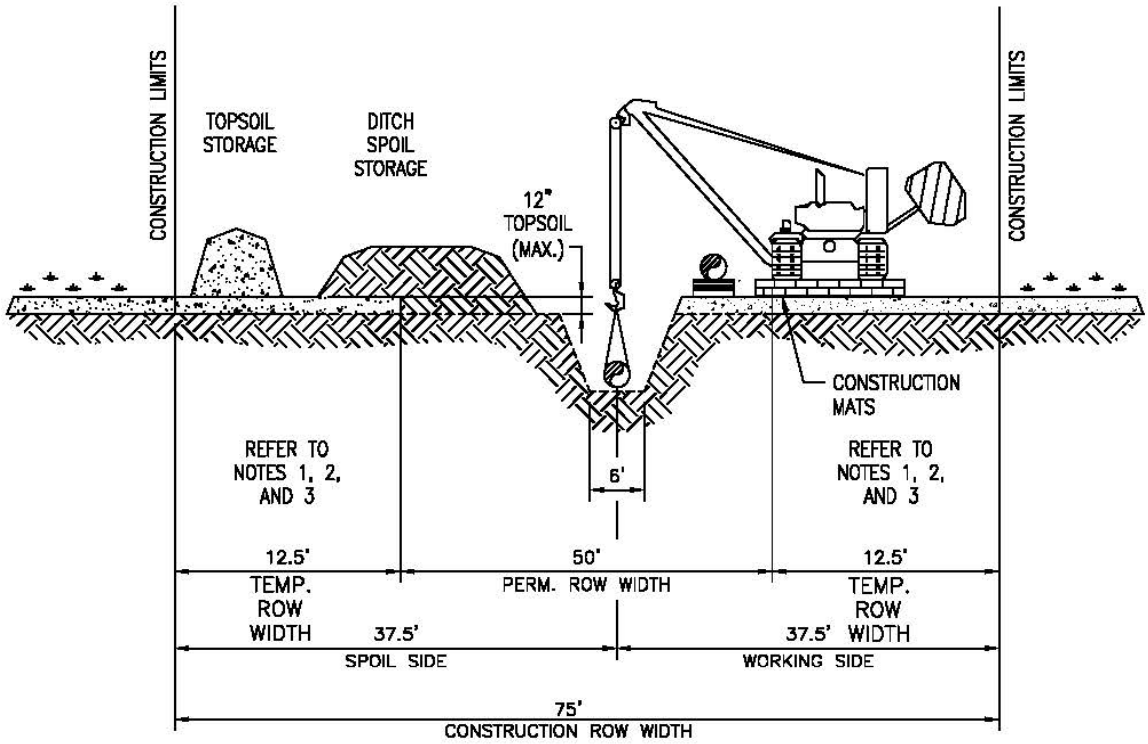
B.2-10
Southgate Project
Typical Trench Breaker Requirements



NOTES:

1. TOPSOIL SEGREGATION/REMOVAL WILL ONLY BE CONDUCTED WITHIN THE PERMANENT EASEMENT AT ALL WETLAND CROSSINGS IN VIRGINIA.

2. GRUBBING ACTIVITIES SHALL BE LIMITED TO THE PERMANENT EASEMENT AT ALL WETLAND CROSSINGS IN VIRGINIA. OUTSIDE OF THE PERMANENT EASEMENT, WETLAND VEGETATION SHALL ONLY BE REMOVED AT OR ABOVE THE GROUND SURFACE. WOODY VEGETATION WITHIN THE TEMPORARY EASEMENT SHALL BE CUT AT GROUND SURFACE WITH THE STUMPS TO REMAIN IN-PLACE.

3. WETLAND CROSSINGS IN VIRGINIA SHALL BE CONDUCTED IN ACCORDANCE WITH NWP12 GENERAL AND NORFOLK DISTRICT REGIONAL CONDITIONS.

THIS TYPICAL CONSTRUCTION DETAIL IS INTENDED TO PROVIDE GUIDANCE TO THE PIPELINE CONTRACTOR. THE ACTUAL CONSTRUCTION TECHNIQUES MAY DIFFER DEPENDING UPON FIELD CONDITIONS AND OR REGULATORY REQUIREMENTS.

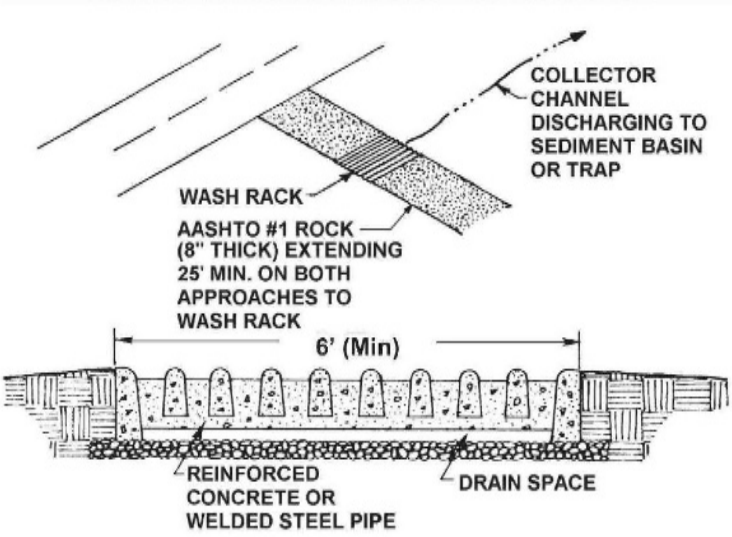
Turbidity Curtain Detail

Rock Construction Entrance with Wash Rack



Modified from Smith Cattleguard Company

IF EXCESSIVE AMOUNTS OF SEDIMENT ARE BEING DEPOSITED ON ROADWAY, EXTEND LENGTH OF ROCK CONSTRUCTION ENTRANCE BY 70 FOOT INCREMENTS UNTIL CONDITION IS ALLEVIATED OR INSTALL WASH RACK.

Wash rack shall be 20 feet (min.) wide or total width of access.

Wash rack shall be designed and constructed to accommodate anticipated construction vehicular traffic.

A water supply shall be made available to wash the wheels of all vehicles exiting the site.

MAINTENANCE: Rock construction entrance thickness shall be constantly maintained to the specified dimensions by adding rock. A stockpile of rock material shall be maintained on site for this purpose. Drain space under wash rack shall be kept open at all times. Damage to the wash rack shall be repaired prior to further use of the rack. All sediment deposited on roadways shall be removed and returned to the construction site immediately. Washing the roadway or sweeping the deposits into roadway ditches, sewers, culverts, or other drainage courses is not acceptable.

A metal wash rack or livestock grate is an acceptable alternative to the reinforced concrete one shown in the standard detail. Approaches to the wash rack should be lined with aashto #1 at a minimum of 25' on both sides. The wash rack should discharge to a sediment removal facility, such as a vegetated filter strip or into a channel leading to a sediment removal device (e.g. a sediment trap or sediment basin). Rock construction entrances with wash racks should be maintained to the specified dimensions by adding rock when necessary at the end of each workday. A stockpile of rock material should be maintained on site for this purpose. Sediment deposited on paved roadways should be removed and returned to the construction site.

NOTE: Washing the roadway or sweeping the deposits into roadway ditches, sewers, culverts, or other drainage courses is not acceptable. Damaged wash racks should be repaired as necessary to maintain their effectiveness. In lieu of washrack installation, MVP will extend the RCE by 70' increments until mud tracking condition is alleviated.

										North Carolina Subtotal:	*61.78*	*3.36*
										PROJECT TOTAL:	**99.50**	**5.70**

Note: The totals shown in this table may not equal the sum of addends due to rounding.

a/ TAR=Temporary, PAR=Permanent Access Road.

b/ Milepost (MP) at final intersection of access road with construction workspace. Approximate MP rounded to the nearest tenth.

c/ Dominant surface condition provided. A=Asphalt, C=Concrete, G=Gravel, D=Dirt, Gr=Greenfield.

d/ AG = Agricultural; CI = Commercial / Industrial; FW = Upland Forest / Woodland; OL = Upland Open Land; OW = Open Water; RD = Residential; SC = Silviculture; WL = Wetland. Where wetlands (WL) are identified within permanent access roads, permanent impacts are not anticipated.

e/ P=Paving, G=Grading, S=Stone, C=Culverts, W=Widening, R=Realignment. No improvements to occur within WLs crossed by the access road.

f/ Does not include area overlapping with pipeline, aboveground facility, or contractor/pipe storage yard construction workspaces.

g/ Does not include area overlapping with pipeline permanent right-of-way or aboveground facility permanent facility boundary (fence line/footprint). Only PARs will have an operational area impact.

S-A19-308-TA-Al195	71.2	Trib. To Back Creek	Perennial	0	N/A	WWH	Class C	N/A

a/ Data is based on waterbody field delineations completed through May 9, 2019 where access has been obtained, National Hydrography Database (NHD), and desktop analysis of approximated resources. "S" indicates stream, "WB" indicates pond, "AS" indicates approximate stream or pond. Approximated streams are also indicated with "*"

b/ MP is closest milepost to waterbody. Mileposts with an "RR" indicate locations where a re-route was incorporated into the pipeline alignment.

c/ Perennial: flowing throughout the year for all or most years, Intermittent: flowing water during certain times of the year, Ephemeral: flowing water only during short periods of the year. For delineated waterbodies, flow type in North Carolina was determined using the NCDWQ Stream Identification Form Version 4.11 and flow type in Virginia has been field estimated. For approximated waterbodies, flow type was estimated based on aerial imagery unless the approximated stream is directly associated with a delineated waterbody in which the approximated waterbody was assigned the same flow type as the associated delineated waterbody.

d/ Crossing width is the intersection of the waterbody and the centerline of the pipeline or access road (unless followed by "*" which indicates the stream width for a parallel pipeline crossing),. For approximated streams, the crossing width was measure using aerial imagery if wide enough to discern, and defaulted to 5 feet if too narrow to be measured using aerial imagery. If the crossing width is "0", the waterbody is not crossed by the centerline, but is within the Project workspace. .

e/ FERC Classification from the 2013 FERC Procedures. Minor (<10 feet); Intermediate (>10 - <100 feet); Major (>100 feet). N/A indicates the stream is not crossed by the Project pipeline..

f/ WWH - Warm Water Habitat.

g/ Virginia Water Quality Designations (VADEQ, 2016b). North Carolina Water Quality Classifications (NCDEQ, 2018d). In Virginia AL = Aquatic Life, R = Recreation, W = Wildlife, FC = Fish Consumption, PWS = PUBLIC Water Source. In North Carolina WS-II = Water Supply II, WA-IV = Water Supply IV, WS-V = Water Supply V, HQW = High Quality Waters, NSW = Nutrient Sensitive Waters

h/ June 1 through November 30 is the FERC mandated warmwater habitat construction window; in-water work, except that required to install or remove equipment bridges, must be completed between these dates unless expressly permitted or further restricted in writing on a site-specific basis by the appropriate federal or state agency. Construction timing windows for mussels may be applicable depending on final consultation with the applicable agencies.

i/ Conventional Open-Cut Crossing will only be used when there is no discernable flow within the waterbody at the time of crossing. Dry Open-Cut Crossing will consist of either Flume, Dam and Pump, or Cofferdam. N/A indicates that the waterbody is not crossed by centerline.

Appendix B.6

Wetlands Crossed by the MVP Southgate Project

Wetland ID a/	State	County	Facility	Wetland Type b/	Approx. MP	Crossing Length (feet) c/	Total Construction Impacts (acres) d/	Total Operation Impacts (acres) e/	Construction Crossing f/

Note: Mileposts with an "RR" indicate locations where a re-route was incorporated into the pipeline alignment.

a/ Data is based on wetland field delineations completed through August 24, 2019 where access has been obtained, National Wetland Inventory (NWI) data, and desktop analysis of approximated resources. Wetland IDs starting with "W" have been field delineated and wetland ID starting with "AW" are approximated based on NWI data and desktop analysis. Approximated wetlands are also indicated by "*". Environmental survey is complete for the Contractor Yards (i.e., CY-01, CY- 03, CY-05, CY-08, CY-19, CY-22, CY-25A, CY-25B, CY-26A, CY-26B). Limits of disturbance for contractor yards have been adjusted to avoid impacting wetlands.

b/ Wetland Classifications PEM = palustrine emergent wetland, PSS = palustrine scrub shrub wetland, PFO = palustrine forested wetland.

c/ Crossing length is measured at the intersection of the wetland and centerline of the pipeline or center of the access road. Crossing length of "0" indicates the wetland is not crossed by the centerline of the pipeline, but is located within the construction workspace. Sums may not equal the total of addends due to rounding. Addends consist of six-decimal digits.

d/ Total construction impacts include all wetland impacts (PEM, PFO, PSS) associated with the construction workspace. Wetland impacts of "<0.01" indicates the impact is less than 0.01 acre, but the impact is included in the project totals. Sums may not equal the total of addends due to rounding. Addends consist of six- decimal digits.

e/ Total operation vegetation impacts include PEM, PSS and PFO impacts for vegetation maintenance. Operational vegetation impacts for PEM and PSS wetlands include a 10-foot-wide vegetation maintenance corridor; operational vegetation maintenance impacts for PFO wetlands include a 30-foot-wide vegetation maintenance corridor (i.e., 10-foot-wide cleared corridor and selective removal of trees within 15 feet of the pipeline). Wetland impacts of "<0.01" indicates the impact is less than 0.01 acre, but the impact is included in the project totals. Minor discrepancies in totals are due to rounding.

f/ Construction crossing method will ultimately be determined based on field conditions observed during construction. "Workspace" indicates that the wetland is not crossed by the pipeline but is located within construction workspace.

APPENDIX B.7

Residential Construction Plans

MVP SOUTHGATE PROJECT

PROPOSED H-650 PIPELINE
ENGINEERING SERVICES DESIGN; JOB NUMBERS 300423
RESIDENTIAL DRAWING NOTES

GENERAL NOTES:

SAFETY FENCE, IN CONJUNCTION WITH ANY PROPOSED EROSION AND SEDIMENTATION CONTROL DEVICES, WILL BE INSTALLED AT THE EDGE OF THE LIMIT OF DISTURBANCE (LOD) FOR A DISTANCE OF 100 FEET ON EITHER SIDE OF THE RESIDENCE OR COMMERCIAL ESTABLISHMENT. FENCING WILL BE MAINTAINED THROUGHOUT ACTIVE CONSTRUCTION IN THE AREA. WHERE NECESSARY, HARD BARRIERS SUCH AS JERSEY BARRIERS WILL BE INSTALLED TO PROVIDE A SOLID, PROTECTIVE BARRIER.

STRUCTURES WITHIN LOD WILL BE REMOVED, RELOCATED, OR PROTECTED PER LAND OWNER AGREEMENT.

PROPERTY LINES DEPICTED ON THIS PLAN ARE BASED ON GIS TAX MAP DATA AND/OR FIELD LOCATED PROPERTY EVIDENCE. THEY SHOULD NOT BE RELIED ON AS AN ACCURATE DEPICTION OF THE ACTUAL PROPERTY LINE LOCATIONS. THEY MAY NOT REPRESENT THE RESULTS OF A BOUNDARY SURVEY.

AREAS OF PERMANENT EASEMENT WILL BE PERMANENTLY MAINTAINED PER USDOT PHMSA REQUIREMENTS. TEMPORARY WORKSPACES WOULD BE ALLOWED TO REVERT BACK TO PRE-EXISTING USES. OTHER MINOR ITEMS WILL BE ADDRESSED THROUGH LANDOWNER STIPULATIONS SPECIFIC TO THE PROPERTY.

CONSTRUCTION CREWS WILL UTILIZE DUST CONTROLS MEASURES AS NEEDED, INCLUDING WETTING AND BRUSHING OF ROADS.

WORK HOURS WILL BE LIMITED TO 7 AM TO 7 PM OR SUNSET (WHICHEVER IS LATER) UNLESS OTHER ARRANGEMENTS HAVE BEEN AGREED UPON WITH LANDOWNER.

CONSTRUCTION METHODS:

THE STOVE PIPE METHOD IS A LESS EFFICIENT ALTERNATIVE TO THE MAINLINE METHOD OF CONSTRUCTION. IT IS TYPICALLY USED WHEN THE PIPELINE IS TO BE INSTALLED IN VERY CLOSE PROXIMITY TO AN EXISTING STRUCTURE OR WHEN AN OPEN DITCH WOULD ADVERSELY IMPACT A COMMERCIAL/RESIDENTIAL ESTABLISHMENT. THE TECHNIQUE INVOLVES INSTALLING PIPE ONE JOINT AT A TIME WHEREBY THE WELDING, X-RAY AND COATING ACTIVITIES ARE ALL PERFORMED IN THE OPEN TRENCH. AT THE END OF EACH DAY THE NEWLY INSTALLED PIPE IS BACKFILLED OR THE OPEN TRENCH IS COVERED WITH STEEL PLATES OR TIMBER MATS.

THE DRAG SECTION CONSTRUCTION METHOD, WHILE LESS EFFICIENT THAN MAINLINE METHODS, IS NORMALLY PREFERRED OVER THE STOVE PIPE ALTERNATIVE. THIS TECHNIQUE INVOLVES THE TRENCHING, INSTALLATION AND BACKFILL OF A PREFABRICATED LENGTH OF PIPE CONTAINING SEVERAL SEGMENTS ALL IN ONE DAY. AT THE END OF EACH DAY THE NEWLY INSTALLED PIPE IS BACKFILLED AND/OR COVERED WITH STEEL PLATES OR TIMBER MATS.

MAINLINE CONSTRUCTION IS THE MOST EFFICIENT CONSTRUCTION METHOD. THIS METHOD IS SIMILAR TO STOVE PIPE AND DRAG SECTION INSTALLATION, BUT ON A LARGER SCALE. ALL STEPS OF THE CONSTRUCTION PROCESS (CLEARING, GRADING, TRENCHING, STRINGING & BENDING, WELDING & COATING, LOWERING & BACKFILL) OCCUR OVER LARGE STRETCHES OF RIGHT-OF-WAY TO MAXIMIZE EFFICIENCY OF THE CONSTRUCTION SPREADS. MAINLINE CONSTRUCTION IS TYPICALLY UTILIZED WHERE LARGE STRETCHES OF PIPELINE ROW ARE UNINTERRUPTED. THIS METHOD MAY BE USED NEAR STRUCTURES WHERE OFFSET FROM WORKSPACES IS LARGE ENOUGH TO FACILITATE SAFE AND PRACTICAL IMPLEMENTATION

CLEANUP AND REVEGETATION PLANS

SUBSOIL AND TOPSOIL (UP TO 12 INCHES) IN RESIDENTIAL AREAS WILL BE SEGREGATED AND RETURNED TO PRE-CONSTRUCTION GRADE AS SHOWN ON DRAWINGS.

IF SOILS ARE REQUIRED TO BE IMPORTED (E.G. IF TOP SOILING IS NOT PRACTICAL), THEY WILL BE CERTIFIED AS FREE OF NOXIOUS WEEDS AND SOIL PESTS, UNLESS OTHERWISE APPROVED BY THE LANDOWNER. IF TREES ARE NEEDED TO BE REMOVED FROM THE LANDSCAPE FOR CONSTRUCTION, THEY WILL BE REPLACED WITH THE SAME SPECIES OR SIMILAR BASED ON LANDOWNER REQUESTS.

RESTORE ALL TURF, ORNAMENTAL SHRUBS, AND SPECIALIZED LANDSCAPING IN ACCORDANCE WITH THE LANDOWNER'S REQUEST, OR COMPENSATE THE LANDOWNER. RESTORATION WORK MUST BE PERFORMED BY PERSONNEL FAMILIAR WITH LOCAL HORTICULTURAL AND TURF ESTABLISHMENT PRACTICES.

ALL DISTURBED RESIDENTIAL UPLAND AREAS WILL BE MULCHED BEFORE SEEDING IF FINAL GRADING AND INSTALLATION OF PERMANENT EROSION CONTROL MEASURES WILL NOT BE INSTALLED WITHIN 10 DAYS OF COMPLETION.

ALL LAWN AREAS AND IMPACTED LANDSCAPING WILL BE RESTORED FOLLOWING CLEAN-UP OPERATIONS AS SOON AS REASONABLY POSSIBLE, OR AS SPECIFIED IN THE LANDOWNER AGREEMENT. IF SEASONAL OR OTHER WEATHER CONDITIONS PREVENT COMPLIANCE WITH THESE TIME FRAMES, TEMPORARY EROSION CONTROLS (SEDIMENT BARRIERS AND MULCH) WILL BE MAINTAINED UNTIL CONDITIONS ALLOW COMPLETION OF RESTORATION.

IF CRUSHED STONE ACCESS PADS ARE USED IN RESIDENTIAL AREAS THEY WILL BE INSTALLED ON TOP OF SYNTHETIC FABRIC TO FACILITATE EASY REMOVAL.

EXCESS ROCK FROM THE TOP 12 INCHES OF SOIL IN RESIDENTIAL AREAS WILL BE REMOVED UNLESS OTHER ARRANGEMENTS WITH LANDOWNER HAVE BEEN AGREED UPON.

TOPSOIL AND SUBSOIL COMPACTION WILL MEET PRECONSTRUCTION CONDITIONS AND WHERE NECESSARY, SOIL COMPACTION MITIGATION MAY BE REQUIRED TO MITIGATE FOR SEVERELY COMPACTED RESIDENTIAL AREAS.

OTHER RESTORATION DETAILS, INCLUDING REVEGETATION REQUIREMENTS RELATED TO LAWNS, MAY BE SPECIFIC TO LANDOWNER STIPULATIONS.

CONDUCT FOLLOW-UP INSPECTIONS OF ALL DISTURBED AREAS, AS NECESSARY, TO DETERMINE THE SUCCESS OF REVEGETATION AND ADDRESS LANDOWNER CONCERNS. AT A MINIMUM, CONDUCT INSPECTIONS AFTER THE FIRST AND SECOND GROWING SEASONS.

LANDOWNER COMPLAINT RESOLUTION PROCESS

IN THE EVENT OF AN ISSUE, LANDOWNERS ARE DIRECTED TO CONTACT THEIR LOCAL MVP SOUTHGATE LAND REPRESENTATIVE. LANDOWNERS CAN ALSO REACH PROJECT PERSONNEL BY CALLING 1-833-MV-SOUTH OR EMAILING MAIL@MVPSOUTHGATE.COM

AFTER WORKING WITH THE SOUTHGATE PROJECT REPRESENTATIVE AND APPROPRIATE RIGHT-OF-WAY AGENT, IF THE LANDOWNER IS STILL NOT COMPLETELY SATISFIED WITH THE RESOLUTION, THE INDIVIDUAL SHOULD CONTACT THE COMMISSION'S LANDOWNER HELPLINE AT (877) 337-2237, OR BY EMAIL, LANDOWNERHELP@FERC.GOV.

APPENDIX B.8

Locations where Southgate Construction Workspace Parallel a Waterbody (or associated Wetland) within 15 feet

Appendix B-8

Locations where Southgate Construction Workspace Parallel a Waterbody (or associated Wetland) within 15 feet

Resource ID	MP	Length Parallel to Resource (feet)	Minimum Distance to Resource (feet) a/	Justification	FERC Comment
S-F18-10 / W-F18-11 (Trib. To Little Cherrystone Creek)	0.2	48 / 46	8	Collocation as route exits Lambert Compressor Station.	The request for construction workspace parallel to waterbody and wetland appears justified and minimizes impacts.
S-F18-17 (White Oak Creek)	9.9	60	0	Crossing location avoids sensitive resource site. Minimizes impact to wetlands. Constructability to avoid side slope construction.	14-18% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-F18-28 / W-F18-29 (Trib to Sandy Creek)	11.4	20/70	0	Collocation and constructability to avoid side slope construction.	30-60% side slopes present nearby. The request for construction workspace parallel to waterbody and wetland appears justified and minimizes impacts.
S-D18-37 (Trib. To Silver Creek)	15.6	60	5	Collocation and constructability to avoid side slope construction.	14-25% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
W-A18-204 / S-A16-205 (Trib. To Trotters Creek)	22.0	187	0	Collocation and constructability, to avoid residence and to support road bore.	The request for construction workspace parallel to waterbody and wetland appears justified and minimizes impacts.
S-E18-35/ W-E18-33 (Trib. To Dan River)	23.9	14 / 39	9	Collocation and constructability to avoid side slope construction.	30-50% side slopes present nearby. The request for construction workspace parallel to waterbody and wetland appears justified and minimizes impacts.
S-A18-143 (Trib. To Machine Creek)	31.9	22	11	Collocation and minimize the severity of slope construction.	50-80% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.

Appendix B-8

Locations where Southgate Construction Workspace Parallel a Waterbody (or associated Wetland) within 15 feet

Resource ID	MP	Length Parallel to Resource (feet)	Minimum Distance to Resource (feet) a/	Justification	FERC Comment
S-A18-151 (Town Creek)	32.7	90	0	Collocation and a route to the east of waterbody crossing includes side slope construction and pond.	14-50% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-154 (Trib. To Town Creek)	33.0	38	0	Constructability to avoid side slope construction to the east and major utility corridor to the west.	14-18% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-94 / W-A18-95 (Trib. To Wolf Island Creek)	37.0	40 / 61	0	Constructability to avoid side slope construction to the southwest and pond to the east.	14-50% side slopes present nearby. The request for construction workspace parallel to waterbody and wetland appears justified and minimizes impacts.
S-A18-4 (Trib. To Lick Fork)	38.5	180	0	Collocation to the northeast and avoids side slope construction to the southwest.	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-B18-44 (Trib. To Lick Fork)	41.6	52	0	Maintains collocation and supports space required for highway crossing	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-212 (Trib. To Hogans Creek)	45.7	29	6	Maintaining collocation	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-218 (Trib. To Haw River)	52.2RR	37	8	Support perpendicular stream crossing	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-87 (Trib. To Haw River)	53.7	43	0	Maximize collocation	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.

Appendix B-8

Locations where Southgate Construction Workspace Parallel a Waterbody (or associated Wetland) within 15 feet

Resource ID	MP	Length Parallel to Resource (feet)	Minimum Distance to Resource (feet) a/	Justification	FERC Comment
S-B18-14 (Trib. To Stony Creek)	63.2RR	55	11	Collocation and constructability to avoid side slope construction and construct around utility towers.	30-50% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
W-B19-161 (Trib. To Boyds Creek)	65.5	81	1	Constructability to avoid residences	The request for construction workspace parallel wetland appears justified and minimizes impacts.
S-A19-353 (Trib. To Boyds Creek)	66.58RR	59	8	Supports request of landowner on route placement	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-B18-9 (Trib. To Haw River)	68.8	50	1	Route location dictated by major road bores north and south of stream and also maintains safe distance between transmission line towers for utility crossing	14-50% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-B18-11 (Trib. To Haw River)	68.9	31	9	Route location dictated by major road bores north and south of stream and maintains safe distance between transmission line towers for utility crossing.	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-A18-116 (Trib. To Haw River)	70.0RR	24	4	Route location dictated by alignment around Town of Haw River structures.	The request for construction workspace parallel to waterbody appears justified and minimizes impacts.
S-C18-82 (Trib. To Haw River)	70.4	93	0	Constructability to avoid side slope construction	30-50% side slopes present nearby. The request for construction workspace parallel to waterbody appears justified and minimizes impacts.

a/ Minimum distance from resource of 0 feet indicates that the wetland or waterbody is located within the Construction Workspace.

Southgate Mainline (H-650 Pipeline)	30 to 50	72.72	72.73	25
Southgate Mainline (H-650 Pipeline)	30 to 50	72.79 RR	72.79 RR	29
Southgate Mainline (H-650 Pipeline)	30 to 50	72.80 RR	72.80 RR	21
Southgate Mainline (H-650 Pipeline)	50 to 66	72.91 RR	72.92 RR	25

Methodology:

1. Steep Slope percentages are grouped as follows:
   30-50%
   50-66%
   66-80%
   80%+
2. Only crossings that are longer than 20 feet are considered. Some locations may seem smaller but they are still considered if they are a continuation of another slope group.
3. For crossings that have multiple variations of slope group within small lengths, an average slope group is assigned.
4. The length of slope crossed might be slightly shorter than actual mile post lengths because of small stretches of data that are not in slope groups.

Notes: Results based on desktop analysis. Data to be verified in field.

Notes:
Sums may not equal addends due to rounding. Addends consist of three decimal digits.

Appendix C.5-2

Areas of Potential FAE
for Right of Way Grade and Pipeline Trench Excavation

From Milepost	To Milepost	Need for FAE			FAE Potential
		Slope	Depth to Bedrock	Rock Type	
0	0.95	X			Low
1.2	1.85			X	Low
17.28	33.89	X	X	X	High
34.5	48.23	X	X	X	High
49.29	68.05	X	X	X	High
70.94	72.81 RR	X			Low
Lambert Interconnect and Main Valve		X	X		Low
LN 3600 Interconnect		X	X		Low
T-15 Dan River Interconnect					None
T-21 Haw River Interconnect					None
Mainline Valves		Included within Mainline FAE Potential			

(1) United States Geological Survey (USGS) Geographic Area. Pittsylvania County, Virginia and Rockingham and Alamance Counties, North Carolina.

(2) United States Department of Agricultural, Natural Resources Conservation Service (USDA/NRCS), 2018 Custom Soil Resources Report for Pittsylvania County, Virginia and Rockingham and Alamance Counties, North Carolina.

(3) "Low" - The potential for FAE is possible within this section depending on depth of and location of planned pipeline and related facilities. The potential of FAE to achieve grade exists but has low probability.

(4) "High" - FAE will be needed within these sections to achieve grade. FAE will not be continuous.

(5) Possibility of FAE based on Notes 1 and 2 for this Table and Table 6-F MVP Southgate Project Resource Report 6 - Geologic Resources. FAE based on slope locations where thickness of overlaying soil may be less than trench depth due to erosion and gravitational influences on the soil.

Appendix C.5-3

Area of Potential FAE for Waterbody Crossings

State/County	Milepost	Waterbody Name	Need for FAE			FAE Potential	Projected Depth to Bedrock (Inches)
