Notes:
NA = Not Applicable
a/: Prime farmland and Farmland of Statewide Importance includes soils mapped and designated as prime farmland and farmland of statewide importance by the NRCS (SSURGO reference column "farmlndcl"). Prime Farmland if drained and / or irrigated and / or reclaimed of excess salts and sodium is not included in this acreage. No areas of Farmland of local importance or unique farmland are affected by the Project.
b/: WEGs (Wind Erodibility Groups) obtained from the NRCS Soil Data Mart. WEGs range from 1 to 8, with 1 being the highest potential for wind erosion, and 8 the lowest. Highly wind erodible soils include those in wind erodibility groups 1 or 2 (SSURGO reference column "weg").
c/: Water erosion potential was determined by averaging the K factor values of horizons of each soil type. Based on the average K factor, each soil type was grouped into a water erosion class of "Low", "Moderate", and "High". Highly water erodible soils include those with a K factor greater than 0.4.
d/: "Urban Land" and "Udorthents" map units do not have a NRCS designated hydric soil status. These map units were considered to be non-hydric soils. Hydric Type is determined with Hydric Classification - Presence ("hydclprs") where if hydclprs of 0% is categorized as "Non-hydric". Values between 1% – 33% are categorized as "Predominantly Non-hydric", 34% - 66% as "Partially Hydric", 67% - 99% as "Predominantly Hydric", and 100% is categorized as "Hydric".
e/: Revegetation Potential is determined by three parameters: drainage class, K factor, and slope, each parameter assigned a value of 1, 2, or 3, then averaged. Drainage classes of excessively drained and very poorly drained are designated low (1), somewhat excessively drained and poorly drained are designated moderate (2), and well drained, moderately well drained, and somewhat poorly drained are designated high (3). Low K factor (3), Moderate (2), and High (1). Slopes of 25% or more are low (1), 8%-25% are moderate (2), and slopes of less than 8% are high (3). The average of these three scores is then taken to determine the overall low, moderate, or high revegetation potential. 1.0-1.7 = Low, 1.8-2.3 = Moderate, 2.4-3.0 = High.
f/: Depth to bedrock is not defined by the NRCS for the "Pavement and Buildings" map unit. In these cases, a depth to bedrock of >60" was assigned, which is consistent with NRCS designations for other natural and fill soils in the Project area. Shallow bedrock soils include those that have lithic or paralithic bedrock within 60 inches or less of the soil surface (SSURGO and STATGO2 reference column "rescind" and "resdept_r").
g/: Stony/Rocky soils include those with a cobbley, stony, bouldery, shaly, channery, very gravelly, or extremely gravelly modifier to the textural class of the surface layer and / or that have a surface layer that contains greater than 5 percent by weight rock fragments larger than 3 inches.

Waccamaw Siouan Tribe in North Carolina	8/3/18, 8/31/18, 11/2/18	None filed to date

TABLE 4.10-6

Cultural Resources Issues Raised to the FERC from Citizens During Scoping, and Public Sessions for Comments on the DEIS for the Southgate Project.

Name	Date/Session	Accession No.	Comments
LETTERS FILED WITH THE FERC DURING THE SCOPING PERIOD			
Mel Aldridge and Angela Hinton	August 30, 2018	20180830-0008	Their property has two buildings listed on the Alamance County Architectural Inventory as Historic Places and two family cemeteries dating before 1835
William Fonville	September 5, 2018	200180905-0027	Home was built in late eighteen hundreds
Bruce and Susan Taylor	September 6, 2018	20180906-0014	Historic site (Burlington-Hillsborough Stage Coach Trail) on property
Abigayle Faulkner	September 10, 2018	20180910-5050	Archaeological site 31AM431 on property
Kate Buble	September 10, 2018	20180910-5120	Concerned about impacts on Haw River Trail, Glencoe Mill Village, and Arches Grove United Church of Christ
Susan Moore	September 12, 2018	20180912-0008	Farm dates back to 1810 and includes family cemetery and Native American archaeological site
STATEMENTS MADE AT PUBLIC SCOPING MEETINGS			
Susan Moore	August 20, 2018 Reidsville, NC	20181004-4006; 20180921-4000	Farm dates back to 1810. There is a family cemetery on the property
William Hunt	August 20, 2018 Reidsville, NC	20181004-4006	He is Native American (Lumberton). The Haliwa Tribe is in the area. Project should not interfere with the use of sacred burial grounds. There is a native graveyard on land of neighbor Slate Stones
Jake Helms	August 20, 2018 Reidsville, NC	20180921-4000	Home sits within Car Scott Farm dating to 1760s, listed on state historic register and federal NRHP
Michelle Morris	August 23, 2018 Haw River, NC	20180921-4000	Home of Governor Scott, designed and built by Jessie Ray – Car Scott Farm (AM641) on NRHP
Patsy Madrin	August 23, 2018 Haw River, NC	20180921-4000	Family has been on land since 1819. Sissiphaw Indians on land, found Native American artifacts
LETTERS FILED WITH THE FERC COMMENTING ON THE DEIS			
Robert Wiltaskins	August 19, 2019	20190906-3055	Indian mound would be in the way of the pipeline route
Crystal Chandler	August 22, 2019	20190906-3055	Avoid Deep Creek Church and Cemetery

TABLE 4.10-6

Cultural Resources Issues Raised to the FERC from Citizens During Scoping, and Public Sessions for Comments on the DEIS for the Southgate Project.

Name	Date/Session	Accession No.	Comments
Jeannie Ambrose	September 16, 2019	20190917-0006	Damages to potential archaeological sites and historic structures could occur. What are the mitigation measures that would be taken and when.
Blue Ridge Environmental Defense League	September 16, 2019	20190916-5106	More input from tribes is needed.
Ann Rodgers	September 16, 2019	20190916-5178	Avoid Little Cherrystone historic site
STATEMENTS MADE AT PUBLIC SESSIONS TO TAKE COMMENTS ON THE DEIS			
Amiee Tilley	August 19, 2019 Wentworth, NC	201990923-4000	Church and cemetery near her land
Dr. Walker	August 19, 2019 Wentworth, NC	201990923-4000	Old homeplace built in 1857
Ann Rodgers	August 20, 2019 Chatham, VA	201990923-4001	Interested in FOIA request about cultural resources
Mark Joyner	August 20, 2019 Chatham, VA	201990923-4001	Contact Danville Historical Society. Project may affect Mountain View historical site
Sonja Ingram	August 20, 2019 Chatham, VA	201990923-4001	Send copies of survey reports to Preservation Virginia. Avoid Little Cherrystone historical site and cemetery
Carolyn Hansely-Mece	August 22, 2019 Haw River, NC	201990923-4002	Archaeological surveys not completed
Crystal Cavalier	August 22, 2019 Haw River, NC	201990923-4002	Member of Occaneechi Band of Saponi Nation. There are undocumented graves where the pipeline is going. Clams are culturally utilized
Jason Crazy Bear Tircuit Keck	August 22, 2019 Haw River, NC	201990923-4002	Married into Occaneechi Saponi Tribe. Found where the burial grounds are. Haw River is sacred.

Table of Other Projects in the Geographic Scope of Analysis Considered for Cumulative Impacts

APPENDIX F.2

Other Projects in the Geographic Scope of Analysis Considered for Cumulative Impacts

Project Type	Project ID / Project Facility a/	Description of Facilities	Temporal Status	Acres Affected b/	Approximate Distance from Southgate Project d/	Shared Watershed (Level HUC-12)	Socioeconomics/ Environmental Justice	Water Resources and Wetlands	Vegetation, Wildlife and Fisheries	Land Use, Recreation, and Visual Resources	Cultural Resources	Air Quality and Noise
[No Shared HUC 10 watershed] (Rockingham County, NC) c/												
Energy Projects	(2) Reidsville Energy Center	500 MW natural gas electric generating facility owned by NTE Energy in Rockingham County, North Carolina.	Construction to start Summer 2019, pending financing	20 acres	12 miles	No shared HUC 12 watershed	X					
Stinking River – Banister River HUC 10 Watershed (Pittsylvania County, VA) c/												
Energy Projects	(53) Whitehorn Solar, LLC	50 MW Solar PV System will deliver power to the existing high-voltage transmission line in the area owned by VA Electric Power Company.	Application for Special Use Permit approved by Pittsylvania County June 4, 2019. NOI submitted June 5, 2019.	700 acres	8 miles	No shared HUC 12 watershed	X	X				X
Cherrystone Creek-Banister River HUC 10 Watershed (Pittsylvania County, VA) c/												
FERC-jurisdictional Natural Gas Interstate Transportation Projects	(6) Virginia Southside Expansion	Also shares Stinking River-Banister River HUC 10 watershed. Approximately 10 miles (out of 100 miles total) of new 24-inch diameter pipeline from Transco mainline in Pittsylvania County, Virginia and into Halifax, Charlotte, and Mecklenburg. Terminates in Brunswick County, Virginia. Construction of CS 166 in Pittsylvania County, Virginia. Operated by Transco.	In-service	1,454.3 acres for construction 119.0 acres for operation	0.4 miles	Cherrystone Creek Shockoe Creek-Banister River	X	X	X	X	X	X
FERC-jurisdictional Natural Gas Interstate Transportation Projects	(52) Virginia Southside Expansion II	Also shares Stinking River-Banister River HUC 10 watershed. Upgrades to CS 166 in Pittsylvania County, Virginia. Modifications to 19 existing facilities in North Carolina and Virginia. Construction activities in Brunswick and Greensville County, Virginia. New CS in Prince William County, Virginia	In-service	180.1 acres for construction 29.3 acres for operation	0 miles	Cherrystone Creek Shockoe Creek-Banister River	X	X	X	X	X	X
FERC-jurisdictional Natural Gas Interstate Transportation Projects	(8) Mountain Valley Pipeline	Also shares Stinking River-Banister River HUC 10 watershed. Approximately 303 miles of 42-inch pipeline and 3 new compressor stations from northwestern West Virginia to southern Virginia. Operated by Mountain Valley Pipeline, LLC and Equitrans, LP	Under Construction.	6,363.4 acres for construction 2,117.8 acres for operation	0 miles	Cherrystone Creek Shockoe Creek-Banister River	X	X	X	X	X	X
FERC-jurisdictional Natural Gas Interstate Transportation Projects	(7) Southeastern Trail	Also shares Stinking River-Banister River HUC 10 watershed Approximately 7.7 miles of 42-in. pipeline looping facilities in Virginia, horsepower additions at existing compressor stations in Virginia, and piping and valve modifications on other existing facilities in South Carolina, Georgia, and Louisiana Compressor Station 165 upgrade in Chatham, VA within Pittsylvania County, VA. Operated by Transco.	Application Filed April 2018. Construction to begin Q3 of 2019. Planned in-service November 2020	466 acres construction 42.6 acres for operation	0.4 miles	Cherrystone Creek	X	X	X	X	X	X
Non-Jurisdictional Facilities associated with Southgate	(26) Lambert interconnect and MLV 1	New interconnecting facility to the Mountain Valley Pipeline system via the H-605 pipeline	Will be reviewed by local agencies prior to construction	20.5 acres construction 11.7 acres operation	0 miles	Cherrystone Creek7	X	X	X	X	X	X

APPENDIX F.2

Other Projects in the Geographic Scope of Analysis Considered for Cumulative Impacts

Project Type	Project ID / Project Facility a/	Description of Facilities	Temporal Status	Acres Affected b/	Approximate Distance from Southgate Project d/	Shared Watershed (Level HUC-12)	Socioeconomics/ Environmental Justice	Water Resources and Wetlands	Vegetation, Wildlife and Fisheries	Land Use, Recreation, and Visual Resources	Cultural Resources	Air Quality and Noise
Transportation/ Roadway Projects	(3) Climax Road Widening	Road widening to a minimum of 20 feet to accommodate traffic	Planning	Not Available	8.9 miles	Cherrystone Creek						
Transportation/ Roadway Projects	(9) U.S. Route 29 South over Norfolk Southern Railroad / VADOT	Replacement of the bridge on U.S. Route 29 South over Norfolk Southern Railroad with approaches on this Principal Rural Arterial roadway in Pittsylvania County	Complete 2017	0.4 acres	4.4 miles	Cherrystone Creek	X	X	X			X
Wolf Island Creek-Dan River HUC 10 Watershed (Henry/**Pittsylvania Counties, VA) c/**												
Transportation/ Roadway Projects	(11) Route 58 over Route 311 / VADOT	About 3.3 million in upgrades to the intersection of Berry Hill Road and U.S. 58 West of Danville to accommodate traffic for the nearby Berry Hill Road industrial Park	Planning	8 acres	2.0 miles	Lower Sandy River						
Transportation/ Roadway Projects	(12) Stony Mill Road / VADOT	The construction of a single lane roundabout at the intersection of Stony Mill Road and Tunstall High Road- 2.2 million	Planning	0.4 acres	0.5 miles	Lower Sandy River						
Transportation/ Roadway Projects	(13) Mount Cross Road / VADOT	A two-phase plan to widen Mount Cross Road to the city limits, making the road a five-lane section with a two-way center turn lane with a new park and ride lot and sidewalk -17 million	Planning	3.3 acres	6.1 miles	Sandy Creek (West) –Dan River						
Cascade Creek-Dan River HUC 10 Watershed (Caswell/**Rockingham Counties, NC and** Henry/**Pittsylvania Counties, VA) c/**												
Non-Jurisdictional Facilities associated with Southgate	(27) LN 3600 Interconnect and Receipt Meter Station	New interconnect to the East Tennessee pipeline system near MP 28.2	Will be reviewed by local agencies prior to construction	4.8 acres construction 0.7 acres operation	0 miles	Cascade Creek	X	X	X	X	X	X
Energy Projects	(40) Old Road Solar	5 MW facility. CPCN issued January 10, 2017	Projected in-service date was October 2016. No construction to-date	18 acres	5.8 miles	No shared HUC 12 watershed	X	X				
Non-Jurisdictional Facilities associated with Southgate	(28) T-15 Dan River Interconnect and MLV 4	New interconnect to the PSNC distribution system near MP 30.4	Will be reviewed by local agencies prior to construction	5.2 acres construction 0.8 acres operation	0 miles	Town Creek – Dan River	X	X	X	X	X	X
Commercial/Industrial Projects	(25) Berry Hill Industrial Park	A 3,500 acres mega-park open for potential development owned by City of Danville and Pittsylvania County. 133 acres of site preparation occurred in March 2017. No further development has occurred at the site	Planning. No construction to-date.	133 acres	1.3 miles	Trotters Creek – Dan River						
Transportation/ Roadway Projects	(24) Berry Hill Road / VADOT	Also crossed Wolf Island Creek – Dan River HUC 10 watershed. Reconstruction of Berry Hill Road in order to accommodate more traffic- 23.7 million	Planning	Not Available	2 miles	Trotters Creek - Dan River						
Transportation/ Roadway Projects	(55) Route 311 Connector Road	Construction of a connector road from the existing interchange of State Route 1260 and US Route 58	Planning – Construction to begin Sept 2022- May 2025	Not Available	3.5 miles	Trotters Creek - Dan River	X	X	X			X
Hogans Creek-Dan River HUC 10 Watershed (Caswell/**Rockingham Counties, NC and Pittsylvania County, VA) c/**												

APPENDIX F.2

Other Projects in the Geographic Scope of Analysis Considered for Cumulative Impacts

Project Type	Project ID / Project Facility a/	Description of Facilities	Temporal Status	Acres Affected b/	Approximate Distance from Southgate Project d/	Shared Watershed (Level HUC-12)	Socioeconomics/ Environmental Justice	Water Resources and Wetlands	Vegetation, Wildlife and Fisheries	Land Use, Recreation, and Visual Resources	Cultural Resources	Air Quality and Noise
Commercial/Industrial Projects	(50) Panaceutics Research and Development Facility / Panaceutics, Inc.	Panaceutics, a manufacturer of personalized medicine and nutrition solutions, will invest $5.8 million to establish a research and development and high-tech manufacturing facility in the Ringgold East Industrial Park in Pittsylvania County, Virginia.	Under Construction	112 acres	10 miles	No shared HUC 12 watershed	X	X				
Energy Projects	(54) Danville Farm Solar	12 MW facility to be developed by Strata Solar Services, LLC on land previously used as a golf course.	Planning. Small Renewable Energy Project Permit received by VADEQ July 10, 2019	185 acres	13 miles	Cane Creek – Dan River	X	X	X			X
Headwaters Haw River HUC 10 Watershed (Guilford/Caswell/**Rockingham/Alamance Counties, NC) c/**												
Residential Projects	(5) Carter Ridge / Keystone Homes	Carter Ridge new construction homes, Carter Ridge Drive, Reidsville, NC	Under Construction	30 acres	5 miles	Little Troublesome Creek	X	X	X			
Energy Projects	(38) Gallant Solar Farm	45 MW facility, CPCN issued March 27, 3018	Projected online June 1, 2019	276 acres	10 miles	No shared HUC 12 watershed	X	X				
Energy Projects	(49) Husky Solar, LLC	7.02 megawatt DC solar photovoltaic facility located on both sides of NC Highway 87 adjacent to Project at MP 49	In operation; Permitted prior to 2015	29 acres	0 miles	Giles Creek-Haw River	X	X	X	X	X	X
Energy Projects	(42) Osceola Solar Project	5 MW facility.	Permitted 2016. Projected in-service September 1, 2017	70 acres	1.8 miles	Town of Altamahaw – Haw River	X	X	X			
Transportation/ Roadway Projects	(22) U.S. 158 (Reidsville Road) Improvements / NCDOT	Proposed 18.8-mile widening of U.S. 158 from U.S. 421/Business 40 in Winston-Salem to U.S. 220 in Guilford County	In Development	71 acres	18.6 miles	No shared HUC 12 watershed						
Energy Projects	(39) Washington Solar Farm	5 MW solar facility. CPCN issued September 9, 2015	Projected online December 2016	30 acres	13 miles	No shared HUC 12 watershed	X	X				
Energy Projects	(37) Cypress Creek Renewables Solar Farm	174,000 MW 600 acre solar farm. Adjacent to Southgate Project at MP 50	Permitted; Construction to begin in 2019	341 acres	0 miles	Giles Creek - Haw River	X	X	X	X	X	X
Back Creek-Haw River HUC 10 Watershed (Guilford/Caswell/**Alamance Counties, NC) c/**												
Non-Jurisdictional Facilities associated with Southgate	(29) T-21 Haw River Interconnect and MLV 8	New interconnect to the PSNC distribution system and the terminus for the Southgate project	Will be reviewed by local agencies prior to construction	1.4 acres construction 0.6 acres operation	0 miles	Boyds Creek – Haw River	X	X	X	X	X	X
Energy Projects	(48) Kimery Road Solar Farm	2 MW Solar Facility	Planning	Not available	1.5 miles	Lower Back Creek	X	X	X			
Energy Projects	(43) Bakatsias Solar Farm	5 MW facility. CPCN issued November 6, 2017.	Expected in-service December 20, 2017	24 acres	7.0 miles	Lower Back Creek	X	X	X			
Residential Projects	(36) Brassfield Meadows	New construction housing development; 18 units	Under Construction	5 acres	1.7 miles	Boyds Creek – Haw River	X	X	X			
Transportation/ Roadway Projects	(17) NC 119 Relocation / NCDOT	Proposed relocation of a portion of N.C. 119 in Mebane – from I-85 to existing the N.C. 119 near Mrs. White Lane	In Development	12 acres	5 miles	Lower Back Creek						
Energy Projects	(41) Green Level-Charles Drew Solar Farm	5 MW solar energy facility	Projected online March 30, 2019	5 acres	0.9 miles	Boyds Creek – Haw River	X	X	X	X	X	X

APPENDIX F.2

Other Projects in the Geographic Scope of Analysis Considered for Cumulative Impacts

Project Type	Project ID / Project Facility a/	Description of Facilities	Temporal Status	Acres Affected b/	Approximate Distance from Southgate Project d/	Shared Watershed (Level HUC-12)	Socioeconomics/ Environmental Justice	Water Resources and Wetlands	Vegetation, Wildlife and Fisheries	Land Use, Recreation, and Visual Resources	Cultural Resources	Air Quality and Noise
Residential Projects	(20) LGI Homes- Bedford Hills	New construction housing development single family homes near 111 Pillow Ln., Burlington, NC	Under Construction	95 acres	1.5 miles	Lower Back Creek	X	X	X			
Residential Projects	(21) Forest Creek / True Homes	New construction housing development 5 new homes in development	Under Construction	40 acres	3.5 miles	Travis Creek – Haw River	X	X	X			
Energy Projects	(47) Necal Solar Farm	5 MW solar facility. CPCN issued November 28, 2017	Planning	42 acres	5.3 miles	No shared HUC 12 watershed	X	X	X			
Energy Projects	(44) Norris Solar Farm	5 MW solar facility. Application September 9, 2016. Projected in-service December 31, 2017	In service	24 acres	1.9 miles	Lower Back Creek	X	X	X			
Resource Extraction	(33) East Alamance Quarry	Gravel, sand, crushed stone aggregates operation. Owned and operated by Martin Marietta Materials, Inc.	In operation	240 acres for operation.	0.1 miles	Boyds Creek – Haw River	X	X	X	X	X	X
Residential Projects	(51) Granite Mill	Development of 176 apartments and 15,000 sq. ft. of commercial space in an abandoned mill.	Planning	6 acres	0 miles	Boyds Creek – Haw River	X	X	X	X	X	X
Big Alamance Creek HUC 10 Watershed (Guilford/**Alamance Counties, NC) c/**												
Energy Projects	(46) Woodgriff Solar	3 MW solar facility	Intent to construct permit expires June, 2019	38 acres	3.2 miles	No shared HUC 12 watershed	X	X	X			
Transportation/ Roadway Projects	(18) N.C. 62 Widening - Ramada Road to U.S. 70 / NCDOT	Proposed widening an approximately 1-mile stretch of N.C. 62 to improve traffic flow and safety	In Development	9 acres	4 miles	No shared HUC 12 watershed						
Energy Projects	(45) Southwick Solar Farm, LLC	3 MW solar facility	Application filed 2017; pending site review	26 acres	2.5 miles	No shared HUC 12 watershed	X	X				

a/ Contains ID related to projects illustrated on Figures 1 through 4.

b/ Acres affected includes the acreage of project that occurs within the watershed and not just the county shared with the Southgate Project. Acreages are estimated based on information available from various sources including the FERC eLibrary, the North Carolina Utilities Commission Website, the Virginia and North Carolina Department of Transportation websites, County websites, Bing aerials, and Google Earth imagery. Estimated acres affected are not based on final engineered project designs, as that level of detail is not available for all other projects. With the exception of the Virginia Southside Expansion project, the Transco Southeastern Trail project, and the MVP Pipeline project, acres affected by construction and operation are assumed to be the same.

c/ HUC-10 Watersheds/counties/states identified in bold indicate watersheds and counties that the Southgate Project would cross. County names that are not bolded are located within a shared HUC-10 watershed, but are not crossed by the Southgate Project.

d/ Distance estimate from Southgate Project centerline.

APPENDIX G

List of Preparers

LIST OF PREPARERS

Federal Energy Regulatory Commission

Mardiney, Amanda – Project Manager
M.A., Environmental Resource Policy, George Washington University, 2012
B.S., Biology, University of Maryland, College Park, 2009

Peconom, John – Deputy Project Manager
B.S., Environmental Biology and Management, University of California at Davis, 2000

Fink, Jennifer – Water Resources
M.A. Environmental Policy, George Washington University, 2016
B.S., Environmental Science, University of Delaware, 2010

Fox-Fernandez, Nancy – Vegetation, Wildlife, T&E
M.S., Natural Resources: Wildlife, Humboldt State University, 2006
B.A., Psychology, Skidmore College, 1993

Friedman, Paul – Cultural Resources
M.A. History, University of California at Santa Barbara, 1980
B.A., Anthropology and History, University of California at Santa Barbara, 1976

Griffin, Robin – Land Use
M.S., Environmental Management, Illinois Institute of Technology, 1999
B.A., English Composition, DePauw University, 1992

Jensen, Andrea – Soils, Geology
B.S., Environmental Geology, College of William and Mary, 2012

Jeudy, Harry – Environmental Engineer – Air Quality, Noise, and Reliability & Safety
B.S., Mechanical Engineering, Pennsylvania State University, 2000

Munoz, Kelley – Socioeconomics, Land Use
B.S., Environmental Science, Lubbock Christian University, 1997

Cardno, Inc.

Jacks, Allen – Project Manager, Biological Resources Task Lead, Project Description,
M.S., Ecology, Coastal Zone Studies, University of West Florida, 1997
B.S., Biology, Georgia College and State University, 1994

Brena, Jeanette– Air and Noise
M.S., Environmental Engineering, Washington State University, 1997
B.S., Civil Engineering, Seattle University, 1996

Brewer, John – Wildlife, Threatened and Endangered Species, Aquatics
M.S., Marine Biology, University of Alaska, Fairbanks, 2007
B.S., Wildlife Ecology and Conservation, Animal Science, University of Florida, 1997

Briggs, Stephanie – Vegetation, Wetlands
B.S., Biological Sciences, Marine Biology, University of Maryland, 1998

Ferris, Jennifer – Cultural Resources
M.A., Anthropology, Washington State University, 2008
B.A., Anthropology, University of Washington, 2001

Marsey, Peter – GIS Figures
M.A., Geography, University of Toronto, 2004
B.A., Geography, University of Delaware, 2001

Moreira, Bruce– Water Resources
M.S., Forest Resources, University of Minnesota, 2001
B.A., Biology, Reed College, 1996

Peters, Duane – Physical Resources Task Lead, Safety and Alternatives
B.S., Environmental Science, Slippery Rock University, 1997

Sechrist, Kim – Social Science Task Lead, Land Use, Socioeconomics
M.S., Environmental Science, Towson University, 2006
B.A., Biology, McDaniel College, 2004

Wallace, Jennifer – Project Scope Task Lead, Cumulative Impacts
M.S., Marine Policy, University of Delaware, 2003
B.S., Oceanography / Environmental Science, Florida Institute of Technology, 2000

Yates, Josh – Geology, Soils
M.S., Geology, University of South Florida, 2013
B.S., Natural Resources Management and Engineering, University of Connecticut, 2005

Cardno, Inc. is a third party contractor assisting the Commission staff in reviewing the environmental aspects of the project application and preparing the environmental documents required by NEPA. Third party contractors are selected by Commission staff and funded by project applicants. Per the procedures in 40 CFR 1506.5(c), third party contractors execute a disclosure statement specifying that they have no financial or other conflicting interest in the outcome of the project. Third party contractors are required to self-report any changes in financial situation and to refresh their disclosure statements annually. The Commission staff solely directs the scope, content, quality, and schedule of the contractor's work. The Commission staff independently evaluates the results of the third-party contractor's work and the Commission, through its staff, bears ultimate responsibility for full compliance with the requirements of NEPA.

APPENDIX I.1

Comments on the Draft EIS and Responses

Southgate Project
Comments on the Draft EIS and Responses

INTRODUCTION

Between the issuance of the Notice of Availability (NOA) for the draft Environmental Impact Statement (EIS) on July 26, 2019, and the close of the comment period on September 16, 2019, the Federal Energy Regulatory Commission (FERC) received approximately 98 individual written letters commenting on the draft EIS, including 3 letters from federal agencies, 3 letters from state agencies; 1 letter from state representatives; 2 letters from a local government agencies and officials; 5 letters from Native American tribes; 33 letters from companies and organizations (including submittals that combined letters from different organizations/individuals under one accession number); and 51 letters from individuals. In addition, we held 3 public comment sessions during the draft EIS comment period, which provided interested parties with an opportunity to present verbal comments on our analysis of the environmental impacts of the Project as described in the draft EIS. A total of 49 verbal comments and 16 written comments were provide at the sessions. We also received several (14) comment letters filed after the close of the official comment period, which we have considered and included in the analysis to the extent possible1.

This appendix presents our responses to relevant comments provided on the draft EIS. Comments are classified as follows:

- FA: Federal agencies and elected officials
- NAT: Native American Tribes
- EO: Elected Officials
- SA: State/Commonwealth agencies
- TA: Town/City agencies
- CO: Companies and Organizations
- IND: Individuals

Appendix I.1 includes an index of comments on the draft EIS, including the FERC accession number, agency/organization/name of the commenter, date the comments were filed, and a comment code. Appendix I.2 provides our responses to the majority of comments that were filed utilizing general comment codes, which are defined as follows:

- GEN: General comments
- ALT: Alternatives

[1] Note that our response to comment includes some comments filed after the end of the official comment period.

- GEO: Geology
- SOIL: Soils
- GW: Groundwater
- SURF: Surface Waters
- WET: Wetlands
- WILD: Wildlife
- AQU: Aquatic Resources
- SOCIO: Socioeconomics
- CULT: Cultural Resources
- AIR: Air Quality
- NOISE: Noise
- SAFE: Reliability and Safety
- CI: Cumulative Impacts
- T&E: Threatened, Endangered, and Other Special Status Species
- LU: Land Use, Recreation, Special Interest Areas, and Visual Resources

Some comments were addressed via a "side-by-side" approach due to the complexity or scope of the comments, or for which our responses in appendix I.2 did not apply. These additional comments are addressed individually in appendix I.3. Most of the comment letters addressed via the side-by-side approach also contained attachments and appendices that were not direct comments on the draft EIS or the Project. These attachments have not been included in this final EIS appendix, but can be found on the FERC eLibrary filed under the applicable accession numbers.

Appendix I.1
Index of Commenters on the Southgate Draft EIS

Letter Code	Commenter Name/Affiliation	Accession Number	Comment Code(s)
Federal Agencies			
FA-1	U.S. Environmental Protection Agency	20190913-5090	Appendix I.3 Side by Side Responses
FA-2	U.S. Fish and Wildlife Service	20190916-5160	Appendix I.3 Side by Side Responses
Elected Officials			
EO-1	State Rep. Riddell and Ross	20190916-5090	Appendix I.3 Side by Side Responses
State Agencies			
SA-1	NC Economic Development Association	20190826-0031	GEN-3
SA-2	Virginia DEQ	20190911-5102	Appendix I.3 Side by Side Responses
SA-4	North Carolina DEQ	20190916-5167	Appendix I.3 Side by Side Responses
SA-5	NC Wildlife Resource Commission	20190916-5189	Appendix I.3 Side by Side Responses
SA-6	NC Dept. of Natural and Cultural Resources	20190930-0238	Appendix I.3 Side by Side Responses
Town/City Agencies and Elected Officials

APPENDIX I.2

General Comments on the Draft EIS and Responses

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
General Comments		
GEN-1	Comments expressing general opposition to the Project and non-specific concerns about environmental impacts (e.g., statements of general concern for impacts on wetlands or wildlife; air quality impacts; safety; statements that quoted text from the draft EIS but provided no additional comments).	The draft and final EISs describe the potential impacts on environmental resources resulting from construction and operation of the Project. Staff considered measures to avoid, reduce, and mitigate impacts on the environment, and as appropriate, are including recommendations in the final EIS. As discussed throughout the environmental analysis section of the EIS, the staff concludes that with implementation of Mountain Valley's impact avoidance, minimization, and mitigation measures, as well as their adherence to our recommendations, Project impacts would not be significant.
GEN-2	Comments that the need of the Project has not been established and that the Project would not benefit local areas crossed by the route. Additionally, commenters contend that the Project would not be consistent with North Carolina's renewable energy initiative.	The Commission will consider the need for the Project and may address these comments in any Order it issues. FERC environmental staff reviews applications for interstate natural gas pipeline projects in accordance with an applicant's stated objective(s) to disclose the environmental impacts of a proposal, to inform the decision makers, and, in accordance with NEPA, evaluate reasonable alternatives to a project.
GEN-3	Comments in support of the Project, including comments related to the need for the Project, economic benefits, the proposed route, and the potential for the Project to meet regional energy goals.	Comments noted.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
GEN-4	Numerous comments concerning the adequacy of the draft EIS; the EIS was "flawed" and "inadequate", our conclusions in the EIS are not appropriate or correct, and the scope of the environmental analysis was too limited. Commenters contend that our analysis and conclusions in the draft EIS are not adequate because Mountain Valley has not yet provided certain environmental data and due to lack of information, the Mountain Valley Pipeline Southgate project does not comply with NEPA.	The EIS discloses the potential impacts on environmental resources resulting from construction and operation of the Project. The EIS was prepared in accordance with NEPA, CEQ guidelines, and other applicable requirements. The EIS includes sufficient detail to enable FERC staff to conclude the significance of the full range of possible impacts on the environment. Duration and significance of impacts are discussed throughout the various EIS resource sections. The EIS identifies and evaluates feasible mitigation measures to reduce those effects whenever possible. Mountain Valley's construction and restoration plans contain numerous mitigation measures to avoid or reduce Project-related impacts. The EIS addresses stakeholder comments and incorporates information as applicable.
GEN-5	Comments that there was insufficient time to review the draft EIS and associated information and requests to extend the draft EIS comment period. Commenters noted that there was a substantial amount of information missing from the EIS that the public did not have a chance to comment on.	A 45-day comment period was opened with the issuance of the draft EIS. The Commission's standard draft EIS comment period is 45 days, which is consistent with the Council for Environmental Quality's (CEQ) regulations implementing NEPA. NEPA does not require every study or aspect of an analysis to be completed before an agency can issue a draft EIS. The public docket for the Project was open for review and comment by stakeholders on all supplemental materials provided after issuance of the draft EIS.
GEN-6	Comments related to the performance of erosion control devices and Mountain Valley contractors during the construction of the Mountain Valley Pipeline Project. We also received comments stating that the draft EIS fails to adequately analyze impacts because it unreasonably relies on minimization and mitigation measures that have previously been ineffective.	Each proposal reviewed by the Commission is considered on its own merits irrespective of other projects. FERC's professional judgement, based on decades of experiences on hundreds of projects is that the Plan and Procedures are sufficient to minimize impacts to resources. See revised section 1.3 of the EIS for a more detailed response to these concerns.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
GEN-7	Many commenters provided general comments regarding their opposition to the use of eminent domain for the Project and Mountain Valleys land acquisition methods.	As discussed in section 4.8.2, if an easement cannot be negotiated with a landowner and the project has been certificated by the FERC, the company may use the right of eminent domain granted to it under Section 7(h) of the NGA and the procedures set forth under the Federal Rules of Civil Procedure (Rule 71A) to obtain the right-of-way and extra workspace areas.
GEN-8	Comments that Project has been segmented from the environmental review of the Mountain Valley Pipeline Project.	Although the Project would be owned and operated by Mountain Valley, it is a separate project from the Mountain Valley Pipeline Project due to the fact that Southgate Project has a different stated purpose and anchor shipper and the Project would have separate facilities. Therefore, the Project requires its own Environmental Analysis.
GEN-9	Commenters stated that the reliance on mitigation measures to conclude that the project will cause no significant impacts is inadequate because many of the mitigation measures proposed are unspecified. Commenters noted that in many instances in the draft EIS we instruct Mountain Valley to come up with mitigation measures that are currently not defined; and that mitigation cannot prevent significant impacts on environmental resources.	Mitigation measures related to the reduction of impacts on specific resources are provided throughout the EIS. To determine the significance of an impact, we consider the duration of the impact; the geographic, biological, and/or social context in which the impact would occur; and the magnitude and intensity of the impact. We also consider the measures that would be implemented by the applicant to avoid, reduce, and mitigate impacts. For most impacts analyzed, Mountain Valley has provided final or draft mitigation measures.
GEN-10	One commenter noted that there was a lack of government oversight, allowing pipelines to be installed without permits and a disregard to Endangered Species Act.	Applicants cannot begin construction of the Project until all state, federal, and local permits are received including completion of consultation under Section 7 of the Endangered Species Act. Federal agency compliance for the Endangered Species Act (ESA) Section 7 is described in section 4.7.1 of the EIS.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
GEN-11	Commenters suggested that state permit requirements and recommendations should be adhered to by the applicant and included in the EIS.	The Commission encourages cooperation between pipelines and local authorities. However, this does not mean that state and local agencies, through application of state or local laws, may prohibit or unreasonably delay the construction and operation of facilities if approved by the Commission. The applicant would be required to comply with all federal and federally-delegated permits. These permits along with other state and local permits are identified in table 1.4-1 of the EIS.
GEN-12	One commenter voiced concerns that the description of the project in Mountain Valley's application does not match the description provided in the draft EIS.	Comment Noted. The current project description as proposed by Mountain Valley in its application and supplemental filings is provided in section 2.1 of the EIS.
Alternatives		
ALT-1	Comments regarding the inadequacy of the alternatives analysis, the limited range of alternatives considered, and a lack of analysis of the No Action Alternative.	As required by NEPA, we have identified and evaluated reasonable alternatives to the Project to determine whether the implementation of an alternative would be environmentally preferable to the proposed action. The EIS also evaluates the No Action Alternative. See section 3.0 of the EIS.
ALT-2	Commenters stated that the alternatives analysis in the EIS needs to consider renewable energy options and an assessment of non-gas energy alternatives and/or energy conservation or efficiency.	The Project would transport natural gas. As explained in the introduction to section 3.0, because renewable energy sources and energy conservation alternatives are alternatives to natural gas consumption, but not natural gas transportation, they do not meet the Project purpose and were not analyzed in our alternatives analysis.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
ALT-3	Several landowners affected by the Project requested alternative routes to avoid their properties and expressed concerns regarding the alignment of the route and access roads on their property.	Section 3.4.3 of the EIS provides an analysis of minor route variations developed based on landowner input and requests. FERC staff asked Mountain Valley to evaluate specific properties based on comments received not only during the draft EIS comment period, but also throughout the entire environmental review process. All alternatives and variations requested by landowners were considered by FERC staff. Not all variations considered were discussed in detail in the draft EIS due to staff determinations that the alternative was not feasible or did not provide a significant environmental advantage. Mountain Valley made several changes to the route in response to landowner concerns and continues to work with landowners to reduce impacts on their property.
ALT-4	Some commenters expressed concerns that Mountain Valley did not fully consider the co-location of the alignment with Transco and other public rights-of-way or transportation corridors.	Mountain Valley has collocated the route with other utility and transportation rights-of-way for about 49 percent of the route. We evaluated alternatives in section 3.0 to evaluate other options to increase collocation; however, these routes did not offer a significant environmental advantage over the proposed route. See section 3.3.2.1 of the EIS for an analysis of the Transco Alternative.
Geology		
GEO-1	Comments concerning the potential of the construction of the pipeline to encounter and disturb uranium deposits.	Section 4.1.4.8 of the EIS has been updated, and includes a more detailed discussion on the geologic setting and potential for uranium occurrence and mobilization in Pittsylvania County, Virginia.
GEO-2	We received comments that blasting of bedrock increases danger of landslides. Commenters requested a landslide mitigation plan.	See section 4.1.4.6 of the EIS for updated information regarding blasting. Blasting would follow the procedures in Mountain Valley's General Blasting Plan, and would be limited in depth, width, and length to minimize disturbances. Mountain Valley would additionally implement control measures within their Landslide Mitigation Report during construction and operation to minimize landslides and potential associated impacts.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
GEO-3	Commenters expressed concern regarding the presence of caves and sinkholes that the pipeline would cross and the potential for blasting to cause sinkhole formation.	As described in section 4.1.4.5 of the EIS, Mountain Valley completed desktop and targeted field assessment of the proposed alignment and no karst features (e.g., caves, sinkholes) were identified.
Soils		
SOIL-1	Commenters expressed concern regarding dust control during construction.	As described in section 4.2.2 of the EIS, Mountain Valley would implement dust suppression measures.
SOIL-2	A few commenters expressed concern about how soil compaction would be abated.	Section 4.2.4 of the EIS discusses measures Mountain Valley would implement to decompact soils and ensure all disturbed areas are returned to pre-construction conditions.
Groundwater		
GW-1	Comments related to groundwater impacts and impacts on private wells. Commenters expressed concerns that the locations of wells are unknown and that blasting and heavy equipment can damage infrastructure, such as wells, underground utilities, and septic systems.	Section 4.3.1 of the EIS includes a detailed discussion of the potential impacts that construction and operation of the Project could have on groundwater resources, including water supply wells, and describes the measures that Mountain Valley would implement to avoid or minimize these impacts. In section 4.3.1.2 of the EIS, we recommend that any Order that may be issued by the Commission require Mountain Valley to file a final table identifying field-verified wells and springs within 150 feet of the Project prior to construction.
Surface Water		
SURF-1	Comments regarding impacts of the project on surface waters, including concerns regarding impacts on water quality.	Section 4.3.2 of the EIS discusses the Project's impacts on surface water resources and describes measures that Mountain Valley would implement to reduce potential impacts.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
SURF-2	Commenters expressed concerns regarding the increase of erosion and transport of sediment into streams from the removal of vegetation and disturbance of stream banks.	Impacts on surface waters and erosion control measures are discussed in sections 2.4, 2.7, and 4.3.2 of the EIS. Mountain Valley would adhere to its Plan and Procedures, and E&SCP to minimize the amount of sediment leaving the immediate area affected by construction. The Plan and Procedures contain requirements for erosion and sediment control during the construction and restoration of the Project. The Plan and Procedures also contain performance based standards that seek to contain soils within the limits of disturbance. As a standard construction practice, the Project would establish a 50-foot-wide wetland and waterbody buffer with erosion and sediment control devices. The buffer would not be grubbed during the initial right-of-way clearing and grubbing sequence. These buffers would remain undisturbed (aside from hand felling trees) until the pipeline crossing is ready to be installed. See also response GEN-6.
SURF-3	Commenters expressed concern about impacts on the Jordan Lake Watershed and that the Project is not adhering to Jordan Lake Rules.	Section 4.3.2.4 of the EIS discusses the Jordan Lake Riparian Buffer.
SURF-4	Several commenters argued that the draft EIS did not appropriately assess the full scope of downstream impacts. Some commenters contend that the three-mile downstream distance used in the draft EIS does not adequately access water quality impacts since many contaminants can travel longer distances.	We analyzed potential impacts to waterbodies crossed by the Project within the HUC-10 watershed geographic scope, as described in section 4.13 of the EIS. Section 4.3.2.7 of the EIS discusses impacts on surface waters, including downstream impacts. We identified 3 streams that are considered impaired for the presence of *Escherichia coli*. No contaminants were identified in streams crossed by the Project. Therefore, we would not expect the introduction of contaminants to occur as a result of in-stream construction. The Project would implement an SPCC Plan and follow measures contained in Mountain Valley's Plan and Procedures to avoid the introduction of contaminants by construction equipment.
SURF-5	Commenters expressed concerns regarding the impact of hydrostatic test water discharges on surface waters	Measures regarding hydrostatic test water discharge are provided in section 4.3.2.7 of the EIS and VII.D.1 of Mountain Valley's Procedures.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
SURF-6	Several commenters contend that Mountain Valley has not fully identified sources of water for use during construction.	Water sources are addressed in section 4.3.2.6 of the EIS. Since the issuance of the draft EIS, Mountain Valley has proposed to use the Dan River as the primary source of water for construction, and water from municipalities as the secondary source.
SURF-7	Commenters expressed concern regarding construction in floodplains, including the safety of the public and workers during flood events that could occur during construction. In addition, commenters expressed concerns that the volume and velocity of water from flooding will increase with less buffer protection due to un-vegetated riparian areas and compacted soils from heavy machinery.	During construction, Mountain Valley would monitor weather conditions. Sections 4.1.4.7 and 4.3.2.7 of the EIS have been updated to include measures Mountain Valley would implement during construction in the event of seasonal or flash flooding. Section 4.3.1.5 discusses the restoration of floodplains and waterbodies to pre-construction contours, Section 4.3.2.2 has been updated to include a discussion of a 50-ft-wide wetland and waterbody buffer, when applicable.
SURF-8	Commenters contend that Mountain Valley has not provided the feasibility studies for trenchless crossings of waterways, such as Deep Creek.	Mountain Valley completed geotechnical investigations and provided crossing plans for each waterbody that would be crossed by HDD or conventional bore. We have updated section 4.3.2.2 of the EIS with this information.
SURF-9	Commenters noted the potential for spills and leaks to occur, and that Mountain Valley should employ measures to prevent spills of fuels or lubricants into state waters.	Section 4.3.2 of the EIS discusses the Project's impacts on surface water resources and measures that Mountain Valley would implement to avoid or reduce potential impacts, including potential impacts from spills and leaks.
Wetland		
WET-1	A commenter expressed concerns regarding impacts on wetlands, specifically noting some proposed workspaces were located within 50 feet of a wetland.	As described in section 4.4.3 of the EIS, Mountain Valley's Procedures specify that all areas of additional temporary workspaces (ATWS) should be set back at least 50 feet from wetlands. Mountain Valley has requested modifications to their Procedures at specific locations within 50 feet of a wetland boundary. Appendix B.3 provides the locations where Mountain Valley proposes less than a 50-foot setback from a wetland and the site-specific rationale for the requested modification from Mountain Valley's Procedures. We have reviewed these ATWS locations and find them acceptable. Mountain Valley has reduced the number of ATWS location within 50 feet of a wetland from 23 to 15 locations.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
Vegetation		
VEG-1	Many commenters expressed concern about deforestation and forest fragmentation, including permanent loss of forested areas.	See section 4.5.4 for a discussion of impacts on vegetation communities, including interior forested areas and forest fragmentation in section 4.5.4.3.
VEG-2	Commenters expressed concerns about the Project potentially causing the spread of invasive species.	Potential impacts related to invasive species are discussed in section 4.5.4.1 of the EIS.
Wildlife		
WILD-1	Commenters expressed concerns regarding temporal and direct impacts on wildlife and habitat.	Section 4.6 of the EIS discusses impacts on wildlife and habitat.
WILD-2	Commenters expressed concerns regarding impacts on migratory birds and avoidance of clearing and construction activities within migratory bird nesting season.	Section 4.6.3.2 of the EIS discuss impacts on migratory birds.
WILD-3	Commenters expressed concern about how the draft EIS characterized downstream impacts on aquatic species. Commenters did not agree with the draft EIS analysis, which mentioned species may migrate away from wildlife-threatening impacts caused by the construction.	Aquatic species immediately downstream of disturbed areas may experience increased rates of stress, injury, and mortality. Impacts on aquatic species with less mobility are discussed in section 4.6.5 of the EIS.
Threatened and Endangered Species		
T&E-1	We received comments that observed bald eagles within the Project area were not noted in the draft EIS.	As noted in section 4.6.3.3 of the EIS, there are no currently documented bald eagle nests within 0.5 mile of the Project footprint, Section 4.6.3.4 discusses the measures that Mountain Valley would follow if bald eagles are observed. Section 4.7 of the EIS notes waterbodies and lands where protected species are known to occur.
T&E-2	Commenters stated that FERC has not provided sufficient information in the draft EIS for the public to assess the actual impacts to listed species, or to assess the *not likely to adversely affect* determination that was made for these species.	Section 4.7 of the EIS discusses impacts on listed species. Federal agency compliance with Section 7 of the ESA is described in section 4.7.1 of the EIS.
T&E-3	Commenters expressed concerns that pipeline construction would harm numerous species and their habitats, including the Roanoke logperch, James spineymussel, Atlantic pigtoe and smooth coneflower.	Sections 4.7.3, 4.7.4, and 4.7.5 of the EIS discusses impacts on listed fish, mussels, and plants.
Land use		

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
LU-1	Commenters expressed concerns regarding the pipeline easement and its impact on current land use and future residential development. Commenters are concerned that construction will render land unusable for farming, habitation, or other uses. Several landowners expressed concern about not being able to cross the pipeline easement, which would cutoff usable land. Some landowners are also concerned that Mountain Valley will not replace fences removed for construction.	Impacts on land use are discussed in section 4.8 of the EIS. Most commonly, cultivated properties go back into cultivation following construction and so, the easement does not affect the resumption of farming. A 50-foot-wide permanent right-of-way would be maintained by Mountain Valley. While structures would not be permitted within the permanent right-of-way, they would be permitted in all areas used for the temporary construction workspace. Mountain Valley stated that they would work with landowners to maintain access to cultivated agricultural portions of their property and would provide access across the right-of-way at the request of the landowner. Mountain Valley would work with landowners to replace and return features of their property that needed to be removed for construction, including fences for livestock.
LU-2	Commenters expressed concern about impacts on public use of recreational parks, trails, and rivers, including the Mountains-to-Sea Trail and a proposed trail in Alamance County.	Impacts on recreational and special use lands are discussed in section 4.8.4 of the EIS.
LU-3	General comments regarding the visual impact of the newly cleared sections of the easement on the public and landowners.	Visual impacts from right-of-way clearing are discussed in section 4.8.6.1 of the EIS.
LU-4	Landowners commented that the pipeline would impact residential septic systems.	Section 4.8.3 of the EIS for analyzes impacts on septic systems.
LU-5	Comments regarding the impact of the pipeline easement on agricultural production during and after construction. Landowner commented on the short-term and long-term impacts of easements within traditional and other unique (truffle farm and seed farm) agricultural crops. Some landowners believe that installation of the pipeline will change the composition of the soil, which will impact crops.	Section 4.8.1.1 of the EIS discusses impacts and mitigation measures regarding agricultural land use affected by the Project.
Socioeconomics		
SOCIO-1	Several commenters expressed concern that the pipeline would lead to decreased property values, which would have a negative economic effect on their futures.	As discussed in section 4.9.5 of the EIS, based on our review of numerous studies, there is no conclusive evidence that indicates that the presence of a pipeline would significantly impact the value of a property.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
SOCIO-2	Commenters expressed concerns that the pipeline would impact tourism in the region.	Impacts to tourism are discussed in section 4.9.6 of the EIS.
SOCIO-3	Commenters expressed concerns regarding mental health impacts of the Project, as well as eco-psychology, eco-therapy, and terra-psychology not being considered in the draft EIS.	Impacts on affected resources including public health, and the associated mitigation measures, are discussed throughout the EIS. An individual's response to the short-term and/or long-term changes to their surrounding environments due to construction of the project would vary significantly depending on a variety of factors. Consequently, assessing those responses, which could include no response at all, is not be feasible.
SOCIO-4	Commenters expressed that there was a lack of analysis regarding impacts to environmental justice communities, particularly those located near the Lambert Compressor Station.	Potential impacts (such as air quality, noise, water resources, etc.) on the human environment including environmental justice communities are discussed throughout the EIS. As discussed in section 4.9.8, while there are several low income and minority populations crossed by the pipeline route, we conclude that they would not be disproportionately affected by the pipeline or the compressor station. Section 4.9.8 has also been updated to include a map of the Project and all census blocks crossed by the pipeline route, including those that contain Environmental Justice communities.
SOCIO-5	Commenters expressed concern regarding impacts of pipeline construction on personal safety. Commenters would like to see a plan from local law enforcement to defuse situations that may occur, including protests.	As noted in section 4.9.3 of the EIS, each county within the Project area has numerous police and fire departments. Mountain Valley would work with local police departments, fire departments, and emergency first responders to address any Project safety concerns.
SOCIO-6	To pay for cleanup of spills or accidents along the pipeline, commenters believe that utility rates will increase, which will have a greater impact on low income populations.	Mountain Valley is responsible for the cleanup of spills and accidents during pipeline construction and operation.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
SOCIO-7	Several commenters mentioned that the draft EIS did not account for social services that will be provided to out of town workers and did not account for non-standard socioeconomic effects, such as the loss in ecosystem services that is currently provided by air, water, forest, and other natural resources.	Socioeconomic impacts are addressed in section 4.9 of the EIS. While we are not aware of a standard for assessing quantifiable impacts resulting from loss of ecosystem services, we note that the project impact on the HUC-10 watersheds crossed by the Project is only about 0.1 percent of the area within these watersheds. Consequently, although we did not assess ecosystem services, it would be difficult to conclude that the loss would be discernable.
SOCIO-8	Commenters contend that the draft EIS inflates economic benefits and understates its adverse impacts. They further state that the EIS analysis uses the entire states of North Carolina and Virginia as its impact area, instead of a more appropriate region. Commenters disagreed with the use of INPLAN.	As discussed in sections 4.9.7 and 4.9.9, benefits to the local economy from payroll expenditures, local purchases of consumables Project-specific materials, room rentals, and sales tax would be short-term and minor. Section 4.9.3 discusses impacts of the Project on public services. |
Cultural		
CULT-1	Several commenters stated that the surveys are not yet complete; and that contend not all resources have been identified, and impacts to cultural resources have not been adequately addressed. Commenters also stated that the draft EIS does not provide information on the findings of the archeological sites identified and note that there are sites that have been previously identified but were not included in the draft EIS. Some commenters contend that the impacts to tribes were not considered, and FERC as the federal lead should have reached out to the tribes, not Mountain Valley. Some commenters believe Section 106 has not been completed properly	In section 4.10.4 of the draft EIS, we acknowledge that the entire pipeline route has not yet been completely inventoried for cultural resources, and recommend that the Commission Order authorizing the Project contain an environmental condition that construction may not begin until after all archaeological surveys have been completed and reviewed, and we have completed the process of compliance with the NHPA.
CULT-2	A letter was received from North Carolina SHPO stating the draft EIS has been reviewed and addresses previous comments. They concur with the revised Plan for Unanticipated Discoveries of Historic Properties and Human Remains. Changes in the revised archeological report and addendum will need to be reflected in Table 4.10-11.	The EIS was revised to reflect comments on reports we received from the NCSHPO, in letters dated July 1 and 22, 2019.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
CULT-3	One commenter requested realignment to avoid impacts to Little Cherrystone Property. This site includes a Native American burial ground. The commenter stated that since it is within the LOD, the public will not be able to monitor the site to make sure access is restricted.	Little Cherrystone Manor/Wooding Cemetery/Site 71-36 is mentioned on page 4-166 of the draft EIS as a NRHP-listed property and listed on table 4.10-9, with the recommendation to "avoid or mitigate." In an environmental information request issued by the FERC on October 3, 2019 we asked Mountain Valley to file either an avoidance plan or a treatment plan for Little Cherrystone Manor. In an October 18, 2019 filing, Mountain Valley stated it would be filing an avoidance plan for Little Cherrystone Manor.
CULT-4	A comment was received noting that the Deep Creek Church and Cemetery is located close to the proposed route. They requested avoidance, compensation for impacts, and to return the site to preconstruction conditions	Our EIR #4 requested an avoidance plan for the church/cemetery. An avoidance plan for the Deep Creek Primitive Baptist Church and Cemetery was filed by Mountain Valley on October 23, 2019.
CULT-5	Commenters noted the Mountain View historic 1890s home, located in the Chatham Historic District on Route 20 is located within the proposed route. It is within the proposed route and will be impacted by the project	Historical architectural site 71-25 (Mountain View Manor) was recorded during surveys conducted by TRC for Mountain Valley between September 2018 and June 2019 (Karpynec, September 2019). It was noted as listed on the NRHP. We have revised the EIS to reflect this new information.
CULT-6	The Choctaw Nation of Oklahoma stated the project is outside of their area of interest. Comments are deferred to other Tribes that have been contacted.	Comment noted.
CULT-7	A commenter stated there are undocumented graves in Ossipee in Altamahaw. Locations passed down through oral tradition of Occaneechi Band of the Saponi Nation.	We asked Mountain Valley about these graves in EIR#4. The company responded in an October 18, 2019 filing Mountain Valley indicated that the Chair of the Occaneechi Band of the Saponi Nation had no knowledge of graves in this area.
CULT-8	The Catawba requested to be notified if Native American artifacts and/or human remains are located during the ground disturbance phase of this project.	Comment noted.
Air		
AIR-1	Commenters expressed concerns regarding the Project-related emissions impact on the region's air quality.	Air emission impacts and mitigation measures are discussed in section 4.11.1.7.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
AIR-2	Commenters were concerned regarding impacts on health resulting from operation of the Lambert Compressor Station. Some commenters requested we study the impacts on more vulnerable populations (environmental justice populations) that are near the Lambert Compressor Station.	Air quality impacts on public health are discussed in detail in section 4.11.1.7. Additionally, potential air quality impacts on vulnerable populations are discussed in section 4.9.8 of the EIS.
Noise		
NOISE – 1	Comments regarding noise and light impacts on humans and wildlife resulting from construction and operation of the pipeline and compressor station.	As described in Section 4.11.2.3, noise from construction and operation of the project, including the Lambert Compressor Station would meet FERC requirements. Effects from chronic noise may vary by species as described in section 4.6.1.1. Mountain Valley would employ noise mitigation measures at the Lambert Compressor Station and the noise levels that wildlife would be exposed to beyond the compressor station property boundary would vary based on the distance from the facility. See section 4.6.1.1 for a discussion of lighting techniques to minimize impacts to wildlife. Lighting impacts on people are discussed in section 4.8.6.2, the Lambert Compressor Station would be surrounded by trees on three sides, shielding it from public view. The vegetative screening would also shield the Lambert Compressor Station from nearby residences, thereby minimizing effects from light.
Safety		
SAFE-1	Commenters expressed concern regarding potential incidents along the pipeline and compressor station facilities, including impacts of natural gas leaks. Commenters also expressed concern regarding the potential for leaks to ignite and subsequent impacts on nearby residences, communities, and the environment.	Section 4.12.1 states that the DOT requires operators to develop and follow a written Integrity Management Program that address the risks on each transmission pipeline segment. In addition, sections 4.12 and 4.9.3 discuss elements of Mountain Valley's emergency response plan and coordination with local first responders in the event of an emergency.
SAFE-2	Concerns were expressed from commenters about how local resources and communities are not equipped to handle an emergency response.	Section 4.9.3 describes the effects that the Project could have to local services (including emergency services). DOT regulations regarding emergency response are described in section 4.12.1

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
SAFE-3	Commenters expressed concerned about public safety during construction. Including safety of construction workers. Several commenters mentioned equipment turnovers from past projects.	Sections 4.12 and 4.9.3 of the EIS discuss elements of Mountain Valley's emergency response plan and coordination with local first responders in the event of an emergency.
SAFE-4	A commenter expressed concern regarding possible accidents in less densely populated areas due to thinner pipeline walls.	As described in section 4.12.1, the DOT regulates pipeline safety under 49 U.S.C. 601. Class locations representing more populated areas require higher safety factors in pipeline design, testing, and operation. Class locations for the Project have been determined based on the relationship of the pipeline centerline to other nearby structures and manmade features.
Cumulative Impacts		
CI-1	Commenters expressed concerns related to climate change, including contentions that the Project will contribute to climate change, sea level rise, and extreme weather events, and subsequently impact other environmental resources, commercial economies, climate refugees, etc. Commenters stated that the EIS failed to adequately utilize available methodologies (Social Cost of Carbon) to assess the Project's climate impact and expressed concern that our failure to address the importance and consequences of GHG emissions undermined several aspects of the overall Project environmental analysis. In addition, commenters contend we did not adequately estimate upstream and downstream GHG emissions that would result from the Project. Commenters also contend that the climate change analysis in the EIS should include GHG emissions from loss of trees and vegetation and burning of brush associated with the Project.	An analysis of the Project's impacts on climate change is discussed in section 4.13.2.9. The social cost of carbon tool is intended for estimating the climate costs and benefits of rulemakings and policy alternatives. The tool cannot predict the actual environmental impacts of a project on climate change. It can only present a monetized global value for the economic costs of climate change and was not considered adequate for the purposes of this EIS. The evaluation of upstream and downstream GHG emissions it outside of the scope of this EIS. Section 4.5.4.3 provides an updated discussion of interior forest impacts; and section 4.13 discusses cumulative impacts on forested areas.

Appendix I.2

General Comments on the Draft EIS and Responses

Comment Code	Comment Summary	Response
CI-2	A few commenters contend that there are increased climate change risks from gas sourced from shale formations, as well as stating that methane is initially a more potent GHG than CO2 after release into the atmosphere. Several commenters expressed concern that the project facilities would leak methane, contributing to GHGs, and that these leaks were not accounted for in the analysis of Project impacts on climate change.	As described in section 4.11.1.2, our use of carbon dioxide equivalents (CO_2e) is consistent with the methods for characterizing methane in greenhouse gas estimates, allowing a common standard for comparison across projects. As discussed in section 4.3.1.5, Mountain Valley would regularly monitor the pipeline for signs of leaks. Similarly, as discussed in section 4.11.1.5 Mountain Valley would comply with all applicable leak detection and repair requirements, including the use of optical gas imaging to conduct leak surveys.
CI-3	Many commenters stated that the cumulative impact analysis was inadequate, including a limited analysis of cumulative impacts on forested wetlands, waterbodies, land use, and other aspects of the human and natural environment.	Cumulative impacts on environmental resources affected by the Project, including wetlands, waterbodies, and land use, are discussed in section 4.13 of the EIS. The analysis is consistent with CEQ guidelines and is sufficient.
CI-4	Several commenters expressed concern regarding the cumulative impacts on air quality and human health from three compressor stations located in close proximity.	An analysis of the cumulative impacts on air quality, including nearby compressor stations, is discussed in section 4.13.2.9 of the EIS. Air quality impacts on public health are discussed in section 4.11.1.7.

Re: Draft Environmental Impact Statement (DEIS) for the Southgate Mountain Valley Pipeline Project, FERC Docket No. CP19-14-000; CEQ #20190176

The U.S. Environmental Protection Agency has reviewed the DEIS for the Southgate Mountain Valley Pipeline ('MVP') Project in accordance with our responsibilities under Section 102(2)(C) of the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act. This DEIS evaluates the potential impacts to natural and human environments resulting from the proposed construction and operation of approximately 73 miles of a new natural gas transmission pipeline, a compressor station, and accompanying facilities that would provide roughly 375 million cubic feet per day (MMcf/d) of natural gas. The proposed pipeline location will traverse through Pittsylvania County, Virginia, and Alamance and Rockingham Counties in North Carolina.

The Federal Regulatory Commission (FERC or the 'Commission') has the decision of whether to issue a Certificate of Public Convenience and Necessity will also serve as the NEPA Section 102(2)(C) lead Federal agency. The EPA is providing the following comments consistent with Section 309 of the Clean Air Act.

The DEIS presented the following alternatives: No Action Alternative, System Alternatives, Major Pipeline Route Alternatives, Pipeline Route Variations, Pipeline Route Realignments, and Alternative Aboveground Facility Sites. Based on our review of the DEIS, the EPA identified several issues that could potentially help to improve the Final Environmental Impact Statement (FEIS). The EPA requests that additional analysis be provided and reported in the FEIS. We also recommend that all relevant permits and consultations be concluded. We have enclosed technical comments and recommendations for your consideration that can potentially strengthen the conclusions in the FEIS (See enclosure).

Effective October 22, 2018, the EPA will no longer include ratings in our comment letters. Information about this change and the EPA's continued roles and responsibilities in the review of federal actions can be found on our website at: https://www.epa.gov/nepa/environmental-impact-statement-rating-system-criteria.

The EPA appreciates the opportunity to review and provide comments on this DEIS. If you have questions or wish to discuss our comments and recommendations, please contact Ms. Maria R. Clark at (404) 562-9513 or clark.maria@epa.gov.

Sincerely,

Christopher A. Militscher
Chief, NEPA Section
Strategic Programs Office

FA-1	United States Environmental Protection Agency

ENCLOSURE

Technical Comments and Recommendations on the Draft Environmental Impact Statement (DEIS) for the Southgate Mountain Valley Pipeline Project, FERC Docket No. CP19-14-000 CEQ #20190176

Purpose and Need: The DEIS was not clear concerning a full description of the purpose and need for the action(s). In the Section 1.1 Purpose and Need, the document stated a description of the proposal and how the Commission bases its decisions. However, the need for this project remained uncertain. The purpose and need of the proposed project stated in the DEIS is: "*...to meet the specific requests for natural gas transportation service of its anchor shipper, Dominion Energy (formerly PSNC Energy), a local natural gas distribution company.*" Additionally, the Commission directed the readers to its "Certificate Policy Statement[1]" to try to clarify how the Commission evaluates the need for the project, and as the Commission states in the DEIS: "*...whether there is a need for a proposed project and whether the proposed project would serve the public interest. The Commission decision, in its Order, would review the need for the Project.*"

FA-1a	**Recommendations:** The EPA recognizes that this section of the DEIS needs to be further developed as the Commission receives agency and public input. While finalizing this discussion, the EPA has provided some general information regarding NC's demand/consumption regarding three energy sectors (See chart below). It is noted that in NC the natural gas sector has increased by more than 100%, but we also noted that the available volume of gas as of today is already exceeding NC's present consumption[2]. We understand that one of the many issues FERC considers for its decision is market demand and supply. We recommend that the FEIS include a well-defined purpose and need that would address the underlining need for this project that balances the benefits and impacts from the proposal.	See response GEN-2 in appendix I.2.

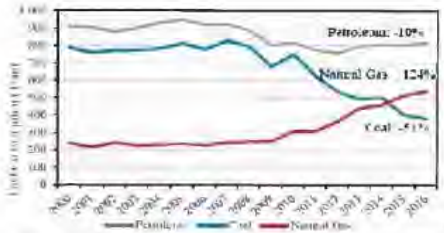

Figure 1 5: Trends in Fossil Fuel Consumption by All Sectors (TBtu)

Alternatives: The EPA's earlier scoping comments recommended that FERC expand the evaluation of the alternatives. While we recommended to further evaluate the Duke Power Alterative (included in this DEIS), and to explore further 'co-location' alternatives that would reduce and minimize environmental impacts.

FA-1b	**Recommendations:** The EPA recommends expanding the System Alternatives section. The DEIS explanation of why this alternative is not feasible is not clear. The EPA also recommends expanding the Major Pipeline Route Alternatives. We recommend studying a new route for the NC proposed route, specifically where the proposed route deviated from co-location at MP 32.8 (begins co-location with the power lines) and beyond. The EPA recognizes that this suggested co-location alternative route would entail additional mileage, but we also recognize the extent of permanent and temporary impacts the proposed new location route would create. We recommend studying the continuation of co-location from MP 32.8 going south and following co-location (with Cardinal Pipeline) looping to the east until reaching the future delivery point at the Haw River location. The EPA can supply the appropriate maps if FERC requires clarification regarding this recommended environmentally-preferable alternative.	See section 3.4.2 of the EIS for discussion of minor route alternatives. The western portion of this alternative was not preferred due to proximity to residences, terrain, and crossings of surface water features and major wetland systems. The eastern portion of this route was considered and is described under the Haw River Alternative. We concluded that these alternatives do not offer a significant environmental advantage when compared to the proposed route.

[1] Certification of New Interstate Natural Gas Pipeline Facilities, Statement of Policy, 88 FERC ¶ 61,227 (1999). "*...the Commission will evaluate the project by balancing the evidence of the project's public benefits against its residual adverse effects.*"
[2] The draft NC Clean Energy Plan was prepared by the North Carolina Department of Environmental Quality, 2019.

NHPA, ESA and CWA Section 404 Compliance: The DEIS states that FERC would complete the

FA-1	United States Environmental Protection Agency	
	process for compliance with the National Historic Preservation Act (NHPA) and the Endangered Species Act (ESA) Section 7 consultations prior to construction. It is also noted that FERC was submitting the DEIS as its biological assessment (BA) and requesting informal consultation with the U.S. Fish and Wildlife Service (FWS). We recognize the substantial information related to NHPA consultations and studies that were presented in the DEIS. We recommend that FERC not allow the applicant to begin ground disturbance until these processes are completed. We also note that the Section 404 of the Clean Water Act (CWA) permitting was pending due to the Corps of Engineers indication that the 404 permits could not be finalized until the NHPA and Section 7 processes were completed.	
FA-1c	**Recommendation:** The EPA strongly recommends that all permits, consultations and the biological opinion (if required) be concluded and available in the FEIS or in the Record of Decision (ROD). The required analyses, ground reconnaissance and consultations for these approvals are extremely important in order to adequately make project decisions.	Comment noted. All consultations would be complete and federal permits would be obtained by Mountain Valley prior to construction.
FA-1d	**Hydrostatic Testing and Horizontal Drill Water**: The DEIS states that hydrostatic test water would be discharge into the Roanoke River Basin and Cape Fear River Basin. Also, the DEIS stated that the project will use municipal water for the test, but at the same time, the DEIS (in a different section) also mentioned that Mountain Valley continues to evaluate other sources of water for hydrostatic testing and Horizontal Directional Drill (HDD) operations. The DEIS mentioned the very high probability of having Inadvertent Return (IR) at the Dan River site and Stony Creek Reservoir when performing HDD activities.	As described in section 2.4.1.6 hydrostatic testing would be completed in compliance with DOT's Minimum Federal Safety Standards 49 CFR 192. See also section 4.12 for discussion of regulations for design requirements related to the prevention and detection of corrosion.
FA-1e	**Recommendations**: The DEIS stated that they will not be using chemicals during hydrostatic testing. By not using chemicals during the testing, water might be left in the pipelines that can cause oxygen corrosion and microbiologically influenced corrosion (MIC). Pipelines might become vulnerable and long-term integrity and safety could become an issue. The EPA recommends that plans be included in the FEIS to prevent these issues. The EPA recommends the use of filter covers to use at the end of the output pipe/hose to capture a variety of deposits such as metals before discharging the used water. It is important to note that if the applicant proposes different sources of water after FERC's licensing decision, the project could require additional permits and therefore, the NEPA process might need to be amended for the additional studies from the affected water bodies from the change in plans involving the hydrostatic test water. The EPA also requests a complete Hydrostatic Testing Plan be included in the FEIS.	Water used for hydrostatic testing would be discharged into upland areas through appropriate energy dissipation devices. Any chemical laden water association with cleaning methods would not be discharged to the ground but instead hauled away and disposed of at an approved waste facility. Mountain Valley would conduct sampling to ensure that discharges meet regulatory thresholds. All drilling fluid would be hauled away and disposed of at an approved and properly permitted waste facility.

FA-1	United States Environmental Protection Agency	
FA-1f	As BMPs for the HDD sites where the possibility of IR exists, the EPA strongly recommends the presence of a 'mud engineer' and a trained crew member ('mud man') to work at every HDD location. We understand that most IR incidents happen when experts and highly trained crew are not at the sites helping to manage this technology and the appropriate mix of materials that this involves. The EPA recommends to strongly consider the following components especially when impacting sensitive areas: • Ticker grade of piping material for crossing water bodies. • The installation of automatic shut-off valves or remote-control valves. • The installation of computerized monitoring and leak detection system. • The use of HDD technique should be considered for more water crossings. • The pipeline should be buried deeper in all water bodies locations to avoid future pipe exposures (thus, the applicant could eliminate pipe degradation that could cost constant repairs/maintenance due to high flow events, human interference and environmental stressors). **Aquatic Resources:** The applicant (Mountain Valley) states that the project would impact 26.8 acres of wetlands, though many of these impacts would be temporary and short-term. The project's operational right-of-way would affect 5.9 acres of wetlands, including the conversion of 0.1 acre of palustrine scrub-shrub (PSS) wetland to palustrine emergent (PEM) wetland, and 4.4 acres of palustrine forested (PFO) wetlands to PSS and PEM wetlands.	Comment noted. Class thickness is designated by DOT. HDD is discussed in section 4.1.4.9.
FA-1g	**Recommendations**: Given the extended time-to-maturity of PFO wetland systems, EPA recommends that temporary PFO impacts be treated as permanent impacts. Filling of aquatic resources, particularly with stream loss, is not only a direct impact, but will likely lead to changes in the biogeochemical and hydrologic conditions of the receiving streams. The EPA is concerned with the potential secondary effects of the project including potential water quality degredation, impacts to hydrology, habitat and biodiversity loss, and downstream impacts from the loss of nutrient cycling, organic matter input and processing, and natural hydrology.	Comment noted. Section 4.4.2 of the EIS describes PFO impacts as long term.
FA-1h	Cumulative impacts from indirect impacts can result from individually minor, but collectively significant, actions taking place over a period of time. Although the impact of a particular action may be considered minor, the cumulative effects of numerous piecemeal changes can result in a major impairment of the water resources. Considering MVP Southgate as a single and complete project, the EPA recommends a cumulative impacts analysis be considered in order to fully assess the effects on water quality, hydrology, habitat and biodiversity in the watersheds within the total project area.	A cumulative impacts analysis of the Southgate project can be found in section 4.13 of the EIS.

FA-1	United States Environmental Protection Agency	
FA-1i	The EPA recommends the applicant document the studies that show minimum or non-impact to upper stream or lower stream sections of these water bodies and their ecosystem. Complete documentation should include communications/consultations to the regular users of these waters.	See response SURF-4 in appendix I.2.
FA-1j	The EPA recommends the completion of any ongoing wetland and stream surveys be included in the FEIS. We also request that practicable avoidance and minimization measures be incorporated into the project design and construction. Although wetland impacts in the DEIS are classified by system type, this classification does not provide details regarding the wetland quality or functional assessment currently provided by these resources. The EPA recommends that functional assessments for impacted waterbodies be provided in the mitigation plan. The EPA recommends a comprehensive mitigation plan be developed to assess and assure the functional performance of any proposed stream mitigation. The plan should include identification of specific performance standards, a monitoring plan, and an adaptive management plan with corrective actions identified should the stream mitigation and relocations be unable to achieve performance standards. The EPA recommends that the baseline assessment of the streams be used to guide the development of these performance standards. If a relocated stream is expected to receive full mitigation credit for the impacted resources, the stream relocation should at a minimum be providing equivalent quality and function to that of the pre-impacted stream. Stream relocations should only be considered 'self-mitigating' if the relocation retains or improves the existing condition of the stream system as measured by the baseline assessment methodology.	A description of existing wetland resources in the Project area is provided in section 4.4.1 of the FEIS. See response SA-2a-10 regarding the completion of surveys. The EIS was prepared in accordance with NEPA, CEQ guidelines, and other applicable requirements. In addition Mountain Valley would be required to comply with all federal and federally-delegated permits as identified in table 1.4-1, including the Section 404 CWA permit. The Compensatory Mitigation Plan would be subject to review and approval by the District Engineer for the COE for the Norfolk District in Virginia and Wilmington District in North Carolina.
FA-1k	An important resource to consider is titled, *"The Framework and Risk Matrix"*. The U.S. Fish and Wildlife Service (USFWS), is one of its developers. This is a pipeline crossing framework and risk analysis approach and it is recommended by the USFWS. This approach is also used for wetlands. For detailed technical information regarding this resource, please contact: Janine_M_Castro@fws.gov **Environmental Justice:** The EPA appreciates that a discussion and analysis of environmental justice (EJ) that was included in the DEIS. The EPA has identified census block groups where linguistically isolated populations are present. **Recommendation:** The EPA recommends expanding the EJ analysis and if linguistically isolated populations are to be impacted by the proposal, the EPA recommends that the applicant should reach out to these communities. All project related documents should be translated into the corresponding languages.	Section 4.3.2 describes the effects of the Projects on surface waterbodies. We recognize that in-stream construction would cause temporary and localized impacts on surface water. However, based on the construction techniques and Mountain Valley's commitment to the Plan. Procedures, and their E&SCP we do not anticipate long-term or significant impacts on surface water resources as a result of construction or operation of the Project
FA-1l	**Air Quality:** The DEIS states that emissions from the new compressor station would be greater than 25,000 metric tons per year. The EPA's 40 CFR Parts 86 et al. rule for mandatory reporting of greenhouse gases will potentially require monitoring and reporting of emissions from this new unit. The DEIS indicated that the new compressor unit could produce up to 16 blowdown events per year.	Comment noted. See revised section 4.9.8.

FA-1	United States Environmental Protection Agency	
FA-1m	**Recommendation:** The EPA recommends that the applicant consider new and proven technologies to reduce methane emissions and include these capture technologies into the new compressor station construction. A variety of applicable resources and technologies can be found at: https://www.epa.gov/natural-gas-star-program/recommended-technologies-reduce-methane-emissions and https://www.epa.gov/natural-gas-star-program/blowdown-reductions. In 2014, the EPA estimated that the transmission and storage sector accounts for 13% of the total methane emissions from the oil and natural gas industry. The EPA reported that Reciprocating Compressors account for 35% of the emissions from this sector. The EPA developed the Natural Gas STAR Program that provides a framework for partner companies with U.S. oil and gas operations to implement methane reducing technologies and practices. We would like to encourage the applicant to join this program and find out its many benefits at: https://www.epa.gov/natural-gas-star-program. On August 28, 2019, the EPA proposed policy amendments to the 2012 and 2016 new source performance standards for the oil and gas industry. These new standards can be found at: https://www.epa.gov/controlling-air-pollution-oil-and-natural-gas-industry/proposed-policy-amendments-2012-and-2016-new.	Comment Noted. Mountain Valley considered new and proven technologies to reduce methane emissions for the Lambert Compressor Station and included such technologies in the compressor station design. A discussion of technologies being implemented at the Lambert Compressor Station to achieve low emission levels is in section 4.11.1. Climate change impacts are discussed in section 4.13.2.9.
FA-1n	**Forested Land Impacts:** Approximately 582 acres of forested land would be cleared as proposed. The DEIS indicated that some areas would be allowed to naturally revert to forest, but that such process could take 30 or more years. Additional impacts occurred when the land clearing releases greenhouse gases into the atmosphere. Furthermore, the project will potentially produce large amounts of vegetative debris, and consequently the need for either on-site burning and/or transportation and disposal. **Recommendation:** The EPA recommends calculating greenhouse emissions from this activity and it be added to the project emissions. The EPA recommends analyzing the impacts of forest fragmentation and use the results to develop a replanting proposal. Also, the EPA recommends using a tree targeted clearance in order to allow some of the most important old growth to remain. The EPA recommends some additional resources regarding greenhouse gas emissions: https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions; https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references. The EPA recommends that vegetative debris be recycled and/or repurposed to the extent practicable, and it be diverted from landfills.	Comments noted. Forest fragmentation is discussed in section 4.5.4.3. Disposal of vegetative debris is discussed in section 4.5.4.1. Greenhouse gas emissions are discussed in section 4.11.1.7.
FA-1o	**Existing Residential, Commercial and Industrial Facilities:** The DEIS included measurements to reduce impacts to the closest (25 and 50 feet within the project) residents/structures. **Recommnedation:** The EPA recommends to include notices of construction (and blasting) to residents within 250 feet from the pipeline construction. Additionally, we ask to provide community notices in other languages, as apropriate.	Comment noted. See revised section 4.1.4.6.
FA-1p	**Clean Diesel:** The EPA recommends that the applicant consider Implementing diesel controls, cleaner fuel, and cleaner construction practices for on-road and off-road equipment used for transportation, soil movement, or other construction activities, including: • Strategies and technologies that reduce unnecessary idling, including auxiliary power units, the use of electric equipment, and strict enforcement of idling limits; and • Use of clean diesel through add-on control technologies like diesel particulate filters and diesel oxidation catalysts, repowers, or newer, cleaner equipment. For more information on diesel emission controls in construction projects, please see: http://www.northeastdiesel.org/pdf/NEDC-Construction-Contract-Spec.pdf.	Mountain Valley has indicated that they will consider clean diesel technologies and strategies for the project.

FA-1	United States Environmental Protection Agency	
FA-1q	**Pipeline Safety:** The EPA understands that there has been a substantial number of recent articles pertaining to public concerns involving natural gas pipeline projects (in general) around the country and their potential impact radius (high consequence areas) if an incident were to occur. Random leaks or other types of incidents/malfunctions might occur at any time on any segment of the pipeline. The Federal pipeline safety regulations at Title 49 §192.935 identifies the types of areas where additional measures must be taken. **Recommendations**: The EPA suggests the development of a 'Risk Assessment' to inform the public in a more detailed manner. We understand that the Pipeline and Hazardous Materials Safety Administration (PHMSA) oversees pipeline saftey. However, we recommend that FERC share with PHMSA any relevant public concerns received regarding pipeline safety. Please note that we are suggesting a 'Risk Assessment' and not a risk management plan (as they are sometimes confused). We believe that these communication and coordination efforts between the agencies might lessen public and community concerns regarding safety issues from nearby natural gas pipelines. The EPA also recommends the use of the latest technology for leak detection, such as infrared laser detectors, aerial sensing-leak mapping systems, hand-held passive infrared cameras, and infrared laser detectors for leaks detection, as appropriate.	FERC staff are in regular communication with PHMSA and also participate as a member of the USDOT PHMSA's Technical Pipeline Safety Standards Committee, which determines if proposed safety regulations are reasonable, feasible, and practicable. See section 4.11.1.5 in the EIS for discussion on Mountain Valley's leak detection methods.

Secretary
Federal Energy Regulatory Commission
888 First Street NC, Room 1A
Washington, DC 20426

Re: Mountain Valley Southgate DEIS (CP19-14-000)

Dear Ms. Bose:

The U.S. Fish and Wildlife Service (Service) has reviewed the July 2019, Draft Environmental Impact Statement (DEIS) for the Mountain Valley Southgate (MVPS) project and the August 16, 2019 letter from James Martin, FERC, to John Ellis, FWS, regarding Status of Consultation for the Proposed Southgate Project (letter). The following comments are provided under provisions of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended, and Bald and Golden Eagle Protection Act (16 U.S.C. 668-668c, 54 Stat. 250), as amended. The Service has met on a regular basis with the project proponent and the FERC regarding this project.

The Mountain Valley Southgate Project is an interstate natural gas transmission pipeline project that will extend approximately 73.7 miles from Pittsylvania County, Virginia to delivery points in North Carolina ending in Alamance County, North Carolina. The project will have the capacity to transport 375 million cubic feet of natural gas per day.

The Service's overarching comments in regards to the DEIS and the letter are that the Service does not believe there is sufficient information for the FERC to make a determination regarding effects to listed species. This is due to the lack of information regarding things such as stream crossings, lack of completed surveys for listed species and the absence of important information regarding the project such as the Erosion and Sedimentation Control Plan. The Service also believes that this would apply to the Corps determinations for any permits needed for crossing streams and wetlands. The letter mentions that a Biological Assessment (BA) is contained within the DEIS. At this time, there is not sufficient information to decide if formal consultation will be needed, but if it is, the BA as included in the DEIS would not be deemed complete due to the lack of the above referenced information.

FA-2	United States Fish and Wildlife Service	
FA-2a	It is the Service's understanding that most of the listed species surveys have been conducted in areas MVPS has access. As of yet the reports of these surveys have not been released. The reports should contain information regarding what species were found including non-listed species, the habitat conditions, and the dates of the survey. For aquatic species, streamflow and turbidity information should be included. Based on the DEIS, the methods of crossing streams along the route have not been decided upon and geotechnical surveys have not been completed. This information will be integral in assessing impacts to listed species in streams where they occur and the crossings of tributaries just upstream of their confluence with streams with listed species. This information is needed by the FERC and the Corps to make informed effects determinations and the Service to evaluate these determinations.	Mountain Valley provided FWS with outstanding survey results for listed species in October 2019. Mountain Valley would provide its Erosion and Sediment Control Plan (E&SC Plan) once approved by the states. Mountain Valley's draft narrative E&SC Plan was filed on June 21, 2019, see section 2.4 for the location of the this information.
FA-2b		See response SURF-8 in appendix I.2. See also appendix B.5 for the proposed crossing method of each stream.
FA-2c	Throughout the DEIS there are statements that the MVPS's Erosion and Sedimentation Control Plan will minimize or avoid impacts to surface waters and fish and wildlife resources in them. Based on our conversations with the FERC as recently as September 9, 2019, MVPS has not provided the Plan. This plan is an integral part of assessing impacts to listed species. It should include measures to protect not only streams with species but also tributary streams that have crossings in close proximity to streams containing listed species. It should also address permanent and temporary construction roads and restoration of them in these areas. In similar projects, the Service has recommended measures such as not grubbing within 50 feet of surface waters containing sensitive species outside of the growing season, which is considered to be April 15 - Nov 15 in this area. We have also recommended that at the end of each workday unvegetated fill be stabilized with an acceptable erosion control cloth, blanket or matting until the fill is ready to be permanently stabilized. FERC should evaluate this plan when making its effects determination for listed species. During the construction phase, the Service requests that the FERC monitor construction closely due to issues that have occurred on the MVP mainline.	Mountain Valley's E&SC Plans would be designed to meet Virginia and North Carolina standards for erosion and sediment control. These plans would be reviewed by the VADEQ and the NCDEQ. See response GEN-6 in appendix I.2 for further response. See section 2.0 of the EIS for discussion of project construction including erosion and sediment controls. Mountain Valley also has agreed to participate in FERC's third party monitoring program, in which a FERC representative would be on site monitoring construction activities.
FA-2d	The DEIS states that MVPS intends to utilize municipal water sources for hydrostatic testing but then goes on to say that MVPS is evaluating a variety of sources of water for hydrostatic testing, HDD operations, dust control, etc. This is confusing and thus makes it difficult to evaluate the impacts. The Service recommends that MVPS not withdraw water from streams that contain listed species. In any stream withdrawals should use screens to prevent impingement and entrainment of aquatic organisms. In streams with sensitive species, a mesh size of 1 mm and an intake velocity of 0.25 feet per second is commonly used. Furthermore, sufficient instream flow to maintain aquatic life should be present at all times. This information will be important for the FERC to utilize in making its effects determination.	Water sources are addressed in 4.3.2.6 of the EIS. Since the issuance of the draft EIS, Mountain Valley has proposed to use the Dan River as the primary source of water for construction and water from municipalities would be the secondary source. Mountain Valley would need to obtain written permission from the FWS for any water withdrawal from a waterbody containing federally listed species prior to getting FERC approval to commencing withdrawal activities, which includes the Dan River. As discussed in section 4.7 of the EIS, our effects determinations take into consideration the withdrawal of water from the Dan River.
FA-2e	In regards to the Migratory Bird Treaty Act, it is the Service's understanding that MVP intends, where practicable, to avoid vegetation clearing during the migratory bird nesting season (March 15 – August 15 in Virginia and April 1 – August 31 in North Carolina). We believe that this in conjunction with the FERC's recommendation that MVPS consult with the Service if the removal of vegetation removal during the nesting season, in conjunction with efforts to collocate much of the project along existing rights-of-way should minimize impacts to migratory birds.	Comment noted.

FA-2	United States Fish and Wildlife Service

In summary, the Service believes that there is currently insufficient information in the DEIS to thoroughly review the project or for the FERC or Corps to make an informed effects determination. The above mentioned information should be provided to the agencies with adequate time to evaluate and discuss with MVPS prior to the release of the FEIS so that it the Section 7 process can be completed and included in the FEIS. The Service intends to continue working closely with the MVPS, FERC, and Corps on this project. If you have any questions please contact John Ellis (john_ellis@fws.gov).

Sincerely,

John Ellis for

Pete Benjamin
Field Supervisor

EO-1	State Representatives	
	Dennis Riddell, Snow Camp, NC. Combined statement of Alamance County State Representatives Ross and Riddell regarding the proposed MVP Southgate pipeline Since the original announcement of the proposed MVP Southgate project the attention of many property owners along the pipeline path in Alamance County has been galvanized over concerns regarding various aspects of the proposed project. Our offices have been contacted by many Alamance County citizens regarding the impact the project may have on their property. We have visited property sites and spoken with the landowners and representatives from MVP Southgate to learn firsthand what may be the consequences for these landowners.	
EO-1a	We understand that this project is under the supervision of FERC and as a federal project the role of the state is secondary. However, the safety	Section 4.12 of the EIS discusses safety concerns.
EO-1b	and property rights of our constituents, in addition to protecting	Section 4.8 of the EIS discusses property rights.
EO-1c	environmentally sensitive areas are very important to us so it became incumbent for us to learn about the FERC process and what we could do to ensure that everyone's rights under the existing laws and rules would be protected.	The EIS describes the potential impacts on environmental resources resulting from construction and operation of the Project. Staff considered measures to avoid, reduce, and mitigate impacts on the environment, and as appropriate, are including recommendations in the final EIS to the Commission.
EO-1d	We believe that the public hearings that FERC has held regarding the MVP Southgate pipeline were well publicized and well attended. The information available to landowners and other concerned citizens was readily on hand. We noted that professionals representing MVP Southgate were also present to discuss the various issues associated with the project. We had conversations with many concerned property owners, members of special interest groups, engineers and project managers with MVP Southgate, FERC officials and more. We also noted that at each of these public meetings an opportunity was provided for anyone to make a public comment for the record. On several occasions we specifically requested additional time and attention from MVP Southgate representatives to go on site again (if needed) to reconsider constituents' requests regarding their particular land site. In each instance we did find MVP Southgate to be responsive and willing to discuss with the landowners an alternative route for the pipeline. On one occasion a representative from MVP Southgate spent close to an hour walking two property sites with both of us and the landowners. We appreciated their willingness to meet, walk, and hear from the landowners.	Comment noted.
EO-1e	As the project moves from the DEIS stage into subsequent comments and analysis we have the following requests: 1. That our constituents' constitutional rights continue to be protected to the full extent of the law.	Comment noted.

EO-1	State Representatives	
EO-1f	2. We understand that eminent domain is both a necessary and troubling power in the hands of governing bodies. As such we urge great restraint in the exercise of this formidable power to obtain property.	As discussed in section 4.8.2, Mountain Valley would first attempt to reach an easement agreement with each landowner. If an easement cannot be negotiated with a landowner and the project has been certificated by the FERC, the company may use the right of eminent domain granted to it under Section 7(h) of the NGA and the procedures set forth under the Federal Rules of Civil Procedure (Rule 71A) to obtain the right-of-way and extra workspace areas.
EO-1g	3. That MVP Southgate continue to work with our concerned constituents regarding their very real concerns about proposed route paths across existing well/septic lines, proximity to dwellings, historic buildings, tribal burial grounds, ponds, creeks, and other documented critical environmental considerations.	As discussed in section 4.8.3, Mountain Valley has developed a landowner complaint resolution process. Mountain Valley would continue to work with landowners throughout the Project timeline to address their concerns. The Project certificate order would include mandatory environmental conditions, which provide a framework to ensure protection of the human and natural environment during construction of the Project and to address any instances of non-compliance encountered during construction.
EO-1h	4. Finally, if the project is approved and goes forward we believe it is vital that, after all the work is done, the land be returned to its' original appearance and whatever remediation is required be performed quickly and thoroughly. Rep. Dennis Riddell Alamance County North Carolina General Assembly District 64 Rep. Steve Ross Alamance County North Carolina Assembly	Mountain Valley would follow all mitigation and restoration measures as outlined in the Plan and Procedures, including those requiring Mountain Valley to return all areas to preconstruction conditions.

SA-2	Virginia Department of Environmental Quality	
	Part I: Section 5.2 of the FEIS	
SA-2a-1	The Commonwealth of Virginia recommends that Federal Energy Regulatory Commission (FERC or the Commission) include the following recommendations in Section 5.2 of the Final EIS (FEIS) and if the Commission approves the construction and operation of the Southgate Project (the Project), it condition the order on adherence to these recommendations. If FERC does not include these recommendations in Section 5.2, then the Commonwealth of Virginia recommends that they be incorporated in appropriate sections of the FEIS, plans and procedures as mitigation measures. **1) New Recommendations**	Comment noted. We expect that any specific construction and restoration measures deemed necessary by the state would be included in the appropriate state authorizations. It has been the policy of FERC staff to not include conditions from other agencies. Largely, this is because staff may not be able to interpret compliance of conditions generated by other agencies.
SA-2a-2	**a) Recommendation:** Mountain Valley Pipeline, LLC (Mountain Valley, MVP or the applicant) should identify any public surface water supply intakes that are located within five miles of the project and coordinate as needed with any identified public water supply entity. **Findings to support recommendation:** Virginia's water quality standards regulation 9VAC25-260 classifies 5 miles upstream of a surface water supply intake as public water supplies. However, the draft environmental impact statement (DEIS) (page 4-32) references water supply intakes located within three miles of the project in Virginia. See the Virginia Department of Environmental Quality (DEQ) comments in Attachment B.	FERC standards include identification of public surface water intakes that are within 3 miles of Project workspaces. We have used the 3-mile standard for many years and are not aware of any instance in which a greater distance was necessary. State agencies may enforce their own regulations and requirements under any state authorizations and/or permits that Mountain Valley would need to obtain for the Southgate Project. See response to SA-2a-1 above.
SA-2a-3	**b) Recommendation:** Should Mountain Valley choose to release hydrostatic test water to upland areas, the hydrostatic test water shall be released through energy dissipating dewatering devices. The energy dissipating dewatering devices must be sized to accommodate the rate and volume of release and be monitored and regulated to prevent erosion and over pumping of the energy dissipating dewatering devices. The upland discharge of hydrostatic test water shall be monitored in accordance with the Virginia Pollutant Discharge Elimination System (VPDES) General Permit. Mountain Valley shall record and track the daily volumes of water withdrawn for hydrostatic testing activities and make such records available during inspection or upon request by the DEQ. In the event of an inadvertent indirect discharge to surface waters, Mountain Valley shall be responsible for ensuring that such discharge complies with all requirements of the VPDES General Permit, including the requirement to notify DEQ within 14 days.	Measures regarding hydrostatic test water discharge are provided in section 4.3.2.7 of the EIS and VII.D.1 of Mountain Valley' Procedures. Mountain Valley would be required to comply with state regulations in order to meet state authorization and permitting requirements (See response to SA-2a-1 and SA-2a-2 above).

SA-2	Virginia Department of Environmental Quality	
	Findings to support recommendation: The discharge of hydrostatic test water to surface waters is regulated under the VPDES Permit Regulation, 9VAC25-31-10 *et seq.*, and the VPDES General Permit Regulation for Discharges from Petroleum Contaminated Sites, Groundwater Remediation, and Hydrostatic Tests (VPDES General Permit), 9VAC25-120-10 *et seq.* Prior to discharging hydrostatic test water to surface waters, Mountain Valley must register for coverage under the VPDES General Permit or obtain an individual VPDES permit if the discharge is not eligible for coverage under the VPDES General Permit. See the DEQ comments in Attachment B.	
SA-2a-4	c) **Recommendation:** Mountain Valley should revise plans to dispose of brush and timber to be consistent with the Department of Forestry's (DOF) published Forestry Best Management Practices for Water Quality, which is available online at http://www.dof.virginia.gov/infopubs/BMP-Field-Guide_pub.pdf, and the FERC Upland Erosion Control, Revegetation, and Maintenance Plan, section III.E. See the DOF comments in Attachment B.	Mountain Valley agreed to be compliant with DOF recommendations. See section 4.5.4.1 for further discussion.
SA-2a-5	d) **Recommendation:** Wetland and stream impacts should be avoided and minimized to the maximum extent practicable. Stream impacts should be minimized or avoided by narrowing the active right-of-way to the minimum necessary at each stream and wetland crossing. Where access is required across a wetland, removable mats should be used to reduce compaction and rutting. When excavation for a structure is necessary in a wetland, excess spoil should not be disposed of in adjacent wetland areas unless authorized by a state or federal wetland permit. See the DEQ comments in Attachment B.	Waterbody crossing are discussed in sections 2.4.2.1 and 4.3.2.2 of the EIS. Wetlands are discussed in section 2.4.2.2 and 4.4.1 of the EIS. In addition Mountain Valley would adhere to its Procedures, which limit the construction right-of-way to 75 feet in wetlands (unless specific locations are approved by FERC). Mountain Valley has reduced construction workspace to 75 feet at waterbody crossings where feasible.
SA-2a-6	e) **Recommendation:** Flag or clearly mark all non-impacted surface waters within the project or right-of-way limits that are within 50 feet of any clearing, grading, or filling activities for the life of the construction activity within that area. The project proponent should notify all contractors that these marked areas are surface waters where no activities are to occur. See the DEQ comments in Attachment B.	Mountain Valley would follow measures outlined in its Plan and Procedures, which address the identification and marking of Project workspaces and sensitive resources. Plan III. A.1 and IV.A.1; Procedures V.B.3.f.
SA-2a-7	f) **Recommendation:** Any temporary impacts to surface waters associated with this project should require restoration to pre-existing conditions. Restore all temporarily disturbed wetland areas to pre-construction conditions and plant or seed with appropriate wetlands vegetation in accordance with the cover type (emergent, scrub-shrub, or forested). The applicant should take all appropriate measures to promote revegetation of these areas. Preserve the top 12 inches of trench material removed from wetlands for use as wetland seed and root-stock in the excavated area. Stabilization and restoration efforts should occur immediately after the temporary disturbance of each wetland area instead of waiting until the entire project has been completed. See the DEQ comments in Attachment B.	Waterbody restoration is discussed in sections 2.4.2.1 of the EIS and V.C. of Mountain Valley's Procedures.
SA-2a-8		Wetland restoration methods are discussed in section 2.4.2.2 and VI.C. of Mountain Valley's Plan.

SA-2	Virginia Department of Environmental Quality	
SA-2a-9	g) **Recommendation:** Heavy equipment in temporarily impacted surface waters should be placed on mats, geotextile fabric, or other suitable material, to minimize soil disturbance to the maximum extent practicable. Equipment and materials should be removed immediately upon completion of work. See the DEQ comments in Attachment B.	Waterbody crossing methods are discussed in sections 2.4.2.1 of the EIS and section V.B. of Mountain Valley's Procedures.
SA-2a-10	h) **Recommendation:** Prior to commencing construction, Mountain Valley shall file with the Commission and DEQ Water Permitting Division all outstanding surveys for impacts to surface waters in all disturbed areas of the project in Virginia, including both the construction and operational rights-of-way, all access roads, stockpile and alternative work areas, and materials storage areas, to the extent that landowner access has been granted. See the DEQ comments in Attachment B. • Identify any areas not surveyed in Virginia. Provide any estimates of surface water impacts in these areas and the sources used to make the estimate. • Include all revisions to the wetland and waterbody crossing tables provided in Appendices B.5 and B.6 of the DEIS, including any revised milepost numbering. • Include a copy of all federal jurisdictional determinations, including drawings and graphics, of surveyed surface waters in Virginia, including federal waters of the United States and any state-regulated isolated waters, springs, or open water.	Mountain Valley has indicated that they would file with FERC and VADEQ the results of all outstanding surveys for impacts on surface water when they are able to obtain access to all areas. If the Project receives a Certificate from FERC, Mountain Valley will be granted eminent domain and therefore will be able to complete any remaining surveys.
SA-2a-11	i) **Recommendation:** Prior to commencing construction, Mountain Valley shall file with the Commission and DEQ Water Permitting Division any proposed or final compensatory mitigation plans that are applicable to unavoidable, permanent surface water impacts in Virginia, and the status of the approval of such plans by the United States Army Corps of Engineers (Corps). Compensation for impacts to State Waters, if necessary, should be in accordance with all applicable state wetland regulations, including the compensation for permanent conversion of forested and scrub-shrub wetlands to emergent wetlands. Consider mitigating impacts to forested or converted wetlands by establishing new forested wetlands within the impacted watershed. See the DEQ comments in Attachment B.	Mountain Valley has indicated that they would file with FERC and VADEQ such proposed or final compensatory mitigation plans.
SA-2a-12	j) **Recommendation:** Prior to construction, Mountain Valley shall file with the Commission and DEQ Water Permitting Division all revisions or updates to crossing methodologies for surface waters in Virginia. See the DEQ comments in Attachment B.	Mountain Valley has indicated that they would file with FERC and VADEQ revisions or updates to crossing methodologies for surface waters in Virginia.

SA-2	Virginia Department of Environmental Quality	
SA-2a-13	k) **Recommendation:** No activity may substantially disrupt the movement of aquatic life indigenous to the water body, including those species, which normally migrate through the area, unless the primary purpose of the activity is to impound water. Culverts (if needed) placed in streams must be installed to maintain low flow conditions. No activity may cause more than minimal adverse effect on navigation. The activity must not impede the passage of normal or expected high flows and the structure or discharge must withstand expected high flows. See the DEQ comments in Attachment B.	Waterbody crossing are discussed in sections 2.4.2.1 and 4.3.2.2 of the EIS. In addition Mountain Valley would adhere to its Plan and Procedures.
SA-2a-14	l) **Recommendation:** Activities should be conducted in accordance with any time-of-year restriction(s) as recommended by the United States Fish and Wildlife Service (FWS), Department of Game and Inland Fisheries (DGIF), Department of Conservation and Recreation (DCR), and Virginia Marine Resources Commission (VMRC). The permittee should retain a copy of the agency correspondence concerning the time-of-year restriction(s), or the lack thereof, for the duration of the construction phase of the project. See the DEQ comments in Attachment B.	Based on recommendations from VADGIF, Mountain Valley has committed to adhere to the Virginia warm water fisheries construction window (i.e., no in-water construction between April 15 and July 15). Section 4.3.2.4 has been updated with this information.
SA-2a-15	m) **Recommendation:** Erosion and sedimentation controls should be designed in accordance with the Virginia Erosion and Sediment Control Handbook, Third Edition, 1992. These controls should be placed prior to clearing and grading and maintained in good working order to minimize impacts to state waters. These controls should remain in place until the area is stabilized and should then be removed. Any exposed slopes and streambanks should be stabilized immediately upon completion of work in each permitted area. All denuded areas should be properly stabilized in accordance with the Virginia Erosion and Sediment Control Handbook, Third Edition, 1992. See the DEQ comments in Attachment B.	Mountain Valley has stated that they would comply with the design requirements of the VA E&S Handbook, Third Edition, 1992, for the creation of the state approved erosion and sedimentation control plans.
SA-2a-16	n) **Recommendation:** All construction, construction access, and demolition activities associated with this project should be accomplished in a manner that minimizes construction materials or waste materials from entering surface waters, unless authorized by a permit. Wet, excess, or waste concrete should be prohibited from entering surface waters. Employ measures to prevent spills of fuels or lubricants into state waters. See the DEQ comments in Attachment B.	Mountain Valley would follow measures outlined in its Plan, Procedures, E&SC Plan, SPCC Plan, and Unanticipated Discovery of Contamination Plan.
SA-2a-17		Mountain Valley has stated that no concrete will be actively cured on the right-of-way.
SA-2a-18	o) **Recommendation:** Herbicides used in or around any surface water should be approved for aquatic use by the United States Environmental Protection Agency (EPA) or the FWS. These herbicides should be applied according to label directions by a licensed herbicide applicator. A non-petroleum based surfactant should be used in or around any surface waters. See the DEQ comments in Attachment B.	Mountain Valley's Plan does not allow the use of herbicides within 100 feet of a wetland or waterbody except as allowed by the appropriate land management or state agency. As part of Mountain Valley's Exotic and Invasive Plant Species Control Plan, If specified for use by federal or state agencies near streams or wetlands, the Project will utilize herbicide applications approved for aquatic use.

SA-2	Virginia Department of Environmental Quality	
SA-2a-19	p) **Recommendation:** In the event that the project does not qualify for a Nationwide Permit 12 (NWP12) from the Corps, then a Virginia Water Protection (VWP) permit may be necessary for project activities in Virginia. Also, should isolated waters be impacted, a VWP permit may be necessary unless otherwise excluded. See the DEQ comments in Attachment B.	Comment noted. See response SA-2a-1.
SA-2a-20	q) **Recommendation:** Removal of riparian buffers not directly associated with the Project's construction activities is prohibited. Disturbance and removal of riparian buffers from Project-related land disturbing activities that would occur within 50 feet of any perennial, intermittent, or ephemeral surface waters shall be avoided where possible, and minimized to the maximum extent practicable if 50 feet is not possible. DEQ shall be notified of any and all instances in which 50 feet is not possible and approval shall be granted by DEQ prior to continuing with an alternate width. Removal of riparian buffers not associated with crossings shall not be allowed where stream bank stability under normal flow conditions would be compromised. See the DEQ comments in Attachment B.	Mountain Valley has stated that as a standard construction practice, the Project will establish a 50' wetland and waterbody buffer with erosion and sediment control devices. The buffer will not be grubbed during the initial right-of-way clearing and grubbing sequence. These buffers will remain undisturbed (aside from hand felling trees) until the pipeline crossing is ready to be installed in the ephemeral, intermittent, or perennial stream. The state may request notifications or additional information from Mountain Valley under state permitting requirements (see response to SA-2a).
SA-2a-21	r) **Recommendation:** The construction limit of disturbance (LOD) in upland areas approaching waterbody and wetland crossings shall be reduced to 75 feet wide and shall apply 50 feet from each side of the stream or wetland crossing to minimize the extent of riparian buffer disturbance. For any area approaching a waterbody or wetland crossing where this reduced LOD is not possible, notification of Commission approval (and Corps approval, if required) shall be provided to the DEQ prior to initiating land disturbing activity in that area. See the DEQ comments in Attachment B.	Mountain Valley would adhere to its Procedures, which limit the construction right-of-way to 75 feet in wetlands (unless specific locations are approved by FERC). Mountain Valley has reduced construction workspace to 75 feet at waterbody crossings where feasible. The state may request additional restriction from Mountain Valley under state permitting requirements
SA-2a-22	s) **Recommendation:** No refueling, hazardous materials storage, equipment maintenance, or equipment parking shall take place within 100 feet of the waterbody or wetland crossing, except as allowed by any applicable and approved Annual Standards and Specifications. See the DEQ comments in Attachment B.	In accordance with Mountain Valley's Procedures, fuel will not be stored within 100 feet of wetlands or waterbodies during construction with the exception of pumps and HDD equipment where secondary containment would be used.

SA-2	Virginia Department of Environmental Quality	
SA-2a-23	t) **Recommendation:** Any surface water withdrawals for the purposes of hydrostatic testing shall not violate applicable Water Quality Standards and shall be managed so that no more than 10% of the instantaneous flow rate from the channel is removed, the intake screens shall be designed so that screen openings are not larger than 1 millimeter, and the screen face intake velocities are not greater than 0.25 feet per second. See the DEQ comments in Attachment B. u) **Recommendation:** Any surface water withdrawals for the purposes of horizontal directional drilling or dust control that do not exceed 10,000 gallons per day from non-tidal waters or two million gallons per day from tidal waters shall not violate applicable Water Quality Standards and shall be managed so that no more than 10% of the instantaneous flow rate from the channel is removed, the intake screens shall be designed so that screen openings are not larger than 1 millimeter and the screen face intake velocities are not greater than 0.25 feet per second. See the DEQ comments in Attachment B. v) **Recommendation:** Daily withdrawals for horizontal directional drilling or dust control activities that exceed 10,000 gallons per day from non-tidal waters and two million gallons per day from tidal waters must comply with the requirements of the Virginia Water Protection Permit Program Regulation. The daily volumes of water withdrawn for horizontal directional drilling or dust control activities shall be tracked and recorded and such records shall be made available during inspection or upon request by DEQ. See the DEQ comments in Attachment B.	Currently no surface water withdrawals are proposed for Project use in Virginia; however, section 4.3.2.6 has been updated to include these specifications for surface water withdrawals.
SA-2a-24	w) **Recommendation:** Water quality monitoring, if required, shall be implemented in accordance with any applicable Upland Construction Water Quality Monitoring Plan. See the DEQ comments in Attachment B.	See response SA-2a-1
SA-2a-25	x) **Recommendation:** The measures identified in the Spill Prevention, Control, and Countermeasure (SPCC) Plan shall be implemented, as well as any subsequent revisions or addenda to the same approved by the Commission. See the DEQ comments in Attachment B.	Comment noted. See response SA-2a-16
SA-2a-26	y) **Recommendation:** All construction and installation associated with the Project shall be accomplished in such a manner that construction material or waste material shall not be placed into any perennial, intermittent, or ephemeral surface waters or karst features. See the DEQ comments in Attachment B.	Mountain Valley's SPCC Plan outlines the handling of waste during construction. All waste would be disposed of at an approved off-site facility.

SA-2	Virginia Department of Environmental Quality	
SA-2a-27	z) **Recommendation:** All measures intended to minimize the potential for discharges of soil or rock shall be implemented as detailed in any applicable General Blasting Plan and Landslide Mitigation Plan, as well as any subsequent revisions or addenda to the same approved by the Commission. If blasting or landslide activity results in unpermitted discharges of soil or rock to any perennial, intermittent, or ephemeral surface waters, DEQ shall be notified immediately, but no later than 24 hours after discovery. Potential impacts to karst features, if present, will be addressed in accordance with any applicable Karst Hazard Assessment and Karst Mitigation Plan. See the DEQ comments in Attachment B.	Comment noted. The state may request notifications or additional information from Mountain Valley under state permitting requirements (see response to SA-2a-1).
SA-2a-28	aa) **Recommendation:** All measures intended to minimize the potential for impacts shall be followed as detailed in any applicable Acid Forming Materials Mitigation Plan, as well as any subsequent revisions or addenda to the same approved by	Comment noted. Mountain Valley has not developed an Acid Forming Materials Mitigation Plan due to the low likelihood of encountering problematic concentrations of acid-producing sulfides.
SA-2a-29	bb) **Recommendation:** The Project, including all relevant records, is subject to inspection at reasonable hours and intervals by DEQ or any authorized representative of DEQ. See the DEQ comments in Attachment B.	Comment noted.
SA-2a-30	cc) **Recommendation:** DEQ shall be notified in writing at least 10 business days prior to any planned Construction Spread pre-construction conferences or meetings. See the DEQ comments in Attachment B.	See response SA-2a-1.
SA-2a-31	dd) **Recommendation:** DEQ shall be notified in writing of any modification of this Project and shall demonstrate in a written statement that said modifications will not violate any license conditions and federal or state approvals. See the DEQ comments in Attachment B.	See response SA-2a-1.
	Part II: FEIS, Plans and Procedures	
	The Commonwealth of Virginia encourages FERC to incorporate the following recommendations into appropriate sections of the FEIS, plans and procedures.	
	1) Proposed Route	
	a) Collocation and Other Route Alignments	
SA-2b-1	i) **Recommendation:** DGIF supports collocating the alignment within an existing utility easement to the greatest extent practicable to avoid and minimize clearing of land and vegetation for new right-of-way. See the DGIF comments in Attachment B.	Section 2.1.1 discuss the collocation of the Project with existing utility easements which is currently at 49 percent.

SA-2	Virginia Department of Environmental Quality	
SA-2b-2	ii) **Recommendation:** While DGIF prefers collocation within an existing utility right-of-way, DGIF supports efforts to minimize creation of new edge habitat and reduce forest fragmentation by locating some sections of the alignment adjacent to and adjoining existing utility easements, when necessary. According to information provided in a separate MVP Southgate Project DRAFT Resource Report 3 addressing fish, wildlife and vegetation, DGIF understands that linear segments of the project totaling 5.6 miles may not be collocated with existing utility easements. DGIF has insufficient information to evaluate what proportion of vegetation clearing along these 5.6 miles will take place within forested habitat, which would result in forest fragmentation and the creation of new edge habitat. Impacts resulting from such vegetation clearing are addressed on page 24 (3-17) of the Resource Report; the major project impact to forest-nesting birds is identified as habitat loss. DGIF submits as an additional consideration that the creation of open corridors within forested habitat exposes forest-nesting birds to increased nest predation pressure from both mammalian and avian predators (including jays, crows, and grackles) and to brood parasitism by brown-headed cowbirds. These in turn impact avian reproductive output, and could result in long-term impacts to avian populations within these newly-created corridors. See the DGIF comments in Attachment B.	Interior forests, habitat fragmentation, and impact to wildlife are discussed in detail in section 4.5.4.3 and 4.6.1.1of the EIS.
SA-2b-3	iii) **Recommendation:** Include a requirement that prior to the end of the FEIS period, Mountain Valley shall file with the Commission and DEQ Water Permitting Division all revisions or updates to Southgate Project maps as provided in Appendix B.1 of the DEIS. See the DEQ comments in Attachment B.	See response SA-2a-1 and SA-2a-10.
SA-2b-4	iv) **Recommendation:** Include a requirement that prior to the end of the FEIS period, Mountain Valley shall file with FERC and DEQ Water Permitting Division a revised TABLE 2.1-2 *Summary of Pipeline Collocated with Existing Rights-of-Way for the Southgate Project a/* to show the collocation lengths in each category by state. See the DEQ comments in Attachment B.	A revised table 2.1-2 has been included in section 2.1.1.

SA-2	Virginia Department of Environmental Quality	
	2) Preconstruction Recommendations	
	a) Air Permitting and Modeling	
SA-2c-1	i) **Recommendation:** Update the FEIS to note that the modeling discussed in Section 5.1.11 used to demonstrate compliance with all air standards does not account for any nearby sources or background emissions. The DEQ Air Division confirms that an application for a minor new source review permit was submitted for the proposed project in November 2018 and an updated application was submitted in April 2019. See the DEQ comments in Attachment B.	See section 4.11.1 of the EIS for the discussion of revised air modeling results.
	b) Aviation	
SA-2c-2	i) **Recommendation:** Ensure that a Form 7460 is submitted to the Federal Aviation Administration for an airspace evaluation as required if any structure associated with this project would be located within 20,000 linear feet of a public use airport or would reach a height above ground of 200 feet or more. See the Department of Aviation (DoAV) comments in Attachment B for additional information.	The nearest public-use airport to the Project route in Virginia is the Virginia Tech-Montgomery Executive Airport. At its closest point, the Project route is approximately 26,000 feet (approximately 4.9 miles) from the airport and approximately 30 feet lower in elevation.
	c) Drinking Water Resources	
SA-2c-3	i) **Recommendation:** Follow recommendations from the Virginia Department of Health (VDH) to verify potential impacts to public water distribution systems or sanitary sewage collection systems with the local utility, implement best management practices (including erosion and sediment controls and spill prevention controls and countermeasures) on the project site, and manage materials onsite and during transport to prevent impacts to nearby surface waters. See the VDH-identified public groundwater wells, surface water intakes and public surface water sources in Attachment B.	Crossing of foreign utilities is discussed in section 2.4.2.5 of the EIS. See response SA-2a-10. Surface water intakes are discussed in section 4.3.2.1.
	d) Floodplain Management	
SA-2c-4	i) **Recommendation:** The DCR Floodplain Management Program recommends that the FEIS include the requirement that Mountain Valley contact the local floodplain administrator for an official floodplain determination, and if the project is located in a Special Flood Hazard Area (SFHA), the project must comply with the community's floodplain ordinance. All development within a SFHA or floodplain, as shown on the locality's Flood Insurance Rate Map, must be permitted and comply with the requirements of the local floodplain ordinance. See the DCR comments in Attachment B for additional information.	Mountain Valley has filed documentation indicating they are coordinating with local floodplain administrators.

SA-2	Virginia Department of Environmental Quality	
	e) Historic Resources	
SA-2c-5	**i) Recommendation:** Continue to coordinate with the Department of Historic Resources (DHR) pursuant to Section 106 of the National Historic Preservation Act, which requires federal agencies to consider the impact of their project on historic properties. See the DHR comments in Attachment B.	Comment noted.
	f) Pollution Prevention	
SA-2c-6	**i) Recommendation:** Include additional information on reuse, recycling and pollution prevention as identified below by the DEQ Office of Pollution Prevention (see the DEQ comments in Attachment B). • Consider the development of an effective Environmental Management System (EMS). An effective EMS will ensure that the proposed project is committed to complying with environmental regulations, reducing risk, minimizing environmental impacts, setting environmental goals, and achieving improvements in its environmental performance. DEQ offers EMS development assistance and recognizes facilities with effective Environmental Management Systems through its Virginia Environmental Excellence Program (VEEP). VEEP provides recognition, annual permit fee discounts, and the possibility for alternative compliance methods. • Consider reuse and recycling opportunities when evaluating waste handling, including asphalt recycling, mulching of brush and timber and water reuse opportunities. • Consider contractors' commitment to the environment when choosing contractors. Specifications regarding raw materials and construction practices can be included in contract documents and requests for proposals. • Choose sustainable materials and practices for construction and design, including the use of native species and pollinators when re-establishing vegetation. • Integrate pollution prevention techniques into maintenance and operation. • Encourage supply chain partners to implement pollution prevention, sustainability, and environmental management systems. • Coordinate with the DEQ Office of Pollution Prevention for additional information and technical assistance relating to pollution prevention techniques and EMS.	Section 2.4.2 of the EIS has been updated to discuss measures Mountain Valley would implement for reuse, recycling, and pollution prevention.

SA-2	Virginia Department of Environmental Quality	
	g) Rare, Threatened and Endangered Species	
SA-2c-7	**i) Recommendation:** Ensure that the analysis accurately addresses potential impacts to Piedmont barbara's-buttons (*Marshallia obovata* var. *obovata*, G4G5TNR/S1/NL/NL), Downy phlox (*Phlox pilosa*, G5/S2/NL/NL) and American bluehearts (*Buchnera americana*, G5?/S1S2/NL/NL), which according to DCR have been historically documented in the project area. See the DCR comments in Attachment B.	Section 4.7.7.6 pf the EIS provides discussion of these species.
SA-2c-8	**ii) Recommendation:** Submit survey results for Piedmont barbara's-buttons, Downy phlox and American bluehearts to DCR so DCR can more accurately evaluate potential impacts to natural heritage resources and offer specific protection recommendations for minimizing impacts to the documented resources. See the DCR comments in Attachment B.	Survey results for Piedmont Barbara's-buttons, Downy phlox and American bluehearts were submitted to VADCR in October 2019; these results are summarized in section 4.7.7.6 of the FEIS.
SA-2c-9	**iii) Recommendation:** Submit copies to DCR Division of Natural Heritage of other completed rare, threatened and endangered species survey reports including the 2018 and 2019 portal bat survey reports as stated on page 4-89. See the DCR comments in Attachment B.	See section 4.7.7 of the FEIS for summaries of other completed rare, threatened and endangered species surveys; Mountain Valley submitted 2018 and 2019 bat portal survey results to VADGIF in October 2019.
SA-2c-10	**iv) Recommendation:** Coordinate results of surveys for state-listed threatened and endangered plant and insect species with DCR and the FWS. Upon review of the results, if it is determined these species are present, and there is a likelihood of a negative impact on the species, DCR will recommend coordination with the Virginia Department of Agriculture and Consumer Services to ensure compliance with Virginia's Endangered Plant and Insect Species Act. See the DCR comments in Attachment B.	Mountain Valley consulted VADGIF and VADCR regarding all state-listed threatened and endangered species potentially present in the Project area and coordinated with the applicable Virginia agency for all state-listed species surveys that were conducted.
	h) Surface Waters and Water Withdrawals	
SA-2c-11	**i) Recommendation:** If surface water sources are used, then the FEIS should include a discussion of what steps will be taken by MVP and its contractors to ensure that the following requirements are met: withdrawing no more than 10% of the instantaneous flow rate from the channel; using the intake screens designed so that screen openings are not larger than 1 millimeter and; ensuring that screen face intake velocities are not greater than 0.25 feet per second. The FEIS should provide the location of withdrawals and some assessment of river flows where withdrawals are proposed with a discussion of how the withdrawals will affect flows, particularly during low-flow or drought conditions. The assessment should explain if any downstream water users may be affected by these water withdrawals, particularly during low flow periods. The DEQ Office of Water Supply can provide information of nearby intakes once the location of the withdrawals is known. See the DEQ comments in Attachment B.	See response SA-2a-23.

SA-2	Virginia Department of Environmental Quality	
SA-2c-12	ii) **Recommendation:** Update Section 4.3.2.6 Surface Water Appropriations with information that identifies the specific municipal or surface water sources from which water for hydrostatic testing would be obtained. See the DEQ comments in Attachment B.	See response SA-2a-23.
SA-2c-13	iii) **Recommendation:** Update Section 4.3.2.6 Surface Water Appropriations with information that identifies the specific sources and estimated amounts of water needed for dust control. See the DEQ comments in Attachment B.	See response SA-2a-23.
SA-2c-14	iv) **Recommendation:** Update Section 4.3.2.6 Surface Water Appropriations to include discussion of procedures to be taken by MVP and its contractors to minimize entrainment of aquatic species and maintain intake rates appropriate to local conditions if surface waters are used. This section should also include a discussion of how the withdrawals might avoid impacts to downstream users during low-flow conditions. See the DEQ comments in Attachment B.	See response SA-2a-23.
SA-2c-15	v) **Recommendation:** Update Section 4.3.2.6 Surface Water Appropriations to state that the following criteria should be used for evaluating proposed water sources (see the DEQ comments in Attachment B): • Withdrawing no more than 10% of the instantaneous flow rate from the channel. • Using the intake screens designed so that screen openings are not larger than 1 millimeter and; • Ensuring that screen face intake velocities are not greater than 0.25 feet per second.	See response SA-2a-23.
	i) Transportation Conflicts	
SA-2c-16	i) **Recommendation:** The Virginia Department of Transportation (VDOT) recommends the monitoring for any potential work plan conflicts related to the Universal Project Code (UPC) T18123 Rural Rustic project on Route 621 that is close to the proposed pipeline. Construction work on UPC T18123 is proposed to begin on 10/04/2022 and conclude on 02/10/2023. See the VDOT comments in Attachment B.	We do not foresee any work plan conflicts related to the UPC T18123 Rural Rustic project, which would be constructed almost a year later in October of 2022. Mountain Valley would coordinate with VADOT in the event that construction activities overlap.
SA-2c-17	ii) **Recommendation:** Continue to monitor the VDOT paving schedule website (https://vdot.maps.arcgis.com/apps/webappviewer/index.html?id=fbf86e85fdcb43e482432f41ddbb51c7) for updated information as there are a number of planned repaving and treatment jobs. The Pavement Status Map Application is updated with new paving projects annually. See the VDOT comments in Attachment B.	All projects in the geographic scope of analysis considered for cumulative impacts are listed in Appendix F.2, including any relevant VADOT projects.

SA-2	Virginia Department of Environmental Quality	
SA-2c-18	iii) **Recommendation:** VDOT recommends the development and implementation of an appropriate work zone to ensure the safe and efficient travel of vehicles during the construction phase of the project. Based upon VDOT's review, the proposed project could pose significant traffic impacts to various roads throughout the service area during construction only. See the VDOT comments in Attachment B.	Comment noted. Mountain Valley has stated it would incorporate all VADOT recommendations into its Traffic and Transportation Management Plan.
SA-2c-19	iv) **Recommendation:** Coordinate with the VDOT Lynchburg District since a VDOT Land Use Permit will be required for any operations within the VDOT right-of-way. See the VDOT comments in Attachment B.	See comment SA-2a-1.
	j) Virginia Outdoors Foundation Easements	
SA-2c-20	i) **Recommendation:** The Virginia Outdoors Foundation (VOF) recommends that FERC revise its analysis to reflect that the VOF easement in Pittsylvania County (PIT-03215) may be intersected by a temporary access road if impacts are unavoidable. This temporary access road, at MP 14.1, is illustrated in Appendix B.1, page B.1-3, with details listed in Appendix B.4, page B.4-2. While specific reference to this intersection of the VOF open-space easement is not mentioned within the DEIS, VOF staff recently spoke with MVP Southgate representatives who acknowledged this encroachment as a possibility. VOF has notified the developers of its conversion/diversion process if impacts are unavoidable but hope Mountain Valley will revise the alignment of the road to completely avoid this open-space easement. See the VOF comments in Attachment B.	Mountain Valley has adjusted access road TA-PI-035 so that it is no longer located on the conservation easement.
SA-2c-22	ii) **Recommendation:** Coordinate directly with VOF regarding the proposed impact to the VOF easement if it is unavoidable or if other impacts are proposed in the future. See the VOF comments in Attachment B.	see response SA-2c-20.

SA-2	Virginia Department of Environmental Quality	
SA-2c-23	***k) Waste Sites in Close Proximity to the Project Site*** **i) Recommendation:** Evaluate the following waste sites to establish their exact location, nature and extent and their potential to impact the proposed project (see the DEQ comments in Attachment B): • *Hazardous Waste/RCRA Facility* ○ VAD003909629, Transcon Gas Pipeline Corp Station 165, 945 Transco Rd, Chatham, Virginia 24531 • *Solid Waste* ○ Permit# SWP571, Pittsylvania Co – Sanitary Landfill, 382 Rainbow Lane, Dryfork, Virginia 24549. Status: Active. ○ Permit# SWP152, Pittsylvania Co – Sanitary Landfill, 382 Rainbow Lane, Dryfork, Virginia 24549. Status: Closed. • *Petroleum Releases* ○ PC# 20087015, Wall Property, 212 Sugarcane Rd, Danville, Virginia 24540 ○ PC# 20112245, Raymond Batterman Residence, 556 Batterman Rd, Chatham, Virginia 24531 ○ PC#20122164, Richard Rust Residence, 5498 Whitmell School Rd, Dry Fork, Virginia 24549	Sections 4.8.5, 4.2.7, and 4.3.1.5 provide discussion regarding the evaluation of hazardous waste and potential contamination sites. All of the sites listed were reviewed.
SA-2c-24	**ii) Recommendation:** DEQ recommends that all construction projects and facilities implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated. All generation of hazardous wastes should be minimized and handled appropriately. See the DEQ comments in Attachment B.	See response SA-2c-6.
SA-2c-25	**iii) Recommendation:** Ensure that the FEIS and applicable procedures include requirements that all structures being demolished/renovated/removed should be checked for asbestos-containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to federal waste-related regulations, state regulations 9VAC 20-81-620 for ACM and 9VAC 20-60-261 for LBP, must be followed. See the DEQ comments in Attachment B.	See response SA-2a-1.

SA-2	Virginia Department of Environmental Quality	
SA-2c-26	**iv) Recommendation:** Ensure that the following requirements are accurately reflected in the FEIS and applicable procedures (see the DEQ comments in Attachment B): • Any soil, sediment or groundwater that is suspected of contamination or wastes that are generated must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations. • Virginia Waste Management Act, Code of Virginia Section 10.1-1400 *et seq.* • Virginia Hazardous Waste Management Regulations (VHWMR) (9VAC 20-60) • Virginia Solid Waste Management Regulations (VSWMR) (9VAC 20-81); • Virginia Regulations for the Transportation of Hazardous Materials (9VAC 20-110) • Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Section 6901 *et seq.* • Applicable regulations contained in Title 40 of the Code of Federal Regulations; and the U.S. Department of Transportation Rules for Transportation of Hazardous Materials, 49 CFR Part 107.	See response SA-2a-10.
SA-2c-27	***l) Wetlands and Water Quality*** **i) Recommendation:** Update the FEIS and applicable procedures with the following requirements (see the DEQ comments in Attachment B): • State Water Control Law (Code of Virginia Chapter 3.1 (§ 62.1-44.2 *et seq.*) • Virginia Acts of Assembly, Chapter 636, Senate Bill 950 [S 950], Approved March 30, 2018 • Virginia Administrative Code 9VAC25-210	See response SA-2a-1.
SA-2c-28	***m) Wildlife Resources*** **i) Recommendation:** If bald eagle nests are discovered during the pre-construction winter nest surveys, DGIF recommends following measures adapted from the FWS National Bald Eagle Management Plan Guidelines (FWS, 2007) and the DGIF Bald Eagle Guidelines for Landowners (DGIF, 2012) between December 15 and July 15. The protective measures Mountain Valley would follow are described in the DEIS (page 207). See the DGIF comments in Attachment B.	Section 4.6.3.4 provides discussion regarding bald eagles. Mountain Valley has committed to following the recommended actions.
SA-2c-29	**ii) Recommendation:** DCR DNH recommends coordination with the FWS and DGIF to minimize impacts to migratory birds, colonial nesting birds and eagles. See the DGIF comments in Attachment B.	Comment noted. Mountain Valley's coordination with FWS and DGIF regarding impacts to migratory birds, colonial nesting birds, and eagles is discussed in section 4.6.3 of the EIS.

SA-2	Virginia Department of Environmental Quality	
	Mitigation Measures for Construction and Maintenance Activities ***a) Erosion and Sediment Control***	
SA-2d-1	i) **Recommendation:** Ensure that the following requirements are accurately reflected in the FEIS (stormwater management and erosion and sediment control plans have been submitted to DEQ and are currently under review). See the DEQ comments in Attachment B. • Natural gas transmission projects that result in regulated land disturbing activities equal to or greater than 10,000 square feet must obtain and comply with DEQ approved Annual Standards and Specifications for Stormwater Management (SWM) and Erosion and Sediment Control (ESC). • In accordance with section 402(l)(2) of the Clean Water Act (CWA), discharges of stormwater runoff from the construction of oil and gas transmission pipelines are exempt from National Pollutant Discharge Elimination System (NPDES) and Virginia Pollutant Discharge Elimination System (VPDES) permitting. Therefore, the General VPDES Permit for Discharges of Stormwater from Construction Activities (9VAC25-880) is not applicable to this project. • Annual Standards and Specifications must be prepared in accordance and consistent with the Virginia Stormwater Management Act (VSMA), the Virginia Stormwater Management Program (VSMP) regulation, the Virginia Erosion and Sediment Control Law, and the Virginia Erosion and Sediment Control regulations. • Plans for erosion and sediment control and post-construction stormwater management must be developed and implemented for all regulated land disturbing activities in accordance with the DEQ-approved Annual Standards and Specifications prior to initiating land disturbance. • To minimize runoff impacts following construction activities, the project must demonstrate compliance with the Virginia Stormwater Management Program post-construction requirements for both water quality and quantity. • All specifications and practices used for erosion and sediment control and stormwater management must be in accordance with the DEQ-approved Annual Standards and Specifications, the Virginia Erosion and Sediment Control Handbook, and the Virginia Stormwater Best Management Practice Clearinghouse unless a deviation or exception is approved by DEQ.	See response SA-2a-1.
SA-2d-2		Mountain Valley would continue to work with VADEQ on seed mix development to incorporate native and pollinator species for right-of-way stabilization which would be included in the Project-specific E&SC Plan to be reviewed and approved by Virginia agencies.

SA-2	Virginia Department of Environmental Quality	
SA-2d-2	ii) **Recommendation:** Use a DEQ-approved native pollinator plant mix for permanent vegetative stabilization. See the DEQ comments in Attachment B. ***b) Horizontal Directional Drilling and Hydrostatic Testing*** i) **Recommendation:** DCR recommends conducting a soil analysis to determine suitability for the use of horizontal directional drill (HDD) and supports the development and implementation of a *Horizontal Directional Drill Contingency Plan* as stated on page 4-84 of the DEIS if drilling fluid is released into a waterbody. See the DCR comments in Attachment B.	HDD feasibility and geotechnical investigations, including soil analyses, are discussed in section 4.1.4.9 of the EIS. Mountain Valley's *HDD Contingency Plan* and drilling fluid and inadvertent return management are also discussed in this section.
SA-2d-4	ii) **Recommendation:** DCR supports preventing withdrawal of water for hydrostatic testing from exceptional value waters as those identified on pages 4-37 and 4-38 of the DEIS or waters containing rare, threatened or endangered species. See the DCR comments in Attachment B.	See response SA-2a-23. Also, see 4.3.2.6 of the EIS for a discussion of hydrostatic test water sources and sections 4.3.2.7 and 4.6.5.3 for a discussion of the impacts and mitigation for water withdrawal from surface waters, including the Dan River. Mountain Valley would need to consult with and obtain approval from the USFWS for any withdrawal from a waterbody containing federally listed species.
SA-2d-5	iii) **Recommendation:** If chlorinated water is used for hydrostatic testing, HDD or conventional bore or drilling fluid additives are used, DCR recommends this water not be released into surrounding water bodies to avoid potential impacts to aquatic resources. See the DCR comments in Attachment B. ***c) Forest Resources***	Measures regarding hydrostatic test water discharge are provided in section 4.3.2.7 of the EIS and VII.D.1 of the Procedures
SA-2d-6	i) **Recommendation:** DCR and DOF recommend that Mountain Valley follow the recommendations of the Virginia Forest Conservation Partnership that were submitted to the FERC docket on August 9, 2019 under the name MVP_SouthgateExtension_ForestMitigation_03_2019.pdf. See the DCR comments in Attachment B for additional information. ii) **Recommendation:** DOF recommends that the Virginia Forest Conservation Partnership calculations with regard to forested acre impacts take precedence over the ones developed by FERC. iii) **Recommendation:** Update the forest fragmentation analysis to reflect findings from DCR that edge habitats would not serve as replacement for the interior forested habitats lost and degraded, would provide little benefit in general to interior forest species habitats surrounding the impact, and these new edge habitats would serve as permanent conduits for invasive species and non-interior forest species competition, having a permanent effect on the surrounding forests. See the DCR comments in Attachment B for additional information.	Mountain Valley has committed to minimizing impacts on forest land and continues to coordinate with VDCR on tree clearing mitigation prior to clearing trees. Mountain Valley would follow measures outlined in its Exotic and Invasive Plant Species Control Plan.

SA-2	Virginia Department of Environmental Quality	
	d) Open Burning and Fugitive Dust	
SA-2d-7	**i) Recommendation:** Include requirements that open burning is allowed only in accordance with 9VAC20-81-95 of the Virginia Solid Waste Management Regulations (VSWMR) and localities should be consulted since they may have additional open burning restrictions. See the DEQ comments in Attachment B. **ii) Recommendation:** Include requirements that construction activities associated with the MVP are subject to the Air Pollution Control Regulations regarding open burning (9VAC5-130 *et seq.*) and fugitive dust (9VAC -50-60 *et seq.*). See the DEQ comments in Attachment B.	As discussed in section 4.11.1.7, any open burning would be conducted on a site-specific basis, and in accordance Mountain Valley's Fire Prevention and Suppression Plana and Virginia regulations. This would include burning only in approved burn areas and during appropriate weather conditions to avoid any impacts on nearby residences, and complying with the open burning prohibition in Virginia from May 1 through September 30.
	e) Right-of-Way Maintenance	
SA-2d-8	**i) Recommendation:** DCR recommends the development and implementation of an invasive species plan to be included as part of the maintenance practices for the right-of-way or invasive species as identified within the footprint of the project on page 4-56, Section 4.5.3. See Item 4a below for additional recommendations and the DCR comments in Attachment B for additional information.	Mountain Valley would follow measures outlined in its Exotic and Invasive Plant Species Control Plan.
SA-2d-9	**ii) Recommendation:** DCR recommends the right-of-way restoration and maintenance practices include appropriate revegetation using native species in a mix of grasses and forbs, robust monitoring and the development of adaptive management plan to provide guidance if initial revegetation efforts are unsuccessful or if invasive species outbreaks occur. See the DCR comments in Attachment B.	See response SA-2d-2.
SA-2d-10	**iii) Recommendation:** DCR recommends the use of a native seed mix for re-vegetating disturbed areas as stated on page 4-62 in the DEIS and best management practices on page 4-63 for preventing the spread of invasive species. See the DCR comments in Attachment B.	See response SA-2d-2
SA-2d-11	**iv) Recommendation:** DCR recommends the invasive species plan be implemented for the lifespan of the project as part of the right-of-way maintenance since invasive species outbreaks can occur any time during construction or post construction. See the DCR comments in Attachment B.	Mountain Valley would monitor for invasive species for two years following construction and maintain the restored area in accordance with its Exotic and Invasive Plant Species Control Plan.

SA-2	Virginia Department of Environmental Quality	
SA-2d-12	v) **Recommendation:** DCR recommends maintenance of vegetation using annual mowing in the non-growing season between 15 October and April 1 and minimal to no use of chemicals and especially in sensitive areas with documented natural heritage resources. See the DCR comments in Attachment B.	As stated in Mountain Valley's Plan, Routine vegetation mowing or clearing over the full width of the permanent right-of-way in uplands shall not be done more frequently than every 3 years. However, to facilitate periodic corrosion/leak surveys, a corridor not exceeding 10 feet in width centered on the pipeline may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In no case shall routine vegetation mowing or clearing occur during the migratory bird nesting season between April 1 and October 14 of any year unless specifically approved in writing by the responsible land management agency or the U.S. Fish and Wildlife Service.
	f) Stream Crossings	
SA-2d-13	i) **Recommendation:** Incorporate the following VMRC recommendations, which are standard instream permit conditions, for jurisdictional stream crossings (VMRC states that it will exert jurisdiction over eight of the project's 81 stream crossings based on drainage areas currently identified in the DEIS and/or previously provided by the applicant. See the VMRC letter in Attachment B.):	See response SA-2a-1.
SA-2d-14	• A "frac-out" contingency plan must be provided for any crossings utilizing the directional drill method to address potential frac-outs or related spills associated with any directional drilling activities.	Mountain Valley would follow measures in it HDD Contingency Plan.
SA-2d-15	• In an effort to minimize adverse impacts to threatened and endangered fish and mussel species, instream surveys and species relocations may be required. No instream construction shall be conducted during any recommended time-of-year restrictions of any year unless waived by DGIF in writing.	Mountain Valley has completed aquatic surveys and filed reports with the appropriate agencies. See section 4.6.5 of the EIS for a discussion of impacts and mitigation for aquatic species, including Mountain Valley's proposed species relocations during in-water work.
SA-2d-16	• The instream construction activities shall be accomplished during low flow periods utilizing darn and pump, flume around or within cofferdams constructed of nonerodible materials in such a manner that no more than half the width of the waterway is obstructed at any point in time. All areas of state-owned bottom and adjacent lands disturbed by this activity shall be restored to their original contours and natural conditions within thirty (30) days from the date of completion of the authorized work. All excess materials shall be removed to an upland site and contained in such a manner to prevent its reentry into state waters.	Waterbody crossing are discussed in sections 2.4.2.1 and 4.3.2.2 of the EIS. In addition Mountain Valley would adhere to its Procedures to minimize impacts during waterbody crossings.

SA-2	Virginia Department of Environmental Quality	
SA-2d-17	• Erosion and sediment control measures shall be in conformance with the Virginia Erosion and Sediment Control Handbook, Third Edition, 1992, and shall be employed throughout construction. • If it is determined that blasting is necessary at any of the crossings, DGIF shall be notified a minimum of 48 hours in advance of the blasting. • The DCR shall be contacted for any stream crossings where karst landscape features are encountered during installation. • DGIF shall be contacted for any work in trout waters to avoid conflicts with trout stocking activities.	See discussion in section 4.6.5.1 of the EIS.
SA-2d-18		Mountain Valley would adhere to measures in its General Blasting Plan and comply with all reporting and notification requirements.
SA-2d-19		No areas of karst have been identified.
SA-2d-20		No trout stream are crossed by the Project.
SA-2d-21	ii) **Recommendation:** Include a table in the FEIS that cites recommendations to protect freshwater aquatic resources provided by DGIF at each of the VMRC jurisdictional stream crossings and the applicant's intention of following those recommendations. See the VMRC comments in Attachment B.	Section 4.6 of the EIS has been updated to include a list of the VADGIF recommendation which Mountain Valley has agreed to follow.
SA-2d-22	iii) **Recommendation:** DGIF recommends conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, and removal of all fish and mussels prior to dewatering the cofferdams. DGIF recommends to the extent practicable, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents reentry into the stream, restoring original streambed and streambank contours, re-vegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. See the DGIF comments in Attachment B.	Waterbody crossings would be completed in accordance with Mountain Valley's Procedures and measures required in other federal or state issued permits.
SA-2d-23	iv) **Recommendation:** DGIF recommends minimizing impacts on fisheries by relocating fishes and mussels from the construction areas. DGIF recommends that all fish and freshwater mussel relocations be supervised by qualified, professional biologists in possession of pertinent federal and/or state permits. See the DGIF comments in Attachment B.	Section 4.6.5.2 of the EIS includes this information and specifies that Mountain Valley would relocate fishes and freshwater mussels present in the waterbody crossing construction area under the d direction of qualified, professional biologists in possession of applicable federal and/or state permits.

SA-2	Virginia Department of Environmental Quality	
	g) Surface Waters and Water Withdrawals	
SA-2d-24	**i) Recommendation:** Update Section 4.3.2.7 General Impacts and Mitigation on Surface Water to include the following to explain how potential impacts to beneficial uses may be avoided (see the DEQ comments in Attachment B): In the event that withdrawals occur from surface water sources, then MVP should avoid an adverse effect or impairment to surface water by: • Withdrawing no more than 10% of the instantaneous flow rate from the channel. • Using the intake screens designed so that screen openings are not larger than 1 millimeter and; • Ensuring that screen face intake velocities are not greater than 0.25 feet per second. If surface water sources are used, then the EIS should include a discussion of what steps will be taken by MVP and its contractors to ensure that the requirements above are met. The EIS should provide the location of withdrawals and some assessment of river flows where withdrawals are proposed with a discussion of how the withdrawals will affect flows, particularly during low flow or drought conditions. The assessment should explain if any downstream water users may be affected by these water withdrawals, particularly during low flow periods. The DEQ Office of Water Supply can provide information of nearby intakes once the location of the withdrawals is known.	See response SA-2a-23.
SA-2d-24	**ii) Recommendation:** Updated Section 4.3.2.8: Surface Water Conclusions with the following information (see the DEQ comments in Attachment B): In the event that withdrawals occur from surface water sources, then MVP should avoid an adverse effect or impairment to surface water by: • Withdrawing no more than 10% of the instantaneous flow rate from the channel. • Using the intake screens designed so that screen openings are not larger than 1 millimeter and; • Ensuring that screen face intake velocities are not greater than 0.25 feet per second. If surface water sources are used, then the FEIS should include a discussion of what steps will be taken by MVP and its contractors to ensure that the requirements above are met. The FEIS should provide the location of withdrawals and some assessment of river flows where withdrawals are proposed with a discussion of how the withdrawals will affect flows, particularly during low flow or drought conditions. The assessment should explain if any downstream water users may be affected by these water withdrawals, particularly during low flow periods. The DEQ Office of Water Supply can provide information of nearby intakes once the location of the withdrawals is known.	See response SA-2a-23.

SA-2	Virginia Department of Environmental Quality	
SA-2d-25	ii) **Recommendation:** Updated Section 4.3.2.8: Surface Water Conclusions with the following information (see the DEQ comments in Attachment B): In the event that withdrawals occur from surface water sources, then MVP should avoid an adverse effect or impairment to surface water by: • Withdrawing no more than 10% of the instantaneous flow rate from the • Using the intake screens designed so that screen openings are not larger than 1 millimeter and; • Ensuring that screen face intake velocities are not greater than 0.25 feet per second. If surface water sources are used, then the FEIS should include a discussion of what steps will be taken by MVP and its contractors to ensure that the requirements above are met. The FEIS should provide the location of withdrawals and some assessment of river flows where withdrawals are proposed with a discussion of how the withdrawals will affect flows, particularly during low flow or drought conditions. The assessment should explain if any downstream water users may be affected by these water withdrawals, particularly during low flow periods. The DEQ Office of Water Supply can provide information of nearby intakes once the location of the withdrawals is known. ***h) Wildlife Resources***	See response SA-2a-23.
SA-2d-26	i) **Recommendation:** DGIF recommends clearing of trees and vegetation during winter months outside bird nesting periods as proposed. See the time of year restrictions for general guidance at https://www.dgif.virginia.gov/wp-content/uploads/VDGIF-Time-of-Year-Restrictions-Table.pdf. If tree removal becomes necessary, DGIF also recommends adherence to its standard tree removal for bat guidance (https://www.dgif.virginia.gov/environmental-programs/environmental-services-section/) to protect threatened and endangered bats known from the region. See DGIF comments in Attachment B.	Section 4.6.3.2 addresses tree clearing windows for migratory birds. Mountain Valley would attempt to refrain from construction-related vegetation clearing between March 15 and August 15 in Virginia. If avoiding the migratory bird nesting season during construction-related clearing becomes unfeasible, Mountain Valley would consult with the FWS to identify measures to implement to minimize impacts on migratory birds.
SA-2d-27	ii) **Recommendation:** DGIF recommends that the project follow protective measures as described in the DEIS (pages 4-67 to 4-68). DGIF supports the protective measures described, including wildlife escape ramps at regular intervals along the excavated trench. See the DGIF comments in Attachment B.	Comment noted.
SA-2d-28	iii) **Recommendation:** DGIF recommends strict adherence to erosion and sediment controls, use of native plants, creation of a scrub-shrub transition zone between the forest edge and maintained herbaceous right-of-way as described in the DEIS (page 4-70). See the DGIF comments in Attachment B.	Comment noted.

SA-2	Virginia Department of Environmental Quality	
SA-2d-29	iv) **Recommendation:** Update Section 4.6.5.3: General Fisheries and Aquatic impacts to downstream users during low-flow conditions. See the DEQ comments in Attachment B.	Section 4.6.5.3 of the EIS has been revised with this information.
	4) Recommendations for Specific Plans	
	a) *Exotic and Invasive Species Control Plan*	
SA-2e-1	i) **Recommendation:** Include all species on the DCR Invasive Species list (https://www.dcr.virginia.gov/natural-heritage/document/nh-invasive-plant-list-2014.pdf) in the Exotic and Invasive Plant Species Control Plan (January 24, 2019 supplemental filing-Session Number 20190124-5165), not only moderately and highly invasive species as mentioned on page 2 of the plan. See the DCR comments in Attachment B.	Mountain Valley has revised it Exotic and Invasive Plant Species Control Plan to include all species on the DCR Invasive Species List.
SA-2e-2	ii) **Recommendation:** Include an invasive species inventory in the invasive species plan for the project area including species and methods for treating invasive species based on the current DCR Invasive Species List. See the DCR comments in Attachment B.	Mountain Valley has included an inventory in their revised report.
	5) Errors in the EIS	
SA-2f-1	a) **Recommendation:** On pages 2-25 and 4-8 the term "silt rock" was used in error. Replace with "silt sock" if that term meets the intention. See the DEQ comments in Attachment B.	Comment noted. This revision has been made to the EIS.
SA-2f-2	b) **Recommendation:** Revise text on page 2-25 so that silt fence and silt sock practices are used as sediment barriers not diversion structures. See the DEQ comments in Attachment B.	Comment noted. This revision has been made to the EIS.

SA-4	North Carolina Department of Environmental Quality

NORTH CAROLINA
Environmental Quality

ROY COOPER
Governor

MICHAEL S. REGAN
Secretary

September 16, 2019

Chairman Chatterjee, and Commissioners Glick and McNamee
c/o Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE Room 1A
Washington, D.C. 20426

Re: North Carolina Department of Environmental Quality Comment on the draft Environmental Impact Statement (DEIS) for the Southgate Project, proposed by Mountain Valley Pipeline, LLC: Docket Number: CP19-14-000.

Dear Commissioners:

SA-4a	The following comments are submitted by the North Carolina Department of Environmental Quality (Department or DEQ), in response to the July 26, 2019, Federal Energy Regulatory Commission's (Commission or FERC) Notice of Availability of the Draft Environmental Impact Statement (DEIS) for the Proposed Southgate Project (Docket Number CP19-14-000).[1] In the Notice, the agency "concludes that approval of the proposed project would result in some adverse environmental impacts, [h]owever if … constructed and operated in accordance with applicable laws and regulations, the mitigation measures discussed in this EIS, and our recommendations, these impacts would be reduced to less-than-significant levels."[2] The comments submitted herein relate to those potential impacts of the Proposed Southgate Project (Project) in North Carolina and serve to (i) reiterate the Department's previous concerns that the Project is unnecessary and not in the public interest, (ii) address the inadequate review and consideration of "reasonable alternatives" in the DEIS, and (iii) identify potential environmental effects that require further evaluation.[3]	Comment noted.

SA-4	North Carolina Department of Environmental Quality	
SA-4b	I. The Proposed Southgate Project is Not in the Public Interest At this time, the Department remains unconvinced that the Project satisfies the criteria for the Commission to deem it in the public interest, and whether it is essential to ensure future growth and prosperity for North Carolinians. This concern was articulated in the letter dated November 5, 2018, in our comments on the stated purpose and need for the Project. Despite the Commission's own recognition in 2018, that its review of projects does "not [look] beyond contracts for a further determination of market or supply….",[4] and outside recommendations that FERC consider such factors in its analyses, the Commission appears to ignore these fundamental data points in its review. We provided data in the November 2018 letter, demonstrating the incongruity between the design-day requirements needed to serve projected population growth in the PSNC (now, Dominion Energy) service territory (11% growth) with the additional throughput contracted capacity for the Project (100% increase) and requested that the Commission investigate beyond the precedent agreement as its sole basis for assessing the need for the Project. In fact, as of the date of this comment, 20% of the pipeline capacity is still unsubscribed, which suggests that the basis for this Project satisfies artificial demand. We emphasize our previous assertion that "without further demonstration of actual demand … certifying the Southgate Project could result in overbuilding a gas pipeline in which the single discernible benefit of the provision of an assured excess in gas capacity available only to [Dominion Energy] in the future."[5]	See response GEN-2 in appendix I.2. The Commission will consider the need for the Project and may address these comments in any Order it issues.
SA-4c	II. The DEIS Provides an Inadequate Review and Incomplete Consideration of Alternatives The National Environmental Policy Act requires the Commission to explore all reasonable alternatives by addressing "the potential for accomplishing the proposed objectives through the use of other systems…[including] non-gas energy alternatives, and/or energy conservation or efficiency, as applicable."[6] DEQ submitted comments addressing alternatives assessments first in response to the Notice of Inquiry issued by FERC in April 2018, soliciting feedback on whether and how to revise the policy statement on the certification of new natural gas transportation facilities pursuant to the Natural Gas Act (NGA).[7,8] Again, in September 2018, DEQ provided comments on FERC's alternatives assessment, this time specific to the Notice of Intent for the Proposed EIS/Scoping for the Project. In both comments, the Department	See response ALT-1 in appendix I.2. Because renewable energy sources and energy consetbation are not natural gas transportation alerternative, and therefore, do not meet the purpose and need of the Project, they were not considered in our alternatives analysis.

SA-4	North Carolina Department of Environmental Quality	
SA-4c	requested that FERC amend its alternatives assessment and address "the potential for accomplishing the proposed objectives through the use of other systems," including "non-gas energy alternatives, and/or energy conservation or efficiency, as applicable."[9] For the third time, the Department repeats this position, this time regarding the preparation of the environmental documents for the Project – the FERC alternatives assessment must consider other systems, including *non-gas energy alternatives, and/or energy conservation or efficiency* (emphasis added). The Commission's own 2002 guidance for Environmental Report Preparation provides that the alternatives analysis should "[d]escribe the effect of any state or regional energy conservation, load-management, and demand-side management programs on the long-term and short-term demand for the energy to be supplied by the project."[10] In our July 25, 2018, response to the Notice of Inquiry for changes to the NGA Policy Statement, we stated that natural gas is but one of several resources that can meet customers' electric and thermal energy needs. We projected that within the time horizon to which a new Policy Statement would apply, a sea change in the economic models for natural gas construction and operations, especially when compared to renewable energy resources, would take place. Fifteen months ago, projected natural gas consumption was largely flat due to efficiency gains, shifting populations, and the declining costs of renewable energy resource alternatives. Since then, these predictions have borne out and the narrative continues: • Domestic commercial and residential natural gas demand is flat.[11] • The United States becomes a net energy exporter in 2020, due to large increases in fossil fuel production coupled with slow growth in domestic energy consumption.[12] • In September 2019, natural gas-powered electricity is outbid by record-low solar + storage power purchase agreements (25 year, 3.3¢/kWh deal between Los Angeles Water and Power and 8minute Solar Energy).[13] • By 2035, it will be more expensive to run 90% of the proposed natural gas plants than it will be to build new solar and wind plus storage systems in the United States.[14,15] The alternatives assessment in this DEIS ignores the demonstrated size and scope of the transitioning energy economy which results in artificially tipping the scales for natural gas, no matter the costs to customers or the impacts on the environment. In keeping with the 2002 Guidance Manual, DEQ provided FERC with three examples of state-level and market-based programs specific to energy demand in North Carolina for FERC's consideration as part of our September 2018 response to the NOI for the Proposed EIS. Six weeks after DEQ submitted these comments, Governor Roy Cooper signed Executive Order 80, directing North Carolina to transition to a clean energy economy and address the impacts of climate change on the state. EO 80 establishes a goal of 40% reduction in statewide greenhouse gas emissions (GHGs) from 2005 levels by 2025, and directs the NC Department of Environmental Quality to develop a Clean Energy Plan. EO 80 lays the foundation for North Carolina's clean energy future and DEQ requests that FERC thoroughly consider this new state policy and its implementation to date in its alternatives analysis in the final EIS. We point FERC to the Clean Energy Plan (both the draft document and supporting research)[16,17] as a valuable resource for the Commission to reference in its alternatives analysis.	See response ALT-1 in appendix I.2. Because renewable energy sources and energy conservation are not natural gas transportation alternatives, and therefore, do not meet the purpose and need of the Project, they were not considered in our alternatives analysis.

SA-4	North Carolina Department of Environmental Quality	
SA-4c	DEQ believes that the methodology underlying the FERC's alternatives analysis is insufficient. DEQ concludes this because the process begins with the assumption that the purpose of the Project – as stated by the applicant, Mountain Valley – is substantiated. As a result, the alternatives assessment in the DEIS represents little more than a check box for NEPA compliance, with its results predetermined from the outset. North Carolinians deserve a thorough assessment of Project alternatives, indeed more than what was done in consideration of the No Action Alternative, the four system alternatives assessing other gas transportation infrastructure, and the combined eleven major and minor route alternatives. Despite the limitations in the methodology of the alternatives analysis, DEQ requests that in addition to addressing the aforementioned and our previously submitted comments, FERC conduct a thorough evaluation of non-natural gas alternatives. Specifically, DEQ recommends that FERC evaluate the "potential for energy efficiency, energy conservation programs, and renewable energy (e.g., wind, solar) to eliminate or meet the need for the Southgate Project."[18] The Commission justifies its decision to end its analysis of non-natural gas alternatives because the stated purpose of the Project is to transport natural gas. This circular reasoning based on an unsubstantiated purpose does not hold up in today's rapidly changing energy economy. The cost of renewable energy resources is rapidly declining and the economics now favor utility-scale solar and onshore wind plus storage over construction of natural gas infrastructure. To dismiss cost-effective non-gas energy alternatives with demonstrated *significant environmental advantage* because "they are not transportation alternatives" especially in light of the environmental effects posed by development of greenfield pipelines is inadequate.	See response ALT-1 in appendix I.2. Because renewable energy sources and energy consetbation are not natural gas transportation alerternative, and therefore, do not meet the purpose and need of the Project, they were not considered in our alternatives analysis.
SA-4d	III. Potential Environmental Effects that Require Further Evaluation The Department commends FERC and its staff on its review of the potential environmental effects posed by the Project and the proposed mitigation measures recommended in the DEIS. It is DEQ's responsibility to thoroughly review the DEIS, the Project, and its potential impact on North Carolina's environment and people. As such, we present the following comments and recommendations for FERC to consider in development of the final EIS.	Comment noted.

SA-4	North Carolina Department of Environmental Quality	
SA-4e	*A. Thorough Examination of Greenhouse Gas Emissions* In the DEIS, the Commission recognizes: the threats posed by climate change; the assessments, findings, and projections of the U.S. Global Change Research Program; and Governor Cooper's recent Executive Order 80, North Carolina's Commitment to Address Climate Change and Transition to a Clean Energy Economy.[19] DEQ agrees with the Commission in its statement that the "construction and operation of the Southgate Project would increase the atmospheric concentration of GHGs, in combination with past, current, and future emissions from all other sources globally and contribute incrementally to future climate change impacts."[20] However, the Department disagrees with the Commission's assertion that no methodology exists to attribute or predict the climate change effects from the Project. We presented several approaches on this topic in comments previously submitted to the Commission on July 25, 2018, and September 10, 2018.[21] If our recommendations, in combination with the Commission's own review of modeling tools proved to be insufficient, then NEPA requires the Commission to conduct independent research or otherwise compile missing information necessary to complete its evaluation.[22,23] More broadly, the Department believes that "the Commission should be doing more as part of its are critical to determining whether the Projects are in the public interest."[24,25] In *Sierra Club v. FERC,* the D.C. Circuit Court of Appeals vacated the Commission's decision on a pipeline project in Florida due to FERC's failure to properly analyze GHGs. The Court found that the Commission has a statutory responsibility to document and consider how its approval of a gas pipeline project will lead to increases in emissions of GHGs that contribute to climate change.[26] As a result, the Commission must consider the Project's direct and indirect environmental effects, the latter including GHG emissions, no matter how much later in time or removed in distance from the project the emissions may be.[27] It is our Agency's position that NEPA does not permit agencies to ignore the well-documented impacts of climate change in the conduct and preparation of their environmental impact analyses.[28] Furthermore, NEPA requires federal agencies to take a "hard look" at all environmental consequences – whether direct or indirect – of any proposed action on the environment, and that "hard look" obligates agencies to carefully consider every significant environmental impact of a project, which must necessarily include a project's contribution to climate change through its GHG emissions.[29,30,31] In summary, because we believe the GHG impacts analysis in the is DEIS inadequate, it does not meet the NEPA standard. For the reasons stated above, the Department requests that FERC	See response CI-1 in Appendix I.2.

SA-4	North Carolina Department of Environmental Quality	
SA-4f	IV. Environmental Justice and Other Impacts that Require Further Evaluation *A. Additional Consideration of Environmental Justice* The Department appreciates the initial treatment and evaluation of socioeconomic impacts in Section 4.9 of the DEIS, particularly the Commission's consideration of environmental justice and the character of the potentially impacted communities. Further, we thank FERC for addressing several of the socioeconomic impacts that DEQ recommended in our Project-related comments.[32] After reviewing the DEIS, the Department agrees with the assertion that "[c]onstructing and operating the Project may affect the socioeconomic character of communities near the proposed facilities."[33] DEQ generally agrees with the Commission's finding that "[a]lthough low income and minority populations exist within the Project area, the Project would not have a disproportionately high and adverse environmental or human health impact on minority or low income populations,"[34] However, the Department requests that the Commission conduct further evaluation of the communities surrounding the Project utilizing a screening or mapping tool (e.g. EPA's EJSCREEN or the NCDEQ Community Mapping System), as recommended in the 2017 *Federal Energy Regulatory Commission, Office of Energy Projects Guidance Manual for Environmental Report Preparation for Applications Filed under the Natural Gas Act.*[35,36,37] Employing such a screening or mapping tool would provide a visualization of key findings and make data interpretation easier. This is critical when considering individuals who have a lower level of education or who may be deemed as limited English proficient (LEP). In addition, the EJSCREEN mapping tool allows for a deeper view into the demographics of a population within a designated buffer of the proposed project. Using a mapping tool to analyze varying buffer distances from the Project (i.e. ¼ miles, ½ miles, ¾ miles, 1 mile, etc.) provides a way to see how population demographics may change with increased distance. This methodology allows for more granular analysis of the surrounding communities and provides a better understanding of those individuals who live the closest to the Project. This methodology also allows for comparisons between the population characteristics of those who live nearer and those who live farther away from the Project. DEQ recommends that these comparisons also include the state-level data. *B. Evaluation of Socioeconomic Impacts in Dominion Energy Service Territory*	As discussed in section 4.9.8, while there are several low income and minority populations crossed by the pipeline route, we conclude that they would not be disproportionately affected by the pipeline or the compressor station. Section 4.9.8 has been updated to include an analysis of linguistically isolated populations and an analysis on the educational attainment of the population. Section 4.9.8 has also been updated to include several maps of the Project and all census blocks crossed by the pipeline route, including those that contain Environmental Justice communities. The Environmental Justice analysis conducted in the EIS includes a more thorough analysis than can be conducted using EJScreen; therefore, EJSCREEN was not used.

SA-4	North Carolina Department of Environmental Quality	
SA-4g	To supplement the socioeconomic analysis, the Department requests that FERC evaluate the economic impact on North Carolinians residing or conducting business in the Dominion Energy service territory, in addition to the two counties in the Project area (Alamance and Rockingham). It stands to reason that all Dominion Energy customers will be impacted by changes in their energy rates once the Southgate gas flows. According to Section 4.13 on cumulative impacts, the DEIS states that Mountain Valley reports a subscribed volume of natural gas (300 MMcf/day), which would be used in North Carolina, primarily by residential and small and medium sized commercial customers for heating, cooking, and other end-uses.[38] Because residential and commercial customers will be directly affected by the construction, development, and transport of this new fuel resource, the Department requests that FERC evaluate potential and anticipated economic impacts on these end-users. In such an evaluation, DEQ requests that FERC consider the energy burden – the percentage of a household's annual income that is spent on energy bills – that the Project will have on ratepayers in Dominion Energy's service territory. The U.S. Census Bureau reports that in 2018, approximately 15% of the state's population, or 1.5 million North Carolinians, live in poverty,[39] many of whom live in counties classified as Tier 1 or Tier 2 by the North Carolina Department of Commerce. Every year, all 100 counties are ranked into tiers of economic wellbeing based on average unemployment, median household income, population growth, and adjusted property tax per capita.[40] Tier 1 Counties are considered the most economically distressed, while Tier 3 Counties are considered the least economically distressed. Many of the low income individuals who live in Tier 1 or 2 counties, identify as Hispanic or Latino or African American, and tend to reside in older housing units. The North Carolina Housing Coalition has examined the energy burden on low-income households in the state. According to the Coalition, low-income households spend a disproportionate percentage of their household earnings on energy costs when compared to their higher earning counterparts. The Coalition reports that in some counties individuals who earn less than the Area Median Income (AMI) for that county, spend two- to three-times more of their household incomes on energy than the average household in the county. In some counties, those earning less than the AMI divert nearly 33% of their incomes to pay energy bills.[41] The Department conducted a preliminary evaluation of the energy burden on households in the counties served by Dominion Energy using public data made available by the Coalition layered on the counties identified by the Department of Commerce tier ranking.[42] This evaluation of the energy burden (using the percentage of annual income that energy accounts for in AMI households) was performed for both low income homeowners and low income renters as displayed in Figures 1 and 2 below.	As discussed in section 1.1 of this EIS, The Commission bases its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project. A discussion of potential rate increases due to the Project is outside the scope of the EIS.

SA-4	North Carolina Department of Environmental Quality

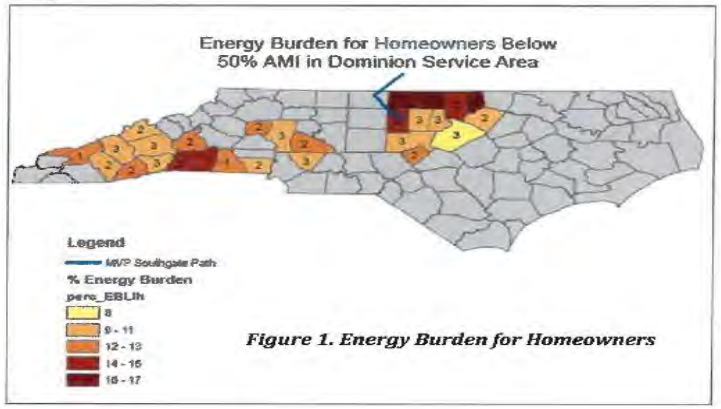

Figure 1. Energy Burden for Homeowners

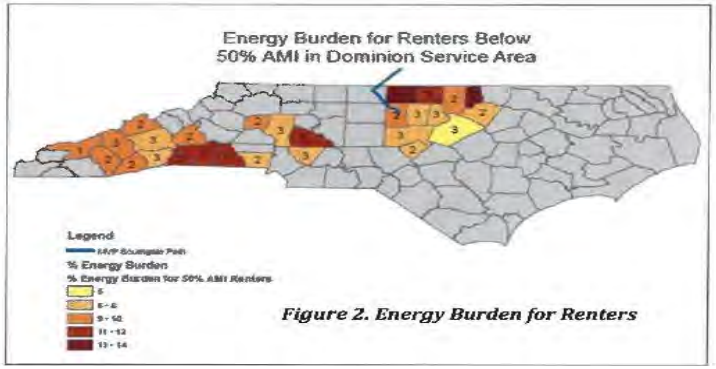

Figure 2. Energy Burden for Renters

SA-4g cont	The energy burden for AMI households in the Dominion Energy service area ranges from 5% (for renters in Wake County) to more than 16% (for homeowners in Person County). To put this in context, the U.S. Department of Health and Human Services classifies energy burden at an amount greater than 6% of a household's annual income as "unaffordable." Based on this definition, each of the counties' lowest earning households (with the exception of Wake County renters) in the Dominion Energy service area have an "unaffordable" average energy burden. Furthermore, these initial evaluations demonstrate that the socioeconomic impacts of the Project potentially extend well beyond the physical route of the pipeline. We ask that FERC use this data to fully evaluate the imposition of pass-through costs for the construction, operation, and ROI for the Project on these populations. This is fundamental information that the Commission must incorporate in its determination of need for the Project. North Carolinians residing or conducting business in Dominion Energy service territory should not be left to shoulder increased energy rates for this Project for which there is no demonstrable demand.	See response SA-4g.

SA-4	North Carolina Department of Environmental Quality	
SA-4h	*C. Issues Beyond DEQ's Jurisdiction* While the increasing practice of "quick take," and anecdotal diminution of property values proximate to pipeline projects are not within DEQ's purview, they are concerns that have been raised to our Department which we believe warrant comprehensive consideration and assessment of their socioeconomic impacts in the final EIS. In addition, we request FERC evaluate the cost-benefit of residential electrification versus greenfield natural gas pipelines to serve heating demand.	Socioeconomic impacts, including property values, are discussed in section 4.9.5 of the EIS. Conducting a cost-benefit analysis of the project compared to other non-proposed projects is outside the scope of the EIS and the requirements of NEPA.
SA-4i	V. Conclusion In summary, we agree with FERC that the Project will result in some adverse environmental impacts with possible extensive socioeconomic impacts as well. In this third comment pertaining to the Project, DEQ reiterates the position that the Project has not been shown to satisfy the criteria for the Commission to deem it in the public interest. We have provided recommendations that FERC evaluate the demand for the Project beyond precedent agreements and assess renewable and other non-gas energy alternatives that are technically and economically feasible substitutes for greenfield gas pipeline development. Anticipating the unlikelihood of the selection of the No Action Alternative, we included numerous suggestions and a glide path for completing a thorough environmental review of the potential impacts the Project poses to North Carolina. Thank you for the opportunity to comment on the DEIS. I trust that the comments will be considered as the Commission reviews and completes the environmental documents for the Project. If you have any questions regarding our comments, please contact me at: (919) 707-8619 or sheila.holman@ncdenr.gov. Sincerely, Sheila C. Holman, Assistant Secretary for the Environment North Carolina Department of Environmental Quality	See response GEN-2 in appendix I.2.

SA-4	North Carolina Department of Environmental Quality	
	APPENDIX A. **DEIS Comments from NCDEQ Division of Energy, Minerals, and Land Resources (DEMLR)**	
SA-4j	**2.3 Land Requirements.** 149.8 acres of contract yards. It is unclear from the DEIS if the contractor yards are land uses in keeping with utility line construction or if they are intended to be long term/permanent laydown areas that are to be used for utility maintenance or future expansion, going forward. Post construction stormwater control measures may be appropriate or required if these sites are to be used long term. No detail was provided on how contractor yard restoration would occur once work is completed. No details, criteria, schedules or detail on post deconstruction inspections were provided. No information was provided to address efforts to abate soil compaction, enhance infiltration, replanting efforts, or identify unauthorized uses, post construction.	Use of contractor yards, temporary work spaces, and access roads would be limited to the time of construction and restoration. All areas would be returned to pre-construction conditions unless otherwise requested by the landowner. See section 2.3.4 for further discussion.
SA-4k	62.4 acres of access roads. DEIS does not clearly explain MVP's criteria for temporary roads. Many different type of land uses install "temporary roads." However, "temporary roads" are often or at least periodically put back into service for use. This commonly occurs in forestry, agriculture and industrial settings. Thereby, the roads are not truly temporary, rather the uses are episodic and fallow roads often remain as an ongoing source of sedimentation. The DEIS does not explain how MVP will ensure the roads are truly temporary and will not remain sources off site sedimentation. No details, criteria, schedules or detail on post deconstruction inspections were provided. No information was provided to address efforts to abate soil compaction, enhance infiltration, replanting efforts, or identify and abate unauthorized uses, post construction.	Unless agreed upon by the landowner, temporary access roads would be returned to pre-construction condition and we expect that use would be temporary and limited to the time of construction and restoration. See section 2.3.5 for further discussion.
SA-4l	Additional Temporary Workspace – 184.9 acres in NC. The DEIS includes no detail on restoration. No information is provided detailing revegetation and abating soil compaction to address increase stormwater runoff and decrease infiltration, post construction.	Section 4.8.1.3 of the FEIS for provides details on the restoration of additional temporary work spaces. Mountain Valley would be required to adhere to the requirements in its Plan and Procedures regarding mitigation, erosion control, and restoration.
SA-4m	**2.4.1.2 Clearing and Grading.** DEIS does not detail how areas beyond construction corridor would be identified to ensure work/land disturbance and impacts to waters do not occur beyond the footprint of the approved construction corridor.	Mountain Valley would follow measures outlined in its Plan and Procedures, which address the identification and marking of Project workspaces and sensitive resources.
SA-4n	**2.4.1.3 Trenching.** The DEIS states "excess rock would be trucked to approved disposal areas." However, the DEIS does not detail how this approval process will occur and be managed to ensure impacts to waters, wetlands, or need for additional erosion control measures would not occur. **2.4.1.5 Lowering-in and Backfilling.** The DEIS states "The pipeline would then be lowered into the trench by side-boom tractors. Trench breakers (such as sand bags or foam) would then be installed in the trench on slopes at specified intervals to prevent subsurface water movement along the pipeline." The DEIS includes no detail, requirements or construction criterial was detailed on installation, construction or specifics of when anti-seep/trench breakers are to be used.	Section 2.4.1.3 of the EIS has been updated with details regarding rock disposal. In areas where the rock/stone is to remain, included in landowner approval is acknowledgement that additional erosion and sediment control may be needed, as well as permanent stormwater management, to be handled in Post-Construction/Restoration Plans. Unless specifically allowed through additional state and Federal permitting, no impacts to aquatic resources will occur through the placement of excess rock. If during construction rock is encountered in steep topographic areas, the rock will be relocated via truck to a stable area with more favorable slope conditions.

SA-4	North Carolina Department of Environmental Quality	
SA-4o	Detail is not provided as to how MVP will ensure contractors understand when to install these measures. Failure to do properly do so could result in impacts to waters and wetlands. The DEIS states "first 12 inches at the bottom of the trench above the pipe would be clean fill, absent of rocks. Limestone dust may be brought in and used as padding material only when other local suitable fill is unavailable." In this section, the DEIS fails to clearly state that suitable material will not consist of soils contaminated with oil, petroleum, hazardous materials, or coal combustion residuals.	See Section 2.4.1.5 of the EIS and Mountain Valley's Plan for details on regarding use of anti-seep/trench breakers. Contractors will be given copies of all plans and an environmental inspector will be on site during construction everyday to monitor appropriate installation of trench breakers.
SA-4p	Detail is not provided as to how MVP will ensure contractors understand when to install these measures. Failure to do properly do so could result in impacts to waters and wetlands. The DEIS states "first 12 inches at the bottom of the trench above the pipe would be clean fill, absent of rocks. Limestone dust may be brought in and used as padding material only when other local suitable fill is unavailable." In this section, the DEIS fails to clearly state that suitable material will not consist of soils contaminated with oil, petroleum, hazardous materials, or coal combustion residuals.	Section 2.4.1.5 has been updated to note that Mountain Valley would use certified clean fill if needed for the Project.
SA-4q	**2.4.1.8 Cleanup and Restoration.** DEIS states that "excess rock/stone would be disposed of within the construction right-of-way with landowner approval or at an approved landfill." Based on this cleanup and restoration approach, the DEIS does not address how this process will occur and be managed to ensure impacts to waters, wetlands, or the need for additional erosion control measures would not occur.	See response to SA-4n.
SA-4r	**2.4.2.1 Waterbody Crossing.** The DEIS states that "Trench spoil would be placed on the banks above the high water mark for use during backfilling. In some cases, the pipeline would be coated with concrete for negative buoyancy." The DEIS does not explain what measures will be taken to prevent direct contact between uncured or curing concrete and waters of the state. The DEIS does not detail how inadvertent contact of uncured concrete will be managed to ensure that discharges to waters of the state do not occur.	Section 2.4.2.1 of the EIS has been revised to describe Mountain Valley's handling of concrete. Mountain Valley has stated that no concrete will be cured on the right-of-way.
SA-4s	**2.4.2.2 Wetland Crossings.** The DEIS does not explain which measures will be taken to prevent direct contact between uncured or curing concrete and water of the state. The DEIS did not detail how inadvertent contacts of uncured concrete will be managed to ensure that discharge to waters of the state do not occur. The DEIS states that "After the pipeline sinks into position, trench breakers are installed where necessary to prevent the subsurface drainage of water out of the wetland." Details are not included to describe how MVP will ensure contractors understand when to install these measures. Failure to do this properly could result in impacts to waters and wetlands. **2.4.2.5 Foreign Utilities.** The DEIS does not clearly address how MVP plans to respond to impacts to potable	See response SA-4r and SA-4o.

SA-4	North Carolina Department of Environmental Quality	
SA-4t	The DEIS does not clearly address how MVP plans to respond to impacts to potable waterlines, reuse lines, sewer lines (both gravity lines and force mains), and other fuel supply lines that may be encountered along the Project route. It is imperative that MVP have contacts with all local governments and utilities along the Project route and have a firm understanding of their reporting, remediation, and any other requirements. This was not addressed in the DEIS.	Discussion of foreign utility lines crossed by the Project is provided in section 2.4.2.5. Septic systems and water lines identified to date and associated mitigation measures are discussed in section 4.8.3.1.
SA-4u	**4.1.4.6 Shallow Bedrock and Blasting.** The DEIS states that "As outlined in the General Blasting Plan, Mountain Valley would: • use seismograph equipment to monitor the velocity of the blasts at select monitoring locations including closest adjacent facilities; • use excess rock from blasting to restore the right-of-way, placed as per landowner agreements, or hauled off-site to an approved disposal site." The DEIS fails to provide specific detail on actual blasting procedures, clearly whether and when seismographs will be used to monitor ground vibration and noise levels.	Section 4.1.4.6 and Mountain Valley's General Blasting Plan provide information on blasting procedures that will be followed by Mountain Valley during construction.
SA-4v	The DEIS does not detail how excess rock disposal approval process will take place and be managed to ensure impacts to waters, wetlands, or need for additional erosion control measures would not occur.	See response SA-4n.
SA-4w	**4.1.4.7 Flooding.** The DEIS explains that mitigation measures may include using concrete coating, gravel-filled blankets, or concrete weights on the pipeline to maintain negative buoyancy. The DEIS does not explain what measures will be taken to prevent direct contact between uncured or curing concrete and water of the state. Furthermore, the DEIS does not detail how inadvertent contacts of uncured concrete will be managed to ensure that discharge to waters of the state do not occur.	See response SA-4r.
SA-4x	**4.3.2.6 Surface Water Appropriations.** Hydrostatic Test Water The hydrostatic test water would be discharged through sediment filters in vegetated uplands away from waterbodies and wetlands. MVP did not detail in the DEIS how it will ensure discharges occur at non-erosive velocities. The DEIS does not include or propose sampling to determine or demonstrate if protective coatings, sediment, turbidity or other constituents would be discharged with test water. Horizontal drilling water The HDD process requires water to be added to a bentonite clay mixture to create drilling fluid. The disposal of the drilling fluid is not adequately detailed in the DEIS.	See section 4.3.2.7 for discussion of impacts and mitigation related to water discharge. Mountain Valley would discharge hydrostatic test water in well-vegetated areas within structures to control runoff. Mountain Valley would assess field conditions to determine the appropriate energy dissipation device and would conduct sampling to ensure that discharges meet any regulatory thresholds.
SA-4y	"All drilling fluid would be disposed of at an approved facility or recycled in an approved manner in accordance with the HDD Contingency Plan. Mountain Valley would separate all water from HDD equipment washing areas from wetlands or waterbodies by drainage barriers to prevent any runoff entry." **2.4.2.6 Agriculture Lands.** The DEIS explains that other mitigation measures in agricultural lands would include relief from compaction and removal of rocks from topsoil.	Section 4.3.2.6 of the FEIS. All drilling fluid would be disposed of at an approved facility or recycled in an approved manner in accordance with the HDD Contingency Plan.
SA-4z	**4.1.2 Mineral Resources.** The DEIS states that "The East Alamance Quarry is a crushed stone aggregates operation in	Comment noted.

SA-4	North Carolina Department of Environmental Quality	
SA-4aa	Haw River and is owned and operated by Martin Marietta Materials, Inc. (North Carolina Department of Environmental and Natural Resources Permit No. 01-08) on 600 acres of land, 375 acres of which are bound under Permit No. 01-08. This permit also provides limitations on blasting practices at the quarry, restricting maximum peak particle velocities to 1.0 inch per second. The Project alignment would cross parcels owned by the East Alamance Quarry for approximately 230 feet, near MP 67. Mountain Valley obtained public information that indicates that the operator has not yet filed for a mining permit on the parcel in question (NC-AL-128); however, through discussions with the operator, it was identified that future mining operations may be completed on this parcel. Mountain Valley therefore proactively rerouted the pipeline on this parcel in an attempt to minimize impacts on any future expansion of the East Alamance Quarry. Currently, the Project alignment is approximately 430 feet from disturbed areas at MP 66.7 and more than 1,200 feet from disturbed areas at MP 67. Mountain Valley has committed to working with the East Alamance Quarry regarding landowner easement agreements to minimize	Mountain Valley has rerouted the pipeline, and the Project would not cross parcels owned by the East Alamance Quarry (Martin Marietta Materials, Inc.). The proposed pipeline would be on average 50 feet from parcels owned by the quarry.
SA-4aa. Cont.	inconvenience and impact to the quarry. Based on these factors, we conclude that the Project would not significantly impact or be affected by the East Alamance Quarry." The DEIS explains that the project alignment would cross parcels owned by the East Alamance Quarry for approximately 230 feet. A permit modification was submitted to DEMLR on April 15, 2019, by Martin Marietta Materials, Inc. for this mine. This modification has not yet been approved by the Division and it did not address this MVP alignment crossing. The modification plans submitted by Martin Marietta Materials will either need to release this area from the permit or Marin Marietta Materials will need to request a modification for its mining permit. Further, the description in the DEIS, as included above, does not accurately depict/address blasting permit conditions as set forth in the East Alamance mining permit 01-08, which includes seismic monitoring.	Mountain Valley has rerouted the pipeline, and the Project would not cross parcels owned by the East Alamance Quarry (Martin Marietta Materials, Inc.). The proposed pipeline would be on average 50 feet from parcels owned by the quarry.
SA-4bb	**4.6.5.3 General Fisheries and Aquatic Resources Impacts and Mitigation.** In the DEIS, Mountain Valley states that it "would minimize impacts from water withdrawals by adhering to the measures in Mountain Valley's Procedures and E&SC Plan. The measures outlined in these plans include preventing water withdrawal from and discharges into exceptional value waters or waters that provide habitat for federally listed threatened and endangered species, unless approved by applicable resource and permitting agencies; screening and positioning water intakes at the water surface to minimize the entrainment of fish and other biota; maintaining adequate flow rates to protect aquatic species; placing water pumps in secondary containment devices to minimize the potential for fuel spills or leaks; regulating discharge rates; and using energy dissipating devices and sediment barriers to prevent erosion. Mountain Valley would obtain and comply with all state water withdrawal and discharge permits." This is not typically required as a part of the state Erosion and Sedimentation Control Plan approval process, and oversight and management of this activity needs to be revisited by MVP.	Mountain Valley would need to obtain written permission from the FWS for any water withdrawal from a waterbody containing federally listed species prior to getting FERC approval to commencing withdrawal activities. In addition, Environmental Inspectors would be on-site to monitor water withdrawal and discharges. Mountain Valley also has agreed to participate in FERC's third party monitoring program, in which a FERC representative would be on site monitoring such activities
	4.8.1.1 Pipeline Facilities, Agriculture Lands.	

SA-4	North Carolina Department of Environmental Quality	
SA-4cc	The DEIS explains that "To avoid and minimize impacts on agricultural lands, Mountain Valley would implement numerous measures as identified in FERC's Plan including measures that address soil segregation, soil compaction, and irrigation systems and would adhere to all other applicable federal, state, and local permit requirements." The DEIS does not clearly detail how soil compaction will be addressed or abated.	Soil compaction is discussin section 4.2.4 of the EIS. Additionally, section 4.8.1.1 of the EIS has been updated to include example mitigation measures. A more detailed list is provided in Mountain Valley's Plan
SA-4dd	**APPENDIX B.** **DEIS Comments from NCDEQ Division of Water Resources (DWR)** **4.3.2.2 Surface Water Crossings.** The DEIS does not explicitly provide that MVP will comply with all the requirements in the state 404 permit and 401 water quality certification, in addition to complying with other pertinent federal and state requirements.	See section 1.4.7 in the EIS (MVP must satisfy all federal permits). Applicants cannot begin construction of the Project until all state, federal, and local permits are received
SA-4ee	**4.3.2.3 Contaminated Sediments and Impaired Waters.** The DEIS does not specifically address whether the Project will cross any watersheds draining to impaired waters and if so, what additional measures will be employed to protect these watersheds.	Section 4.3.2.3 of the EIS discusses impaired waterbodies.
SA-4ff	**4.3.2.4 Federal and State Designated Use and Exceptional Waters.** 1. The DEIS provides that "North Carolina administers a river designation intended to protect specific rivers with outstanding natural, scenic, educational, recreational, geologic, fish and wildlife, historic, scientific, cultural or other values. The Project does not cross any North Carolina rivers with these designations." DEQ repeats its request made in our comment on Draft Resource Report 2 that MVP address whether the Project crosses the watershed of any of these rivers, and if so, describe the additional measures MVP will take to protect these valuable resources. 2. The DEIS provides that the Project will cross WS-II, WS-IV, Nutrient Sensitive Waters (NSW), and HQW, but there is no discussion of what measures MVP will take to avoid those crossings or what additional measures will be employed within the watershed of those classified waters to ensure they are protected. In particular, the Department calls attention to the WS-II watershed (the entire watershed not just the "watershed" designated in the WS rules for development). DEQ repeats its request made in our comment on DRR2 that MVP address specific alternatives analysis in addition to the general discussion of these waterbodies in the DEIS.	Surface waterbody crossing methods are described in sections 2.4.2.1 and 4.3.2.2 of the EIS. In addition Mountain Valley would adhere to Mountain Valley's Plan and Procedures; and the Project-specific E&SC Plan. The Plan and Procedures contain requirements for erosion and sediment control during the construction and restoration of the Project. The Plan and Procedures also contain performance based standards to contain soils within the limits of disturbance. To ensure compliance with these standards, Mountain Valley has agreed to a FERC third-party monitoring program. FERC Compliance Monitors would inspect the project daily to ensure compliance during all phases of construction and restoration. If the Project is determined to be out of compliance, Mountain Valley would be required to remedy the situation as soon as possible.
SA-4gg	**4.3.2.7 General Impacts and Mitigation on Surface Water.** The DEIS states that hydrostatic test water would be discharged over vegetated land surfaces and the discharge rate would be regulated using valves and energy dissipation devices. DEQ requests a detailed evaluation of discharge rates be included in the final EIS.	See response SA-4x.

SA-5 North Carolina Wildlife resources Commission

North Carolina Wildlife Resources Commission

Gordon S. Myers, Executive Director

MEMORANDUM

TO: Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission

FROM: Vann Stancil
Research Coordinator
Habitat Conservation Division

DATE: September 16, 2019

SUBJECT: Comments on Draft Environmental Impact Statement for Southgate Project – Mountain Valley Pipeline, LLC. CP19-14-000

Biologists from the North Carolina Wildlife Resources Commission (NCWRC) have reviewed the Draft Environmental Impact Statement (DEIS) prepared by the Federal Energy Regulatory Commission (FERC) for the Southgate Project proposed by Mountain Valley Pipeline, LLC (MVP). Biologists with the NCWRC have met with representatives of the MVP Southgate Project in the past and provided comments on the project. Comments are provided in accordance with certain provisions of the Clean Water Act of 1977 (33 U.S.C. 1251-1387), the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.), North Carolina Environmental Policy Act (G.S. 113A-1 through 113A-10; 1 NCAC 25) and North Carolina General Statutes (G.S. 113-131 et seq.).

The Southgate Project is an interstate natural gas transmission pipeline project that will extend approximately 73.7 miles from Pittsylvania County, Virginia to delivery points in North Carolina. Approximately 42.8 miles of 16" diameter pipeline and associated aboveground facilities will traverse the Dan and Haw river basins in Rockingham and Alamance counties in North Carolina. An additional 4.3 miles of 24" diameter pipeline will be installed in Alamance County. The project will terminate in Alamance County on the east side of the Haw River between Graham and Swepsonville. The project will have the capacity to transport 375 million cubic feet of natural gas per day.

SA-5	North Carolina Wildlife resources Commission	
	MVP has collocated over 50 % of the pipeline with existing linear corridors. The project would impact 26.8 acres of wetlands; 5.9 of these acres are within the operational right-of-way. The proposed Southgate Project will cross 224 waterbodies; three of these are major waterbodies. Most streams will be crossed using dry-ditch methods while five crossing will be done using horizontal direction drill (HDD) or conventional bore techniques. The NCWRC offers the following specific comments on the DEIS:	
SA-5a	1. Pages ES-5 & ES-9. The amount of collocated pipeline is listed as 40 miles and 54 % on page ES-5 and 39 miles and 52.5 % on page ES-9. Table 2.1-2 on page 2-3 lists 38.7 miles or 52.5 % of collocated pipeline. These discrepancies should be compared and clarified.	The noted discrepancies have been revised in the EIS.
SA-5b	2. Page ES-8. Cumulative Impacts. The DEIS does not adequately address the cumulative impacts that will occur as a result of the Southgate Project. The DEIS does not consider the impacts associated with constructing new pipelines for distributing natural gas to customers once the project is complete.	The EIS was prepared in accordance with NEPA, CEQ guidelines, and other applicable requirements. Our analysis in section 4.13 is consistent is consistent with FERC style, formatting, and policy regarding NEPA evaluation of different types of impacts, including cumulative impacts. Our analysis of cumulative impacts was based on the potential geographic scope of impacts on each resource, as described in section 4.13. Plans for construction of new pipelines to distribute gas to customers is unknown and is outside of the scope of this EIS.
SA-5c	3. Page 1-2. Purpose and Need. The proposed Southgate Project will interconnect with the Mountain Valley Pipeline which is still under construction. Until the Mountain Valley Pipeline project is complete and operational, constructing the Southgate Project is premature.	The Commission will consider the need for the Project and may address these comments in any Order it issues.

SA-5	North Carolina Wildlife resources Commission	
SA-5d	4. Page 2-9. 2.3.3. Additional Temporary Workspaces. Appendix B.3 lists locations where additional temporary workspaces (ATW) are located less than 50 feet from a wetland or waterbody. Many of these ATWs are located 0 feet from surface water resources. Providing appropriate comments on ATWs within 50 feet of surface water features is not possible given the lack of detailed information provided in Appendix B.3. Maps showing delineated wetlands and waterbodies along with proposed ATWs are needed to provide comments on this aspect of the project.	As described in 4.4.3 of the EIS, Mountain Valley's Procedures specify that all extra work areas should be set back at least 50 feet from wetlands. Mountain Valley has requested modifications to their Procedures at specific locations within 50 feet of a wetland boundary. Appendix B.3 provides the locations where Mountain Valley proposes less than a 50-foot setback from a wetland and the site-specific rationale for the requested modification from Mountain Valley's Procedures. We have reviewed these ATWS locations and find them acceptable. The current alignment sheets identify the location of all workspaces and the delineated wetlands and waterbodies.
SA-5e	5. Page 2-12. 2.4. Construction Procedures & Page 4-34. Appendix B.8 lists locations where the construction workspace parallels a waterbody within 15 feet. Providing appropriate comments on construction workspaces paralleling surface water features within 15 feet is not possible given the lack of detailed information provided in Appendix B.3. Maps showing delineated wetlands and waterbodies along with proposed construction workspaces and contour lines are needed to provide comments on this aspect of the project.	The current alignment sheets identify the location of all workspaces and the delineated wetlands and waterbodies. Alignment sheet are available on the FERC eLibrary using docket number CP19-14 and accession number 20191220-5298.
SA-5f	6. Page 2-15. 2.4.1.2. Clearing and Grading. NCWRC recommends the use of biodegradable and wildlife-friendly sediment and erosion control devices. Silt fencing, fiber rolls, and/or other products should have loose-weave netting that is made of natural fiber materials with movable joints between the vertical and horizontal twines. Silt fencing or similar materials that have been reinforced with plastic or metal mesh should be avoided as they impede the movement of terrestrial wildlife species. Studies have	Mountain Valley has stated they would evaluate the use of erosion control devices with plastic or metal mesh reinforcement to determine if alternative devices could be installed in certain terrestrial sensitive areas. Mountain Valley has requested additional information from the NCWRC for specific habitat types along the right-of-way as candidates for wildlife friendly alternatives.
SA-5g	7. Page 3-3. 3.3.1. Existing and Approved Natural Gas Pipeline Systems. The Atlantic Coast Pipeline is located east of the Southgate Project, not west.	The noted discrepancies have been revised in the EIS.
SA-5h	8. Page 3-6. 3.4 Route Alternatives and Variations. In a letter dated 10 August 2018, NCWRC recommended routes variations for the Southgate Project. MVP responded to these recommendations on 1 Nov. 2018. While most recommendations were not incorporated into the route, MVP indicated that they adjusted the route in the Town Creek watershed to reduce the number of stream crossings. We recommend that this adjustment be described in the EIS where appropriate.	Section 4.3.2.2 of the EIS has been updated to include this information.

SA-5	North Carolina Wildlife resources Commission	
SA-5i	9. Page 4-32. 4.3.2.2. Surface Water Crossings. Mussel surveys are not yet complete, therefore NCWRC cannot recommend where time of year restrictions (TOYR) are appropriate. In general, NCWRC recommends more stringent measures to control sedimentation and erosion in watersheds that drain to waterbodies with sensitive species. Such measures include installing sediment control fencing and stabilizing unvegetated fill. Unvegetated fill should be stabilized at the end of each work day with an acceptable erosion control cloth, blanket, or matting until the fill is ready to be permanently stabilized. In addition, no grubbing should occur with 50' of surface waters with sensitive species outside of the growing season (TOYR from Nov. 15 – April 1) to protect mussels from sedimentation impacts.	Aquatic species surveys were completed in 2019 and no state- or federal-listed mussel species were observed. Mussel survey results were submitted to NCWRC in October 2019.
SA-5j		As a standard construction practice, the Project will establish a 50' wetland and waterbody buffer with erosion and sediment control devices. The buffer will not be grubbed during the initial right-of-way clearing and grubbing sequence. These buffers will remain undisturbed (aside from hand felling trees) until the pipeline crossing is ready to be installed in the ephemeral, intermittent, or perennial stream.
SA-5k	10. Page 4-33. 4.3.2.2. Surface Water Crossings. NCWRC may request additional HDD or conventional bore crossings if rare aquatic species are detected during surveys.	Comment noted. See response SA-5i.
SA-5l	11. Appendix B.5. In the table Waterbodies Crossed by the Southgate Project, the crossing method listed is "Open Cut – Dam and pump, Flume". Open cut should be described in section 4.3.2.2 and/or the terminology in the table should be updated. It is unclear if open cut is a dry-ditch crossing method or a wet crossing method.	Waterbody crossing methods are described in Section 2.4.2.1 of the EIS. We have updated appendix B-5 to note the Open-Cuts crossings will be Dry-Ditch crossings.
SA-5m	12. Page 4-38. State Designated Use and Exceptional Waters. Five streams with sensitive warmwater fish are proposed to be crossed using HDD or conventional bore. As long as these five streams are crossed using either HDD or conventional bore, NCWRC does not request a TOYR for warmwater fish.	Comment noted.
SA-5n	13. Page 4-42. Horizontal Directional Drill Water & Page 4-43. Dust Control. NCWRC supports the use of municipal water for HDD, dust control and other uses. More information is needed if surface water supplies will be used. If municipal water has any additives such as chlorine or chloramine or if an algicide is added to the water, it should not be released into surface waters unless it is safe for sensitive species including amphibians and aquatic invertebrates.	See section 4.3.2 of the EIS for a discussion of Mountain Valley's proposed water sources for the Project, water discharge procedures, and measures to minimize impacts from water withdrawal and discharge.
SA-5o	14. Page 4-52. 4.4.2. General Impacts and Mitigation. One of the stated requirements for successful wetland revegetation is that invasive species and noxious plants are not present, unless "they are abundant in adjacent areas" undisturbed by construction. Abundant is not defined and it is unclear if the same species must be present and "abundant" to consider revegetation successful despite the presence of invasive species. Efforts should be made to control invasive species and noxious plants regardless of adjacent conditions.	Mountain Valley has stated it would conduct spot eradications of exotic or invasive species that are found within the right-of-way in numbers substantially greater than those existing pre-construction, regardless of adjacent conditions.

SA-5	North Carolina Wildlife resources Commission	
SA-5p	15. Page 4-52. Extra Workspace Within 50 Feet of Wetlands. Appendix B.3 lists locations where additional temporary workspaces (ATW) are located less than 50 feet from a wetland or waterbody. Many of these ATWs are located 0 feet from the resources. Providing appropriate comments on ATWs within 50 feet of surface water features is not possible given the lack of detailed information provided in Appendix B.3. Maps showing delineated wetlands and waterbodies along with proposed ATWs are needed to provide comments on this aspect of the project.	See comment SA-5d.
SA-5q	16. Page 4-55. 4.5.2. Vegetation Communities of Special Concern or Value. The NCWRC does not have purview over plants that are state listed.	Comment noted.
SA-5r	17. Page 4-62. Pipeline Facilities. The EIS should include seeding details such as specific plant species, seeding rates, composition of each species in plant mixes and location and conditions where different seed mixes would be used.	Mountain Valley would continue to work with NCDEQ and NCWRC on seed mix development to incorporate native and pollinator species for right-of-way stabilization which would be included in the Project-specific E&SC Plan to be reviewed and approved by North Carolina agencies.
SA-5s	18. Page 4-64. Interior Forest Fragmentation and Edge Effects. While we recognize that a large percentage of the Southgate Project will be collocated, there are impacts to interior forests. More detail is needed regarding how the acreage of interior forest and forest edge was calculated. A table showing the acreage of forested blocks affected by the pipeline and the amount of interior forest and forest edge impacted in each block would be helpful.	Section 4.5.4.3 and 4.6.1.1 of the EIS have been updated with additional information provided by Mountain Valley in response to an environmental information request regarding impacts on interior forest.
SA-5t	19. Page 4-65. 4.5.5. Vegetation Conclusions. Concluding that there is "extensive distribution of similar vegetation communities" in North Carolina underestimates the local impacts of the pipeline on interior forests and the wildlife species inhabiting them. We recommend efforts in addition to collocation to mitigate for lost acreage of interior forest.	Interior forests, habitat fragmentation, and impact to wildlife are discussed in detail in section 4.5.4.3 and 4.6.1.1of the EIS. Mountain Valley continues to work with Virginia and North Carolina agencies to address forest fragmentation concerns.
SA-5u	20. Page 4-68. 4.6.1.1. Pipeline Facilities. The DEIS states that direct handling of any state or federally listed species will be prohibited unless approved by the applicable regulatory agencies. NCWRC can have further discussions with MVP regarding conditions and procedures for handling state listed species.	Comment noted.

SA-5	North Carolina Wildlife resources Commission	
SA-5v	21. Page 4-68. 4.6.1.1. Pipeline Facilities. The discussion of interior forest impacts and habitat fragmentation does not adequately address the increase in forest edge or loss of large blocks of interior forest. The NCWRC is concerned about forest fragmentation and the impacts on interior forest and their associated wildlife species resulting from the Southgate Project. North Carolina provides migratory corridors as well as breeding habitat for hundreds of species of birds. The loss of habitat and increased fragmentation will result in edge effect, which will intensify predation, reduce productivity, allow for the spread of invasive species and displace already imperiled species. More information is needed regarding forest block sizes before and after right-of-way (ROW) clearing and mitigative measures to reduce impacts to interior forest habitat.	See response SA-5s ad SA-5t.
SA-5w	22. Page 472. 4.6.2. Sensitive and Managed Wildlife Habitats. In North Carolina, "Game Areas" should be referred to as Game Lands.	Section 4.6.2 has been updated with this change.
SA-5x	23. Page 4-73. 4.6.3.1. Migratory Birds. The last sentence of the fourth paragraph should also include the "NC Wildlife Action Plan as species of greatest conservation need" in the list of conservation priorities. Similarly, Table 4.6-2 should reference NCWRC for species such as northern bobwhite and brown-headed nuthatch.	Section 4.6.3.1 has been updated with these changes.
SA-5y	24. Page 4-75. Migratory Birds Impact and Mitigation. Breeding bird capture data suggest that migratory bird breeding can occur as early as late March and continue through August in the Piedmont in North Carolina. Therefore, we support the recommendation from the US Fish and Wildlife Service that clearing be avoided from April through August to minimize impacts to breeding birds. 25. Page 4-76. Migratory Birds Impact and Mitigation. NCWRC recommends a TOYR for ROW maintenance from April 1 to October 1. This will reduce impacts to nesting wildlife, including reptiles, amphibians and ground-nesting birds.	Mountain Valley would attempt to avoid clearing vegetation between April 1 and August 31 during construction in North Carolina. Mountain Valley has proposed to modify its Plan to not conduct maintenance clearing or mowing of the right-of-way between April 1 and October 15 of any year. If avoiding the migratory bird nesting season during construction-related clearing becomes infeasible, Mountain Valley would consult with the FWS to identify measures to implement to minimize impacts on migratory birds.
SA-5z	26. Page 4-79. 4.6.4.1. Game Species Impacts and Mitigation. The DEIS states that measures to keep all-terrain vehicles (ATV) from using ROWs are discussed in Section 4.9 Transportation. Controlling ATV access to ROWs is an important topic but it is not addressed in Section 4.9. Off-road vehicles and ATVs can impact aquatic resources by driving across and along streams as well as impacting vegetation in riparian zones near streams. Access to streams along maintained ROWs will increase once the Southgate Project is completed.	Mountain Valley would manage unauthorized off-road vehicle (ORV) and ATV use on their operational rights-of-way by adhering to Section VI of Mountain Valley's Plan, which includes measures such as signs, fences/gates, and slash, timber, and boulder barriers. Section 4.9 has been updated to include a discussion of ATV vehicles.
SA-5aa	27. Page 4-80. 4.6.5.2. Fisheries of Special Concern Impacts and Mitigation. NCWRC can participate in future discussions to develop a detailed plan for relocating aquatic species at crossing locations.	Comment noted.

SA-5	North Carolina Wildlife resources Commission	
SA-5ab	28. Page 4-85. Hydrostatic Testing and Water Withdrawals. Text in this section of the DEIS indicates that water will be withdrawn from surface waters. Elsewhere in the DEIS, municipal water sources are listed as the primary or only source of water. This discrepancy needs to be addressed. To prevent entrainment and impingement of aquatic organisms, the NCWRC recommends intake velocities, as measured through the intake screening material, of 0.25 feet per second (fps) or less and mesh sizes of 1 mm in surface waters containing sensitive species.	Section 4.6.5.3 of the EIS has been updated with information regarding water sources for the Project and surface water withdrawals. Mountain Valley has agreed to adhere to these recommendations.
SA-5ac	29. Page 4-92. 4.7.4.5. Mussel Surveys. NCWRC should also be consulted if listed or otherwise sensitive mussel species are documented during surveys.	Aquatic species surveys were completed in 2019 and no state- or federally-listed mussel species were observed.
SA-5ad	30. Page 4-94. Table 4.7-2. Northern Long-eared Bats should be listed in the table as state threatened. Northern yellow bat does not occur in the study area. Records confirmed by biologists of the northern yellow bat are only from Brunswick County. Potential records occur in Mecklenburg and New Hanover counties.	Table 4.7-2 has been updated in the EIS to include this information.
SA-5ae	31. Page 4-95. 4.7.7.1 Mammals. Little brown bats may also occur in Rockingham and Alamance counties.	Section 4.7.7.1 of the EIS has been updated with this information.
SA-5af	32. Page 4-95. 4.7.7.1 Mammals. It is stated that "No roost trees for tri-colored bats occur in the Project area." This statement seems unlikely since in the summer, tri-colored bats have been found to roost in dead clusters of leaves, live foliage, and in hollows in trees.	The text in the EIS has been edited slightly to read that no *known* roost trees are present
SA-5ag	33. Page 4-96. 4.7.7.1 Mammals. Due to the decline of bat populations, specifically those of myotis species and tricolored bats, we feel the project would not significantly impact bats if tree clearing activities were avoided during the maternity roosting season for bats (May 15 – August 15).	As noted in section 4.6.3.2, Mountain Valley would attempt to refrain from construction-related vegetation clearing between March 15 and August 15 in Virginia and between April 1 and August 31 in North Carolina.
SA-5ah	34. Page 4-96. 4.7.7.1 Mammals. Due to the decline of bat populations, specifically myotis species and tricolored bats, we recommend that tree clearing activities not occur during the maternity roosting season for bats (May 15 – August 15). Adhering to this TOYR, which coincides with the TOYR for migratory birds, would enable the project to further avoid significant impacts to bats.	See response SA-5ah.
SA-5ai	35. Page 4-97. 4.7.7.4. Mussels. NCWRC can participate in future discussions to develop a detailed plan for relocating mussels and other aquatic species at crossing locations.	Comment noted.
SA-5aj	36. Page 5-8. 5.1.6. Wildlife and Aquatic Resources. While some fish species may migrate away from impacts, some benthic fish species may not move away and freshwater mussels will not move away from impacts.	See response SA-2d-23.

SA-5	North Carolina Wildlife resources Commission	
SA-5ak	37. Appendix B-5. Waterbodies Crossed by the Southgate Project. This table includes streams that are apparently not crossed by the pipeline because the crossing width is 0 and the crossing method is N/A. The reason for including these stream crossings is unclear. Additional commentary is needed.	The footnotes in appendix B-5 have been revised to clarify that waterbodies with a crossing width of 0 and crossing method of N/A would not crossed by the pipeline, but are located within Project workspaces.
SA-5al	38. Appendix B-8. The justification for locating construction workspace within 15 feet of surface waters is often avoiding side slope construction. Including more details about the side slopes, such as the slope percent, would help justify the decision to locate the construction workspace so close to surface waters. Including the minimum and average distance of the workspace to the waterbody and providing a name for streams would also be beneficial.	Additional justification was provided by Mountain Valley and incorporated into appendix B.8.

Re: MVP Southgate Project, Construct Interstate Pipeline, Multi County, ER 18-1041

Dear Ms. Bose:

SA-6a	We have reviewed the draft environmental impact statement for the proposed Southgate Project. The document adequately addresses our concerns about archaeological resources in North Carolina.	Comment noted.
SA-6b	We previously reviewed the revised Plan for Unanticipated Discoveries of Historic Properties and Human Remains for the MVP Southgate Project as appendix 4-C to Resource Report 4. We concur that this plan provides adequate protection for unexpected discoveries that may occur during construction.	Comment noted
SA-6c	We note that listed communications and survey results represent data available up to the early months of 2019 and we look forward to reviewing the updated EIS. Since then, we reviewed the revised architectural survey report and an addendum to that report resulting in changes that will need to be reflected in Table 4.10-11, *Historic Sites Identified by Mountain Valley in the Direst APE of the Southgate Project in North Carolina.*	Table 4.10-11 has been updated in the EIS.
SA-6d	Our responses to those reports were issued on June 18, 2019 and July 22, 2019, respectively. We have enclosed a copy of the table with our edits highlighted. Also, when referencing survey site numbers (SSN) please list all four numerical digits including leading zeros; for example, AM0122.	Comment noted.

The above comments are made pursuant to Section 106 of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Regulations for Compliance with Section 106 codified at 36 CFR Part 800.

Thank you for your cooperation and consideration. If you have questions concerning the above comment, contact Renee Gledhill-Earley, environmental review coordinator, at 919-814-6579 or environmental.review@ncdcr.gov. In all future communication concerning this project, please cite the above referenced tracking number.
Sincerely,

Renee Gledhill-Earley

for Ramona Bartos, Deputy
Deputy State Historic Preservation Officer

TA-2 City of Burlington

City of Burlington

Robert C. Patterson, Jr., P.E.
Water Resources Director

September 16, 2019

Kimberly D. Bose, Secretary
Federal Regulatory Energy Commission
888 First Street, NE, Room 1A
Washington, DC 20426

RE: OEP/DG2E/Gas3
Mountain Valley Pipeline, LLC
Southgate Project
Docket No. CP19-14-000
Draft Environmental Impact Statement

Dear Secretary Bose:

TA-2a

Upon review of the Draft Environmental Impact Statement (DEIS) prepared by FERC regarding the MVP Southgate Project and on behalf of the City of Burlington, I submit concerns regarding the routing of the MVP Southgate Project. As planned, the pipeline will cross the City-owned Stoney (also spelled Stony) Creek Reservoir - a source of drinking water for nearly 100,000 citizens in Alamance and Guilford counties, including the City of Burlington, the Town of Gibsonville, the Town of Elon, the Town of Haw River, the Village of Alamance, the Town of Ossipee, the Town of Whitsett, as well as a supplemental source to the City of Greensboro and an emergency source for the City of Graham.

1) Following a presentation by MVP representatives to the Burlington City Council on August 20, 2018, the following graphic illustrating a proposed alternative route was prepared by the City of Burlington Engineering Department and presented to MVP on September 6, 2018 for its consideration. The blue shaded area to the north is Lake Cammack and the blue shaded area to the south is Stoney Creek Lake. Water flows from Lake Cammack via Stoney Creek to Stoney Creek Lake and our drinking water intake is located on the southern end of Stoney Creek Lake. The orange line to the south is an approximation of the proposed route of the pipeline, and the green line to the north indicates a possible alternative route.

The proposed route of the pipeline as shown in the DEIS crosses a section of the lake approximately 304 feet wide in the upper reach of Stoney Creek Reservoir just south of NC HWY 62 at approximately MP 63.6 (page 4-33). As noted in Section 4.3.2.4 for the DEIS (page 4-38), the City has requested that the pipeline "not cross city property." Specifically, per our September 6, 2018 submittal, the City of Burlington has requested that the pipeline be routed north of NC HWY 62 such that it crosses the portion of Stoney Creek that runs between Lake Cammack and Stoney Creek Lake, both City-owned drinking water supply sources. This location would not directly cross under the water supply and, would have a narrower crossing on the

See section 3.4.2.6 of the EIS. We evaluated the requested alternative and determined that it would not provide a significant environmental advantage due to the fact that the alternative route would cross through an area that is heavily residential and would be within 25 feet of several residences. Due to the residential nature of the proposed alternative, we conclude that it does not offer a significant advantage to the proposed Southgate route. Section 4.1.4.9 of the EIS provides information regarding the HDD crossing, potential impacts on the Stony Creek Reservoir, and Mountain Valley's mitigation measures to minimize impacts. Based on our review, we conclude that subsurface conditions identified by the geotechnical studies would not render the HDDs infeasible. We conclude that potential impacts from HDD construction and potential inadvertent releases would not be significant.

TA-2	City of Burlington	
TA-2a	creek rather than the lake. The City of Burlington does not own the land along Stoney Creek running between Lake Cammack and Stoney Creek Reservoir. Unfortunately, MVP has not responded to this request leaving the City with concerns regarding potential impact to the water supply. Without sufficient detail to review the potential physical and environmental impacts effects upon the City of Burlington's drinking water reservoir, we are concerned that this crossing could adversely impact the integrity of the reservoir, water quality, and recreational activities.  ***The City of Burlington hereby requests and strongly encourages MVP and FERC to realign the pipeline so that it does not cross a City-owned water supply reservoir, including the above suggested routing or reconsideration of alternative routes presented in Section 3.4 the DEIS (pages 3-6 to 3-11), the Lake Cammack East and North-South Alternatives. Each of these routes would minimize risk to drinking water supplies.***	The Stony Creek Reservoir intake is located approximately 1.8 river miles downstream of the Project's proposed HDD crossing. Mountain Valley representatives met with the City of Burlington officials on November 23, 2019 to discuss the crossing and will continue to coordinate during construction.
TA-2b	2) Stoney Creek Reservoir is also part of the Burlington's Recreation and Parks System (http://burlingtonnc.gov/218/Lakes-Marinas) with various types of outdoor recreation activities available to residents. Without sufficient detail to review the potential physical and environmental impacts effects upon the City of Burlington's drinking water reservoir, we are concerned that this crossing could adversely impact the integrity of the reservoir, water quality, and recreational activities.	Impacts on recreational and special use lands are discussed in section 4.8.4. Also, see response to TA-2a above.

TA-2	City of Burlington	
TA-2c	3) Regarding the proposed alignment, it is noted (pages 4-14, 4-15) only one geotechnical boring near the Stoney Creek Reservoir was completed and that the proposed horizontal directional drilling (HDD) method of crossing of the reservoir is expected to be within bedrock and "A proposed depth of cover of 50 to 55 feet below ground surface would be maintained between the Stoney Creek Reservoir and the proposed alignment." The location of the single boring is not indicated, nor is it clear if the above statement means the HDD crossing will be 50 to 55 feet below the bottom of the reservoir, or 50 to 55 feet below the ground surface at the boring location, which could bring the HDD crossing significantly closer to the bottom of the reservoir, increasing the risk of compromising the reservoir bottom. Further, the City of Burlington requests copies of data requested by FERC on DEIS page 4-15 relating to "… all outstanding geotechnical studies for the proposed … Stoney Creek Reservoir HDD crossings, revised feasibility and hydrofracture analyses, and any proposed mitigation following the completion of these studies."	As stated in Section 4.1.4.9, a proposed depth of cover of 50 to 55 feet bags would be maintained between the Stony Creek Reservoir and the proposed alignment. Mountain Valley's Geotechnical Report of Subsurface Exploration is available on the FERC elibrary using accession number 20191216-5158.
TA-2d	4) Although according to Section 4.3.3.3 and 4.3.3.4 (pages 4-76 & 4-77) indicates that there are no known bald eagle concentration areas or nesting areas within the project, City of Burlington staff have reported numerous bald eagle sightings at both Lake Cammack and Stoney Creek Reservoir over the last several years. We request that care and diligence be taken when performing pre-construction nest surveys to minimize any impacts to these populations. Thank you for your time and consideration of these concerns. Sincerely, Robert C. Patterson, Jr, PE Water Resources Director City of Burlington.	As noted in section 4.6.3.4, there are no currently documented bald eagle nests within 0.5 mile of the Project footprint. Mountain Valley would conduct pre-construction surveys for bald eagles and file results of the surveys with FERC.

NAT-2	Sappony Tribe

CULTURAL HERITAGE PARTNERS
LAW • POLICY • STRATEGY

September 16, 2019

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

RE: Sappony Tribe's Response to the Draft Environmental Impact Statement (EIS) for the Southgate extension of the Mountain Valley Pipeline Associated with Docket Nos. CP19-14-000 and PF18-4-000

Dear Secretary Bose:

As you know, my law firm represents the Sappony Tribe ("Sappony") concerning the Mountain Valley Pipeline Southgate extension. This letter summarizes the Tribe's response to the Draft Environmental Impact Statement (EIS) for the project. The Tribe has already submitted extensive comments on the docket, including a privileged letter filed on July 1, 2019 regarding the cultural resources reports.

NAT-2a

The Draft EIS does not provide an accurate summary of Siouan linguistic affiliations, the Tribe's pre-Contact history, its post-Contact history, or its association with the project area. Additionally, the Tribe has a series of requests regarding the cultural resources and other project impacts that have gone unaddressed. These comments on the Draft EIS summarize these concerns as well as concerns about the environmental and socioeconomic impacts of the project.

For these reasons and those set forth below, the Tribe asserts its right to consult with FERC. To this end, this letter requests additional documents needed for the Tribe to understand fully the project's purpose, scope, and need, in addition to all potential adverse environmental effects, along with alternatives that will avoid, minimize, or mitigate those effects.

1. **The Draft EIS mischaracterizes the history and linguistic relationships of the Virginia Siouan tribes.**

NAT-2b

As the Tribe discussed in the privileged letter on the docket filed on July 1, 2019, several of the cultural resource reports underpinning the EIS mischaracterize the history and relatedness of the western Virginia Siouan tribes. The analysis in these sections is deeply flawed and mischaracterizes Sappony and other Virginia tribes' historical associations with and contemporary relationship to the project area. Furthermore, these reports do not acknowledge or discuss the close relationship between the Sappony Tribe and the Cheraw (also spelled Saura or Saraw) in the Piedmont in both northern North Carolina and Virginia.

Within the cultural resources reports for North Carolina and Virginia are Ethnographic Analyses intended to describe tribal historic movements and assess contemporary interests in the

NAT-2a	Section 4.10.3.1 of the EIS briefly summarizes the Pre-Contact, Post-Contact, and linguistic affiliations of the Sappony Tribe. Our description was accurate and based on appropriate anthropological and ethnohistorical references. The EIS text states that the Sappony probably spoke a dialect within the Siouan-Catawaban language family (Woodard et al. 2017). The Late Woodland and Protohistoric cultural traditions of southern Virginia and northern North Carolina are characterized by archaeologists as the Dan River and Saratown Phases (Eastman 1999). John Lederer visited the Sappony in 1670 (Briceland, 1987).
NAT-2b	See response to NAT-2a. With regard to Sappony trade relations with the Saura, the EIS text states that the Occaneechi Path trade route connected tribes in Virginia to tribes in North Carolina. Comments regarding Mountain Valley's cultural resources reports is not relevant to our descriptions in the EIS. The EIS accounts for anthropological scholarship, and in fact cites Hantman 2018.

NAT-2	Sappony Tribe	
NA-2b	project area. These Ethnographic Analyses largely characterize the project area in Pittsylvania, Alamance, and Rockingham Counties as associated with the ancestors of the Catawba Indian Nation and state-recognized North Carolina tribes. For example, the Occaneechi Path, a significant north-south trade route that travels through the project area associated with Monacan and Sappony trading towns and other Tutelo-Saponi communities like Occaneechi Town, is mentioned in the "European Settlement to Society" Cultural Background section but associated solely with the Occaneechi Band of Saponi Nation. The Ethnographic Analysis section mentions briefly that the path "linked south-central Virginia with the Catawba and other groups to the south and the area surrounding Richmond to the north" as early as the 1670s and that European traders traveled on the path. The report fails to acknowledge any Monacan or other Tutelo-Saponi associations with this path. Eighteenth century tribal names, such as the Eno, Occaneechi, and Shakori tribes (in the Eno River drainage), the Cheraw Indians (on the Dan River), the Sissipahaw (on the Haw River), and the Occaneechi, Tutelo, and Saponi tribes (associated with the Gaston culture on the Roanoke River) are generally described in the Ethnographic Analysis as having been later incorporated into the Catawba Indian Nation. The Sappony do not challenge that the Catawba have interests in the pre-Contact cultural resources of this area, but not all members of the piedmont tribes did so, and there are cultural distinctions between the remnant Virginia Siouan groups and the Catawba. It is not the case that the Catawba are the only federally-recognized tribe with a strong connection to the project area, or that FERC should assume that the Catawba claim is stronger than the Monacan one. The Draft EIS disregards the accepted body of contemporary, antiquarian, and early anthropological scholarship that underlines the familial and clan linkages between the Tutelo-Saponi and Monacan groups, and instead assumes that the Catawba tribe is the primary federally-recognized tribe affiliated with this area. Jeffrey Hantman's 2018 book *Monacan Millennium: A Collaborative Archaeology and History of a Virginia Indian People* (p. 143-148), for example, concludes that beginning in the mid-18th century several colonial Monacan trading towns and settlements in the Roanoke River Valley were linked to others along the Occaneechi path. Extensive evidence links the Tutelo-Saponi groups with the Monacan Confederacy. The Bureau of American Ethnology publication *Indians of the South East* clearly identifies the Saponi as a contraction of Monasukapanough, a Saponi town within the Monacan confederacy, located near present-day Charlottesville. The book *The Tutelo Spirit Adoption Ceremony*, by Frank G. Speck and George Herzog, similarly describes the relatedness of these groups in contrast to some of the Sioan groups further south. The book states: "The eastern Siouans must be sharply separated into two groups, the Virginia Siouans, including the Manahoac, Monacan, Nahyssan, Saponi, Tutelo, Occaneechi, and Moneton, and the Carolina Siouans embracing all the rest. Even a superficial comparison of the Tutelo and Catawba vocabularies on one hand and the western dialects on the other is sufficient to show that Catawba stands clearly apart from all of them, and that Tutelo is nearer Dakota, Hidatsa, and others of the western languages than it is to Catawba" (page 1). While the Tribe does not dispute that fragments of some Tutelo and Saponi groups migrated north or south in the 18th century, it is not the case that the Catawba is the only federally-recognized tribe with a strong connection to the project area, or that the Catawba claim should be assumed to be stronger than the Monacan one.	See above NA-2b comment response

NAT-2	Sappony Tribe	
NA-2b	Erroneous conclusions regarding tribal history and Siouan identity have resulted in a flawed tribal affiliation analysis in the cultural resources reports that is replicated in the Draft EIS. Ethnographic Analyses in previous cultural resource reports largely characterize the project area in Pittsylvania, Alamance, and Rockingham Counties as associated with the ancestors of the Catawba Indian Nation and state-recognized North Carolina tribes. The Draft EIS furthermore incorrectly characterizes the Monacan people as not linguistically Siouan. Nevertheless, the Draft EIS then uses this incorrect linguistic characterization and a restricted assessment of Monacan ancestral territory to minimize Monacan affiliation with the project area. While the EIS states that "[w]e believe that the Nottoway Tribe, Sappony Tribe, and Occaneechi Band have a demonstrated interest in the cultural resources of the Project area; and, therefore, they could be consulting parties," it does not include any language affirming Monacan demonstrated interest in the cultural resources. The Sappony Tribe is glad that FERC recognizes the clear cultural association between the Sappony and the project area, but disputes the FERC characterization of the Monacan. The Saponi and the Monacan had an extremely close relationship during prehistory, based on linguistic, familial, and political connections. This EIS casts doubts on Monacan statements regarding affiliation and cultural interest, which are dismissed as mere assertions, as seen in the following statements from the EIS: • "In a letter to the FERC dated July 1, 2019, the Monacan Indian Nation asserts that the Occaneechi Path trade route connected Monacan villages with Tutelo-Sapponi communities such as Occaneechi Town." (Draft EIS page 4-162); and • "The Monacan Indian Nation asserts that Hantman (2018) believes that the Hurt Power Plant site (44PY144) and the Graham-White site (44RN21) are probably associated with the Monacan." (Draft EIS page 4-162). The Sappony Tribe supports these assertions by the Monacan Indian Nation, as does the preponderance of scholarly work on this topic. Letters submitted by both the Sappony Tribe and the Monacan Indian Nation have cited sources that contained evidence regarding these topics, and FERC and the Mountain Valley Pipeline contractors have had every opportunity to directly investigate these questions of affiliation. The EIS and the underlying cultural resources reports must be improved with greater research into these topics, reflecting the following widely-accepted characterizations: 1. The Monacan were linguistically and socio-politically Siouan and are related to the Sappony Tribe. 2. The Sappony interest in the project area includes their relationship with the Upper and Lower Sauratown sites, and several Sappony families have Cheraw descent. 3. Siouan tribes in Virginia engaged in kin-based alliance systems and confederacies supported by a mutually-intelligible language. Tribal history and ceramic patterns suggest an intermarriage system in which the core tribes of central Virginia had a Monacan pattern of ceramic decoration and other site patterns, and the Roanoke Valley was a distinct but related group, with occasional appearance of Monacan-style ceramics suggestive of regular kin exchange, trade, and alliances. 4. Most Virginia Siouan tribe names other than Monacan and Mannahoac (e.g., Saponi, Tutero, Nahyssan, Occaneechi) are not referenced until 1650 or later. There is therefore considerable ambiguity regarding whether these tribes had a strongly separate pre-Contact identity; whether they were family or village names within the Monacan Confederacy pre-Contact; or whether they are post-Contact sub-groups that formed around migration or distinctions in trade practices.	See above NA-2b comment response

NAT-2	Sappony Tribe	
NA-2b	5. During the 17th-18th centuries, Virginia tribes experienced colossal loss of native population and disruption of lifeways as a result of European colonialism. Several of the Virginia Siouan groups traveled west and south to remain on the frontier with minimal contact with settlers. There was considerable bifurcation and amalgamation of tribal groups as necessitated for survival. 6. Because of these factors, modern Virginia Siouan tribes (like many other tribes) are commonly made up of more than one historic tribe, have a variety of consultation interest areas, and have individuals within these tribes who understand themselves to have a descendancy from multiple Virginia Siouan groups. Detailed and accurate examinations of native history are essential, especially when assessing impacts of infrastructure projects to native peoples, especially for tribes that still experience a lack of acknowledgement or recognition from the federal government, and especially when projects propose to damage native sites.	See above NA-2b comment response
NAT-2c	2. **The Sappony Tribe's relationship with the Cheraw tribe is well-documented and has clear implications for the project area.** European expansion caused repeated coalescence and splintering of tribal groups during the 17th and 18th centuries that continues to impact how tribes experience their ancestral relatedness to cultural resources. One of the tribes with a historical and contemporary connection with the Sappony Tribe is the Cheraw, who occupied the project area around Eden, North Carolina in settlements known as Upper and Lower Saratown. In 1715, the Eno and Saraw (Cheraw) tribes petitioned the state of Virginia to be allowed to settle at Fort Christanna with the Saponi, and the Indians who resided in the fort for its short-lived existence became known collectively as the Saponi (see Woodard 2016; Beaudry 1985). Stephanie Gamble's 2013 article in Native South, *A Community of Convenience: The Saponi Nation, Governor Spotswood, and the Experiment at Fort Christanna, 1670-1740*, similarly discusses these tribal complexities. Gamble characterizes the Cheraw, Saponi, and other groups as intimately connected. This follows directly from the work of James Merrell, whose well-recognized THE INDIANS' NEW WORLD: CATAWBAS AND THEIR NEIGHBORS FROM EUROPEAN CONTACT THROUGH THE ERA OF REMOVAL states that a "From Esaws along the Catawba River to Mannahoacs on the Rappahannock, all were descended from Siouan-speaking migrants who had drifted over the mountains centuries before Columbus…These societies were variations on a common theme. A fundamental unity underlay piedmont life, a unity grounded in a shared cultural heritage and physical environment. All spoke Siouan. All built towns on terraces above the rivers and creeks" (Merrell 2009: 10). In May 1732, Saponis and some Cheraw families petitioned Virginia Governor Gooch to return to Virginia, and they were permitted to settle again on the Appamattox or Roanoke River. Merrell attributes this discomfort of the Saponis with the Catawbas as indicative of the differences between Virginia Siouan and those further south, commenting that "Though Siouan-speakers and piedmont peoples, Saponis were descended from the Monacan and Mannahoac stock, branches quite distinct in speech and custom from their southern cousins. It would appear, then, that Catawbas could incorporate small and culturally variant peoples, a Natches or Yamasee band, or sizeable groups that were close relatives, like Cheraws and Waterees, but that large and foreign populations proved more difficult" (Merrell 2009: 116). Furthermore, these Cheraw families appear to have found a home among the Sappony Tribe, because the tribe's Executive Journals (v. 4, page 269) state that the Cheraw formally joined the Sappony in 1732. Rather than melding entirely with the Saponi identity, Sappony Tribe members today maintain a family genealogy that includes information about relatedness to the Cheraw and other incorporated Siouan tribes located along the Virginia and North Carolina border. Because of this, the Tribe is especially concerned with having a high level of detail about any archaeological investigations in the vicinity of Upper and Lower Saratown. The Tribe also wants this tribal connection made clear in cultural resources reports and the EIS. If additional information is needed on this subject, the Tribe invites FERC and TRC to contact the Tribe.	See response NAT-2b.

NAT-2	Sappony Tribe	
NAT-2d	**3. The Tribe requests that their broader questions regarding the cultural resources, stated in July 2019, be acknowledged and addressed.** As the Tribe pointed out in its July 2019 comments, there is a considerable body of contemporary, antiquarian, and early anthropological scholarship that underlines the familial and clan linkages between the Saponi, Monacan, and other Siouan groups. FERC's Ethnographic Analysis underplays the clan and familial associations between Tutelo, Saponi, and Monacan sites, language, and culture, and implies that all the descendants of these grounds are now incorporated within the Catawba or state-recognized North Carolina tribes. The Tribe made requests in July 2019 based on the need to correct inaccuracies in the cultural resources reports. These requests were not acknowledged or addressed, and the requests are also highly pertinent to addressing issues in the Draft EIS. The Tribe again requests that: A) The cultural resources consultant address deficiencies in the Cultural Background and Ethnographic Analysis sections, specifically the way in which these reports mischaracterize Siouan history and treats information on native history as largely useful for determining tribal affiliation rather than incorporating it into the context of the broad swath of history impacted by the project; B) The consultants incorporate into their analysis, which currently relies too heavily on information written before 2000, a variety of sources and texts related to Sappony and Siouan pre- and post-Contact history; C) The consultants perform oral history interviews with local tribes, to illuminate the several centuries of native life and movements currently not covered by these reports and to rectify a lack of reference to native persistence in these areas after 1780; D) The Tribe receive ongoing and active communication regarding planned archaeological testing on pre-Contact sites, especially those in Pittsylvania County; E) Survey reports assessing the eligibility of architecture along the pipeline include information typical for Phase II investigations, such as deed research, which is essential for determining the potential native affiliation or a site's potential eligibility under Criteria A or B; and F) The Tribe receive a call from TRC to discuss the material contained in this letter, so that the Tribe can provide any clarification that may be required. Thus far, the Tribe has received no contact from FERC or TRC regarding these other requests, and the Draft EIS does not reference most of these concerns. Moreover, the Tribe has not been updated regarding the archaeological testing and further work except for one proposed site visit, which was planned by the project proponents on a site that had only been subject for testing for a few days, and which was selected because of ease of access rather than significance to tribes. Furthermore, the Tribe has previously and repeatedly asked for more details on the environmental impact of this project, but has not received materials related to these issues. None of the other requests have been acknowledged or addressed. The Tribe now reiterates these requests be addressed before FERC finalizes the Draft EIS.	See response NAT-2b.

NAT-2	Sappony Tribe	
NAT-2e	**4. The Tribe has environmental and socioeconomic concerns regarding the project.** The Sappony Tribe is located today in High Plains, North Carolina and Virgilina, Virginia, around 70 miles from the pipeline route. Many tribal members are Virginia and North Carolina residents and taxpayers with concerns regarding the pipeline impacts, which tree clearing, impacts to animal species, risks to water quality from sediment discharge and other effluents from construction; and visual effects to a long area of most rural, natural terrain. The Tribe is also concerned about the safety concerns for explosions or fires set off by the pipeline construction or occurring for the life of the project. FERC must include information about the blast or incineration zone radius on either side of the pipeline so that FERC, the Tribe, and the public can understand the full potential for adverse effects.	See response GEN-1 in appendix I.2. Impacts on water resources is discussed in Section 4.3 of the EIS; vegetation in 4.5, and wildlife in 4.6
NAT-2f		See response SAFE-1 in appendix I.2.
NAT-2g	The Tribe also must emphasize the poor track record of this project proponent on previous projects including the Mountain Valley Pipeline mainline, which has been beset by problems that include: • inadequate sediment control plans resulting in considerable sediment fines; • permanent damage to critical historic resources like the Appalachian Trail; and • causation of landslides that endanger residences in West Virginia.	See response GEN-6 in appendix I.2.
NAT-2h	Furthermore, explosions associated with pipeline infrastructure in West Virginia (TransCanada's Leach Xpress Pipeline), Washington (Plymouth LGN storage facility) and Massachusetts (Columbia Gas Pipeline) illustrate the level of impact and harm these events can have. In the Columbia Gas example, one man lost his life, approximately 80 homes and buildings were destroyed, 8,600 people were evacuated, and a state of emergency was declared.	See response SAFE-1 in appendix I.2.
NAT-2i	The Draft EIS for the Southgate project acknowledges that hazards to the project include seismicity, karst topography, landslides (exacerbated by the need for blasting to shallow bedrock in some areas), flooding, and erosion. The document also acknowledges that the project will cross two state level aquifers, both of which are suitable for drinking, and will cross near a variety of private wells, and states that the project poses risks to the water quality in these water sources.	See response GEN-1 in appendix I.2.
NAT-2j	Although FERC currently characterizes the adverse environmental impact as moderate and states that adjustments could reduce these impacts to less-than-significant levels, the Tribe points out that given the previous track record of EQT, it is equally or more likely that the adverse impacts become significantly more substantial than the Draft EIS predicts. For this reason, the Tribe requests that FERC develop a plan to assess and review these impacts and establish periodic monitoring to determine whether impact levels and appropriate mitigation approaches have changed. The Tribe looks forward to assisting FERC on ongoing cultural resources identification and mitigation associated with the Southgate project as the consultation process moves forward. Thank you for consideration of our comments. Best regards, Marion F. Werkheiser Marion Werkheiser Attorney at Law	See response GEN-6 in appendix I.2. To ensure compliance with these standards, Mountain Valley has agreed to a FERC third-party monitoring program. FERC Compliance Monitors would inspect the project daily to ensure compliance during all phases of construction and restoration. If the Project is determined to be out of compliance, Mountain Valley would be required to remedy the situation as soon as possible.

RE: Monacan Indian Nation's Response to the Draft Environmental Impact Statement (EIS) for the Southgate extension of the Mountain Valley Pipeline Associated with Docket Nos. CP19-14-000 and PF18-4-000

Dear Secretary Bose:

As you know, my law firm represents the Monacan Indian Nation ["Nation"] concerning the Mountain Valley Pipeline Southgate extension. This letter summarizes the Nation's response to the Draft Environmental Impact Statement (EIS) for the project. The Nation has submitted extensive comments on the docket, including a privileged letter filed on July 1, 2019 regarding the cultural resources reports.

NAT-4a

The Draft EIS does not provide an accurate summary of the Nation's pre-Contact history, its linguistic affiliation, its post-Contact history, or its association with the project area. Additionally, FERC has not addressed a series of requests from the Nation regarding the cultural resources and other project impacts. The following comments on the Draft EIS summarize these concerns as well as concerns about the environmental and socioeconomic impacts of the project.

For these reasons and those set forth below, the Nation asserts its right to consult with FERC. To this end, this letter requests additional documents needed for the Nation to understand fully the project's purpose, scope, and need, in addition to all potential adverse environmental effects, along with alternatives that will avoid, minimize, or mitigate those effects.

Section 4.10.3.1 of the EIS briefly summarizes the Pre-Contact, Post-Contact, and linguistic affiliations of the Monacan Indian Nation. Our description are accurate and based on appropriate anthropological and ethnohistorical references. The EIS addresses previous letters filed by the Monacan Indian Nation in Section 4.10.1.2.

NAT-4	Monancan Nation	
NAT-4b	**1. The Draft EIS dismisses Monacan interest in the Southgate area, minimizes Monacan history in western Virginia, and mischaracterizes the tribe's linguistic affiliation.** As the Nation discussed in the privileged letter on the docket filed on July 1, 2019, several of the cultural resources reports underpinning the EIS mischaracterize Monacan historical associations with and contemporary relatedness to the project area. The analysis in these sections is deeply flawed and they have resulted in a conclusion in the Draft EIS that ignores impacts of the project on the Monacan Indian Nation. Within the cultural resources reports for North Carolina and Virginia are Ethnographic Analyses intended to describe tribal historic movements and assess contemporary interests in the project area. These Ethnographic Analyses largely characterize the project area in Pittsylvania, Alamance, and Rockingham Counties as associated with the ancestors of the Catawba Indian Nation and state-recognized North Carolina tribes. The EIS furthermore incorrectly characterizes the Monacan people as not linguistically Siouan, and appears to use this linguistic characterization and a restricted assessment of Monacan ancestral territory to minimize Monacan affiliation with the project area. The Draft EIS is incorrect in its statement that the "Monacan and Manahoac had no demonstrated linguistic affiliation with the Siouian language family." The Monacan tribe self-identifies as Siouan and tribes like the Sappony Tribe recognize an association with the Monacan based on participation with the Monacan confederacy and Siouan linguistic and political affiliation. The Monacan/Mannahoac language does not survive, but linguistic sources seem to characterize it as related to Tutelo, the Siouan Saponi language. Sources that dispute the Monacan Siouan affiliation do not appear to have an alternate linguistic history for the Monacans or to dispute their political and trade connections with other eastern Siouan groups that may be representative of a cultural affiliation. Nevertheless, the Draft EIS then uses this incorrect linguistic characterization and a restricted assessment of Monacan ancestral territory to minimize Monacan affiliation with the project area. While the EIS states that "[w]e believe that the Nottoway Tribe, Sappony Tribe, and Occaneechi Band have a demonstrated interest in the cultural resources of the Project area; and, therefore, they could be consulting parties," it does not include any language affirming Monacan demonstrated interest in the cultural resources. Furthermore, Monacan statements regarding affiliation and cultural interest (based on a broad set of information that includes tribal information and scholarly work) are dismissed as assertions, as seen in the following statements from the EIS: • "In a letter to the FERC dated July 1, 2019, the Monacan Indian Nation asserts that the Occaneechi Path trade route connected Monacan villages with Tutelo-Sapponi communities such as Occaneechi Town." (EIS page 4-162) • "The Monacan Indian Nation asserts that Hantman (2018) believes that the Hurt Power Plant site (44PY144) and the Graham-White site (44RN21) are probably associated with the Monacan." (EIS page 4-162)	Section 4.10.3.1 of the EIS provides information from sources recommended by the Monacan Indian Nation. There is no conclusion in the Cultural Context. Instead, we discuss potential Project impacts on the Monacan Indian Nation in Section 4.10.1.2. Archeological sites that may be important to the Nation are mentioned in Section 4.10.3.3. The Nation's comments regarding Mountain Valley's cultural resources reports is not relevant to the EIS; nor does the EIS contain an "Ethnographic Analysis." The quote that: "The Monacan and Manahoac had no demonstrated linguistic affiliation with the Siouian language family, but did have political and trade associations with the Tutelo, Sapponi, and Occaneechi" is taken from Woodard et al., 2017, a source recommended by the Monacan Indian Nation in its July 1, 2019 letter to the FERC. Further, Section 4.10.2.1 of the EIS acknowledged that the Monacan occupied the piedmont region of Virginia at contact.

NAT-4	Monancan Nation	
NAT-4b	Letters submitted by both the Sappony Tribe and the Monacan Indian Nation have cited sources that contained evidence regarding these topics, and FERC and the Mountain Valley Pipeline contractors have had every opportunity to directly investigate these questions of affiliation. Jeffrey Hantman's 2018 book Monacan Millennium: A Collaborative Archaeology and History of a Virginia Indian People (p. 143-148), for example, concludes that beginning in the mid-18th century several colonial Monacan trading towns and settlements in the Roanoke River Valley were linked to others along the Occaneechi Path. There is extensive evidence linking the Tutelo-Saponi groups with the Monacan Confederacy: The Bureau of American Ethnology publication Indians of the South East clearly identifies the Saponi as a contraction of Monasukapanough, a Saponi town within the Monacan Confederacy located near present-day Charlottesville. The Southgate project crosses part of a larger Monacan confederacy, described in a variety of sources including on the tribe's website, in which the Monacan and related Siouan groups continued to operate after the arrival of European colonists. Monacan families were part of the Indian occupation at Fort Christanna, and once the Monacan tribe developed a permanent settlement in Amherst, some members of the Saponi, Occaneechi, Tutelo, and Tuscarora Indians joined with the Monacans there and become part of the contemporary Monacan tribe. This inter-related nature of these Eastern Siouan groups was noted in a 2011 Cultural Affiliation Statement for the New River Gorge National River and Gauley River National Recreation Area prepared by Robert Maslowski for the Northeast Region NAPGRA Program of the National Park Service. Maslowski's report states that "[both] Hantman (2001) and Houck and Maxham (1993) include the Tutelo, Saponi, and Occaneechi under the term Monacan," and characterizes the Eastern Siouan associations as extending west into West Virginia, though the report was written before the Monacan Indian Nation received federal recognition and therefore does not note that they are a relevant federally-recognized tribe. The 19th century persistence of the Monacan in western Virginia is described in some more recent academic work like Rainville 2018 (Invisible Founders: How Two Centuries of African American Families Transformed a Plantation into a College) and Hantman 2018 (p. 150-156). A footnote in the Draft EIS did acknowledge that the Monacan people "have political and trade associations with the Tutelo, Sapponi, and Occaneechi," but chooses to base its determination of cultural relatedness on the flawed conclusion that there was no Monacan linguistic relationship with the Virginia Siouan groups. The Tutelo Spirit Adoption Ceremony, by Frank G. Speck and George Herzog, similarly describes the relatedness of these groups in contrast to some of the Siouan groups further south. The book states that: "the eastern Siouans must be sharply separated into two groups, the Virginia Siouans, including the Manahoac, Monacan, Nahyssan, Saponi, Tutelo, Occaneechi, and Moneton, and the Carolina Siouans embracing all the rest. Even a superficial comparison of the Tutelo and Catawba vocabularies on one hand and the western dialects on the other is sufficient to show that Catawba stands clearly apart from all of them, and that Tutelo is nearer Dakota, Hidatsa, and others of the western languages than it is to Catawba" (page 1). While the Nation does not dispute that fragments of some Tutelo, Saponi, and Monacan groups migrated north or south in response to existential threats, it is not the case that the Catawba are the only federally-recognized tribe with a strong connection to the project area, or that the Catawba claim should be assumed to be stronger than the Monacan one.	See above NAT-4b comment response

NAT-4	Monancan Nation	
NAT-4b	The Ethnographic Analysis underplays the clan and familial associations between Tutelo, Saponi, and Monacan sites, language, and culture, and implies that all the descendants of these grounds are now incorporated within the Catawba or state-recognized North Carolina tribes. Eighteenth century tribal names, such as the Eno, Occaneechi, and Shakori tribes (in the Eno River drainage), the Sara Indians (on the Dan River), the Sissipahaw (on the Haw River), and the Occaneechi, Tutelo, and Saponi tribes (associated with the Gaston culture on the Roanoke River) are generally described in the Ethnographic Analysis as having been later incorporated into the Catawba Indian Nation. The Monacans do not challenge that the Catawba have interests in the pre-Contact cultural resources of this area, but are aware of their own relatedness to this area and perceives a minimization or exclusion of Monacan ancestral interests in the content of the cultural resources reports and the Draft EIS. The Monacan Indian Nation is aware that several families and groups of the Tutelo and Saponi people were incorporated into the Monacan Indian Nation, and these deficiencies in the record combine to erase important Monacan associations with this area.	See above NAT-4b comment response
NAT-4c	The EIS and the underlying cultural resources reports must be improved with greater research into these topics, reflecting the following widely-accepted characterizations: 1. The Monacan were linguistically and socio-politically Siouan and are related to the Sappony Tribe and other Siouan tribes along the North Carolina/Virginia border. 2. Siouan tribes in Virginia engaged in kin-based alliance systems and confederacies supported by a mutually-intelligible language. Tribal history and ceramic patterns suggest an intermarriage system in which the core tribes of central Virginia had a Monacan pattern of ceramic decoration and other site patterns, and the Roanoke Valley was a distinct but related group, with occasional appearance of Monacan-style ceramics suggestive of regular kin exchange, trade, and alliances. 3. Most Virginia Siouan tribe names other than Monacan and Mannahoac (e.g., Saponi, Tutero, Nahyssan, Occaneechi) are not referenced until 1650 or later. There is therefore considerable ambiguity regarding whether these tribes had a strongly separate pre-Contact identity; whether they were family or village names within the Monacan Confederacy pre-Contact; or whether they are post-Contact sub-groups that formed around migration or distinctions in trade practices. 4. During the 17th-18th centuries, Virginia tribes experienced colossal loss of native population and disruption of lifeways as a result of European colonialism. Several of the Virginia Siouan groups traveled west and south to remain on the frontier with minimal contact with settlers. There was considerable bifurcation and amalgamation of tribal groups as necessitated for survival. 5. Because of these factors, modern Virginia Siouan tribes (like many other tribes) are commonly made up of more than one historic tribe, have a variety of consultation interest areas, and have individuals within these tribes who understand themselves to have a descendancy from multiple Virginia Siouan groups. Detailed and accurate examinations of native history are essential, especially when assessing impacts of infrastructure projects to native peoples, especially for tribes that still experience a lack of acknowledgement or recognition from the federal government, and especially when projects propose to damage native sites.	Comments noted. Section 4.10.3.1 provides a short description of Cultural Context, which is intended only as a brief summary and introduction, to address these issues. The EIS acknowledges that the pipeline route would cross historic Monacan territory, and that the Nation has an interest in potential project impacts on cultural resources.

NAT-4	Monancan Nation	
	2. The Nation requests that their broader questions regarding the cultural resources, stated in July 2019, be acknowledged and addressed	
NAT-4d	In its July 2019 comments, the Nation provided evidence for this considerable body of scholarship describing the historical linkages between the Tutelo-Saponi and Monacan groups. The Nation made requests in July 2019 based on the need to correct inaccuracies in the cultural resources reports. These requests were not acknowledged or addressed, and the requests are also highly pertinent to addressing issues in the Draft EIS. The Nation again requests that: A) The cultural resources consultant address deficiencies in the Cultural Background and Ethnographic Analysis sections, specifically the way in which these reports mischaracterize Monacan history and treats information on native history as largely useful for determining tribal affiliation rather than incorporating it into the context of the broad swath of history impacted by the project; B) The consultants incorporate into their analysis, which currently relies too heavily on information written before 2000, a variety of sources and texts related to Monacan and Siouan pre- and post-Contact history; C) The consultants perform oral history interviews with local tribes, to illuminate the several centuries of native life and movements currently not covered by these reports and to rectify a lack of reference to native persistence in these areas after 1780; D) The Nation receive ongoing and active communication regarding planned archaeological testing on pre-Contact sites, especially those in Pittsylvania County; E) Survey reports assessing the eligibility of architecture along the pipeline include information typical for Phase II investigations, such as deed research, which is essential for determining the potential native affiliation or a site's potential eligibility under Criteria A or B; F) The subcontractor TRC develop a method to review the pipeline landscape (including the direct and indirect APE) for potential burial mounds, and provide greater detail on potential impact to a site called Sugar Loaf Mound (31RK141) near the project in North Carolina; and G) The Nation receive a call from TRC to discuss the material contained in this letter, so that the Nation can provide any clarification that may be required. Thus far, the Nation has received no contact from FERC or TRC regarding these other requests, and the Draft EIS does not reference most of these concerns. Moreover, the Nation has not been updated regarding the archaeological testing and further work except for one proposed site visit, which was planned by the project proponents on a site that had only been subject for testing for a few days, and which was selected because of ease of access rather than significance to tribes. Furthermore, the Nation has previously and repeatedly asked for more details on the environmental impact of this project, but has not received materials related to these issues. None of the other requests have been acknowledged or addressed. The Nation now reiterates these requests be addressed before FERC finalizes the Draft EIS.	In Section 4.10.1.2 we discuss correspondence from the Monacan Indian Nation, including the July 2019 letter. The Nation's comment about Mountain Valley's cultural resources reports is not relevant to the EIS. However, Mountain Valley has stated that its contractor reviewed the sources recommended by the Nation. The results of archaeological surveys are detailed in Section 4.10.3.3. Mountain Valley stated that it has provided the Monacan Nation with copies of all cultural resources investigations reports. Site 31RK141 (Sugar Loaf Mound) was not identified in the area of potential effect (APE), so it will not be affected by the Project.

NAT-4	Monancan Nation	
	3. The Monacan Indian Nation has environmental and socioeconomic concerns regarding the project.	
NAT-4e	The Nation has just over 2000 members, many of whom are located in proximity to the pipeline. The tribe's modern home on Bear Mountain is less than 70 miles away from the project area. Many tribal members are Virginia and North Carolina residents and taxpayers with concerns regarding the pipeline impacts, which tree clearing, impacts to animal species, risks to water quality from sediment discharge and other effluents from construction; and visual effects to a long area of most rural, natural terrain. The Nation is also concerned about the safety concerns for explosions or fires set off by the pipeline construction or occurring for the life of the project.	See response GEN-1 in appendix I.2. Impacts on water resources is discussed in Section 4.3 of the EIS; vegetation in 4.5, and wildlife in 4.6.
NAT-4f		See response SAFE-1 in appendix I.2.
NAT-4g	The Nation also must emphasize the poor track record of this project proponent on previous projects including the Mountain Valley Pipeline mainline, which has been beset by problems that include: • inadequate sediment control plans resulting in considerable sediment fines; • permanent damage to critical historic resources like the Appalachian Trail; and • causation of landslides that endanger residences in West Virginia.	See response GEN-6 in appendix I.2.
NAT-4h	Furthermore, explosions associated with LNG pipeline infrastructure in West Virginia (TransCanada's Leach Xpress Pipeline), Washington (Plymouth LGN storage facility) and Massachusetts (Columbia Gas Pipeline) illustrate the level of impact and harm these events can have. In the Columbia Gas example, one man lost his life, approximately 80 homes and buildings were destroyed, 8600 people were evacuated, and a state of emergency was declared.	See response SAFE-1 in appendix I.2.
NAT-4i	The Draft EIS for the Southgate project acknowledges that hazards to the project include seismicity, karst topography, landslides (exacerbated by the need for blasting to shallow bedrock in some areas), flooding, and erosion. The document also acknowledges that the project will cross two state level aquifers, both of which are suitable for drinking, and will cross near a variety of private wells, and states that the project poses risks to the water quality in these water sources.	See response GEN-1 in appendix I.2.

NAT-4	Monancan Nation	
NAT-4j	Finally, the Monacan hold trees to be culturally significant natural resources. As discussed in the Nation's February 2019 letter, trees have such significance to the Nation that they have made cutting trees on their tribal lands unconstitutional. The Nation has requested consultation on tree cutting plans before they are finalized but has so far not received any materials with specific commitments regarding the tree cleaning and restoration plans. Similarly, according to the Draft EIS the project will have an effect on five federally-protected species, the northern long-eared bat, Roanoke logperch, James spiny mussel, small whorled pogonia and smooth coneflower. Although FERC currently characterizes the adverse environmental impact as moderate and states that adjustments could reduce these impacts to less-than-significant levels, the	In Section 4.10 of the EIS we state the following: "Cultural resources are locations of human activity, occupation, or use. According to the FERC's Office of Energy Projects 'Guidelines for Reporting on Cultural Resources Investigations for National Gas Projects' (July 2017), 'cultural resources include any prehistoric or historic archaeological site, district, object, cultural feature, building or structure, cultural landscape, or traditional cultural property.' Although 'cultural resources' are not defined in 36 CFR 800, it is a 'term-of-art' in the field of historic preservation and archaeological research. Indian tribes believe that cultural resources could include natural resources, such as plants and animals of traditional importance to tribes, and topographic features and view sheds that may be sacred." Impacts on forest are discussed in section 4.5 of the EIS. Forest and vegetation clearing plans are discussed in section 2.4.1.2 of the EIS. Threatened and endangered species are discussed in Section 4.7 of the EIS.
NAT-4k	Nation points out that given the previous track record of EQT, it is equally or more likely that the adverse impacts become significantly more substantial than the Draft EIS predicts. For this reason, the Nation requests that FERC develop a plan to assess and review these impacts and establish periodic monitoring to determine whether impact levels and appropriate mitigation approaches have changed. * * * The Nation looks forward to assisting FERC on ongoing cultural resources identification and mitigation associated with the Southgate project as the consultation process moves forward. Thank you for consideration of our comments. Best regards, Marion F. Werkheiser Marion Werkheiser Attorney at Law	See response GEN-6 in appendix I.2.

Re: Monacan Indian Nation's Renewed Request for Information | Southgate extension of the Mountain Valley Pipeline Associated with Docket Nos. CP19-14-000

Dear Secretary Bose:

NAT-7a	As you know, I represent the Monacan Indian Nation in the permitting process for the MVP Southgate project overseen by the Federal Energy Regulatory Commission (FERC). The Nation has a variety of concerns regarding project, its impacts on historic properties significant to the Nation, the Project's incomplete cultural resources reports, and the Draft Environmental Impact Statement (DEIS). Since the Nation submitted its privileged comments in July regarding the cultural resources reports, it has received no response to its concerns or its requests for additional information. As a reminder, in those comments the Nation asked that: A) The cultural resources consultant address deficiencies in the Cultural Background and Ethnographic Analysis sections, specifically the way in which these reports mischaracterize Monacan history and treats information on native history as largely useful for determining tribal affiliation rather than incorporating it into the context of the broad swath of history impacted by the project;	The EIS discusses historic properties important to the Monacan Indian Nation. It acknowledges that cultural resources investigations for the Project are currently incomplete, and makes recommendations to finish the process of complying with Section 106 of the NHPA prior to the Commission allowing construction to begin. In Section 4.10.1.2 of the EIS we discuss correspondence from the Monacan Indian Nation, including the July 2019 letter.
NAT-7b		The Nation's comment about Mountain Valley's cultural resources reports is not relevant to the EIS.
NAT-7c	B) The consultants incorporate into their analysis, which currently relies too heavily on information written before 2000, a variety of sources and texts related to Monacan and Siouan pre- and post-Contact history;	Mountain Valley has stated that its contractor reviewed the sources recommended by the Nation.
NAT-7d	C) The consultants conduct oral history interviews with local tribes, to illuminate the several centuries of native life and movements currently not covered by existing cultural resources reports and to rectify a lack of reference to native persistence in these areas after 1780;	We would not require this information.
NAT-7e	D) The Nation receive ongoing and active communication regarding planned archaeological testing on pre-Contact sites, especially those in Pittsylvania County;	Mountain Valley stated that it has provided the Monacan Indian Nation with copies of all cultural resources investigations reports.

NAT-7	Monacan Indian Nation	
NAT-7f	E) Survey reports assessing the eligibility of architecture along the pipeline include information typical for Phase II investigations, such as deed research, which is essential for determining the potential native affiliation or a site's potential eligibility under Criteria A or B;	The State Historic Preservation Offices (SHPO) of Virginia and North Carolina have accepted Mountain Valley's historic architectural survey reports without requiring deed research.
NAT-7g	F) The subcontractor TRC Solutions, Inc. (TRC) develop a method to review the pipeline landscape (including the direct and indirect APE) for potential burial mounds, and provide greater detail on potential impact to a site called Sugar Loaf Mound (31RK141) near the project in North Carolina; and	Site 31RK141 (Sugar Loaf Mound) was not identified in the area of potential effect (APE), so it will not be affected by the Project.
NAT-7h	G) TRC should contact the Nation to discuss the material contained in this letter, so that the Nation can provide any clarification that TRC may require.	Mountain Valley indicated that it has contacted the Monacan Indian Nation on numerous occasions (see table 4.10-3 in the EIS).
NAT-7i	Moreover, in July 2019, the Nation received the DEIS. The vast majority of the errors identified by the Nation in the cultural resources reports were compounded in the DEIS. The Nation submitted comments on the Draft EIS on September 16, 2019 and has still not heard anything from NextEra or FERC regarding their concerns since that time.	Our responses to comments from the Monacan Indian Nation on the Southgate draft EIS are contained in the final EIS.
NAT-7j	One of the most concerning elements coming out of the cultural resources reports and the DEIS is the mischaracterization of Monacan ancestry and of Eastern Siouan history generally. The Nation would like to affirm the following points, supported by scholarship, which are critical to get right in any analysis of effects for the Southgate extension of the Mountain Valley Pipeline: 1. The Monacan were linguistically and socio-politically Siouan and are related to the Sappony Tribe and other Siouan tribes along the North Carolina/Virginia border. 2. Siouan tribes in Virginia engaged in kin-based alliance systems and confederacies supported by a mutually-intelligible language. Tribal history and ceramic patterns suggest an intermarriage system in which the core tribes of central Virginia had a Monacan pattern of ceramic decoration and other site patterns, and the Roanoke Valley was a distinct but related group, with occasional appearance of Monacan-style ceramics suggestive of regular kin exchange, trade, and alliances. 3. Most Virginia Siouan tribe names other than Monacan and Mannahoac (*e.g.*, Saponi, Tutero, Nahyssan, Occaneechi) are not referenced until 1650 or later. Therefore, there is considerable ambiguity regarding whether these tribes had a strongly separate pre-Contact identity; whether they were family or village names within the Monacan Confederacy pre-Contact; or whether they are post-Contact sub-groups that formed around migration or distinctions in trade practices. 4. During the 17th-18th centuries, Virginia tribes experienced colossal loss of native population and disruption of lifeways as a result of European colonialism. Several of the Virginia Siouan groups traveled west and south to remain on the frontier with minimal contact with settlers. There was considerable bifurcation and amalgamation of tribal groups as necessitated for survival. 5. Because of these factors, modern Virginia Siouan tribes (like many other tribes) are commonly made up of more than one historic tribe, have a variety of consultation interest areas, and have individuals within these tribes who understand themselves to have a descendancy from multiple Virginia Siouan groups.	See response NAT-4d.

NAT-7	Monacan Indian Nation	
NAT-7k	It is disappointing to see the tribe's history misrepresented in the DEIS for this project, and to have received no response from FERC to the tribe's earlier concerns. In our comments on the DEIS, the Nation reiterated the requests associated with the cultural resources reports, and also pointed out the potential adverse effects to historic and cultural properties associated with contemporary members of the Nation located along the proposed project route. The Nation also underlined the importance of forestry resources for the tribe, and asked to see tree cutting plans for the Southgate project for at least the third time. The Nation additionally requested in September that FERC develop a plan to assess and review environmental, historical, and social impacts and establish periodic monitoring to determine whether impact levels and appropriate mitigation approaches have changed. These failures in the consultation process undermine not only FERC's duty to consult with tribes in a meaningful way, but also to engage in government-to-government consultation. As far as the Nation is aware, destructive archaeological data recovery continues on sites associated with Monacan ancestors without Monacan or other tribal involvement. Eligibility assessments for historic architecture are being made by cultural resources consultants without research into past owners, which is required under Virginia survey guidelines and might help identify properties with native associations or other historical importance. Decisions regarding tree clearing and mitigation are likely being made without Monacan or tribal involvement. Monacan tribal history is being mischaracterized based on poor scholarship, despite repeated attempts by the tribe to provide correct information. For all these reasons, the Nation asks FERC to acknowledge these communications and these requests, and to provide a meaningful response to the Nation regarding these requests and the broader context of the September and July communications. Furthermore, in order to assist the Nation's objectives in returning their cultural patrimony to the tribe, we ask that landowners associated with any site likely to have Monacan associations be asked to sign agreements that would return these artifacts and cultural remains to the Nation at the conclusion of the required cultural resources investigations. Sincerely, Marion Werkheiser Attorney at Law	The Cultural Context information is intended to be a brief section, but it does not misrepresent the Tribe's history. Mountain Valley stated that it has provided the Monacan Indian Nation with copies of all cultural resources investigations reports. Impacts on forest are described in Section 4.5 of the EIS. The forest and vegetation clearing process is described in section 2.4.1.2 of the EIS.
NAT-7l		Impacts on cultural resources and mitigation measures for affected historic properties are detailed in Section 4.10 of the EIS.
NAT-7m		There are no failures in our consultations process. As previously noted, Mountain Valley stated that it has provided the Monacan Indian Nation with copies of all cultural resources investigations reports, including treatment plans that recommended archaeological data recovery. The Virginia SHPO accepted Mountain Valley's cultural resources investigations reports. Our scholarship on Monacan history is not poor, as we utilized sources recommended by the Nation. Vegetation is described in Section 4.5 of the EIS. Our draft Programmatic Agreement for the Southgate Project, provided to the Monacan Nation on January 8, 2020, includes a stipulation that Mountain Valley request that landowners donate artifacts to repositories found acceptable by the signatories.

NAT-8 Sappony Tribe

CULTURAL HERITAGE PARTNERS
LAW • POLICY • STRATEGY

December 12, 2019

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission (FERC)

Washington, D.C. 20426

Re: Response of the Sappony Tribe to the DEIS for the Southgate Extension of the Mountain Valley Pipeline Associated with Docket No. CP19-14-000

Dear Ms. Bose:

As you know, I represent the Sappony Tribe in the permitting process for the MVP Southgate project overseen by the Federal Energy Regulatory Commission ("FERC"). The Tribe has a variety of concerns regarding project, its impacts on historic properties significant to the Tribe, the Project's incomplete cultural resources reports, and the Draft Environmental Impact Statement (DEIS). Since the Tribe submitted its privileged comments in July regarding the cultural resources reports, the Tribe has received no response to many of its concerns or its requests for additional information. As a reminder, in those comments the Tribe asked that:

A) The cultural resources consultant address deficiencies in the Cultural Background and Ethnographic Analysis sections, specifically the way in which these reports mischaracterize Sappony, Monacan, and Siouan history and treats information on native history as largely useful for determining tribal affiliation rather than incorporating it into the context of the broad swath of history impacted by the project;
B) The consultants incorporate into their analysis, which currently relies too heavily on information written before 2000, a variety of sources and texts related to Sappony, Tutelo, Monacan, and Siouan pre- and post-Contact history;
C) The consultants conduct oral history interviews with local tribes, to illuminate the several centuries of native life and movements currently not covered by existing cultural resources reports and to rectify a lack of reference to native persistence in these areas after 1780;
D) The DEIS incorporate information provided by the Tribe in their September 16, 2019 letter, in order to recognize Sappony relatedness to the Cheraw Tribe, which had several major historical towns in the project area of MVP Southgate, and correct currently inaccurate information regarding Cheraw movements after the 18th century;
E) The Tribe receive ongoing and active communication regarding planned archaeological testing on pre-Contact sites;

NAT-8a	Impacts on cultural resources and mitigation measures for affected historic properties are detailed in Section 4.10 of the EIS. We acknowledge that cultural resources investigations for the Project are currently incomplete, and we make a recommendation to finish the process of complying with Section 106 of the NHPA prior to the Commission allowing construction to begin. In Section 4.10.1.2 of the EIS we discuss correspondence from the Sappony Tribe, including the July 2019 letter.
NAT-8b	The Tribe's comment about Mountain Valleys' cultural resources reports is not relevant to the EIS. Section 4.10.3.1 of our EIS discusses historical relationships between the Sappony and Monacan.
NAT-8c	The Tribe's comment about Mountain Valleys' cultural resources reports is not relevant to the EIS.
NAT-8d	We would not require this information.
NAT-8e	Relations between the Sappony and Saura are briefly mentioned in Section 4.10.3.1 of our EIS.
NAT-8f	Mountain Valley indicated that it provided the Tribe with copies of all cultural resources investigations reports.

NAT-8	Sappony Tribe	
NAT-8g	F) Survey reports assessing the eligibility of architecture along the pipeline include information typical for Phase II investigations, such as deed research, which is essential for determining the potential native affiliation or a site's potential eligibility under Criteria A or B; G) TRC should contact the Tribe to discuss the material contained in this letter, so that the Tribe can provide any clarification that TRC may require.	The SHPOs of Virginia and North Carolina have accepted Mountain Valley's historic architectural survey reports without requiring deed research.
NAT-8h		Mountain Valley indicated that it has contacted the Tribe Nation on numerous occasions (see table 4.10-3 in the EIS).
NAT-8i	Moreover, in July 2019, the Tribe received the DEIS. The vast majority of the errors identified by the Tribe in the cultural resources reports were compounded in the DEIS. The Tribe submitted comments on the Draft EIS on September 16, 2019 and has still not heard anything from NextEra or FERC regarding their concerns. One of the most concerning elements coming out of the cultural resources reports and the DEIS is the mischaracterization of Eastern Siouan tribal history. The Sappony would like to affirm the following points, supported by scholarship, which are critical to get right in any analysis of effects for the Southgate extension of the Mountain Valley Pipeline:	Section 4.10.3.1 provides brief information on Eastern Siouan tribal history. The comments of the Sappony Nation on the DEIS are addressed in this FEIS.
NAT-8j	1. The Monacans were linguistically and socio-politically Siouan and are related to the Sappony Tribe and other Siouan tribes along the North Carolina/Virginia border. 2. Siouan tribes in Virginia engaged in kin-based alliance systems and confederacies supported by a mutually-intelligible language. Tribal history and ceramic patterns suggest an intermarriage system in which the core tribes of central Virginia had a Monacan pattern of ceramic decoration and other site patterns, and the Roanoke Valley was a distinct but related group, with occasional appearance of Monacan-style ceramics suggestive of regular kin exchange, trade, and alliances. 3. Most Virginia Siouan tribe names other than Monacan and Mannahoac (*e.g.,* Saponi, Tutero, Nahyssan, Occaneechi) are not referenced until 1650 or later. Therefore, there is considerable ambiguity regarding whether these tribes had a strongly separate pre-Contact identity; whether they were family or village names within the Monacan Confederacy pre-Contact; or whether they are post-Contact sub-groups that formed around migration or distinctions in trade practices. 4. During the 17th-18th centuries, Virginia tribes experienced colossal loss of native population and disruption of lifeways as a result of European colonialism. Several of the Virginia Siouan groups traveled west and south to remain on the frontier with minimal contact with settlers. There was considerable bifurcation and amalgamation of tribal groups as necessitated for survival. 5. Because of these factors, modern Virginia Siouan tribes (like many other tribes) are commonly made up of more than one historic tribe, have a variety of consultation interest areas, and have individuals within these tribes who understand themselves to have a descendancy from multiple Virginia Siouan groups. For example, several Sappony families know themselves to primarily be of Cheraw descent and have both documents and family oral history related to their ancestors joining with the Sappony Tribe after the Cheraw scattered.	Comments noted. See response NAT-2a.

NAT-8	Sappony Tribe	
NAT-8k	In its September comments on the DEIS, the Tribe reiterated the requests associated with the cultural resources reports, and the Tribe pointed out the potential adverse effects to historic and cultural properties associated with contemporary members of the Tribe located along the proposed project route. The Tribe also underlined the importance of forestry resources for the tribe, and asked to see tree cutting plans for the Southgate project for at least the third time they have done so. The Tribe additionally requested that FERC develop a plan to assess and review environmental, historical, and social impacts and establish periodic monitoring to determine whether impact levels and appropriate mitigation approaches have changed.	Impacts on cultural resources and mitigation measures for affected historic properties are detailed in Section 4.10 of the EIS. Vegetation is described in Section 4.5 of the EIS.
NAT-8l	Failures in the consultation process undermine not only FERC's duty to consult with tribes in a meaningful way, but also to engage in government-to-government consultation. As far as the Tribe is aware, destructive archaeological testing has continued on sites associated with Sappony ancestors without Sappony or other tribal involvement. Eligibility assessments for historic architecture are being made by cultural resources consultants without research into past owners, in violation of Virginia survey guidelines. Decisions regarding tree clearing and mitigation are likely being made without Sappony or tribal involvement. Sappony tribal history has been mischaracterized based on poor scholarship, despite repeated attempts by the Tribe to provide correct information. For all these reasons, the Tribe asks FERC to acknowledge these communications and these requests, and to provide a response to the Tribe regarding these requests and the broader context of the September and July communications.	There have been no failures in the FERC's consultation process. As documented in Section 4.10.1.2 of the EIS, the FERC staff consulted on a government-to-government basis with Indian tribes, in accordance with Part 800.2(c)(3). However, the Sappony Tribe does not qualify as an "Indian tribe" defined by Part 800.16(m). Mountain Valley indicated that it provided the Sappony Tribe with copies of all cultural resources investigations reports, including a treatment plan that recommended archaeological data recovery. The Virginia SHPO accepted Mountain Valley cultural resources investigations reports. Our scholarship on Tribal history is not poor; however, the Cultural Context in Section 4.10.3.1 of the EIS is very brief. Vegetation is described in Section 4.5 of the EIS. Our responses to the Sappony Tribe comments on the draft EIS can be found in this final EIS.
NAT-8m	In October, the Tribe received a series of addendum reports and a Treatment Plan for North Carolina site 31RK259. The Tribe notes that revised cultural background reports include acknowledgements of greater aspects of Sappony history, critically their relatedness to Cheraw groups and much greater detail on Sappony post-Contact history as developed through sources communicated by the Tribe in previous letters. The Tribe appreciates this correction of part of the historical record, and asks that this more robust assessment of post-Contact native history be incorporated into the Final EIS. Site 31RK269 is of particular concern to the Tribe because of its age and its proximity near Eden, where the Cheraw and other related tribes lived in the still poorly understood post-Contact period. Given that 1,350 square meters of the site are located within the project permanent easement, with an unknown amount of that area being impacted through construction, the project proposes to conduct data recovery at the site. Because of the time period of the site, analysis of Cheraw lifeways and recovered artifacts would benefit from historical ethnography based on 17th century primary sources. The Tribe therefore also requests that a list of primary source information regarding native communities in this region be compiled and reviewed as part of the background research for this excavation to enable a richer analysis of its results. **The Tribe requests a meeting to discuss proposed Treatment Plan methods and research.** Best regards, Marion F. Werkheiser Marion Werkheiser Attorney At Law Counsel for the Sappony Tribe	Comments noted. However, we do not intend to expand the Cultural Context in the EIS. The Treatment Plan for site 31RK259 was accepted by the North Carolina SHPO on November 18, 2019. Since the Sappony Tribe is an intervener, FERC staff is constrained by ex-parte rules. Typically, staff does not meet with Native American organizations that are not federally-recognized Indian tribes.

Appendix I.3 - Southgate Project Response to Comments Side-by-Side Table				
MVP Southgate Project Comments on the Draft Environmental Impact Statement - September 13, 2019				
Section	**Page**	**Draft Environment Impact Statement (DEIS) Language**	**Mountain Valley DEIS Comment Response to FERC**	**FERC Response**
ES	ES-4	"As described in the Project's Water Resources Identification and Testing Plan, Mountain Valley would offer pre-construction and post-construction water quality testing for water supply wells located within 150 feet of Project workspaces. We are recommending that prior to construction Mountain Valley provide additional information on private water wells or springs, including the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs."	Mountain Valley would like to clarify that as stated in the Project's Water Resources Identification and Testing Plan, Mountain Valley will conduct pre-construction testing of all private wells located within 150 feet construction workspace. The Project will conduct post- construction tests if requested by a landowner who had a pre-construction test.	**CO-6A** - Mountain Valley confirmed in their December 16, 2019 response that they would offer pre- and post-construction quality and yield testing for all water wells and water supply springs located within 150 feet of construction workspaces. If a landowner does not allow the Project to conduct pre-testing then post-testing will not occur as in such case there would no baseline data by which to measure post-construction water quality. Mountain Valley would offer this testing to the landowner in accordance with the procedures outlined in Mountain Valley's Water Resources Identification and Testing Plan
1.0	1-1	"Mountain Valley is a joint venture between affiliates of EQT Midstream Partners, LP; NextEra Energy US Gas Assets, LLC; WGL Midstream, Inc.; RGC Midstream, LLC; and Con Edison Gas Midstream, LLC. Southgate Project facilities would be operated by an affiliate of the EQT Corporation."	Mountain Valley requests an update to the footnote on page 1-1: "MVP Southgate is a joint venture among affiliates of EQM Midstream Partners, LP; NextEra Energy Inc.; AltaGas Ltd. and RGC Resources, Inc. MVP Southgate Project facilities would be operated by an affiliate of EQM Midstream Partners, LP.	**CO-6b -** Comment noted. The EIS has been updated with this information.
1.4	1-13	Table 1.4-1 Major Environmental Permits, Licenses, Approvals, and Consultations Applicable to the Southgate Project; State of North Carolina NCDEQ-Division of Water Resources	Application was denied on procedural grounds until a preferred route was identified by the FERC, at which time Mountain Valley was instructed it could reapply for the Joint Permit Application under Section 401 of the Clean Water Act; Isolated/non-404 wetland and water permit.	**CO-6c-** Comment noted. Table 1.4-1 has been updated.
2.1.1	2-3	"The pipeline has been designed to transport 375 million MMcf/d of natural gas. The maximum allowable operating pressure (MAOP) for the new pipeline would be about 1,440 pounds per square inch gauge (psig). For 39 miles (52.5 percent) of the route, the Project would be collocated with existing utility corridors and rights-of-way (see table 2.1-2)."	Mountain Valley would like to clarify that the H-605 pipeline's MAOP would be 1,480 psig, while the H-650 pipeline's MAOP would be 1,440 psig.	**CO-6d** – Comment noted. The EIS has been updated with this information.
2.4.1.6	2-18	"Mountain Valley has indicated that after for hydrostatic testing would be obtained from two municipal water sources."	Mountain Valley would like to clarify that surface water sources such as the Dan River are now being proposed as primary hydrostatic test water sources. Mountain Valley intends to file updates to Table 2.3-7 "Proposed Hydrostatic Test Water Use	**CO-6e** – Section 2.4.1.6, 4.3.2.6, and 4.6.5.3 of the EIS have been updated with information regarding water sources for the Project and surface water withdrawals.

			Summary," in a supplemental filing to be filed with FERC in October 2019.	
2.4.1.3	2-16	"The trench would be dug at least 12 inches wider than the diameter of the pipeline and excavated to a depth of 5.5 feet to 9 feet in order to provide sufficient cover over the pipeline in accordance with DOT standards in 49 CFR 192.327 (see table 2.4-1). There would generally be36 inches of cover over the top of the pipeline in deep soils and 18 inches of cover in areas of consolidated rock. At waterbody crossings, the pipe would be more deeply buried; with a minimum of 4 feet of cover at navigable waterways and a minimum of 2 feet of cover at waterbodies with consolidated rock."	Mountain Valley would like to clarify that the trench would provide sufficient cover over the pipeline in accordance with United States Department of Transportation standards in 49 CFR 192.327, as noted in Table 2.4-1 of the DEIS. The depths provided in the DEIS may be specific to topography, soil composition, and pipe diameter and may not be true across the entire project alignment.	**CO-6f** - Comment noted. The EIS has been updated with this information.
4.1.4.2	4-7	Table 4.1-1 Surficial Geology Crossed by the Southgate Project	Mountain Valley requests that Table 4.1-1 in the DEIS be replaced with Table 6.3 that was included in the report "Earthquake and Active Fault Hazard Analyses" filed with RR6, Appendix 6F on November 6, 2018. Mountain Valley has determined this table to be a more accurate summary of faults and zones located in the relative Project vicinity.	**CO-6g** – Comment noted. Table 4.1-1 has been updated.
4.3.2.4, 4.6	4-38, 4-81	"All waterbodies crossed by the Project are designated warm water fisheries. The FERC requires all in-stream work, except the installation and removal of equipment bridges, be completed in warm water fisheries between June 1 and November 30 unless expressly permitted or further restricted by an appropriate federal or state agency in writing. In response to a FERC environmental information request regarding adherence to in water construction windows, Mountain Valley responded that based on correspondence with Virginia and North Carolina state agencies no construction windows were anticipated except possibly for mussels. However, Mountain Valley has not provided any written correspondence from the VADGIF and NCWRC regarding any timing restrictions on waterbodies containing warm water fisheries. Though aquatic surveys have determined that protected fish and mussel species are not present in streams in Virginia, consultation with the	Mountain Valley would like to clarify that no time of year restrictions have been provided from the United States Fish and Wildlife Service (USFWS). Mountain Valley intends to adhere to the Virginia Department of Game and Inland Fisheries (VDGIF) warm water fishery restrictions (April 15-July 15). Based on consultation with North Carolina Wildlife Resource Commission, no timing restrictions are required for warm water fisheries crossed in North Carolina. Mountain Valley will request an alternative measure from FERC's Procedures (Section V.B.1.b.) as part of the supplemental filing to be filed with FERC in October 2019. Agency correspondence from VDGIF and NCWRC are included in Attachment 1a.	**CO-6h** - Based on recommendations from VADGIF, Mountain Valley has committed to adhere to the Virginia warm water fisheries construction window (i.e., no in-water construction between April 15 and July 15); based on the results of Mountain Valley's aquatic surveys in the waterbodies of North Carolina, which did not document any state-listed aquatic species, NCWRC has stated it would not require any in-water construction date restrictions.

		VADGIF is currently ongoing. Consultation with NCWRC and aquatic surveys in North Carolina are still pending, including streams that are proposed to be crossed via conventional bore or HDD methods. Additional details of specific fisheries and agency consultation are addressed in section 4.7. Absent any waivers from or further restrictions on in-waterworks timing from VADGIF and NCWRC, Mountain Valley is required to follow the warm water fisheries timing window in its Procedures (June 1 through November 30)."		
4.5.4.1	4.63	"Once construction is complete, Mountain Valley would monitor and control occurrences of noxious and invasive weed species throughout restoration and for 2 years following restoration in locations along the route where infestations were not identified prior to construction."	Mountain Valley would like to clarify that it will monitor and control occurrences of noxious and invasive weed species until FERC deems restoration is complete. Mountain Valley will submit a revised Exotic and Invasive Species Control Plan to be filed with FERC in October 2019.	**CO-6i** – Section 4.5.4.1 has been updated to note that Mountain Valley would monitor the right-of-way for 2 years post-construction. Mountain Valley's updated EIPSCP was filed in October 2019.
4.6.1.1	4-70	"To increase the speed and success of restoration of wildlife habitat, Mountain Valley would implement right-of-way restoration measures contained in FERC's Plan and Mountain Valley's Procedures, E&SC Plan, and solicit guidance from the USDA NRCS, VADCR, and NCWRC to restore the pipeline corridor using native seed mixes specific to the Project locations."	Mountain Valley will continue to consult with agencies to develop and refine seed mixes that contain as many native and naturalized species as possible to ensure the right-of-way is stabilized and restored.	**CO-6j** – Comment noted. Section 4.6.1 notes that Mountain Valley will continue to consult with agencies regarding seed mixes.

4.6.3.2	4-75	"The FWS recommended that Mountain Valley avoid clearing from March 15 - August 15 in Virginia and from April 1 - August 31 in North Carolina."	As stated in RR3, the Southgate Project intends to clear trees outside of peak Migratory Bird Species of Concern (MBSC) breeding season. Should a significant delay to the start of construction occur, then incidental take may occur; however, as explained by the U.S. Department of the Interior in M- 37050, issued December 22, 2017, the Migratory Bird Treaty Act (MBTA) does not prohibit incidental take. If this situation occurs, the Project will consult with USFWS and NCWRC to determine appropriate voluntary conservation measures to minimize impacts to the greatest extent practicable.	**CO-6k** - Section 4.6.3.2 of the EIS provides discussion on migratory birds.

			While the nesting season is generally considered April 1 to August 31, the majority (eight of 12) of Project MBSC do not begin nesting until May.	
4.7.1	4-88	Table 4.7-1 Federal Endangered, Threatened, or Other Special Status Species Known to Occur or Potentially Occurring in the Southgate Project Area	Table 4.7-1 omits Schweinitz's sunflower, a federally listed endangered species endemic to North Carolina. This species was added on November 20, 2018 to the renewed species list from the USFWS. Following conversation with the USFWS Raleigh office, no surveys are required for this species. Agency correspondence of this communication on December 12, 2018 is included in Attachment 1a.	**CO-6l** - Footnote a/ in table 4.7-1 notes that Schweinitz's sunflower is one of the nine species listed by federal and state agencies as potentially being present in the Project counties; however, the species are not known to occur in the portions of the counties that would be crossed by the Project and they are therefore not listed in the table
4.7.5.1	4-92	"Correspondence with the FWS indicated small whorled pogonia might be present within the Project area in Rockingham and Alamance Counties and recommended that Mountain Valley conduct surveys for the species (FWS, 2018c, 2018d). If small whorled pogonia occurs in the Project right-of-way, it could be vulnerable to removal during clearing and grading, or trampling and crushing by foot traffic or movement of heavy machinery."	The DEIS indicates that small whorled pogonia is vulnerable to sedimentation and run-off in the vicinity of the right-of-way. Mountain Valley would like to clarify that this is an upland species that is not likely to be impacted by run-off.	**CO-6m** – As noted in section 4.7.5.1, clearing and grading in upland areas could potentially cause sedimentation and run-off impacts to upland plants.
4.7.5.1	4-93	"Mountain Valley conducted field surveys for small whorled pogonia in 2018, but surveys were conducted outside of the optimal survey window for the plant."	Mountain Valley would like to clarify that the small whorled pogonia surveys took place in 2018 from July 21-27, August 23, August 28-31, and September 4-6. Surveys during 2019 occurred on June 17-22 and August 6, 8, 9, 12, 14 and 17. Additional surveys are anticipated during September 2019. The optimal survey window for small whorled pogonia is mid-May to early July; however, habitat surveys can be performed outside of this survey window. No species have been identified to date.	**Co-6n** - Comment noted. Clarification regarding the dates and locations that surveys were conducted in 2018 and 2019 and are planned for 2020 has been included in the EIS.
4.7.5.1	4-93	"Right-of-way clearing could also adversely affect smooth coneflower habitat by altering light exposure or hydrology or by increasing sedimentation and runoff in the vicinity of the right-of-way."	Mountain Valley would like to clarify that the smooth coneflower actually prefers open woods, roadsides, clear-cuts, and utility rights-of-ways, etc. Because of this, clearing is likely to not to adversely affect potential habitat for smooth coneflower.	**CO-6o** - As noted in section 4.7.5.1, clearing and grading in the habitats preferred by the smooth coneflower could potentially cause sedimentation and run-off impacts.
4.7.5.2	4-93	"Mountain Valley conducted field surveys for smooth coneflower and its habitat in 2018; however, Mountain Valley was not able to survey all areas with potentially suitable habitat due to a lack of land access. Therefore, Mountain Valley	Mountain Valley would like to clarify that surveys for smooth coneflower are being conducted throughout the summer and early fall months. Smooth coneflower surveys took place in 2018 from July 21-27, August 23, August 28-31, and September	**CO-6p** - See response CO-6p -

		plans to complete surveys for smooth coneflower in June of 2019."	4-6. Surveys during 2019 occurred to date on June 17-22 and August 6, 8, 9, 12, 14 and 17. Additional surveys are anticipated during September 2019. The optimal survey window for smooth coneflower is late May to October. No species have been identified to date.	
4.7.7.4	4-97	"Three state-listed mussel species, in addition to the five federally listed species discussed in section 4.7.4, potentially occur in the Project area."	The statement on Page 4-97 (Section 4.7.7.4) of the DEIS that five federally listed mussel species are discussed in section 4.7.4 is incorrect. Section 4.7.4 discusses four mussel species of which only one is federally listed. James spinymussel (*Pleurobema collina*) is federally Endangered, the Green Floater (*Lasmigona subviridis*) and Yellow Lampmussel (Lampsilis cariosa) are federal species of concern, and the Atlantic Pigtoe (Fusconaia masoni) is proposed for listing as Threatened. "Species of concern" is an informal term and does not signify federal listing, and species proposed for listing cannot be defined as "listed" until the determination process is complete.	**CO-6q -** Comment noted. Section 4.7.7.4 in the FEIS has been revised.
4.7.7.4	4-97	"Mountain Valley conducted surveys in Rockingham and Alamance Counties for crayfish in 2019 in conjunction with its mussel surveys but has not filed the results of the surveys to date."	The DEIS states that Mountain Valley conducted surveys in Rockingham and Alamance Counties for crayfish in 2019 in conjunction with its mussel surveys but has not filed the results of the surveys to date. Mountain Valley would like to clarify that this sentence implies that crayfish surveys were conducted for both species of crayfish; however, only Carolina Ladle crayfish surveys were completed in conjunction with mussel surveys.	**CO-6r -** Comment noted. Section 4.7.7.4 in the EIS has been revised.
4.13.2.9	4-629	Climate Change	See Attachment 1b	**CO-6s -** As described in section 4.11.1.2, our use of carbon dioxide equivalents (CO2e) is consistent with the methods for characterizing methane in greenhouse gas estimates, allowing a common standard for comparison across projects.
5.1.3	5-4	"The river crossing would take 3 to 7 days to complete"	Mountain Valley would like to clarify, as stated, in its Environmental Information Request Response dated February 13, 2019, the crossing of the Sandy River could take approximately 5- 10 days. This timeframe is approximate and is dependent on field conditions, weather, and access.	**CO-6t** – Comment noted. Sections 5.1.3 and 4.8.4.1 have been updated in the EIS

CO-7	Blue Ridge Environmental Defense League

the information to create the map in **Attachment 1** and several other maps illustrating the presence of former uranium mining leases in Pittsylvania County extending from the area northeast of the massive uranium deposit at Coles Hill in Chatham down to the southwestern corner of Pittsylvania County

FROM: Ann Rogers, Blue Ridge Environmental Defense League (BREDL)

RE: OEP/DG2E/Gas 3
Mountain Valley Pipeline, LLC
Southgate Project
Docket No. CP19-14-000

SUBJECT: Failure of Southgate Draft Environmental Impact Statement to document the Southgate pipeline's co-location with multiple uranium mining leases historically held by Marline Uranium Corporation in the uranium-rich Chatham fault zone

INTRODUCTION

The Draft Environmental Impact Statement (DEIS) for the Southgate pipeline states in Section 4.1.4.8 (pages 4-12 and 4-13), "The closest economically viable uranium deposit to the Project is at Coles Hill in Pittsylvania County, Virginia, 3.5 miles north of the Lambert Compressor Station (Coles Hill, LLC). This deposit is exposed locally within Coles Hill and proceeds to dip and extend underground (RTII, 2012). No encounters with the Coles Hill deposit are anticipated as a result of Project-required excavation due to the deposit depth and distance from the Project. . . . Concentrations of uranium in sediment, soils, shallow bedrock, and groundwater near the Project workspace in Pittsylvania County are comparable to concentrations in environmental media in the conterminous United States. . . . Significant impacts on human health and the environment are not anticipated during construction and operation of the project."

CO-7a

This assessment offered by the DEIS fails to consider dozens of uranium mining leases that were held by Marline Uranium Corporation in the area in Pittsylvania County through which the Southgate pipeline has been routed.

Below we: (1) discuss the documentation of the Marline uranium mining leases conducted by Piedmont Residents in Defense of the Environment (PRIDE) in 2010 and 2011, (2) offer mapping to illustrate PRIDE's findings, and (3) offer additional evidence of the presence of economically viable uranium ore deposits that coincide with the geographic area now planned for construction of the Southgate pipeline.

The discussion of uranium in Section 4.1.4.8 has been updated.

HISTORIC MARLINE LEASES COINCIDE WITH SOUTHGATE PIPELINE CORRIDOR

Research conducted by BREDL's chapter, PRIDE in 2010-11

CO-7b

During 2010-11, members of PRIDE conducted research at the Pittsylvania County (VA) Real Estate Office to obtain documentation of leases held by Marline Uranium Corporation to conduct uranium mining in Virginia. Their research generated a database containing over 600 records of these historic Marline leases. PRIDE's research was shared with Piedmont Environmental Council in 2011, who used

the information to create the map in **Attachment 1** and several other maps illustrating the presence of former uranium mining leases in Pittsylvania County extending from the area northeast of the massive uranium deposit at Coles Hill in Chatham down to the southwestern corner of Pittsylvania County

See response CO-7a.

CO-7	Blue Ridge Environmental Defense League	
CO-7c	The map in **Attachment 2** illustrates the Southgate pipeline corridor and its proximity to the historic Marline leases. On the map, the Southgate pipeline corridor is indicated by the brown line extending from Chatham southwest to where the pipeline crosses into North Carolina. The red dots on the map indicate the locations of some of the Marline leases that were discovered by PRIDE to be on record with the Pittsylvania County government in 2010-11. The map illustrates only a small fraction of the 618 total leases documented by PRIDE in the communities of Hurt, Long Island, Gretna, Chatham, Dry Fork, Danville, Cascade, and Axton, VA. The map clearly illustrates that the Southgate pipeline is planned for construction in a geographic area coinciding with dozens of Marline leases. ***Berry Hill Mega Park and Judy Byrd Mountain*** The public has long had knowledge of a large uranium deposit at the Berry Hill Mega Park and nearby Judy Byrd Mountain in southern Pittsylvania County, both of which are proposed to be crossed by the Southgate pipeline. In describing Pittsylvania Supervisor Tim Barber's position on uranium mining, an October 29, 2015 article appearing in the Danville Register & Bee states, "Barber opposes uranium mining because he doesn't think it's proven to be safe and it would decrease property values. Also, there is a large uranium deposit on Judy Byrd Mountain – adjacent to Berry Hill mega park – in southwestern Pittsylvania County that could be mined if the moratorium were lifted, he said." The Pittsylvania County Board of Supervisors passed a resolution in June, 2010 prohibiting the mining or milling of uranium at the Berry Hill Mega Park. Please see copy of the supervisors' resolution in **Attachment 3**. The Berry Hill Mega Park and Judy Byrd Mountain both appear on the map in **Attachment 2**. The Southgate DEIS fails to consider the impacts of excavation and pipeline development through the sizable uranium deposit at Berry Hill and Judy Byrd Mountain. ***Perkins Mountain*** On August 29, a landowner whose property is proposed to be crossed by the Southgate pipeline disclosed to BREDL staff that his father had received payments for a uranium lease on Perkins Mountain, located west of the City of Danville. Perkins Mountain, illustrated on the map in **Attachment 2**, is crossed by the Southgate pipeline. ***Danville Triassic Basin*** In 2007, PAC Geological Consulting, Inc. issued a report titled, "Technical Report on the Coles Hill Uranium Property, Pittsylvania County, Virginia". The report, which was written for Virginia Uranium, Inc., the company seeking to mine the very large uranium deposit at Coles Hill, contains the following description of the geology of the Coles Hill deposit:	See section 4.1.4.8 for a discussion on Uranium in the Project area. According to the Uranium Mining in Virginia: Scientific, Technical, Environmental, Human Health and Safety and Regulatory Aspects of Uranium Mining and Processing in Virginia (2012), the Judy Byrd Mountain may be within an area associated with Triassic aged sedimentary rocks that have the potential to contain occurrences of uranium based on generalized geologic stratigraphy. Sedimentary rocks in this area may contain uranium concentrations of 70 - 140 parts per million (ppm). Uranium concentrations of this size are not considered economically viable due to the lower uranium grades present in comparison to similar geologic deposits that exist globally. The National Geochemical database indicates that two rock samples were collected from a site located approximately 3,300 feet from Judy Byrd Mountain. The average uranium concentration from the rocks samples collected was approximately 4.65 ppm. In comparison the global average uranium concentration of granite is 4.8 ppm. Furthermore, the Mountain Valley Project pipeline easement is located approximately 640 feet from the location of Judy Byrd Mountain. The construction practices utilized in pipeline installation limit trenching activities to a depth of 7 feet below land surface. The shallow excavation depth further limits the possibility of encountering rock materials that may contain uranium concentrations.
CO-7d	***Perkins Mountain*** On August 29, a landowner whose property is proposed to be crossed by the Southgate pipeline disclosed to BREDL staff that his father had received payments for a uranium lease on Perkins Mountain, located west of the City of Danville. Perkins Mountain, illustrated on the map in **Attachment 2**, is crossed by the Southgate pipeline.	See response CO-7a.

CO-7	Blue Ridge Environmental Defense League	
CO-7e	***Danville Triassic Basin*** In 2007, PAC Geological Consulting, Inc. issued a report titled, "Technical Report on the Coles Hill Uranium Property, Pittsylvania County, Virginia". The report, which was written for Virginia Uranium, Inc., the company seeking to mine the very large uranium deposit at Coles Hill, contains the following description of the geology of the Coles Hill deposit: ***9.2** Property and Local Geology (Fig. **9.2**)* The property geology of the CHUP [Coles Hill Uranium Property] has been mapped by Marline geologists and Henika and Thayer (1983) and modified by Jerden (2001) . . . The Chatham Fault Zone has been mapped and studied by Lineberger (1983). The deposits are hosted within a fault-bounded wedge of Precambrian or Paleozoic mylonitic quartzofeldspathic gneiss and some amphibolite exposed along the Chatham fault zone at the faulted northwest margin of the Danville Triassic Basin. The augen gneiss is probably a tectonically and hydrothermally altered variety of biotite gneiss and mica schist of the Fork Mountain Formation. Initial cataclasis and brecciation along the Chatham fault zone resulted in hydrothermal events causing sodium metasomatism, chloritization, and argillization that may have been followed by hematization and uranium mineralization. The hydrothermal events coextend and are coeval with northerly trending Jurassic diabase dykes. Jerden and Sinha (1999) suggested that the Coles Hill uranium deposit formed within a structurally controlled, hydrothermal cell that developed during Mesozoic extension in response to a localized heat flux associated with mafic intrusive activity. The report contains a map showing the Danville Triassic Basin associated with the Chatham fault zone in which, as described above, the uranium deposits at Coles Hill and elsewhere in Pittsylvania County are found. A copy of this map appears in **Attachment 4.** The Chatham fault zone is recognized by geologists as being rich in uranium ore deposits and potentially exploitable as an economic asset. The DEIS should be revised to recognize that the Southgate pipeline has been routed through an area with a reputation among geologists as having rich potential for uranium mining.	See section 4.1.4.8 for a discussion on Uranium in the Project area. The Uranium Mining in Virginia: Scientific, Technical, Environmental, Human Health and Safety and Regulatory Aspects of Uranium Mining and Processing in Virginia (2012) study indicates that the only economically viable uranium deposit within both the Chatham fault zone and the state of Virginia occurs within the Cole Hills property. The Chatham fault zone is associated with Triassic aged sedimentary rocks that have the potential to contain uranium concentrations based on g+C1eneralized geologic stratigraphy. However, the uranium concentrations of these sedimentary rocks range from approximately 70 ppm to 140 ppm and are not considered an economically viable resource when compared to similar geologic deposits that exist globally.
CO-7f	**REQUEST TO FERC** We request that FERC require Mountain Valley Pipeline, LLC to (1) revise the Southgate DEIS so that it recognizes that the Southgate has been routed through an area containing significant quantities of economically viable uranium, and (2) consider the environmental impacts of building the Southgate through an area with significant concentrations of uranium ore.	As discussed in section 4.1.4.8, concentrations of uranium in soil the Project area in Pittsylvania County, Virginia are comparable to concentration in environmental media in the conterminous U.S. and concentrations of uranium in groundwater is significantly lower than U.S. Environmental Protection Agency maximum contaminant levels. Significant impacts on human health and the environment are not anticipated during construction and operation of the Project.

CO-8	Friends of the Central Shenandoah

Comments Regarding the MVP-Southgate Project DEIS
Submitted by
Friends of the Central Shenandoah

CO-8a	**Executive Summary - Flaws in the Draft Environmental Impact Statement** The Federal Energy Regulatory Commission has failed to address all of the issues required by the Natural Gas Act and the National Environmental Policy Act in the preparation of the Draft Environmental Impact Statement for the Southgate project.	See response GEN-4 in appendix I.2.
CO-8b	Neither the Commission nor the applicant has produced any substantiated information that shows an increased demand for gas supply exists for PSNC/Dominion Energy. This is crucial to determine the "necessity" for the project. Only 0.1 percent of PSNC/Dominion Energy's customers are in the industrial category. The remaining 99.9 percent of customers are either residential or commercial. Project developers have said that no gas is expected to be provided to electric generators. Information provided by the North Carolina Utility Commission shows that gas usage by residential and commercial customers in North Carolina is less in 2017 than in 2013, despite annual increases in the number of customers in both categories. Decreased gas usage per residential and commercial customer is expected to continue. PSNC experts testified to the state regulator that its winter baseload requirements are not expected to increase for the next five years. The worst-case Design Day scenario for PSNC is expected to increase in the future, although the assumptions that are used in that calculation have not been provided. Design Day estimates project the maximum gas usage under extreme conditions that may happen rarely, or not at all. PSNC/Dominion Energy has multiple options for meeting peak conditions that do not require year-round payments for unnecessary pipeline capacity which would severely burden ratepayers with billions of dollars in higher costs. The burden of proof is on the applicant to show that its project is better than the situation that currently exists.	See response GEN-2 in appendix I.2.
CO-8c	The "No Action" alternative is superior to the proposed Southgate project. That would mean the Southgate project would not be built and PSNC/Dominion Energy would continue to depend on Transco, which has served it reliably for decades.	We concluded in Section 3.2 that the No Action Alternative does not meet the Project objective and is not likely to provide a significant environmental advantage.

CO-8	Friends of the Central Shenandoah	
CO-8d	Transco has already expanded in capacity by far more than the amount proposed by Southgate. Providing more capacity using the Transco system would not require any new construction, as opposed to the 73 miles of new pipeline construction required for the Southgate project. New capacity could be added in small increments from Transco instead of committing to a huge amount of capacity from Southgate that must be paid for in full even if it is not used. PSNC/Dominion Energy has committed to capacity additions in 2020-21 that more than doubles its firm capacity reservation. This is poor utility planning and irresponsible regulatory oversight. If the Southgate DEIS had included a side by side comparison of alternatives, as required by NEPA, it would show that continuing to use Transco would provide more operational flexibility, require no new construction, and would cost, at most, half of what the Southgate project would cost. It is difficult to understand how any objective regulator could approve the Southgate projects given the availability of a lower cost, lower impact, and currently operating alternative.	See section 3.3.2.1 of the EIS for discussion of the Transco Alternative.
CO-8e	The Commission seems to have taken the position that because they have ignored the requirements of NEPA, the Natural Gas Act and their own guidelines for the past 20 years, and because few cared or objected, they could continue to do so. We care. We object to the Commission failing to follow the legal requirements. The consideration of the need for a project and whether it serves the public interest should be an integral part of the evaluation of a new pipeline project, as the law requires. The Commission should fulfill its role as an objective arbiter to balance the interests of the project developers with the interests of the public that the project is intended to serve. The missing portions in the Draft Environmental Impact Statement that are required by NEPA and the Natural Gas Act should be provided and the DEIS should be re-issued for public comment.	See response GEN-4 in appendix I.2.

DEIS Comments
MVP Southgate Project
Docket No. CP19-14-000

Federal Energy Regulatory Commission
888 First Street, N.E. Washington, D.C. 20426

Our organization represents the resources, citizens and wildlife of the Dan River Basin in Virginia and North Carolina.

CO-9a	Though the majority of our comments are directly related to the DEIS, there is one major issue in which we feel compelled to address. The MVP Southgate Project is a proposed extension of an incomplete and highly troubled pipeline- the MVP mainline project. The mainline has been troubled for years by violations, accidents, lawsuits and significant community opposition. MVP has not confidently portrayed the ability to not only construct the mainline project with any regard to the environment or their own quality standards, but have not proven their ability to complete the ever inflating project altogether. MVP seems to be 'putting the wagon before the horse' when applying for permits for MVP Southgate. We would highly recommend denying the project altogether for the reasons following in this submission and believe that the FERC should at the least deny this project until MVP has successfully demonstrated their ability to complete a project with any regard to meeting the conditions outlined in their permits without causing continued harm to landowners and communities in Virginia and West Virginia.	See response GEN-6 in appendix I.2.
CO-9b	The lack of a confident analysis proving the need for the MVP Southgate is also a major concern. Can FERC justify permitting this project when the negative impacts on the environment, water sources and communities greatly outweigh any proven need, or lack thereof? The NCDEQ and other independent analyses do not show a definite need for this project and some estimate the need of NG supply to fall as other sources of energy are continually made more available and cost efficient. The gas supply existing in NC is already in a surplus. Rockingham County alone already has three existing pipelines, one of which (Transco) has been upgraded with capabilities to flow gas in either direction. We highly recommend that the FERC review this when considering any impact stated in the DEIS.	See response GEN-2 in appendix I.2.

CO-9	Good Stewards of Rockingham	
CO-9c	**Aesthetic Impacts to the Region** The 72-mile long, 100-foot wide construction zone for this pipeline will leave a needless and damaging scar of visual blight and degraded lands. The aesthetic value of our region is an important asset in building the thriving and economy-boosting tourism attraction that each county in the project path is diligently working toward. The DEIS greatly underestimates the long term and significant impacts the deforestation and permanent ROW would cause our region.	See section 4.8.6.1 of the EIS for a discussion of visual impacts.
CO-9d	Residents and landowners who would frequently view the ROW will be hit hardest by visual impacts and the loss of use of their land. Residents will lose the privacy and visual screens of large trees and hedgerows to construction; the pipeline and its numerous new roads would be built and operated directly next to scores of homes – and will pass right through one home; and construction will render many property owners' land unusable for farming, habitation or other uses. Even so, the DEIS claims that there will be no impacts on local property values.	See response LU-1 in appendix I.2.
CO-9e	The pipeline would also impact the experiences of countless recreational users of public parks, recreation and conservation areas by generating dust and noise pollution, disturbing wildlife, and disrupting public access during construction. Users of National Wild & Scenic River candidates like the Dan and Haw Rivers; future designated recreational water trails like the Banister River; and public trails like the Mountains-to-Sea Trail and a planned public trail in Alamance County would all be affected. The project would also clear trees within view of the Colonial Heritage Byway (Route 150 in Rockingham County), causing permanent impacts. The HDD crossing of the Dan River is planned for the only river access in a minority and/or impoverished community. The DEIS does not seriously consider the potential impacts to our communities and tourism by the proposed project.	See section 4.8.4 of the EIS for a discussion on impacts on recreation.
CO-9f	**Wetlands** Pipeline construction will have a long term impact on nearly 27 acres of wetlands. In addition to the pipeline construction, Mountain Valley is asking for a waiver of FERC's wetland protection setbacks and plans to locate 23 additional temporary workspaces within 50 foot of wetlands. This is not protective of the sensitive Haw River watershed and should not be allowed.	See response WET-1 in appendix I.2.

CO-9	Good Stewards of Rockingham	
	Wildlife and Fisheries	
CO-9g	Constructing the Project would disturb approximately 1,439 acres of wildlife habitat, much of which would be permanently destroyed by the project. The project would also cross 21 perennial waterbodies containing fisheries of special concern: 8 in Virginia, and 13 in North Carolina. Recreational fishing is a large economic driver in both Virginia and North Carolina and any risk to our economic inputs should be considered a serious concern.	See section 4.6 of the EIS for further discussion.
CO-9h	The U.S. Fish & Wildlife Service requested that Mountain Valley minimize impacts to vulnerable migratory bird species which use the project area such as bald eagles, northern bobwhite, and red-headed woodpecker by avoiding clearing vegetation during the peak migratory bird nesting season (March 15 - August 15 in Virginia and April 1 - August 31 in North Carolina). Mountain Valley has defied the agency's guidance and has proposed clearing vegetation during peak nesting season from March 15 – April 30 and from August 16 - 31. FERC's DEIS ignored the obvious impacts to migratory birds that would result from this reckless activity.	See section 4.6.3.2 of the EIS for a discussion on migratory birds.
CO-9i	This project would impact and disrupt key wildlife habitat, including the North Carolina Forest Legacy Areas and Piedmont Land Conservancy Easement, as well as the Virginia Piedmont Forest Block Complex Important Bird Area (IBA).	See section 4.6 of the EIS for a discussion of these areas.
	Threatened/Endangered Species	
CO-9j	Pipeline construction would harm numerous aquatic species, including the Roanoke logperch, James spineymussel, Atlantic pigtoe and smooth coneflower. All are currently listed as endangered under the Endangered Species Act with the exception of the Atlantic pigtoe, which is currently under consideration for protection. Habitat for these aquatic species along the Virginia-North Carolina border would be at great risk from sedimentation caused by pipeline construction.	See section 4.7 of the EIS for a discussion of impacts to listed species. Federal agency compliance for the Endangered Species Act (ESA) Section 7 is described in section 4.7.1 of the EIS.
CO-9k	The scope of downstream impact considered in the DEIS is insufficient, as well as the scope of surveys for endangered aquatic species. The DEIS and MVP have also mentioned species may simply migrate away from wildlife-threatening impacts caused by the construction, this is false. Some species are considered sedentary and will not simply remove themselves from dangers brought about by MVP Southgate. Furthermore, shallow water depths of certain streams will further prevent migration of species capable of doing so. Our waters are currently impaired by turbidity and cannot afford the potential of any further impacts brought about by an unnecessary project. Our wildlife is in the process of rebounding and this project can only cause harm to the process.	See response WILD-3 in appendix I.2.

CO-9	Good Stewards of Rockingham	
CO-9l	**Socioeconomics** Construction of the project will cause long term impacts to the environment and would overlap with peak tourism season, both potentially negatively impacting the tourism economy in the area. Local employment is unlikely to be increased, property values will likely decrease, and the negative effects of the pipeline will be long-lasting. Many of the impacts referred to as short-term in the DEIS, like deforestation, must absolutely be considered a long-term impact considering the extensive amount of time required to naturally rehabilitate the area. FERC's analysis of the positive economic impacts state they will be "temporary and minor". We agree to that extent. MVP has more recently claimed that this project will add local jobs but with no agreements of proof of this statement. It is unclear why this was included in the DEIS when there can be no guarantee to this degree. MVP has not sufficiently demonstrated the likelihood of hiring locals in their history on the mainline and common contractors of this scope would be hired by bid, leaving much uncertainty to this claim.	Impacts to tourism are discussed in section 4.9.6 of the EIS.
CO-9m	**Environmental Justice** The DEIS neglects the entirety of neighborhoods such as Draper Village in Rockingham County, NC. The sole river access local to this community is the location of the proposed HDD drilling under the Dan River at Draper Landing. The scope of EJ must be expanded and more attentively addressed. The race and income of our residents must not dictate their ability to access clean and useable resources. The HDD process and deforestation poses very real and likely risks to the enjoyment, ecosystems and access to Draper Landing. The DEIS minimizes these risks and seems to suggest the additional ROW will not be damaging to any degree because of its proximity to an existing ROW. **If FERC cannot consider the cumulative impacts of greenhouse emissions, environment loss and public safety by adding additional fossil fuel infrastructure- FERC should not be so brazzen to consider it in this sense.**	See section 4.9.8 for discussion of impacts on Environmental Justice communities. See section 4.8.4 for discussion on recreation areas.
CO-9n	**Air Quality and Noise** The Lambert compressor station has the potential to emit 125,000 tons of greenhouse gases, 3.5 tons of formaldehyde each year and over 10 tons of particulate matter each year, putting nearby communities at risk for cardiovascular issues and asthma.	Air quality impacts are discussed in section 4.11.1.7.
CO-9o	The compressor station will be built in proximity to two Transco compressor stations already in operation. Cumulative impacts and the potential to impact human health with two minor source polluting facilities and one Title V facility (pending FERC approval) have not been adequately evaluated to assume that human and environmental health will not be adversely impacted. The potential risks for this project greatly outweigh any proof of need.	See response CI-4 in appendix I.2.

CO-9	Good Stewards of Rockingham	
CO-9p	**Reliability and Safety** The DEIS merely states that pipeline developers would comply with minimum construction and operation standards. It gives no reason for people living within the blast radius to feel safe. The National Transportation Safety Board documents interstate pipeline accidents, and its database includes numerous recent natural gas pipeline ruptures, leaks, and explosions. Moreover, studies show a spike in accidents involving new pipelines in recent years. The majority of the pipeline would be in Class 1 population density areas, meaning it would mandate the lowest safety standards and put those living near the pipeline at an even greater risk.	See response SAFE-1 in appendix I.2.
CO-9q	**Cumulative Impacts** FERC states that impacts from construction and operation of the pipeline will be temporary and localized. However, this assessment fails to take into account the long term and cumulative impacts that will occur to forested wetlands and forested habitats. It also fails to take into account the amount of dirt and mud entering streams from construction runoff. The nearly 3 miles of in-stream work paired with the removal of streamside vegetation will have cumulative, and negative impacts in the watershed, a watershed which is designated by the State as nutrient and sediment sensitive and is already experiencing negative effects on water quality and aquatic life.	Cumulative impacts to forested wetlands and habitats were evaluated in sections 4.13.2.3 and 4.13.2.4. Cumulative impacts to streams and other waterbodies were evaluated in section 4.13.2.2. Our analysis in section 4.13 is consistent is consistent with FERC style, formatting, and policy regarding NEPA evaluation of cumulative impacts.
CO-9r	**Conclusions of the DEIS** FERC is ignoring the significant impacts of this project. The DEIS describes widespread, permanent impacts like the long-lasting or permanent destruction of hundreds of acres of forests and wetlands, but in turn says that impacts won't be significant because mitigation measures will be used during construction. Mitigation can not prevent the significant impacts that permanent forest and wetland destruction cause. The DEIS' reliance on mitigation measures to argue that the project will cause no significant impacts falls short because many of the mitigation measures proposed to prevent significant impacts to local resources are unknown. In many instances, the DEIS instructs Mountain Valley Pipeline to come up with mitigation measures that are currently not defined. FERC can not claim that unknown measures will prevent significant environmental impacts.	See response GEN-9 in appendix I-2.
CO-9s	FERC concluded that no significant environmental impacts would be inflicted by this project while lacking the necessary information to assess what those impacts would be. For example, MVP has yet to provide FERC with its feasibility studies for its plan to cross Deep Creek with the pipeline, a site where imperiled aquatic species are suspected to live.	See response SURF-8 in appendix I.2. As discussed in section 4.6.5 of the EIS, Mountain Valley has provided aquatic species surveys results.

CO-9	Good Stewards of Rockingham	
CO-9t	FERC acknowledges that MVP will use 5.9 million gallons of water in constructing the project and MVP has only announced within the week their plans to use the Dan River as the source. Our rivers have suffered enough, especially the Dan. Our species cannot withstand the risks, neither can our tourism. The removal of the water from the Dan leads to the belief that the water will be returned their, supposedly with no chemicals. As the EPA has recently suggested, the lack of chemicals in the hydrostatic test water may lead to issues such as corrosion in the tested pipe. The plan for this project is immature, vague in scope and mitigation, and overly minimizing of the true risks to our land, air, water and citizens. The lack of information and scope is preventing FERC from assessing the project thoroughly.	See response SURF-6 in appendix I.2.
CO-9u	Residents throughout the proposed path of MVP Southgate must already deal with contaminated drinking water in their recreation and homes. The disregard by FERC to substantially consider alternatives to this project are a direct slap in the face to all those living here, working here and raising families here who deserve and require clean water. The possibility of this project being completed without long term impacts is non existent. We cannot afford the risks and are not willing to roll the dice on a company whose history clearly shows a disregard for safety and environmental control measures. As stated previously, **the MVP Southgate project is a proposed extension of a highly troubled and ever inflacting project that has not demonstrated a capability of being completed.** On behalf of our resources, wildlife, environment and residents- we strongly suggest that FERC deny permits for MVP Southgate.	See response GEN-4 in appendix I.2.

RE: Comments on FERC's Draft Environmental Impact Statement for Mountain Valley Pipeline's Southgate Project (Docket Number: CP19-14-000)

Dear Ms. Bose:

The Southern Environmental Law Center offers the following comments on the Federal Energy Regulatory Commission's ("FERC" or "the Commission") Draft Environmental Impact Statement for the Southgate Project ("project") proposed by Mountain Valley Pipeline, LLC ("Mountain Valley"). These comments are submitted on behalf of the Haw River Assembly, Waterkeeper Alliance, Sierra Club, and Appalachian Voices.

The National Environmental Policy Act ("NEPA") requires that federal agencies prepare a "detailed" environmental impact statement ("EIS") for every "major [f]ederal action[] significantly affecting the quality of the human environment."[1] The purpose of NEPA is to "prevent or eliminate damage to the environment and biosphere by focusing [g]overnment and public attention on the environmental effects of proposed agency action."[2] By focusing the agency's attention on the environmental consequences of its proposed action, NEPA "ensures that important effects will not be overlooked or underestimated only to be discovered after resources have been committed or the die otherwise cast."[3]

CO-14a

The proposed project would tear through over 70 miles of Virginia and North Carolina, causing long-lasting damage to rivers, streams, and wetlands. It would threaten vulnerable ecosystems and numerous endangered, threatened, and other sensitive species. And it would harm already overburdened environmental justice communities. Moreover, the North Carolina Department of Environmental Quality has expressed serious doubts about whether this pipeline is even necessary to meet the energy demands. Despite all of this, the Commission has failed to put together a thorough and detailed environmental impact statement as required by NEPA

See response GEN-1 in appendix I.2.

CO-14	Southern Environmental Law Center	
CO-14b	Most notably, the draft EIS is missing critical reports regarding the potential environmental effects of the project—information that the Commission must have to identify and evaluate impacts in preparing the draft EIS. In addition, the Commission has failed to evaluate all reasonable alternatives to the project, to assess significant health impacts to environmental justice communities, and to adequately analyze cumulative impacts. The draft EIS thus fails to provide the public with an opportunity for meaningful review and comment, in violation of NEPA. The Commission must acknowledge the deficiencies in the draft EIS, as discussed in these comments, and issue a revised draft EIS for public comment. Alternatively, the Commission must issue a supplemental draft EIS for public comment.	See response GEN-4 in appendix I.2, as well as additional comments below.
CO-14c	**I. The project's purpose and need impermissibly excludes reasonable alternatives to the project.** A purpose and need for an action is essential to the NEPA process, as it guides an agency's scope of review—in particular, an agency's consideration of all reasonable alternatives.[4] As NEPA regulations state, an agency's alternatives analysis "is the heart of the environmental impact statement," "providing a clear basis for choice among options by the decisionmaker and the public."[5] In this case, the project's purpose and need is defined too narrowly. As a result, the Commission fails to consider all reasonable alternatives in the draft The purpose and need for the project is defined narrowly as meeting "requests for *natural gas transportation service* of [Mountain Valley's] anchor shipper, Dominion Energy," rather than meeting the energy need within the region.[6] Because the Commission is only looking at alternatives that can transport natural gas, the agency ignores energy efficiency and all renewable alternatives—such as solar, wind, and battery storage. Renewable energy alternatives, which are gaining market share as their costs continue to drop,[7] might provide the needed energy while avoiding the proposed project's significant environmental impacts. Similarly, because the Commission only considered alternatives that transport natural gas, the agency has not taken a hard look at the No Action Alternative—or the possibility that the project is not constructed, as required by NEPA.[8] In fact, the Commission has not considered whether or not there is an energy need for the proposed project.[9] That failure persists despite the North Carolina Department of Environmental Quality's letter to the Commission questioning whether or not the project is needed, and providing evidence that the project would instead create an excess supply of natural gas in the region.[10] The Commission's constricted statement of purpose and need is not allowed under NEPA. Because the purpose and need forms the basis upon which to compare alternatives, an agency is not permitted "to contrive a purpose so slender as to define competing 'reasonable alternatives' out of consideration."[11] As written, the project's purpose and need can only be met by providing one energy source through one mode of transportation for the benefit of one company. The Commission must broaden the purpose and need for the project so that it actually considers a No Action Alternative—or the possibility that the project is not constructed—and renewable energy alternatives in its alternatives analysis.	The Project's purpose and how it relates to alternatives is addressed in the introduction to section 3.0. As stated in the EIS, the FERC reviews proposals developed by other entities. However, the FERC does not plan, design, build, or operate natural gas infrastructure. Accordingly, the project proponent is the source for identifying the purpose for developing and constructing a project. The Commission cannot simply ignore a project's purpose and substitute an alternative purpose for it that a commenter deems more suitable. As stated in section 1.1, the purpose of the Southgate Project is to is to meet the specific requests for natural gas transportation service of its anchor shipper, Dominion Energy, a local natural gas distribution company. Alternatives that do not achieve this purpose cannot be considered as feasible or reasonable alternatives to the Project. Also see responses ALT-1 and ALT-2 in appendix I.2.

CO-14	Southern Environmental Law Center	
	II. The draft EIS is missing information that is essential for the Commission's assessment of environmental effects. The Commission's conclusion that the project would not have significant environmental impacts cannot be substantiated because critical information is incomplete or omitted entirely. The Commission cannot, lawfully, reach a determination regarding the environmental effects of the project based on such unsupported speculation. An EIS is fundamentally an information dissemination tool: it allows federal agencies and the public to fully understand the environmental impacts of proposed actions before they begin and before resources have been committed.[12] Under NEPA, the public has a right to review and to provide comments on draft EISs.[13] This makes it essential that all relevant information is available—so that the agency drafting a draft EIS can adequately assess environmental impacts, and so that the public has the needed information to review and comment on the draft EIS.[14] The Commission's failure to collect and provide all relevant information on the project's environmental impacts is a fatal flaw in its draft EIS. A. <u>The Commission does not have adequate information to evaluate impacts to sensitive species</u>. The Commission does not have enough information to evaluate the impacts that the project would have on federal or state-listed species or their habitats, yet the draft EIS erroneously assumes that sensitive species and their habitats are not in affected areas. The agency has not yet consulted with the U.S. Fish and Wildlife Service to determine whether or not any federally listed or proposed endangered or threatened species or their designated critical habitats would be affected by the project.[15] The agency has not determined the nature and extent of adverse impacts, nor measures that would avoid, reduce, or mitigate impacts on habitats or species.[16] Moreover, Mountain Valley has not completed aquatic surveys to determine that protected fish and mussel species are not present in impacted rivers and streams, and the company has not completed its consultation with the Virginia Department of Game and Inland Fisheries and the North Carolina Wildlife Resources Commission.[17] As the draft EIS states, impacts on these species "may be greater […] because these species may be more sensitive to a disturbance; more specific to a habitat; and less able to move to unaffected suitable habitat."[18] These species could experience "habitat fragmentation, loss, or degradation; decreased breeding or nesting success; increased predation or decreased food sources; and injury or mortality."[19] For instance, sedimentation from the project would likely endanger numerous sensitive mussel species in both Virginia and North Carolina.[20] Studies show that excess sedimentation harms freshwater mussels by clogging their gills and suffocating them, by interfering with filter feeding, and by reducing the production of food from decreased sunlight.[21]	See responses GEN-4 and T&E-1 in appendix I-2.

CO-14d

CO-14	Southern Environmental Law Center	
CO-14d	Without having conducted aquatic surveys or finished consultations with state and federal wildlife agencies, the Commission and Mountain Valley falsely assume that they have all the information that they need to protect sensitive species in constructing the project. For instance, the draft EIS states that where sensitive fish or mussel species are present—and therefore, where it is necessary for Mountain Valley to avoid disturbing a particular stream—construction methods that do not trench through the stream are proposed.[22] The draft EIS also states that "*none of the crossings with sensitive fish or mussel species* have the potential to require blasting."[23] Without completed aquatic surveys, and completed consultations with the appropriate agencies—including the Virginia Department of Game and Inland Fisheries, the North Carolina Wildlife Resources Commission, and the U.S. Fish and Wildlife Service—Mountain Valley and the Commission cannot possibly ensure that the project's actions, including river and stream crossings or blasting events, would avoid sensitive aquatic species. The Commission must prepare a revised draft EIS, or issue a supplemental draft EIS, that addresses the new information regarding impacts to sensitive species, and release it for public comment. B. <u>The Commission does not have other key information to adequately evaluate environmental impacts.</u> Other missing information includes, but is not limited to: • Final site-specific plans for all stream, river, and wetland crossings, including horizontal directional drilling ("HDD") and conventional bore crossings; • All wetland surveys; • Mountain Valley's Stormwater Pollution Prevention Plan; • Mountain Valley's Compensatory Mitigation Plan for wetland impacts; • Mountain Valley's Final Erosion and Sediment Control Plan; • Written correspondence from Virginia and North Carolina state agencies regarding any timing restrictions on waterbodies containing warmwater fisheries; • Geotechnical studies for the proposed Dan River and Stony Creek Reservoir HDD crossings, revised feasibility and hydrofracture analyses, and any proposed mitigation for these crossings; • Information on impacts to North Carolina's Jordan Lake Riparian Buffer Area, including information on proposed mitigation and impacts to riparian buffers; • Complete locations of all private water wells and springs within 150 feet of the Project work areas, including information on the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs; • A list of final water sources to be used for the project, including for dust control, hydrostatic testing, and HDD operations—including information on intake locations, waterbody names, withdrawal rates and methods, measures to minimize entrainment of fish, and water discharge locations; • Mountain Valley's revised plans to dispose of brush and timber; • Measures that Mountain Valley will take to minimize impacts on migratory birds; • Results of Mountain Valley's pre-construction bald eagle nest and colonial rookery surveys;	See above CO-14d comment response

CO-14	Southern Environmental Law Center	
CO-14d	• All cultural resources survey reports, Mountain Valley's site evaluation reports and avoidance or treatment plans, and comments on Mountain Valley's cultural resources reports and plans from the Virginia and North Carolina State Historic Preservation Officers and interested Indian tribes; • Mountain Valley's Nighttime Construction Noise Management Plan, and • Toxicological, environmental, and health information for coatings used for the project's pipeline and associated utilities. Not only does the draft EIS rely on incomplete and missing information to conclude that there would be no significant impacts from the project, the draft EIS is filled with indeterminate and discretionary phrases that fail to give the public enough information to assess the project's impacts, for instance: • Construction would only be conducted during low flow periods "when *practicable.*"[24] • Blasting would only be used "after all *reasonable* means of trench excavation are unsuccessful," and would be completed during dry or low flow periods "where *practicable.*"[25] • Vegetative buffer would only be "allow[ed]" for conventional bores "*to the extent practicable.*"[26] Casing to prevent conventional bores from collapsing would only be used "*if required.*"[27] • Ground surface would only be restored "as closely *as practicable* to original contours."[28] At no point does the Commission define what is "practicable," or when certain protective measures would be "required." In many of these scenarios, the risk is significant. For instance, crossing a river or stream using a conventional bore method is dangerous because of "the possibility of the borehole collapsing without warning."[29] The draft EIS states that certain measures can be taken to reduce this risk—for instance, Mountain Valley could "allow for a vegetative buffer on each side" of the river or stream, or the company could "use a casing [...] to prevent the bore from collapsing."[30] However, these actions depend on whether not the company finds it "practicable" or whether the company believes it is "required," yet the draft EIS fails to provide any clarity for the public as to whether or not these protective actions will be taken.[31] For the reasons stated above, the draft EIS is "so inadequate as to preclude meaningful analysis," and the Commission must prepare a revised draft EIS and release it for public comment.[32] Alternatively, the Commission must issue a supplemental draft EIS that addresses new information.[33] Without crucial additional information, the Commission simply cannot evaluate how the project will affect the environment, and the public cannot meaningfully comment on the project.	See above CO-14d comment response

CO-14	Southern Environmental Law Center	
CO-14e	**III. The Commission failed to adequately analyze impacts to environmental justice communities.** The Commission failed to take a hard look at how the project would degrade the "healthful environment" for environmental justice communities in close proximity to the project. When enacting NEPA, Congress declared that "each person should enjoy a healthful environment and that each person has a responsibility to contribute to the preservation and enhancement of the environment."[34] The Commission thwarted this central goal of NEPA in failing to adequately consider how the project would harm low-income communities, Native Americans, and communities of color. For instance, two census block groups within one mile of the project's Lambert compressor station contain environmental justice populations.[35] Yet, the draft EIS does not assess the health impacts that the compressor station would have on these populations. The draft EIS only states that, while there will be "long-term impacts on air quality," they would "not be significant" because potential pollution emissions would be below National Ambient Air Quality Standards.[36] However, the existing evidence indicates that impacts could be significant, and the Commission must further analyze potential impacts to the communities surrounding the Lambert Compressor Station.	Environmental justice communities are discussed in section 4.9.8 of the EIS.
CO-14f	The Lambert compressor station would cause significant increases in hazardous air pollutants, particulate matter, precursors to ozone, and other air pollution. Ozone exposure can cause respiratory symptoms, such as coughing, throat irritation, chest pain and tightness, wheezing, and shortness of breath; reduced lung function; and airway inflammation.[37] Fine particle pollution also causes health problems, such as heart attacks, aggravated asthma, decreased lung function, and irregular heartbeats.[38] Ozone and fine particulate matter contribute to over 200,000 premature deaths in the United States each year.[39] Moreover, there is no evidence of a safe level of exposure for either of these pollutants, and both have health effects even below the current National Ambient Air Quality Standards.[40] A recent report from Physicians for Social Responsibility indicates additional potential pollution from compressor The draft EIS ignores all of these potential health impacts when briefly discussing potential harms to environmental justice communities. The Commission failed to collect information on the local, baseline health conditions that will be degraded, and it failed to assess the cumulative impacts to the health of environmental justice communities. In fact, the draft EIS does not even offer any information about the people or communities who live closest to the Lambert compressor station. The most harmful impacts from the compressor station will be suffered by those who live in the areas closest to and downwind of the compressor station. Therefore, the Commission must assess the makeup of the communities living closest to the station. And in order to assess harm to these communities, the Commission must evaluate local, baseline health conditions that will be degraded by the compressor station's pollution, and assess the cumulative health impacts to environmental justice communities caused by the station and by other projects nearby. The draft EIS lacks sufficient information for the public to understand the project's impact on environmental justice communities. The Commission must revise the draft EIS to include additional environmental justice analysis, particularly regarding impacts from the Lambert compressor station.	Air quality impacts are discussed in detail in section 4.11.1.7 of the EIS. Air quality impacts on environmental justice communities are discussed in section 4.9.8 of the EIS. A cumulative air quality impact analysis can be found in section 4.13 of the EIS. Also see response AIR-2 in appendix I.2.

CO-14	Southern Environmental Law Center	

IV. The Commission has not analyzed trenchless construction methods at over 200 crossings, thus failing to consider all reasonable alternatives.

CO-14g

Under NEPA, the Commission is required to "[r]igorously explore and objectively evaluate *all reasonable alternatives*."[43] The Commission has failed to evaluate the possibility of trenchless construction—which is known to be less harmful—for hundreds of crossings through rivers, streams, and wetlands. Rather than selecting construction methods that allow the company to dig under these waters, Mountain Valley has instead proposed to blast, carve, and dig through all but five or six of 224 stream and river crossings—turning to methods that cost the least, but have the most potential for severe impacts.[44]

Trenchless construction methods that go under rivers and streams are less harmful than construction methods that use trenches within waters.[45] During construction that uses trenches, the "[c]learing and grading of stream banks, in-stream trenching, the installation and removal of temporary crossing structures, trench dewatering, and backfilling" all harm water quality.[46] Construction in rivers and streams can "cause the dislodging and transport of channel bed sediments and the alteration of stream contours," which "could alter stream dynamics and increase downstream erosion or deposition."[47] Sedimentation can also "alter stream bottom characteristics, such as converting sand, gravel, or rock substrate to silt or mud."[48] Turbidity can reduce the amount of light in streams and photosynthetic oxygen production, and it could "introduce chemical and nutrient pollution from sediments."[49] Stirring up "deposited organic material and inorganic sediments could cause an increase in biological and chemical use of oxygen," decreasing dissolved oxygen concentrations.[50]

Increased sedimentation and turbidity caused by in-stream construction significantly harm aquatic life. As stated in the draft EIS, "[s]edimentation could smother fish eggs and other benthic biota."[51] Changes to habitat caused by construction "could reduce juvenile fish survival, spawning habitat, and benthic community diversity and health"; "reduce dissolved oxygen levels in the water column and reduce respiratory functions of in-stream biota"; and "reduce the ability for biota to find food sources or avoid prey."[52]

Even after construction is completed, there would be significant long-term damage to rivers and streams. The project would leave a permanent gaping strip above the right-of-way in forested riparian areas, where trees would not be permitted to regrow. Riparian vegetation provides numerous key functions for waterbodies, including protecting waters from pesticides, sediment, and other pollutants, stabilizing stream banks, and regulating water temperatures. Furthermore, sedimentation and erosion can be expected to continue long after construction from disturbed stream beds and unanticipated flooding and storm events—resulting in the chronic degradation of water quality and habitats.[53] These impacts to rivers and streams are not "temporary and localized" impacts, as the Commission claims,[54] particularly given that there are many instances where the proposed pipeline would affect several tributaries to the same stream.

Construction that uses trenches similarly harms wetlands. As stated in the draft EIS, construction could increase turbidity; "alter the capacity of wetlands to function as habitat and as erosion control buffers"; and cause soil compaction or rutting from heavy equipment, thus "alter[ing] water infiltration, hydrology, and potentially inhibiting germination of seeds and the ability of plants to develop root systems."[55] Discharges "from stormwater, dewatering structures, or hydrostatic testing" could also harm water quality by sending sediments and pollutants into wetlands.[56] As the Commission states, many of these impacts to wetlands "would be longer term or permanent."[57] For instance, the project would fragment forested wetlands by

North Carolina will be impacted by construction from the pipeline,[59] and at least 75 wetlands would suffer from "permanent impacts."[60]

Section 4.3.2 and 4.4.2 discusses measures that Mountain Valley would implement to reduce potential impacts on surface waters and wetlands crossed by the Project. We reviewed all wetland and waterbody crossings and the proposed crossing method. We conclude in the EIS that implementation of Mountain Valley's collocation routing, workspace design, and construction methods would avoid impacts on wetlands and waterbodies to the extent practicable, and constructing the Project in accordance with Mountain Valley's Procedures and other plans, impacts would be minimized, and most impacts would be minor and temporary or short-term.

CO-14	Southern Environmental Law Center	
CO-14g	Mountain Valley proposes to use trenches for more than 200 crossings—including crossings through the Banister River, a potential Blueway river (a state-designated recreational water trail); through the Sandy River in Virginia, which potentially qualifies for a designation that the river "possess[es] outstanding scenic, recreational, historic, and natural characteristics of statewide significance";[61] through the Haw River, a designated protected watershed in North Carolina; as well as many water supply waters and nutrient sensitive waters in North Carolina.[62] Because there are reasonable trenchless construction alternatives to these crossings and many others, the Commission must require Mountain Valley to evaluate the possibility of crossing each river and stream without using harmful trenches, and the Commission must prepare a revised draft or supplemental EIS that reflects that additional analysis.	See above CO-14g comment response
CO-14h	**V. The draft EIS fails to take a hard look at cumulative impacts.** The Commission's draft EIS fails to take a hard look at cumulative impacts that result from adding the project's impacts to the impacts of other past, present, and reasonably foreseeable projects on the environment. A cumulative impact is the [I]mpact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.[63] Cumulative impact analyses that contain "cursory statement[s]" and "conclusory terms" are insufficient under NEPA.[64]	See response CI-1 in appendix I.2.
CO-14i	First, the temporal and geographic scope of the Commission's cumulative impacts analysis for the project is far too limited. This is evidenced by the fact that the Commission neglects to mention the cumulative impacts to the Haw River watershed caused by a massive mixed-use development on 7,120 acres in Pittsboro, North Carolina—Chatham Park.[65] Chatham Park is expected to add up to 22 million square feet of commercial space and 22,000 new residential dwelling units—enough homes to accommodate 60,000 new residents.[66] The proposed site for Chatham Park includes important and sensitive natural resources, including important habitat for the federally endangered Cape Fear Shiner and other sensitive species.[67] The U.S. Fish and Wildlife Service has written several letters to the Town of Pittsboro's Board of Commissioners and Town Manager regarding the impact that the development would have on the Haw River, particularly impacts on sensitive species.[68] The agency states in one letter, Many areas along the Haw River are recognized for their rarity, ecological function in the landscape, and unique natural resources that they support. The importance of the habitats these areas provide for fish and wildlife makes protection from habitat degradation essential.[69]	The Chatham Park development is located approximately 25 miles southeast of the project, and is considered outside of the Southgate Project's geographic scope for cumulative impacts.

CO-14	Southern Environmental Law Center	
CO-14i	Chatham Park would exacerbate existing water quality problems in the Haw River, as well as Robeson Creek and Jordan Lake, by significantly increasing stormwater runoff, sedimentation, and nutrient loading. Yet the draft EIS's cumulative impacts analysis does not even mention the massive planned development. The Commission's failure to discuss the cumulative environmental impacts caused by the project and Chatham Park is a glaring omission in its analysis—and it demonstrates that the Commission's temporal and geographic boundaries for its analysis are too narrow. They exclude pending or already planned projects that would cause significant impacts on the environment, such as Chatham Park. EPA guidance on cumulative impacts states that "[s]patial and temporal boundaries should not be overly restrictive in cumulative impact analysis."[70] Accordingly, the Commission must revise the draft EIS to broaden the scope of its cumulative impacts analysis so that it includes impacts caused by massive projects that are known to cause harm to the same environmental resources.	See above CO-14i comment response
CO-14j	In addition, cumulative impacts must be analyzed using metrics that are actually helpful to understanding specific environmental impacts. For instance, cumulative impacts to particular rivers, streams, and wetlands can be measured by quantifying increased sediment discharge, stream bank erosion, and soil compaction. However, instead of quantifying impacts to streams and wetlands in a manner that informs the public and agencies, the draft EIS makes a serious of vague statements about potential impacts: > Turbidity plumes *may travel* downstream for a few miles, but typically the plume would disperse and become diluted to background levels […] Projects involving in-water work would have to occur within similar timeframes within close distance to have a cumulative effect on turbidity […] Clearing, grading or other earthwork within the watershed *may* also increase the potential for cumulative impacts on water quality from increased stormwater runoff and sedimentation.[71] The draft EIS does not discuss what background levels are in specific streams or wetlands; how much turbidity there would be from other projects or how far turbidity would travel; whether or not many projects occur within similar time frames; or whether or not other projects involve clearing, grading or other earthwork that could increase stormwater runoff and sedimentation. Without providing any support, the draft EIS further assumes that dozens of other projects "would likely have similar impacts on surface waters due to increased turbidity and sedimentation during construction" as Mountain Valley's project would.[72] Such vague and conclusory assertions do not meet the Commission's obligations under NEPA. Moreover, Commission cannot ignore its NEPA obligations by relying on the permitting processes of other agencies,[73] yet it does this repeatedly throughout the draft EIS. For instance: • Instead of actually taking a hard look at the cumulative impacts of non-jurisdictional project-related facilities, the draft EIS simply states that "impacts associated […] are *expected to be minimal* due to the limited footprint of these projects and potential mitigation measures required by permitting agencies."[74] • With regards to mining operations, the draft EIS states that "[n]o significant cumulative impacts are anticipated from these facilities as operational activities would be subject to state and local permit requirements."[75]	The assessment of cumulative impacts is dependent upon readily available information. When there is uncertainty concerning the impacts of other projects, staff uses its experience to reduce this uncertainty and communicates this uncertainty to decision makers and the public. It is reasonable to assume that other projects would be subject to permit requirements including environmental impact minimization and mitigation measures.

CO-14	Southern Environmental Law Center	
CO-14j	• The Commission further "*assume[s]* other non-FERC-regulated projects would follow similar requirements set by the permitting agencies" that FERC sets for projects under FERC's jurisdiction regarding the protection and restoration of soils.[76] • The Commission "*assume[s]* that the […] prime farmland affected by the Cypress Creek Renewables Solar Farm, and the Husky Solar Farm would also be required to return these areas to pre-construction conditions."[77] • The Commission also assumes that non-FERC projects "would be required (by permit) to install erosion and stormwater control devices to minimize runoff."[78] and that projects "would *likely be required* to install and maintain [best management practices] similar to those proposed for the Southgate Project as required by federal, state, and local permitting requirements so as to minimize impacts on waterbodies."[79] • The Commission "*expect[s]*" that other projects "that are subject to permitting approval would be designed to minimize impacts on fisheries and aquatic resources and that the [Virginia Department of Environmental Quality] and [the North Carolina Department of Environmental Quality] would require any other projects to adhere to state-mandated or recommended timing windows for construction within waterbodies containing sensitive fish species."[80] The Commission cannot broadly assume that the actions of other state and federal permitting agencies will protect environmental resources, ignore its own obligation to assess the cumulative impacts of all of these projects, and then arbitrarily conclude that the cumulative impacts will not be significant. Finally, the Commission provides numerous excuses for failing to adequately assess cumulative impacts, before it simply concludes that the impacts would not be significant. For instance, the draft EIS states: • "Construction timeframes […] are currently unknown" for particular transportation and road improvement projects.[81] • "Due to the speculative nature of the housing and development markets and funding mechanisms for other projects listed […], it is difficult to determine the amount of land that would ultimately be affected."[82] • "It is unknown whether construction activities" would "coincide with the Southgate Project."[83] • "We were unable to quantitatively determine the number of [water wells and springs] on a HUC-12 watershed basis."[84]	See above CO-14 comment response
CO-14j	These excuses cannot withstand scrutiny—the Commission cannot continue to rely on missing or incomplete information to avoid evaluating impacts caused by the project and by other past, present, and reasonably foreseeable projects. Because the Commission unreasonably restricted the scope of its cumulative impacts analysis, failed to quantify many of the effects that it does acknowledge, relied inappropriately on other agencies' permitting decisions, and failed to collect the necessary information to evaluate cumulative impacts, the draft EIS's cumulative impacts analysis does not meet the requirements of NEPA. **VI. Conclusion** For the reasons set forth above, the Commission's draft EIS for the Southgate Project proposed by Mountain Valley Pipeline, LLC fails to satisfy the requirements of the National Environmental Policy Act. To remedy these defects, the Commission must prepare and issue a	See response GEN-4 in appendix I.2.

FERC DEIS [FERC/EIS-0297D] – MVP Southgate Project

Comments and Request for 60-Day Extension for Comments

I am submitting comments on behalf of the Blue Ridge Environmental Defense League (BREDL) based in Glendale Springs, NC. BREDL is a regional, community-based, non-profit environmental organization founded in March 1984. Our founding principles are earth stewardship, environmental democracy, social justice, and community empowerment. BREDL has chapters and members throughout the Southeast including in the MVP Southgate impacted counties of Pittsylvania in Virginia and Rockingham and Alamance counties in North Carolina.

BREDL will submit additional comments.

CO-17	Blue Ridge Environmental Defense League	
CO-17a	**Public Release of DEIS was Premature** Per Federal Energy Regulatory Commission (FERC) regulations on implementing the National Environmental Policy Act (NEPA), 18 CFR § 380.3(b), an applicant must (1) Provide all necessary or relevant information to the Commission and (2) Conduct any studies that the Commission staff considers necessary or relevant to determine the impact of the proposal on the human environment and natural resources. There are too many instances of incomplete data or lack of information mentioned throughout the DEIS. This DEIS should not have been released for public comment until the information was completed. For examples, • Regarding geotechnical studies for Dan River and Stony Creek Reservoir crossings: "Mountain Valley's geotechnical contractor determined that the current HDD design is feasible; however, additional geotechnical borings are planned to confirm the findings." "Access issues limited collection of geotechnical information at the Stony Creek Reservoir crossing location."[1] • Regarding data on springs in Virginia and North Carolina: "Published, recent data on springs in Virginia and North Carolina are not currently available. ..Based on surveys completed at this time..." [2] • Regarding wetlands: "Couldn't survey all wetlands..."[3] • Regarding Endangered, Threatened and Sensitive Species: " To date, Mountain Valley has not completed surveys or provided survey results to the Commission for federally listed bat hibernacula, aquatic biota, and plant species along the Project survey corridor." [4] Because the DEIS contains many information deficiencies, there are numerous FERC Staff recommendations listed throughout. These so-called recommendations illegally sidesteps public input and offer no guarantee that recommendations will become requirements. These holes in the DEIS will increase variance requests. The FERC variance process is not governed by regulations or published policy, does not include public input and does not allow for detailed analysis. FERC's reliance on recommendations and variances unlawfully circumvents the NEPA process. Moreover, the DEIS states that, "We determined that, for most resources, the construction and operation of the Project would result in limited adverse environmental impacts. This determination is based on our review of the information provided by Mountain Valley and further developed from environmental information requests; field reconnaissance; scoping; literature research; alternatives analyses; and contacts with federal, state, and local agencies, and other stakeholders. We conclude that approval of the Project would result in some adverse environmental impacts, but these impacts would be reduced to less-than-significant levels through implementation of our recommendations and Mountain Valley's proposed avoidance, minimization, and mitigation measures."[5]	See response GEN-4 in Appendix I.2. Our analysis is based on the best available survey and publically available data. Mountain Valley has completed geotechnical studies for the Dan River and Stony Creek HDD. Mountain Valley has also completed surveys for aquatic species and has submitted reports to FERC, USFWS, and state agencies. At the time of the final EIS, limited surveys are still pending for bat portals, federal and state listed plant species, and wetlands. Mountain Valley would be required to submit the results of these remaining surveys to FERC and the appropriate agencies prior to approval for construction.

CO-17	Blue Ridge Environmental Defense League	
CO-17b	The DEIS is relying on recommendations to justify FERC's determination of less-than-significant impacts. There is no guarantee that these recommendations will become requirements or that they will be implemented. FERC must take a "hard look" at the environmental consequences of an action. Coalition for Responsible Growth ~ Res. Conservation v. FERC, 485 F. App'x 472, 474 (2d Cir. 2012).	Our recommendations will become conditions of the Commission Order. Mountain Valley would be required to satisfy all of the conditions of the Order prior to approval to begin construction.
CO-17c	This DEIS is fatally flawed because it lacks detailed and complete analysis which would aid public input and agency decision-making. It should be rescinded, fully completed, then re-released for public review once FERC's NEPA implementation regulations are properly met.	See response GEN-4 in appendix I.2.
CO-17d	**Request for 60-Day Extension** In light of numerous shortcomings of information throughout the DEIS, BREDL respectfully requests a 60-Day Extension for Public Comments.	See response GEN-5 in appendix I.2.
CO-17e	**Segmentation** FERC and Mountain Valley Pipeline, LLC have segmented the MVP Southgate project as a separate project outside of the MVP-mainline, illegally splitting this project into two parts. As BREDL pointed out in our August 21, 2018 comments at the Chatham, VA scoping meeting, "While this project is deemed as independent from the Mountain Valley Pipeline...it is indeed dependent on the completion of the MVP project." We further charge that FERC's attempt to mislead the public and to not evaluate these two "projects" in one environmental document was arbitrary and capricious. We are not convinced that FERC did not know about the Southgate Project prior to April 11, 2018. Construction had already started on the MVP-Mainline Project – just two months prior to the MVP-Southgate Project being announced. As soon as FERC received notice of the Southgate Project, FERC should have taken the appropriate actions. **Jun. 23, 2017 FERC issued the Final Environmental Impact Statement.** **Oct. 13, 2017 FERC issued a Certificate of Public Convenience and Necessity for MVP.** **Feb. 2018 Construction of the MVP began with tree-cutting.** **Apr. 11, 2018 MVP announces the MVP Southgate Project.** Federal agencies may not "artificially divid[e] a major federal action into smaller components, each without a `significant' impact." Coalition on Sensible Transp. v. Dole, 826 E2d 60, 68 (D.C. Cir. 1987). Without the MVP mainline project, the MVP Southgate project would be void. The mainline project has yet to be completed. FERC must consider both "projects" in one environmental document. The time between the issuance of the MVP-mainline FEIS in June, 2017 and the announcement of plans to build the Southgate in April, 2018 was just ten months. FERC certified the MVP-mainline in October, 2017 based on plans to have its gas flow into the Transco pipeline system, and then within a period of only six months, began articulating that this MVP-mainline gas would be redirected by the Southgate to "two new delivery points on the Dominion Energy distribution system in Rockingham and Alamance Counties, North Carolina."	See response GEN-8 in appendix I.2.

CO-17	Blue Ridge Environmental Defense League	
CO-17e	Mountain Valley Pipeline, LLC sought to avoid addressing the entire project and its cumulative impacts. FERC had the authority and the responsibility to stop work on the MVP-mainline as soon as it received the news regarding the Southgate project. In fact, FERC is required to do so. FERC must analyze the MVP-Mainline and MVP-Southgate projects in one environmental document so that cumulative impacts can be properly considered and addressed. The Draft Environmental Impact Statement (DEIS) for the MVP Southgate says the following: "Mountain Valley states that the Project will provide additional firm natural gas transportation services for Dominion Energy to meet its growing supply needs via interconnections with the under construction Mountain Valley Pipeline project in southern Virginia and the interstate pipeline of East Tennessee in North Carolina to two new delivery points on the Dominion Energy distribution system in Rockingham and Alamance Counties, North Carolina."[9] The Southgate DEIS further states that "The Transco system does not connect with the Project's proposed receipt point with the Mountain Valley Pipeline."[10] However, the Final Environmental Impact Statement (FEIS) for the MVP-mainline, issued in June, 2017, states, "In general, as described by the Applicants, the purpose of both the MVP and the EEP is to transport natural gas produced in the Appalachian Basin to markets in the Northeast, Mid-Atlantic, and Southeastern United States. Specifically, the MVP would deliver the identified gas volumes (2 Bcf/d) to five contracted shippers via a pooling point at Transco Station 165 in Pittsylvania County, Virginia."[11] FERC has not shown that there are logical termini between the projects, or that each project results in a segment that has substantial independent utility apart from the other project. See Taxpayers Watchdog, Inc. v. Stanley, 819 F.2d 294, 298 (D.C. Cir. 1987) (Taxpayers Watchdog). In fact, the DEIS has indicated the opposite by stating that the purpose and need for the Southgate project is dependent on "Dominion Energy [meeting] its growing supply needs via interconnections with the under construction Mountain Valley Pipeline project." Per NEPA regulations, §1508.25, scope consists of the range of actions, alternatives and impacts to be considered in an environmental impact statement. The scope of an individual statement may depend on its relationships to other statements. Connected actions must be discussed in the same impact statement. Actions are connected if they automatically trigger other actions. Cumulative actions when viewed with other proposed actions to have significant impacts must be discussed in the same impact statement. The courts have ruled against such pipeline segmentation. Delaware Riverkeeper Network et al successfully argued that FERC's pipeline approval process was illegal because it had segmented its environmental review. On June 6, 2014, the United States Court of Appeals for the District of Columbia issued an opinion and order finding that FERC's segmentation violated NEPA and that FERC had failed to consider the cumulative impacts of these projects. The court decision stated:	See above CO-17e comment response

CO-17	Blue Ridge Environmental Defense League	
	"The temporal nexus here is clear. Tennessee Gas proposed the Northeast Project while the 300 Line Project was under construction, and FERC plainly was aware of the physical, functional, and financial links between the two projects. And FERC's consideration of the Northeast Project application overlapped with its consideration of the remaining two projects. Indeed, FERC's review of the Northeast Project overlapped with its review of the Northeast Supply Diversification Project for the first six months and with the MPP Project's review for the final six months. Thus, FERC was obliged to take into account the condition of the environment reflected in the recently related and connected upgrades. The adjacent lands were recently disturbed, wildlife faced a larger habitat disruption, there was an increase in pressure and gas moving through the system, and wetlands and groundwater flow was disrupted. These effects could not be ignored in FERC's NEPA review of the Northeast Project.	
CO-17e	Tennessee Gas states that it did not know at the time it commenced the 300 Line Project that it was embarking on a series of upgrade projects that would soon transform the entire pipeline. That may be so. But the important question here is whether FERC was justified in rejecting commenters' requests that it analyze the entire pipeline upgrade project once the Northeast Project was under review and once the parties had pointed out the interrelatedness of the sequential pieces of pipeline which were, in fact, creating a complete, new, linear pipeline. Because of the temporal overlap of the projects, the scope and interrelatedness of the work should have been evident to FERC as it reviewed the Northeast Project. Yet FERC wrote and relied upon an EA that failed to consider fully the contemporaneous, connected projects."	See above CO-17e comment response
	No matter that construction on the MVP-Mainline Project is underway or how far along that construction may or may not be. **FERC must immediately stop work on the MVP-mainline project, halt the Southgate DEIS process, and return to square one. FERC must consider and evaluate these two projects - dependent on each other – in one environmental document.**	
	Purpose and Need / Convenience and Necessity	
CO-17f	FERC needs to further explain the purpose and need for this project. Meeting the "specific requests" of Dominion Energy is an extremely vague reason and frail attempt at meeting purpose and need and following the spirit of the NEPA.	
	The DEIS states,	
	"In general, as described by Mountain Valley, the purpose and need for the Southgate Project is to meet the specific requests for natural gas transportation service of its anchor shipper, Dominion Energy, a local natural gas distribution company. Mountain Valley states that the Project will provide additional firm natural gas transportation services for Dominion Energy to meet its growing supply needs via interconnections with the under construction Mountain Valley Pipeline project in southern Virginia and the interstate pipeline of East Tennessee in North Carolina to two new delivery points on the Dominion Energy distribution system in Rockingham and Alamance Counties, North Carolina."[12]	See response GEN-2 in Appendix I.2.

CO-17	Blue Ridge Environmental Defense League	
CO-17f	The CEQ principle regulations for implementing the National Environmental Policy Act are "to make sure that federal agencies act according to the letter and the spirit of the Act."[13] Per NEPA CEQ regulation, Section 1502.13—the Purpose and Need Statement, the environmental impact statement "shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action." FERC approval of a pipeline requires a demonstration of need and that, on balance, the project will serve the public interest. (Certification of New Interstate Natural Gas Pipeline Facilities, 88 FERC ¶ 61,227 (1999), clarified, 90 FERC ¶ 61,128, further certified, 92 FERC ¶ 61,094 (2000)). Sources indicate that natural gas usage is beginning to decline both in the United States and Globally. In the U.S., the Energy Information Administration projects that gas production will decline 2% from 12% in 2018 to 10% in 2019. U.S. power generators' gas usage may be peaking, rising to an expected record 30.6 bcfd in 2019 but then falling to 29.6 bcfd in 2020 as renewables produce more electricity, EIA data shows.[14] Across the globe, demand for natural gas surged by 4.6% in 2018. However, the International Energy Agency says that extraordinary growth rate is not sustainable. Over the next five years, IEA expects gas demand to only increase by 1.6% per year on average.[15] As renewable energy continues to increase, the demand for natural gas will continue to decline. Further indication that the purpose and need of this project is weak at best and why more details are needed. In January 2018 a report by the International Renewable Energy Agency (IRENA), which has more than 150 member countries, says the cost of renewable energy is falling so fast globally that it should be a consistently cheaper source of electricity generation than fossil fuels by 2020. The report says the cost of generating power from onshore wind has fallen by 23% since 2010 while the cost of solar photovoltaic Solar Photovoltaic (PV) electricity has fallen by 73%. IRENA projects that wind and solar (PV) generation costs will fall to $0.03 per kilowatt hour by 2020.[16] In the U.S. a 2017 Department of Energy report confirmed that the United States can safely and reliably operate the electric grid with high levels of renewables. In 2010 renewables accounted for 11.9% of electricity generated with 3.5% from wind and 0.2% from solar. By 2017 renewables grew to 17.0% of electricity generated. Wind power grew to 6.3% and solar increased to 1.3%.[17] In October 2018, the United Nations released a dire report on Climate Change. The report said that by 2050, emissions of heat-trapping greenhouse gasses, including methane, should be reduced by 35%, relative to the 2010 rate. "Emissions would need to decline rapidly across all of society's main sectors, including buildings, industry, transport, energy, and agriculture, forestry and other land use," the report said.	See above CO-17f comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17f	The report also recommended changes to land use, urban planning, infrastructure systems and energy use. They recommended gas should only account for 8% of energy by 2050. Currently, natural gas makes up around 25% of global consumption. The Commission's role in reviewing the details of any project is to make a determination of public convenience and necessity. The Commission is supposed to base its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project. It's not done so here. As mentioned earlier, market demand is waning. Steve Schlotterbeck, former CEO of EQT, has provided some details in financing and market demand. Here's an excerpt from desmogblog.com: "Back in 2014, Sheffield told Forbes that he expected Pioneer could produce a million barrels of oil a day from the Permian basin by 2024 — up from 45,000 barrels a day in 2011. Now, Sheffield, who left the helm of Pioneer in 2016 and returned this February, says that those million-barrel-a-day plans are looking increasingly doubtful as the industry has struggled to prove to investors that it's capable not only of producing enormous volumes of oil and gas, but that it can do so while booking profits rather than losses. 'We lost the growth investors,' Pioneer CEO Scott Sheffield told the Journal. 'Now we've got to attract a whole other set of investors.' Sheffield's comments on the shale oil industry's fiscal difficulties come on the heels of a warning from the former CEO of the country's largest natural gas producer about the shale gas industry's financial distress. Steve Schlotterbeck, former CEO of America's largest producer of natural gas, described the impact over a decade of fracking on Marcellus shale drilling companies at a recent petrochemical industry conference. 'In a little more than a decade, most of these companies just destroyed a very large percentage of their companies' value that they had at the beginning of the shale revolution,' he said, in remarks reported by DeSmog on Sunday. 'Excluding capital, the big eight basin producers have destroyed on average 80 percent of the value of their companies since the beginning of the shale revolution.' Schlotterbeck, the former CEO of EQT who now serves on the board of directors for the Energy Innovation Center Institute which offers training for workers in the oil and gas, solar, and construction trades, offered his view of the end results for investors at the petrochemical industry conference on Friday. A 2016 study conducted by Synapse Energy considering the need for the Mountain Valley and Atlantic Coast pipelines found that the regions natural gas supply using existing and upgraded infrastructure is sufficient to meet the maximum demand through 2030.[20] Additional new pipelines are not needed.	See above CO-17f comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17g	**EQT Financing** Following the financial trouble and drama coming out of EQT is like watching a television episode of Dallas or Yellowstone. It does not paint a stable picture of the company. If FERC fulfills its duties and responsibilities in an unbiased manner, then the shaky financing alone should void the MVP-Southgate Project. What follows is a timeline highlighting EQTs financial shenanigans: November 2017 Rice Energy was purchased by EQT making EQT the largest U.S. natural gas producer, according to Marcellus Drilling News. August 2018 In the middle of a family vacation, Rob McNally was summoned to Pittsburgh to interview for EQT's top job. He got the job after the unexpected departure of EQT's last CEO, Steve Schlotterbeck. EQT woes continued as the Pittsburgh Post-Gazette reported. "Things in the drilling fields had gotten off track to the tune of a $300 million cost overrun, which was revealed in a disastrous call with analysts in late October. Mr. McNally, then still the company's CFO, took a hit. He claims he learned of the operating issues late in the quarter and has blamed the EQT's siloed structure and punitive environment for not being told sooner. Analysts and some former employees have said Mr. McNally either knew or should have known about a derailment that significant. The morning of the analyst call, the executives were unprepared, said Jimmi Sue Smith, EQT's CFO. The team didn't have a cohesive message, she said. Even as the call was beginning, they were still piecing together what had gone wrong. "I knew it would be bad," Mr. McNally said. "But I didn't know how bad." The day of the call, EQT's stock price slid 13 percent. Mr. McNally officially became the CEO a few weeks later. And in a few more weeks, he'd become a target of a proxy war waged by former Rice Energy founders Toby and Derek Rice, who said Mr. McNally was part of the problem and — nothing personal, but ... — needed to be replaced at once. The logical replacement, they argued, was Toby Rice."[21]	Comment noted. These comments are outside the scope of the environmental analysis. However, as discussed in section 1.1 of this EIS, the Commission bases its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project.

CO-17	Blue Ridge Environmental Defense League	
CO-17g	December 2018 Once source told Marcellus Drilling News that EQT is a "total mess." "'Well, the EQT situation is a total mess.' So began a super secret email to Marcellus Drilling News from a highly-placed source we implicitly trust. Not long after receiving that email, we spotted a press release from the Rice brothers, Toby and Derek, who along with their other two brothers, previously founded and built Rice Energy into a major Marcellus/Utica operator."[22] January 2019 The Pittsburgh Post-Gazette reported on the Rice Brothers efforts to gain control of EQT and recent layoffs. Nearly a month after the founders of a company acquired by EQT Corp. challenged its CEO to a proxy fight, Rob McNally is fighting back. In a letter to shareholders issued on Monday — the same day that the Downtown-based oil and gas firm laid off more than 100 employees and promised the cuts would save $50 million annually — Mr. McNally offered confidence for the company's future and said returning money to shareholders would be among EQT's top priorities for the year. The letter comes after a long silence from the company which faced public criticism from two former executives of Rice Energy Corp., a company that EQT bought in a $6.7 billion deal in 2017. Derek and Toby Rice, with the support of at least one hedge fund, want to replace Mr. McNally with Toby Rice and to reconfigure the board of directors. Meanwhile, Monday's job cuts follow the layoffs of more than 200 employees in November 2017 after the close of the Rice deal. [23] February 2019 Prior to being laid off on Jan. 7, 2019, two EQT employees allegedly logged onto company computers and stole secrets. Thousands of proprietary documents, ranging from emails to a mission-critical program that tracks all of EQT's wells. [24] March 2019 Fitch Ratings changed EQM Midstream Partners and Equitrans Midstream outlook from stable to negative, as reported by Dow Jones & Company, Inc.	See above CO-17g comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17g	June 2019 As The Street posted on its Real Money website section, there is nothing positive about EQT stocks. The site recommended they be avoided. Excerpts from the website point to EQT's financial slide. "In his second "Executive Decision" segment on *Mad Money* Tuesday night, our own Jim Cramer sat down with Rob McNally, president and CEO of EQT Corp. (EQT) , the natural gas producer embroiled in a bitter proxy fight with Rice Energy, a company it acquired in 2017. McNally said since his management team was put in place in November 2018, EQT has split its upstream and midstream businesses and has outperformed their peers. He admitted that in absolute numbers, this has been disappointing for shareholders, as natural gas prices have fallen. When asked about the proposals made by those backing Rice Energy, McNally said simply that those claims are not based in reality. He said while EQT is drilling fewer wells than before, they still expect 5% production growth this year." "In the weekly bar chart of EQT, below, we can see a three-year decline for this stock. Prices have remained below the declining 40-week moving average line for much of the past three years.  **Bottom-line strategy:** There is nothing positive or constructive about the charts of EQT. Avoid."[25]	See above CO-17g comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17g	One of the shareholders of EQT stock has decided to sue the company over alleged fraudulent activities. Marcellus Drilling News reported: "The Cambridge (Massachusetts) Retirement System is not happy with their investment in EQT shares of stock, so they're suing the company. They hope to turn the lawsuit into a class action on behalf of other shareholders. Cambridge claims EQT made false and misleading statements about their purchase of Rice Energy–claims about cost efficiencies that never materialized, and claims about the location of Rice leases that were not as close to EQT's acreage as claimed. In a word, Cambridge is alleging fraud on the part of EQT."[26] July 2019 "Natural gas producer EQT Corp's largest shareholder on Monday extended its support for the nominees of Toby and Derek Rice, the two brothers who sold their company to EQT more than a year ago and are pressing for changes to its board. The Rice brothers were part of the founding team at Rice Energy, which was bought by EQT in November 2017. They say EQT management is responsible for the company's underperformance since the deal and have pushed for an overhaul of its board."[27] Toby Rice is named CEO of EQT. Rice ousted former CEO Robert McNally, who was named CEO last year after Steven Schlotterbeck resigned. August 2019 Jimmi Sue Smith, who became EQT's senior vice president and chief financial officer in November 2018, was terminated — without cause — effective Thursday, according to a Securities and Exchange Commission filing. Earlier in the month, Gary Gould, on the job roughly six months as chief operating officer, abruptly left EQT.[28] September 2019 The Pittsburgh Post-Gazette reported that EQT Corp. is laying off 196 employees, nearly one-quarter of its workforce, the Downtown Pittsburgh-based natural gas producer announced Tuesday, September 10. The newly announced layoffs bring EQT's total number of employees down to about 650, compared to more than 900 who were on payroll last year. WPXI has reported on EQT plans to lay off around 200 as the company's financial instability continues. "EQT Corp. is readying plans to lay off around 200 employees in a move that could happen sometime this week. Multiple sources told the Business Times about the plans for the layoffs, which would be a significant portion of the 800 or so employees that are working at the downtown Pittsburgh-based natural gas driller. It would be the second round of layoffs at EQT (NYSE: EQT) since January, when about 100 employees were laid off by the previous management team. EQT declined comment."[29] As you can see from the above timeline, EQT is an unstable company with significant financial problems.	See above CO-17g comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17h	**Exports** The DEIS indicates that MVP has said the company has no plans to export natural gas.[11] Yet, once the natural gas gets to the end of the pipeline, it is no longer up to MVP. MVP has said that themselves. In addition, market forces indicate exporting LNG will increase in the coming years. "Analysts believe the natural gas market is not trading on demand fundamentals because supply growth continues to far outpace rising consumption. Energy firms are pulling record amounts of oil from shale formations and with that oil comes associated gas that needs either to be shipped or burned off."[12] "U.S. Natural Gas supplies will increasingly reach foreign markets in the form of liquefied natural gas, a form of the fuel chilled to its liquid form, mostly for transport by sea. IEA says the U.S. could top Qatar and Australia as the world's top LNG exporter by 2024. IEA expects new LNG capacity from the U.S., Australia and Russia will make up 90% of export growth."[13] In a November 2016 Roanoke Times article, it was reported that "[t]wo years ago, WGL Midstream and Vega Energy Partners signed a 20-year natural gas sales agreement with a U.S.-based subsidiary of GAIL Ltd., a natural gas company in India, to supply natural gas for export through the Dominion Cove Point liquefied natural gas export facility in Maryland. WGL reported that "the majority of the natural gas would be purchased by WGL Midstream through an existing arrangement with Antero Resources Corp. In a June 2015 email, Ruben Rodriguez of WGL affirmed that most of the natural gas for the GAIL agreement would be supplied by Antero but noted that "natural gas from the Mountain Valley Pipeline could be part of the remaining GAIL supply portfolio."[14] In the Roanoke Times article, Natalie Cox, a spokeswoman for Mountain Valley Pipeline, noted "The proposed MVP terminates at Transco's station 165, at which time the shippers determine where their portion of the gas will be used."[15] The DEIS further states, "The nearest LNG export terminal to the terminus of the Project would be the existing Cove Point LNG terminal on the Chesapeake Bay in Calvert County, Maryland, about 190 miles away. There is no direct connection from the Project terminus in Alamance County, North Carolina to the Cove Point terminal."[16] As FERC should be quite aware, pipelines criss cross throughout the United States. Natural Gas via the MVP and MVP Southgate Projects finding its way overseas is clearly possible. That MVP would have to seek approval if the project is expanded to export natural gas is no substitute for review now. At that point, the MVP Southgate would have already been completed. There has to be more of a guarantee that exportation will not be needed to financially sustain this project.	As noted in section 2.8, the Southgate Project is not able or designed to export natural gas.

CO-17	Blue Ridge Environmental Defense League	
CO-17i	**Section 106** More effort is required to contact and seek input from the tribes. Just because there was no response is not sufficient. Per NEPA §1501.2 (2), FERC is obligated to consult early with Indian tribes. Federal and FERC guidance also requires that FERC must reach out to tribes, not just the project sponsor – MVP in this case. **We are requesting under the Freedom of Information Act all communications between FERC and the tribes.** In the DEIS, it is stated that, "A private citizen of Virginia, Ann Rodgers, suggested that we consult with the Cheyenne River Sioux Tribe and the Rosebud Sioux Tribe of South Dakota about the Project. However, when Mountain Valley reached out to the Cheyenne River Sioux Tribe and the Rosebud Sioux Tribe, these two tribes did not respond to correspondence."[37] Executive Order 13175 (2000), Consultation and Coordination with Tribal Governments lists as one of its purposes "to strengthen the United States' government-to-government relationships with Indian tribes..." Thus, the government-to-government consultation process continues to embody the unique relationship between the United States and Indian tribes. FERC's own procedures require consultation: "The Commission does not delegate its government-to-government Tribal consultation responsibilities. Within the context of our governing statutes (e.g., the NGA), the FERC has a trust responsibility to federally recognized Tribes, as described more fully in the FERC's Policy Statement on Consultation with Indian Tribes in Commission Proceedings.19 Tribes may also have additional interests beyond the identification and treatment of cultural resources, and those concerns may be of a larger environmental, socio-economic, or health context. If a Tribe does not wish to communicate or coordinate with the project sponsor, the Commission will consult directly with the Tribes. While a project sponsor is expected to reach out to Tribes early in its application planning stage, the FERC typically initiates consultation when the FERC staff has enough information to initiate its NEPA process and issues a Notice of Intent to Issue an Environmental Document. Additionally, project-specific letters from the FERC staff to Tribes may be issued on a project-by-project basis."[38] It further states: "If no response is received from a Tribe within 30 days after the request for comments is sent that does not necessarily mean that the Tribe does not have interest. The project sponsor or its consultant should follow-up with a telephone call, email, or other means, to verify that the appropriate Tribal representative has received the information, and either doesn't require any further information or has no comments."[39] The courts have made it clear that a federal agency must fulfill its obligation to consult. City of Phoenix, Arizona v. Huerta, 869 F.3d 963 (D.C. Cir. 2017) FERC's duty here is inescapable.	In section 4.10.4 of the DEIS, we acknowledge that the entire pipeline route has not yet been completely inventoried for cultural resources, and recommend that the Commission Order authorizing the Project contain an environmental condition that construction may not begin until after all archaeological surveys have been completed and reviewed, and we have completed the process of compliance with the NHPA.

CO-17	Blue Ridge Environmental Defense League	
CO-17j	BREDL will submit additional comments on Section 106. **Cumulative Air Quality Impacts** ***Why we need a cumulative air quality impact assessment at Transco Village*** The Lambert compressor station is proposed for construction as part of the Southgate pipeline at Transco Village in Chatham, VA. As stated in the Southgate DEIS, the proposed construction site of the Lambert compressor is approximately 0.62 mile from Transco Compressor Station 165 and about 600 feet from Lambert Compressor Station 166. Anticipated air pollution from the Lambert compressor station, combined with air pollution from Transco Compressors 165 and 166, will cumulatively exceed threshold levels under PSD/NNSR Major Source for NOx, CO, and Total HAPs, as well as thresholds levels under Title V for NOx, CO, VOC, and Total HAPs. FERC must perform a cumulative impacts assessment to quantify the air pollution impacts of adding the Lambert compressor station to the two existing compressors at Transco Village. We understand that permitting under PSD/NNSR Major Source and Title V is conducted on a "per facility" basis. However, this does not exonerate FERC from considering cumulative impacts of all three compressors, all of which will be confined to a space less than a mile in length. Paradoxically, the Article 6 Air Permit Application for the Lambert Compressor Station, submitted by Southgate developer Mountain Valley Pipeline, LLC in November 2018 states on page 9-23, "Because operation of the Southgate Project, along with the other existing and proposed major Title V projects/facilities, will be regulated by the VADEQ and NCDEQ through the air permitting process, the cumulative effects of the operation of the Project with other projects is not expected to result in adverse air quality impacts." Here it appears that the permitting processes of the state DEQs are being proffered by Mountain Valley Pipeline, LLC as a substitute for a cumulative impact assessment of co-locating three compressor stations in a very confined geographic area. The need for FERC to perform this cumulative impact assessment is supported by Virginia Department of Environmental Quality (DEQ)'s comments to the Southgate DEIS, which state, "In section 5.1.11 they discuss conducting modeling to demonstrate compliance with all air standards. It should be noted the modeling conducted did not account for any nearby sources or background emissions." A cumulative impacts assessment must be performed by FERC to prevent the creation of an "air pollution ghetto" in the rural community surrounding Transco Village in Chatham, VA. Wilma Subra, who served for seven eyars as vice-chair of the EPA's National Advisory Council for Environmental Policy and Technology, and for six years on the EPA's National Environmental Justice Advisory Council, documented the following health threats to families living near compressor stations (source: Southwest Pennsylvania Environmental Health Project, Summary on Compressor Stations and Health Impacts, February 24, 2015):	An analysis of the cumulative impacts on air quality, including nearby compressor stations, is discussed in section 4.13.2.9 of the EIS. Air quality impacts on public health are discussed in section 4.11.1.7.

CO-17	Blue Ridge Environmental Defense League	
CO-17j	Acute Health Impacts Experienced by Individuals Living and Working near Compressor Stations tension and nervousness joint and muscle aches and pains vision impairment personality changes depression, anxiety irritability confusion drowsiness weakness irregular heartbeat irritation to skin, eyes, nose, throat and lungs respiratory impacts sinus problems allergic reactions headaches dizziness, light headedness nausea, vomiting skin rashes fatigue weakness Chronic Health Impacts Experienced by Individuals Living and Working Near Compressor Stations damage to liver and kidneys damage to lungs damage to cardiovascular system damage to developing fetus reproductive damage mutagenic impacts developmental malformations damage to nervous system brain impacts leukemia aplastic anemia changes in blood cells and clotting. ***Transco compressor renovations*** Transco Compressor 166 was completed in 2018. Transco Compressor 165 is currently in the planning process for major renovation, with expected completion date of June, 2021. The permitting process for this renovation is still in progress, and there is potential that Virginia DEQ may deny the permit or require that it be amended. For this reason, it is necessary to acknowledge that the combined air pollution outputs of Transco stations 165 and 166 consist of two sets of figures, one "before renovation", i.e. the existing outputs, and another "after renovation", reflecting drastically reduced pollution outputs resulting from equipment upgrades.	See above CO-17j comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17j	For this reason, we offer the following table to illustrate the "before" and "after" pollution scenarios anticipated at Transco Village. Table 2.1 is taken from the Transco Southeastern Trail Project Air Permit Application (source: Transcontinental Gas Pipeline Company, LLC, Southeastern Trail Project, Air Permit Application, Compressor Station 165, June 20, 2018, Table 2-1, p.4). *TABLE 2.1 POTENTIAL EMISSIONS CHANGE FOR STATIONS 165 & 166 (TONS/YR)* **Potential Emissions** / NO_x / CO / VOC / PM / PM_{10} / $PM_{2.5}$ / SO_2 / Total HAPs Existing Stations 165 and 166 Potential Emissions: 3,746.10 / 1,026.40 / 251.20 / 60.30 / 60.30 / 60.30 / 10.10 / 73.49 Potential Emissions Increase From New Equipment: 92.75 / 33.08 / 17.28 / 11.67 / 11.67 / 11.67 / 6.00 / 3.56 Potential Emissions Decrease For M/L 1 – M/L 10 Shutdown: (3,222.00) / (668.00) / (159.00) / (36.00) / (36.00) / (36.00) / (2.20) / (53.31) **Post Project Potential Emissions From Stations 165 and 166**: **616.85** / **391.48** / **109.48** / **35.97** / **35.97** / **35.97** / **13.90** / **23.74** In light of the information provided by Transcontinental Gas Pipeline Company in Table 2.1, above, it is very concerning to BREDL that the Southgate DEIS drastically underreports the air pollution levels anticipated to be emitted by Transco Compressors 165 and 166. This underreporting, occurring in Table 4.13-6 from the Southgate DEIS (copied below), must be corrected so that the Southgate FEIS more accurately reflects the data offered by Transcontinental Gas Pipeline Company. TABLE 4.13-6 **Potential Annual Emission Rates Associated with the Southgate Project and Transco Compressor Station 165 and 166 (tons per year)** NOx / CO / VOC / SO_2 / $PM_{2.5}/PM_{10}$ Lambert Compressor Station: 34.9 / 58.6 / 8.4 / 5.4 / 10.4 Transco Compressor Station 165 a/: 182.3 / 207 / 35.4 / 12 / 23.3 Transco Compressor Station 166 b/: 32.4 / 29.49 / 3.2 / 5.16E-02 / 2.1/3.8 a/ Source: FERC 2019 b/ Source: FERC 2016 ***Thresholds will be exceeded*** To illustrate the facts supporting the need for a cumulative air quality impact assessment, BREDL offers the following chart, which has been compiled using data from the Lambert revised permit application (source: Mountain Valley Pipeline, LLC, Lambert Compressor Station, Southgate Project, Article 6 Air Permit Application, Revision 1, April 25, 2019) and the Transco permit application for renovation of Transco compressor 165 (source: Transcontinental Gas Pipeline Company, LLC, Southeastern Trail Project, Air Permit Application, Compressor Station 165, June 20, 2018). As can be seen by comparing the chart below with Table 2.1, above, we have used the "after renovation" air pollution outputs from Transco Compressor 165 as the basis of our calculations. Even after accounting for the drastic air quality improvements anticipated through renovation of Transco Compressor 165, the combined pollution from the three compressors at Transco Village will exceed thresholds for NOx, CO, and Total HAPs.	See above CO-17j comment response

CO-17 **Blue Ridge Environmental Defense League**

Cumulative air pollution impacts of 3 compressors at Transco Village meet 7 threshold criteria

Source	NOx	CO	VOC	PM	PM10	PM2.5	SO2	Total HAPS
MVP Lambert	34.86	58.58	8.44	10.35	10.35	10.35	5.38	4.52
Transco 165/166	616.85	391.48	109.48	35.97	35.97	35.97	13.90	23.74
TOTAL	651.71	450.06	117.92	46.32	46.32	46.32	19.28	28.26
PSD/NNSR Major Source Threshold (tons/year)	250	250	250	n.a.	250	250	250	25
Does TOTAL meet threshold under PSD/NNSR?	yes	yes	no	n.a.	no	no	no	yes
Title V permit (40 CFR 70) major source threshold	100 of any air pollutant	100 of any air pollutant	100 of any air pollutant	100 of any air pollutant	100 of any air pollutant	100 of any air pollutant	100 of any air pollutant	25
Does TOTAL meet threshold under Title V?	yes	yes	yes	no	no	no	no	yes

It should be reiterated that BREDL recognizes that permitting under the two programs cited in the chart above, PSD/NNSR Major Source and Title V (40 CFR 70), is conducted on a "per facility" basis which does not take into account the outputs of neighboring facilities. However, the requirements under NEPA for consideration of cumulative impacts in cases such as we see developing at Transco Village are clear and unequivocal.

Hazardous air pollutants

As illustration of what is meant by "Total HAPS" in the chart, above, we offer the following chart providing a detailed list of the Hazardous Air Pollutants (HAPs) anticipated as combined emissions from the three compressors at the Transco Village site. Please note that the figures in this chart reflect the improved emissions that are anticipated after the renovation of Transco compressor 165.

Lambert and proposed Transco Stations 165 & 166 potential emissions – after renovations of Transco compressor 165 (source: Transcontinental Gas Pipeline Company, LLC, Southeastern Trail Project, Air Permit Application, Compressor Station 165, June 20, 2018)

		LAMBERT	TRANSCO 165/166	TPY	lbs/yr
Hazardous Air Pollutants (HAPs)	AP-42 Emission Factor (lb/MMBtu)	Facility PTE (tons/yr)	Post Project Potential to Emit (tons/yr)	TOTAL	TOTAL
VOC-HAP					
Acetaldehyde	4.00E-05	0.115	2.01	2.125	4,250.00
Acrolein	6.00E-06	0.0184	1.56	1.5784	3,156.80

Toluene	1.30E-04	0.374	0.48	0.854	1,708.00
Xylenes	6.40E-05	0.184	0.31	0.494	988.00

Thank you for your prompt attention to this matter.

CO-17j

See above CO-17j comment response

CO-17	Blue Ridge Environmental Defense League	
CO-17k	**Restrict Burning on Moderate PM 2.5 Forecasted Days in the Region** The DEIS (p. 4-193 or pdf p. 323) mentions that open burning will be used to dispose of land clearing debris. To lessen severe health impacts, especially to sensitive populations, open burning must be restricted to days when regional particulate matter is forecasted to be low. Sources of fine particles (PM 2.5) include all types of combustion activities (motor vehicles, power plants, wood burning, etc.) and certain industrial processes. PM 2.5 is associated with increased premature deaths and is especially harmful to people with lung disease such as asthma and chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema, as well as people with heart disease. Exposure to particulate air pollution can trigger asthma attacks and cause wheezing, coughing, and respiratory irritation in individuals with sensitive airways. An estimated 200,000 people die early deaths each year in the U.S. because of PM 2.5 exposure. Researchers have found that for every increase of five micrograms per cubic meter of PM 2.5 pollution the risk of lung cancer rose by 18%, and for every increase of 10 micrograms per cubic meter in PM 10 pollution the risk increased by 22%.[46] An earlier study found for each 10 µg/m3 increase in PM2.5 concentrations there was an associated 15–27% increase in lung cancer mortality.[47]	As discussed in section 4.11.1.7, any open burning would be conducted on a site-specific basis, and in accordance Mountain Valley's Fire Prevention and Suppression Plan and Virginia and North Carolina regulations (9VAC5-130; 15A NCAC 02D.1900). This would include burning only in approved burn areas and during appropriate weather conditions to avoid any impacts on nearby residences, and complying with the open burning prohibition in Virginia from May 1 through September 30.
	Safety	
CO-17l	The DEIS states, "In accordance with DOT regulations, the proposed facilities would be regularly inspected for leakage and potential pipeline hazards such as construction activity, encroachments, and evidence of recent unmonitored excavations as part of scheduled operations and maintenance, including: • physically walking and inspecting the pipeline corridor periodically; • conducting fly-over inspections of the right-of-way as required; • inspecting and maintaining MLVs and meter stations; and • conducting leak surveys at least once every calendar year or as required by regulations."[48] Please define "periodically" and "as required".	See response SAFE-1 in appendix I.2.
	Additional Comments	
	Erosion and Sediment Control	
CO-17l	The DEIS states, "The Project would cross about 1.8 miles of slopes greater than 30 percent. Mountain Valley has developed construction methods for rugged terrain, which include slopes that typically exceed 30 to 35 percent, to allow for the safe operation of equipment, and prevention of severe erosion. "(DEIS, p. 77) With all due respect, after what has occurred along the MVP mainline, we have no faith that MVP's Erosion and Sediment Control Plan (E&SC Plan) and Best Management Practices (BMPs) (DEIS, p. 28) will work and pose "no permanent effects to surface or ground water." (DEIS, p. 30)	See response GEN-6 in appendix I.2.
	Endangered and Threatened Species	

CO-17	Blue Ridge Environmental Defense League	
CO-17n	According to the DEIS MVP/FERC would like to use the DEIS as the Biological Assessment for the project.[49] We strongly object to this. We respectfully request that the FWS require and complete the proper Biological Assessment. An assessment that – unlike this DEIS - is not lacking in species surveys.	See response T&E-2 in appendix I.2.
CO-17o	**Working 24-Hour a day** Longstanding policy of the Federal Energy Regulatory Commission (FERC) is to cooperate with local jurisdictions. As stated in the MVP Southgate DEIS, "the FERC encourages cooperation between applicants and state and local authorities[50]..." This statement is in consonance with FERC policy under sections 3 and 7 of the Natural Gas Act[51]. However, instead of respecting local governments' ordinances that were put in place to promote the health, safety and general welfare of its citizens, FERC is allowing MVP to upend this protection. The DEIS stated that "Mountain Valley is in discussion with Pittsylvania County to assess applicability of the Pittsylvania County Noise Ordinance with regards to 24-hour construction at the Lambert Compressor Station."[52] MVP does not need to work 24 hours a day to construct a compressor station. Buildings and facilities go up every day all over this country without continuous noisy work going on 24 hours a day. Let the residents and animals near the compressor station get a good nights sleep.	See section 4.11.2.3 for a revised discussion of noise levels due to 24-hour construction at the Lambert Compressor Station.
CO-17p	**Property Values** The DEIS stated, "Our review of available studies indicates that the Project is not likely to have a significant adverse impact on property values."[53] BREDL research indicates that property values have plunged for some landowners who signed easements for the Atlantic Coast Pipeline in Highland and Nelson Counties, Virginia. In Nelson County, we found three properties that averaged a reduction in property value of 32.5%. In Highland County, many properties with signed easements decreased in value on an average of 7%.[54]	See section 4.9.5 of the EIS for a discussion or property values.
CO-17q	**No Action Alternative** We respectfully request the Commission to choose the No Action Alternative and deny the Certificate for the Mountain Valley Pipeline, LLC Southgate Project. This project is not needed and does not serve the public convenience and necessity. Respectfully submitted, Mark E. Barker Executive Assistant, BREDL	We concluded in Section 3.2 that the No Action Alternative does not meet the Project objective and is not likely to provide a significant environmental advantage.

CO-22	Haw River Assembly

Haw River Assembly
Phone: (919) 542-5790 P.O Box 187 Bynum, NC 27228 www.hawriver.org

September 16, 2019

Emily Sutton, Riverkeeper
Haw River Assembly
P.O Box 187
Bynum, NC 27228

Haw River Assembly is the Waterkeeper organization responsible for protecting the Haw River watershed in North Carolina. Our organization represents over 1,000 members and supporters in 8 counties throughout our watershed. The Mountain Valley Pipeline Southgate extension project would cause irreversible harm to the Haw River watershed. The proposed Draft Environmental Impact Statement excludes many significant impacts to the watershed and overlooks potential threats and risks. Please see the following comments and revise the Draft Environmental Impact Statement to accurately assess the environmental threats posed by this project.

4.3 Water Resources

Landowner surveys have not been completed and many locations of wells and springs are unknown. Not enough information is included and finalized to approve this DEIS based on this uncertainty.

The DEIS minimizes the risk of impacts to private well owners water quality. Blasting and heavy equipment can damage infrastructure and make well water unsafe. This is not a risk the impacted communities and landowners can bear.

Communities already face contaminated drinking water sourced from the Haw River and surface water reservoirs. The risk of contaminated wells is a significant risk. Many of these contaminants can go undetected in drinking water, due to no color or scent. Private well owners are financially responsible for testing well water; this testing is extremely cost prohibitive, leaving many landowners unaware of contamination.

Erosion and sedimentation is an ongoing concern in the Haw River basin, and many of our streams are impaired due to poor benthic life. Most streams have not been surveyed by the state, but at Haw River Assembly, we monitor streams through our volunteer programs and through ongoing certified lab sampling. Sedimentation, erosion, and increases in stormwater velocity, has left many creeks with steep, inaccessible banks, void of healthy aquatic habitat. The risk of increasing erosion and sedimentation, increasing turbidity levels should not be minimized.

All of these streams in the Haw River basin must adhere to the Jordan Lake rules, which requires strong nutrient protections and sedimentation measures. Mountain Valley's requirement

CO-22a	See response GW-1 in appendix I.2.
CO-22b	See response SURF-2 in appendix I.2.
CO-22c	Section 4.3.2.4 of the EIS discusses the Jordan Lake Riparian Buffer.

CO-22	Haw River Assembly	
CO-22d	to restore the ground surface "to original contours as closely as practicable" leaves us with serious concerns. We have seen the work MVP contractors have done on the mainline and have little faith that these requirements will be met at all. However, leaving so much subjectivity in what is or what is not practicable allows MVP Southgate to argue the the bare minimum is all that is necessary. This is a sensitive watershed and this project will not be completed in a way that prevents serious watershed degradation.	See response GEN-6 in appendix I.2.
CO-22e	Many public water supply intakes are located downstream of these stream crossings, but further than three miles downstream. Many of the contaminants that could impact drinking water quality do not breakdown. Therefore, this three mile limit for downstream impacts is not an accurate assessment of the full scope of impacts.	See response CO-22c.
CO-22f	Dam - and - pump or flume methods can cause potentially irreversible degradation to stream health. In order to adequately assess impacts, the crossing methods should be specified for each stream crossing in the initial DEIS in order for thorough review and comment.	See response SA-2a-2 in appendix I.3. See also response SURF-4 in appendix I.2.
CO-22g	Including clauses like "when practicable" leaves too much subjectivity to MVP Southgate contractors. We have seen over 200 water quality and sediment and erosion control violations on the mainline done by the same teams.	Appendix B.5 provides the proposed crossing method for each waterbody.
CO-22h	HDD and conventional bore crossing methods do in fact have impacts on surface water bodies and ground water, though this DEIS states otherwise.	see response GEN-6 in appendix I.2.
CO-22i	Crossing Stony Creek Reservoir is a threat to over 50,000 people who depend on the reservoir for protected drinking water.	See section 4.3.2.2 and 4.3.2.7 for discussion of impacts from HDD and conventional bore crossings.
CO-22j	The lack of information regarding Deep Creek crossings leaves this DEIS incomplete.	See section 4.3.2.4 for discussion of the Stony Creek Reservoir crossing.
CO-22k	Having work areas back 50 ft from wetlands and waterbodies is inadequate. Allowing for less than a 50 foot setback is against the Jordan Lake Rules which are in place to protect streams from nutrient and sediment impairment.	Section 4.3.2.2 has been updated with information regarding the Deep Creek crossing.
CO-22l	Having a 15 foot butter on waterbodies and wetlands is not adequate and does not adhere to the Jordan Lake Rules.	See response CO-22c.
CO-22m	Many impacted waterbodies are listed as inclusive data. This is not enough information to assume that those waterbodies are not impaired and careful attention should be given to all stream crossings. Downstream segments are impaired due to turbidity, nutrients, and benthic life, all of which could be degraded by this project upstream.	See section 4.3.23 for a discussion of impaired waterbodies.
CO-22n	Variance request should be denied due to high risks of sedimentation and nutrient pollution in Jordan Lake.	See response CO-22c.
CO-22o	Much of the pipeline is in the flood zone of the Haw River, which has seen record flooding the past two years. This volume and velocity of water will be increased with less buffer protection and compacted soils from heavy machinery.	See response SURF-7 in appendix I.2.
	The DEIS also minimizes any cumulative impacts to surface waters. This is misleading. Dredging, open-cut pipeline crossings, and other instream activities will have a great impact on surface water quality health in the stream and downstream throughout the watershed.	

CO-22	Haw River Assembly	
CO-22p	The DEIS also minimizes impacts by stating that a HUC-10 is an appropriate sized watershed for this project, implying that the streams and cumulative impacts to those streams will be managed and mitigated through the natural processes of the aquatic system. The Haw River watershed has extremely flashy flow tendencies. The high and low flow points have not been factored into this review. Jordan Lake Buffer rules have also not been mentioned in the cumulative impacts. What will the sediment and nutrient load be? How will cumulative impacts be quantified for long term impacts to the buffer zones?	See section 4.12.2.2 for discussion of cumulative impacts on water resources.
CO-22q	There has not been a feasibility study done to assess access to Deep Creek. This DEIS should not be approved until that assessment has been completed and the public has had adequate time to comment and review that assessment.	See response CO-22k.
CO-22r	Dry- ditch crossing methods in impaired streams are not an adequate way to prevent sedimentation, erosion, and aquatic health destruction.	See response CO-22m.
CO-22s	This project proposes to use 5.9 million gallons from two municipal water sources. How will that water be disposed of? What will the impacts be to receiving waters? These are critical questions that have been excluded from this review.	Measures regarding hydrostatic test water discharge are provided in section 4.3.2.7 of the EIS and VII.D.1 of Mountain Valley's Procedures.
CO-22t	**4.4 Wetlands** Pipeline construction will impact nearly 27 acres of wetlands and will result in permanent impacts to nearly 6 acres of wetlands through ongoing maintenance. Although some areas would be allowed to regrow, due to the length of time required for the wetlands to regenerate, construction impacts would be long-term. And despite FERC's own Procedures which specify that all additional temporary work spaces be set back at least 50 feet from a wetland, Mountain Valley has proposed 23 locations for workspaces within 50 feet of a wetland and has asked for modifications to those procedures.	See response WET-1 in appendix I.2.
CO-22u	**4.6 Wildlife and Fisheries** MVP says it relies on its "consultation with US Fish and Wildlife Service" to minimize impacts, but courts have just recently thrown out multiple FWS permits regarding endangered species relying on similar assumptions and stating that this is not sufficient to protect species. MVP, LLC presents no evidence to show that construction of the pipeline will not harm or destroy these numerous species and instead relies on a broad, general promise that it will not harm species because it will do its best not to. "Mountain Valley would implement erosion and sediment control BMPs described in its E&SC Plan at all crossings of waterbodies containing fisheries of special concern. Mountain Valley also would adhere to all federal and state permit conditions, including those regarding the minimization of impacts on fisheries of special concern including adhering to recommended work windows for in-water construction (or requesting a work-window modification, if needed)."	FERC continues to work with FWS and state agencies. Consultation with the FWS is required by Section 7 of the ESA. Federal agency compliance for the Endangered Species Act (ESA) Section 7 is described in section 4.7.1 of the EIS.

CO-22	Haw River Assembly	
CO-22v	**4.9 Socioeconomics** The Socioeconomic impacts do not include social services that will be provided to out of town workers for this project. The DEIS is misleading in stating that "Affected counties would experience the greatest impacts associated with employment, housing, public services, transportation, traffic, property values, economy, and taxes." Local employment will not be increased, property values will decrease, and any impacts to the surrounding economy will be short lived.	An assessment of the social services provided to our of town workers is beyond scope of EIS. A socioeconomics analysis is provided in section 4.9 of EIS
CO-22w	**4.13 Cumulative Impacts** The DEIS states that soil impacts would be localized, however, ground disturbance in the buffer areas and in the streams during crossings construction will result in extreme sedimentation and erosion impacts. Many small streams are crossed in a close proximity in this proposed project, and these small streams will be inundated with sediment and aquatic habitat will be threatened. The cumulative impacts have not factored in the amount of increased impervious surfaces that will also be contributing to stormwater velocity and temperature increases. The DEIS lists the Mountain Valley Pipeline (mainline) project as an example for minimizing cumulative impacts, yet this project has already seen over 200 water quality violations, which is not only a burden to stream health, but to state agency staff budgets. The DEIS also minimizes any cumulative impacts to surface waters. This is misleading. Dredging, open-cut pipeline crossings, and other instream activities will have a great impact on surface water quality health in the stream and downstream throughout the watershed. The DEIS repeatedly describes large, significant impacts, and then bases its prediction of no significant impacts on MVP's compliance with mitigation measures. There are many problems with this. These include MVP's history of noncompliance during construction of the mainline , many of the mitigation measures relied upon to predict no significant impacts are unspecified in the DEIS, and the DEIS predicts long-lasting or permanent impacts to hundreds of acres of forests and wetlands, but ignores these impacts in saying that mitigation measures will avoid significant impacts. Mitigation can not prevent significant impacts permanent forest and wetland destruction that is essential to the design of the project.	See response CI-1 in appendix I.2. Also, see response to GEN-6 and SURF-2 in appendix I.2. There would be a minimal increase in impervious surfaces as a result of the Project as most areas would be revegetated after construction is complete.
CO-22x	By its own admission, FERC released this DEIS - and its conclusion that no significant environmental impacts would be inflicted by this project - while lacking the necessary information to assess what the impacts to various environmental resources would be. For example, MVP has yet to provide FERC with its feasibility studies for its plan to cross Deep Creek with the pipeline, a site where imperiled aquatic species are suspected to live. The DEIS acknowledges that MVP will use 5.9 million gallons of water in constructing the project, but has no information regarding where MVP will source that water from, preventing FERC from assessing the environmental impact of those water withdrawals. Lastly, archaeological surveys have not been completed for the project area, preventing analysis of impacts to cultural resources.	See response GEN-4, SURF-8, and CULT-1 in appendix I.2. As discussed in section 4.6.5 of the EIS, Mountain Valley has provided aquatic species surveys results.

CO-22	Haw River Assembly	
CO-22y	MVP, LLC has failed to show that it will not harm threatened and endangered species in constructing MVP Southgate, relying on nothing more than tautological assurances that pipeline construction will not harm species because it has concluded after review that the pipeline will not harm species.	See response T&E-2 in appendix I.2.
CO-22z	In conclusion, too many critical components have been overlooked and excluded from this Draft Environmental Impact Statement. The communities who would potentially face the burden of those impacts should have adequate time to read a respond to additional information that would be submitted later in the process. Additionally, impacts that have been admitted and included here have been presented in a misleading way, or have been significantly lessened. We urge you to deny this Draft Environmental Impact Statement until it is complete and accurately assess the impacts of this proposed project.	Comment noted. See responses above.

CO-24 Appalachian Mountain Advocates

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

In the Matter of

MOUNTAIN VALLEY PIPELINE, LLC Docket No. CP19-14-000

COMMENTS ON DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR MOUNTAIN VALLEY PIPELINE, LLC'S PROPOSED SOUTHGATE PROJECT

Appalachian Mountain Advocates, Center for Biological Diversity, and Sierra Club submit the following on behalf of Appalachian Voices, Center for Biological Diversity, Chesapeake Climate Action Network, Food and Water Watch, Haw River Assembly, Honor the Earth, NC Council of Churches, NC Interfaith Power and Light, and the Sierra Club (collectively, "Commenters") regarding the Federal Energy Regulatory Commission's ("FERC") draft environmental impact statement ("DEIS") for Mountain Valley Pipeline, LLC's ("Mountain Valley") proposed Southgate Project ("the Project"). For the reasons described below, the DEIS fails to fulfill FERC's duty under the National Environmental Policy Act ("NEPA") to take a "hard look" at the Project's impacts.[1]

I. The DEIS's Failure to Independently Assess the Purpose and Need for the Project Undermines Its Alternatives Analysis

CO-24a

To establish the purpose and need for the Project, FERC relies entirely on Mountain Valley's desires and ignores the question of whether there is a real public need for the additional pipeline capacity proposed to be added. DEIS at 1-2 (relying on "the specific requests for natural gas transportation service of [Mountain Valley's] anchor shipper, Dominion Energy" to establish the purpose and need for the Project). In so doing, FERC improperly restricts its analysis of alternatives to those that can transport Mountain Valley's full desired volume of gas from its desired starting and ending points. *See* DEIS at 3-1 ("An alternative that cannot achieve the purpose for the Project cannot be considered as an acceptable replacement for the Project."); *id.* at 3-3—3-6 (rejecting system alternatives because they purportedly cannot accommodate Mountain Valley's full desired volume of gas).

As noted in Section 3.0, FERC identified and evaluated reasonable alternatives to the Project. Reasonable alternatives would meet the Project's stated purpose. See also responses GEN-2 and ALT-1 in appendix I.2; and response to CO-14c in appendix I.3.

CO-24	Appalachian Mountain Advocates	
Co-24a	The Council on Environmental Quality's ("CEQ") regulations for implementing the National Environmental Policy Act ("NEPA") require that an Environmental Impact Statement (EIS) "specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action."[2] The CEQ regulations also require the Commission to consider and evaluate the no action alternative.[3] A properly drafted purpose and need statement is critical to "inform the agency's review of alternatives to the proposed action and guide its final selection."[4] A purpose and need statement "will fail if it unreasonably narrows the agency's consideration of alternatives so that the out-come is preordained."[5] Where, as here, a federal agency is reviewing an applicant-sponsored project, it "cannot restrict its analysis to those 'alternative means by which a particular applicant can reach his goals.'"[6] An agency must "exercise a degree of skepticism in dealing with self-serving statements from a prime beneficiary of the project."[7] As courts have noted, "[r]equiring agencies to consider private objectives . . . is a far cry from mandating that those private interests define the scope of the proposed project."[8] An agency must also "look hard at the factors relevant to the definition of purpose" and "always consider the views of Congress, expressed, to the extent that the agency can determine them, in the agency's statutory authorization to act, as well as in other congressional directives."[9] The Natural Gas Act ("NGA") gives FERC powerful tools to regulate the development of pipeline infrastructure, directing the Commission to deny any application not "required by the present or future public convenience and necessity" and allowing it to impose "such reasonable terms and conditions as the public convenience and necessity may require."[10] In addition, FERC's Certificate Policy requires the Commission to balance the alleged need for a project against the adverse impacts on affected landowners and the surrounding communities.[11] Thus, when identifying a purpose and need, the Commission should consider its authority to shape pipeline certificates and reject unnecessary construction. More generally, the Commission should recognize that the main purpose of the NGA is "to encourage the *orderly* development of plentiful supplies	See above CO-24a comment response

CO-24	Appalachian Mountain Advocates	
Co-24a	of . . . natural gas at reasonable prices."[12] The goals of promoting order and economy would be frustrated by a piecemeal analysis that ignores the potential for haphazard and redundant pipeline development. Likewise, the subsidiary goals of the NGA—including "conservation" and "environmental" considerations[13]—would be poorly served if the Commission failed to consider a regional perspective. FERC may not uncritically accept a project proponents' stated need for a pipeline, as it has in the DEIS. Rather, the agency must consider whether expected gas demand can be met by existing pipeline capacity. If not, FERC must consider how much additional capacity is needed to meet demand and to what extent that capacity can be provided by alternatives to the proposal, including but not limited to alternatives that upgrade existing gas pipelines and/or involve building new pipelines on existing rights-of way. In so doing, FERC should also look at the potential for significant decline in production from the Marcellus and Utica formations that would supply the gas for the pipelines and the ability of increasingly price-competitive renewable energy sources and energy efficiency to meet electric demand over the life of the proposed pipelines.[14] FERC should project electric-sector natural gas use in the region using detailed data on specific generating units, estimating gas demand both on an annual basis and for the hour of peak demand in each year. FERC must critically analyze and document any assumptions regarding: 1) market rules and topology, 2) hourly load profiles, 3) forecasted annual peak demand and total energy, 4) thermal-unit characteristics, 5) conventional hydro and pumped storage unit characteristics, 6) fuel prices, 7) renewable unit characteristics, 8) transmission system paths and upgrades, 9) generation retirements, additions, and uprates, 10) outages, 11) environmental regulations, and 12) demand response resources. Only by analyzing all of those factors can FERC determine whether the proposed pipeline project is actually needed.	See above CO-24a comment response

CO-24	Appalachian Mountain Advocates	
CO-24b	Mountain Valley justifies the need for the Project primarily by referenced to futur increased demand for natural gas in the region.[15] But objective evidence shows that such deman is unlikely to increase, and that any such increase could be met with expansion of renewabl energy, which must be considered as an alternative to the Project. Available evidence demonstrates that demand for natural gas for power generation in the region that includes Virginia and North Carolina is level through 2030.[16] Projections from the Energy Information Administration (EIA) show that demand for natural gas for power generatio is not growing in the region that includes Virginia and North Carolina. In EIA's 2017 Energy Outlook, the reference case for the South Atlantic region, *i.e.* a scenario reflecting improvements in known technologies and the views of leading economic forecasters and demographers,[17] projects that the demand for natural gas for electricity generation will decrease from 2015 to 2020 and will not return to 2015 levels until approximately 2034.[18] Thus, According to EIA's analysis, new gas transmission capacity is not needed until 2034 at the earliest. An analysis performed by the Applied Economics Clinic[19] ("AEC Report") confirms tha the increased demand that Mountain Valley claims necessitates the Project is illusory. Because Mountain Valley has provided no evidence that MVP Southgate or Dominion Energy[20] will use the additional supply to provide gas to electric generators, the report focuses on gas demand for final use by residential, commercial, and industrial customers. AEC Report at 7. The report find that Mountain Valley's claims of increased future demand are uniformly inflated. Mountain Valley relies on a nationwide projection to claim that gas demand is likely to increase by 0.9 percent per year between 2017 and 2040, but the EIA's projection for the region that would be served by the Project only foresees growth of 0.2 percent annually for the period analyzed. *Id.* at 8. Further, Mountain Valley wrongly cites an annual increase of in demand for gas in North Carolina of 7.6 percent from 2010 to 2017 as evidence of need for the Project. That figure, however, includes the increase in consumption of gas both for direct use and for electric generation, whereas there is no evidence the Project will be used to deliver gas for electric customers. North Carolina's direct gas consumption by residential, commercial, and industrial customers—which is what the proposed project would serve—actually fell by an annual rate of 0.1 percent between 2010 and 2017. *Id.* at 9. Finally, MVP uses an inflated projection of future	See response GEN-2 in appendix I.2.

CO-24	Appalachian Mountain Advocates	
CO-24b	population growth and fails to acknowledge that per capita gas consumption has been steadily falling due to increased energy efficiency and other advances when claiming that future population growth necessitates increased supply. *Id.* at 9-10. **Table 1: North Carolina gas and population growth, MVP LLC and corrections** **MVP LLC Claims** / **AEC Fact Check** MVP claims: **7.6 percent** historical (2010-2017) annual growth in North Carolina gas demand (including gas for electricity) / Fact check: **-0.1 percent** historical (2010-2017) annual growth in North Carolina gas demand (excluding gas for electricity) MVP claims: **0.9 percent** annual growth in future gas sales (2017-2040) based on all U.S. expected growth from EIA forecast / Fact check: **0.2 percent** annual growth in future gas sales (2017-2040) for the South Atlantic region from EIA forecast MVP claims: **1.6 percent** annual growth in future gas use (2020-2035) for the Southeast, which MVP states is largely due to population growth / Fact check: North Carolina's population is only expected to grow **1.0 percent** annually (2020-2035) *Sources: EIA, North Carolina Natural Gas Consumption by End Use. Available at: https://www.eia.gov/dnav/ng/ng_cons_sum_dcu_snc_a.htm; EIA, AEO 2019, Reference Case. Available at: https://www.eia.gov/outlooks/aeo/data/browser/#/?id=2-AEO2019&region=1-5&cases=ref2019&start=2017&end=2050&f=A&linechart=ref2019-d111618a.8-2-AEO2019.1-5&ctype=linechart&sourcekey=0; North Carolina Office of State Budget and Management, County/State Population Projections. Available at: https://www.osbm.nc.gov/demog/county-projections. Note: South Atlantic region includes Delaware, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia, and the District of Columbia.* It is very likely that any additional future demand could be met with efficiency programs and other measures which would not require the taking of private property by eminent domain and substantial harm to environmental resources. The AEC Report explains that "[g]as energy efficiency and other demand-side programs may be an inexpensive alternative to pipeline investments.... Efficiency programs reduce the amount of gas needed to provide the same level of energy and heating and can be a cheap and effective way to reduce peak demand." *Id.* at 19. FERC's overly narrow statement of purpose and need caused it to fail to adequately consider such alternatives, which would have far less impact. FERC must not simply accept the applicant's claims of need at face value, but rather must independently verify that there is a true market demand for the Project that justifies the taking of private property through eminent domain and substantial harm to communities, water quality, air quality, forests, wildlife, and the climate. Because the DEIS fails to do so, it does not satisfy NEPA's hard look requirement.	See above CO-24b comment response

CO-24	Appalachian Mountain Advocates	
	II. The DEIS Improperly Fails to Consider the Project as a Connected Action With the Mountain Valley Pipeline Mainline and Thus Fails to Consider the Full Impacts of Both Projects Together in a Single EIS	
CO-24c	FERC's EIS fails to fully analyze the impacts of the Project together with the impacts of the closely related Mountain Valley Pipeline mainline ("MVP mainline"), thus undermining its significance determinations. The MVP Southgate Project is an interdependent part of and dependent upon the larger MVP mainline. FERC's scope of review in an environmental analysis should encompass connected, cumulative, and similar actions.[21] Actions are connected if they automatically trigger other actions which may require an EIS, cannot or will not proceed unless other actions are taken previously or simultaneously, or are interdependent parts of a larger action and depend on the larger action for their justification.[22] "[A]n agency must discuss '[c]onnected actions' – that is, 'closely related' actions – 'in the same impact statement.'"[23] Similar actions are those actions that, when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography.[24] An agency should analyze similar actions in the same EIS when the best way to assess adequately the combined impacts of similar actions or reasonable alternatives to such actions is to treat them in a single EIS.[25] Importantly, "significance cannot be avoided by terming an action temporary or by breaking it down into small component parts."[26] "An agency impermissibly 'segments' NEPA review when it divides connected, cumulative, or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration."[27]	See response GEN-8 in appendix I.2.
CO-24d	Further, it is well-established that FERC must evaluate the cumulative impacts of a natural gas pipeline before it issues a certificate of public convenience and necessity for the project.[28] NEPA's implementing regulations define these impacts as the > impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions.[29] A cumulative impacts analysis provides the agency and the public "with a complete understanding" of the impacts that will result from the project.[30] Importantly, an agency cannot defer this analysis "when meaningful consideration can be given now."[31] The agency must evaluate the cumulative impacts of related projects proposed or reasonably foreseeable in a geographic area in a single, comprehensive, regional EIS in order to fully understand the impacts of the proposed action in its proper context.[32]	Cumulative impacts are discussed in section 4.13 of the EIS.

CO-24	Appalachian Mountain Advocates	
CO-24e	Because it relies almost entirely on the MVP mainline project (which is currently under construction despite lacking several federal permits) for its supply of gas, the MVP Southgate unquestionably depends on the mainline for its existence and thus both "[c]annot or will not proceed unless other actions are taken previously or simultaneously" and "depend[s] on the larger action for [its] justification."[33] The two projects thus should have been analyzed as connected actions. FERC's failure to analyze the impacts of Mountain Valley Pipeline's connected projects together renders its significance findings incomplete.[34] FERC concludes that the Project will not have significant adverse impacts on any of the resources analyzed, such as soils, vegetation, wildlife, and aquatic resources. DEIS at 5-1 to 5-12. Even if some impacts of the Project alone were not significant, the combined impacts of the two connected actions may be significant. That is particularly true in regards to impacts to forests, which FERC found in the MVP mainline EIS to be significant, and impacts to aquatic resources, which have in practice proven to be significant during construction of the MVP mainline.[35]	See response GEN-8 in appendix I.2.
CO-24f	FERC's minimal analysis of the MVP mainline's impacts in the cumulative impacts section, DEIS at 4-246, does not cure this defect. It is well-established that FERC must evaluate the cumulative impacts of a natural gas pipeline before it issues a certificate of public convenience and necessity for the project.[36] As explained above, because the projects are connected actions FERC must analyze the full impacts of each project in a single EIS,[37] which it fails to do. In addition, in the instances where FERC analyzes the cumulative impacts of the projects together, it does so on too small a scale by looking only at impacts within the same HUC-12 watersheds. As the MVP mainline's substantial sedimentation impacts on the Roanoke River basin demonstrate, the projects' impacts can extend far beyond the HUC-12 level. FERC's cumulative impacts analysis thus does not capture the actual combined impacts of the two projects and fails to satisfy NEPA's hard look requirement.	See response CI-1 and CI-3 in appendix I-2.

CO-24	Appalachian Mountain Advocates	
CO-24g	**III. The DEIS Fails to Adequately Assess the Project's Greenhouse Gas Emissions and Climate Impacts** The DEIS does not take the required hard look at the Project's greenhouse gas ("GHG") emissions and climate impacts. FERC fails to estimate upstream and downstream GHG emissions, to utilize readily available tools for assessing their climate impact (including significance), to consider potential mitigation, or to distinguish the Project's climate impacts from those of feasible alternatives. **A. The DEIS fails to Estimate Upstream GHG Emissions** NEPA requires consideration of reasonably foreseeable "indirect effects" of a proposed action that "are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable."[38] This includes "growth inducing effects and other effects related to induced changes in the pattern of land use . . . and related effects on air and water and other natural systems" that are "removed in distance" from the site of the proposed action.[39] FERC has acknowledged that "there may well be instances in which upstream gas production is both reasonably foreseeable and sufficiently causally connected to a pipeline project to qualify as an indirect effect."[40] Yet the DEIS makes no effort to assess upstream GHG emissions associated with the Project. FERC must disclose the fact and nature of foreseeable effects of gas production that will be induced by the Project. FERC should seek out information, including from the Project applicant, that would help it "predict the number and location of any additional wells that would be drilled as a result of production demand created by the Project."[41] "It should go without saying that NEPA . . . requires the Commission to at least attempt to obtain the information necessary to fulfill its statutory responsibilities." *Id.* at 5.	See response CI-1 in appendix I.2.

CO-24	Appalachian Mountain Advocates	
CO-24g	Even if FERC undertakes the requisite attempt but determines it cannot obtain specific information regarding upstream activities, the DEIS can still provide useful information. For example, FERC has previously "estimated the impacts associated with the production wells that would be required to provide 100 percent of the volume of natural gas to be transported by [a gas pipeline project], on an annual basis for GHGs."[42] In that case, FERC used "the project volume and the expected estimated ultimate recovery of Marcellus shale wells" to estimate the number of wells that "would be required to provide the gas over the estimated 30-year lifespan of the project."[43] FERC then used the Department of Energy's Life Cycle Analysis of Natural Gas Extraction and Power Generation to estimate upstream GHG emissions. *Id.* at n.210. In sum, FERC must attempt to obtain more information regarding upstream activity that would result from the Project. If specific information proves unobtainable, FERC can still estimate upstream GHG emissions based on the volume of gas that the Project is designed to transport. Instead, the DEIS fails to do either—and also fails to comply with 40 C.F.R. § 1502.22, which outlines the procedures an agency must comply with when "there is incomplete or unavailable information."[44] **B. The DEIS Fails to Estimate Downstream GHG Emissions** Effects are reasonably foreseeable if they are "sufficiently likely to occur that a person of ordinary prudence would take [them] into account in reaching a decision."[45] In the gas pipeline context, downstream greenhouse-gas emissions are quintessential indirect effects, because such emissions predictably result from operating a pipeline whose sole purpose is to transport gas that will be consumed by end-users.[46]	See above CO-24g comment response.

CO-24	Appalachian Mountain Advocates	
CO-24g	Downstream emissions are an indirect effect even if the ultimate destination of the fuel is unknown.[47] For example, any uncertainty regarding the ultimate destination of the gas does not change the fact that the Project is designed to transport 375 million cubic feet of gas per day to end users. FERC is a legally relevant cause of the emissions resulting from combustion of the transported gas.[48] [49] Moreover, here "Mountain Valley has indicated that the currently subscribed volume of natural gas, 300 MMcf/d, would be used in North Carolina, primarily by residential and small and medium-sized commercial customers for heating, cooking, and other end-uses." DEIS at 4-269. This information could be used to estimate the downstream GHGs. Greenhouse gas "estimation tools have become widely available" and are "already in broad use." Council on Environmental Quality, Revised Draft Greenhouse Gas Emissions and Climate Change Guidance (Dec. 2014) at 15.[50] If FERC for some reason believe it required additional information to estimate downstream GHG emissions, it must explain why and attempt to obtain that information. As FERC has conceded, "its lack of jurisdiction over shippers, distributors, and end users 'doesn't preclude or foreclose' it from further developing the record by requesting additional data from the project applicant."[51] For example, FERC could require the project applicant to obtain additional information from "anchor shipper, Dominion Energy (formerly PSNC Energy), a local natural gas distribution company," regarding its purported "growing supply needs."[52] The DEIS states that the remaining 75 MMcf/d "could be utilized in either North Carolina or Virginia," and "[t]he end use of this gas is not known." DEIS at 4-269.[53] Analyzing GHG emissions and climate impacts does not depend on knowing the specific locations where gas combustion will occur. If FERC believes a full-burn estimate does not accurately reflect anticipated emissions, FERC should explain why—and must attempt to provide a more accurate estimate.[54] NEPA requires agencies to analyze and consider downstream effects even if the "exact[]" net increase in emissions may "depend[] on several uncertain variables."[55] "[S]ome educated assumptions are inevitable in the NEPA process," and agencies can disclose "assumptions so that readers can take the resulting estimates with the appropriate amount of salt."[56]	See above CO-24g comment response

CO-24	Appalachian Mountain Advocates	
CO-24g	The Project's direct and indirect GHG emissions, and resulting climate impacts, must also be considered along with other projects in the region, including but not limited to other interstate gas pipelines.[57] **C. The DEIS Fails to Utilize Available Methodologies to Assess the Project's Climate Impact** In addition to failing to estimate indirect GHG emissions, the DEIS fails to account for the climate impact of GHG emissions. As a result of this deficiency, nothing in the DEIS allows the public or decisionmakers to meaningfully determine whether the harm caused by Project GHG emissions would warrant mitigation, selection of a less harmful alternative, or certificate denial. "The impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct."[58] The DEIS outlines some general climate change impacts, DEIS at 4-267 to 4-268, but does not assess the impacts caused by *this Project*.[59] Moreover, because the tools used by the U.S. Global Change Research Program to assess current and future impacts of climate change respond to different emission scenarios, it is possible to meaningfully discuss the *incremental* impact of the emissions at issue here. The DEIS recognizes that "[w]hen determining the significance of an impact, both context and intensity are relevant. DEIS at 4-0.[60] Context "means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality."[61] Intensity "refers to the severity of impact."[62] Yet the DEIS fails to assess the context or intensity of the Project's greenhouse-gas effects. FERC's failure to assess the Project's GHG emissions and their climate impacts invalidates the DEIS's conclusion that the Project would not have significant impacts. DEIS at 4-270, 5-1. FERC cannot approve a project on the basis that it will have no significant impacts when it has failed to assess one of the Project's most severe and long-term impacts.	See above CO-24g comment response

CO-24	Appalachian Mountain Advocates	
	FERC first claims that it has "not been able to find any GHG emissions reduction goals established at the federal level," noting that the national emissions reduction targets expressed in the Clean Power Plan and the Paris climate accord are pending repeal and withdrawal, respectively. DEIS at 4-269. Even if repeal or withdrawal were complete, these targets could be used to provide context. Moreover, the United States remains a party to the United Nations Framework Convention on Climate Change and its associated Paris Agreement. While President Trump has indicated the United States will remove itself from the Agreement, the United States presently has an internationally established commitment to limiting the average increase in global temperatures to 1.5 degrees Celsius. But the DEIS fails to consider the Paris Agreement commitments--or other useful targets that would help provide context, such as the IPCC's established carbon budget--as part of its consideration of the Project's GHG emissions. The DEIS fails to explain why any of these targets could not be used to provide context for Project emissions.	
CO-24g	FERC's excuses related to state climate goals also fail. The DEIS mentions that Virginia has a plan that calls for a reduction of GHG emissions 30% below a "business as usual" scenaric by 2025, but then simply states: "We do not have the data that identified the 'business as usual' scenario." DEIS at 4-269. In other words, despite the numerous steps that Virginia has taken on climate change that are identified in the DEIS (e.g., the Governor's Commission on Climate Change, Executive Order 19, Governor's Climate Change and Resiliency Update Commission and associated report that includes "an inventory of contributors of GHG" and "evaluation of impacts," and carbon trading regulation), the DEIS makes no attempt to use any of this to provide context for the Project's emissions.[63] The DEIS also states that because the Project "is intended to serve end users in North Carolina, we cannot determine Southgate Project effects, if any, on Virginia's GHG goals."[64] But a portion of the Project is being constructed in Virginia, and the location of the end-use is not relevant to climate impacts. This statement also conflicts with the DEIS's statement in the next paragraph that "[t]he remaining 75 MMcf/d could be utilized in either North Carolina or Virginia."[65]	See above CO-24g comment response

CO-24	Appalachian Mountain Advocates	
CO-24g	The DEIS mentions North Carolina Governor Roy Cooper's Executive Order 80, which mandates a statewide reduction of GHG emissions by 2025 to 40% below 2005 levels, but provides no explanation of how the Project's GHG emissions--including from downstream combustion--would affect that goal. Instead, the DEIS simply concludes the discussion with the conclusory statement that "[f]or both the subscribed and unsubscribed volumes, we cannot determine Southgate Project effects on the states' goals." DEIS at 4-269. The DEIS makes no attempt to provide the states' goals in terms of actual GHG emissions targets, or to calculate the Project's lifecycle emissions, which would provide helpful context for decision-makers and the public.	See above CO-24g comment response
CO-24h	FERC should also provide further information regarding the impact of Project GHG emissions, including context and intensity, by using the Interagency Working Group's ("IWG") social cost of carbon ("SCC") protocol.[66] The DEIS states that "there is no universally accepted methodology to attribute discrete, quantifiable, physical effects on the environment to the Southgate Project's incremental contribution to GHGs." DEIS at 4-269. But a "universally accepted methodology" is not the standard—and while FERC maintains that it lacks "a method for relating GHG emissions to specific resource impacts," *Id.* at 4-270 elsewhere FERC has acknowledged that the Social Cost of Carbon "constitute[s] a tool that can be used to estimate incremental physical climate change impacts."[67] The SCC "estimates the monetized climate change damage associated with an incremental increase in CO2 emissions."[68] The damage estimate includes lost agricultural productivity, human health impacts, property damage from increased flooding, and lost ecosystem services. FERC has acknowledged that the SCC is an "appropriate[]" tool for federal agencies to use "to inform their decisions," and that agencies have been rightly "faulted for failing to use it."[69] Like those other agencies, FERC is the legally relevant cause of the GHG emissions at issue.[70] FERC does not (and cannot) offer a rational explanation for refusing to use a tool it acknowledges is useful and appropriate to inform other agencies' decisionmaking—including project-level reviews.[71] In another recent case concerning an energy infrastructure project, where the agency's NEPA analysis quantified greenhouse gas emissions but claimed that it was impossible to discuss the effects thereof, the court ruled that the agency's refusal to use the social cost of carbon to illustrate the impact of these emissions was arbitrary and capricious.[72]	See response CI-1 in appendix I.2

CO-24	Appalachian Mountain Advocates	
CO-24h	Accordingly, the DEIS is incorrect when it states that FERC is "not able to assess potential GHG-related impacts attributable to the Southgate Project." DEIS at 4-270. Although FERC has discretion to choose among reliable methodologies for evaluating impacts, FERC cannot refuse to provide any evaluation whatsoever when a generally accepted methodology is available.[73] A widely used tool that FERC has acknowledged is useful for project-level reviews is available, but the DEIS fails to even mention it. In other gas pipeline proceedings, FERC has provided excuses for refusing to use the SCC. Those excuses fail. For example, FERC has claimed there is no consensus on the appropriate discount rate, resulting in significant variation in output. But courts have rejected this reasoning.[74] As the 2010 Technical Support Document explained, a range of three discount rates—2.5, 3, and 5 percent—"reflect reasonable judgments" and "span a plausible range" of appropriate discount rates, and are consistent with OMB Circular A-4.[75] As explained by the IWG, uncertainty as to the most appropriate discount rate is a reason to provide social cost estimates using the range of plausible rates—which FERC and other agencies have done in other proceedings—but it is not a reason for ignoring the social cost of greenhouse-gas emissions entirely.[76] FERC has also claimed there is no basis to designate a particular dollar amount as significant. But assessing the significance of any impact requires FERC's professional judgment. For example, no third party provided FERC with a threshold for significance for impacts on housing, recreation areas, and tourism, but FERC nonetheless concluded such impacts would not be significant. DEIS at 4-124, 4-128, 4-137. And FERC routinely evaluates the relative importance of monetized benefits that it anticipates, *see, e.g., id.* at 4-129 (taxes), weighing them against qualitative impacts. NEPA does not, of course, require agencies to monetize adverse impacts in all cases.[77] The statute does, however, require FERC to take a hard look at the "ecological …, aesthetic, historic, cultural, economic, social, [and] health," effects of its actions, "whether direct, indirect, or cumulative."[78] Monetization of costs may be required where	See above CO-24h comment response

CO-24	Appalachian Mountain Advocates	
CO-24h	available "alternative mode[s] of [NEPA] evaluation [are] insufficiently detailed to aid the decision-makers in deciding whether to proceed, or to provide the information the public needs to evaluate the project effectively." Translating GHG emissions into climate damages would contextualize[79] the impact, making it more accessible to the public and decision-makers, and would aid a significance determination. Thus, while FERC claims that it is "unable to determine the significance of the Southgate Project's contribution to climate change," it ignored a tool that would have helped it do just that. DEIS at 4-270. Although they likely underestimate the true costs of GHG emissions, the IWG's social cost metrics remain the best estimates yet produced by the federal government for monetizing the impacts of GHG emissions and are "generally accepted in the scientific community."[80] This is true notwithstanding Executive Order 13,783, which disbanded the Interagency Working Group and formally withdrew its technical support documents.[81] Indeed, that Executive Order did not find fault with any component of the IWG's analysis. To the contrary, it encourages agencies to "monetiz[e] the value of changes in greenhouse gas emissions" and instructs agencies to ensure such estimates are "consistent with the guidance contained in OMB Circular A-4."[82] The IWG tool, however, illustrates how agencies can appropriately comply with the guidance provided in Circular A-4: OMB participated in the IWG and did not object to the group's conclusions. As agencies follow the Circular's standards for using the best available data and methodologies, they will necessarily choose similar data, methodologies, and estimates as the IWG, since the IWG's work continues to represent the best estimates presently available.[83] Thus, the IWG's 2016 update to the estimates of the social costs of greenhouse gases remains the best available and generally accepted tool for assessing the impact of greenhouse gas emissions, notwithstanding the fact that this document has formally been withdrawn.[84]	See above CO-24h comment response

CO-24	Appalachian Mountain Advocates	
CO-24h	The estimates of social cost are based on reasonable forecasts of the actual physical effects greenhouse gas emissions will have on the environment, including temperature, sea level rise, ecosystem services, and other physical impacts, together with assessments of how these physical changes will impact agriculture, human health, etc. The social cost protocol identifies the social cost imposed by a ton of emissions' pro rata contribution to these environmental problems. This either amounts to an assessment of physical impacts or the best available generally accepted alternative to such an assessment; either way, the tool is appropriate for use under NEPA.[85] As noted, although FERC has discretion to choose among reliable methodologies for evaluating impacts, that discretion does not allow FERC to provide no evaluation whatsoever when a generally accepted methodology is available.[86] **D. The DEIS's Failure to Adequately Assess the Project's GHG Effects Precludes Informed Decision-Making** The failure to adequately assess the Project's indirect greenhouse-gas emissions—including their volume, climate impact, significance, and cumulative effect—is contrary to NEPA's goals of informed decisionmaking and informed public comment. Failure to grapple with the importance and consequences of greenhouse gas emissions undermines several aspects of the Project analysis. For example, estimating the social cost of GHG emissions would help the public and FERC understand whether the adverse consequences of the Project's emissions are severe enough to tip the balance toward the conclusion that the project is contrary to, and not required by, the public convenience and necessity. Moreover, had FERC concluded that the climate impacts were significant, this would have supported more meaningful evaluation of alternatives that could potentially reduce these impacts. Instead, the DEIS fails to disclose the climate benefits (or lack thereof) of any of the potential alternatives. The Project's GHG emissions and climate impacts should be compared to the emissions and impacts of various alternatives, including the no-action alternative. FERC's arbitrarily narrow Project purpose and need compound this error because it caused FERC to improperly exclude alternatives involving renewable energy and energy efficiency, which would have lower direct and indirect GHG emissions.	See above CO-24h comment response

CO-24	Appalachian Mountain Advocates	
CO-24h	In sum, FERC must take a hard look at these impacts so it can consider them when deciding whether to approve the Project, deny it on the ground that it "would be too harmful to the environment," or select a less harmful alternative.[87] The DEIS fails to provide information that would be useful in answering these questions. Estimating the impacts of emissions using the social cost protocols would speak to these issues, regardless of whether FERC concludes that the impact is or is not significant. The DEIS also fails to assess possible mitigation of greenhouse-gas impacts. *See id.* at 1374 (FERC "has legal authority to mitigate" downstream emissions).	See above CO-24h comment response
CO-24i	**IV. The DEIS Fails to Adequately Analyze Impacts to Aquatic Resources Because It Unreasonably Relies on Minimization and Mitigation Measures That Have Proven Ineffective in Practice** The Project would require crossing 224 waterbodies, including three major waterbodies, using primarily a dry, open-cut crossing technique. DEIS at 4-32. It would also traverse substantial areas of steep slopes. *Id.*, Appendix C.3. FERC recognizes that > Construction activities in-stream channels and on adjacent banks may affect waterbodies. Clearing and grading of stream banks, in-stream trenching, the installation and removal of temporary crossing structures (e.g., culverts, cofferdams), trench dewatering, and backfilling could each cause temporary, local modifications of aquatic habitat involving sedimentation, increased turbidity, and decreased dissolved oxygen concentrations; DEIS at 4-43. FERC likewise notes that > The clearing and grading of stream banks could expose soil to erosional forces and would reduce riparian vegetation along the cleared section of the waterbody. The use of heavy equipment for construction could cause compaction of near-surface soils, an effect that could result in increased runoff into surface waters in the immediate vicinity of the proposed construction right-of-way. Increased surface runoff could transport sediment into surface waters, resulting in increased turbidity levels and increased sedimentation rates in the receiving waterbody. Disturbances to stream channels and stream banks could also increase the likelihood of scour after construction *Id.* at 4-44. Nonetheless, FERC concludes that these impacts would be temporary and localized and that Mountain Valley's compliance with FERC's Plan and Procedures and the Project-specific Erosion and Sediment Control Plan would minimize impacts to the level of	See response GEN-9 in appendix I.2

CO-24	Appalachian Mountain Advocates	
CO-24j	FERC's conclusions are not supported by the available evidence showing that pipeline construction has substantial adverse impacts on water quality, primarily through sedimentation associated with slips and runoff from cleared areas adjacent to stream crossings. FERC offers no explanation for why past projects, which were subject to the very same sorts of Best Management Practices in FERC's Procedures and the Project-specific ES&C Plan, led to significant water quality impacts but the MVP Southgate Project will not. FERC's conclusions are thus arbitrary and capricious. Pipeline construction has a long, unacceptable track record of causing severe water quality problems in this region. In particular, Mountain Valley and its contractors have caused severe adverse impacts to water quality during construction of the MVP mainline in Virginia and West Virginia. In light of these past problems, FERC may not reasonably rely on its standard mitigation measures, particularly for erosion and sedimentation control, to conclude that impacts to aquatic implementation of those controls. FERC knows that implementation is never perfect and that, with this particular project applicant, it has been anything but. FERC's assurances that its standard mitigation measures can effectively minimize aquatic impacts have unfortunately proven hollow in experience. For example, on the MVP mainline the U.S. Forest Service's compliance monitoring firm, Transcon Environmental, cited Mountain Valley for causing sediment pollution in Jefferson National Forest and noted that the company's sediment control measures were "failing" and "not functioning properly," resulting in sedimentation impacts as far as 300 feet downstream from a Project stream crossing.[90]	See response GEN-6 in appendix I.2.

CO-24	Appalachian Mountain Advocates	
CO024j	Likewise, the West Virginia Department of Environmental Protection (WVDEP) on April 3, 2018, cited Mountain Valley for violations at the construction sites of two compressor stations, noting that the erosion control measures had failed to contain sediment and sediment-laden water from leaving the work site.[91] WVDEP issued another Notice of Violation on May 9, 2018, for an incident where sediment controls at a stream crossing "failed and were breached allowing sediment laden water to enter stream. … Sediment deposits were observed in stream causing conditions not allowable" under West Virginia's water quality standards.[92] Additionally, separate WVDEP inspections on June 6, 2018, resulted in two Notices for failure of control measures leading to sediment and sediment-laden water leaving the pipeline right-of-way, noting that MVP's plans were inadequate and that additional mitigation measures were required.[93] More recently, a July 6, 2018, WVDEP inspection led to yet another notice for failing to prevent sediment and sediment laden water from leaving the right-of-way.[94] The Virginia Department of Environmental Quality (VADEQ) issued a Notice of Violation on July 9, 2018 for widespread sedimentation impacts identified in citizen-complaint driven investigations conducted on May 21, May 23, May 24, May 30, June 6, June 13, June 26, and June 27, 2018.[95] Those impacts occurred along the project route in Craig, Franklin, Giles, Montgomery, Pittsylvania and Roanoke Counties.[96] VADEQ noted that many of Mountain Valley's erosion and sedimentation controls were ineffective and that the company did not repair failing controls within the required timeframe.[97] In one instance, "[c]ombined impacts to the two stream channels covered a distance of approximately 2,800 linear feet. This unauthorized fill ranged in depth up to eleven inches of sediment, which was released from MVP's construction right of way due to overwhelmed and damaged erosion and sediment controls."[98] Failing controls at another site led to 6,009 linear feet of impacts with sediment depositions up to seven inches deep.[99] Mountain Valley itself has identified numerous sedimentation events, including events not cited in the above notices, in its weekly status reports to FERC.[100] Those failures continue to this day.[101]	See above CO-24j comment response

CO-24	Appalachian Mountain Advocates	
CO-24j	Such failures are not simply a result of faulty implementation, but in many cases inadequacy of the chosen mitigation measures. Indeed, following a severe event that resulted in asserted that its "controls were installed properly."[102] The fact that FERC has not taken a single enforcement action or issued a stop work order for violations of its own Plans and Procedures on which it relied further demonstrates that the mitigation measures themselves, not just Mountain Valley's implementation, are inadequate. Such incidents have not been limited to the MVP mainline or to other large 42-inch diameter pipelines. Indeed, there are numerous examples of significant sedimentation and other pollution impacts occurring during smaller pipeline construction despite the use of industry-standard erosion and sedimentation controls. For example, in 2006, during construction of a 20-inch East Tennessee Gas Pipeline in Tazewell and Smyth Counties, Virginia, slopes failed in two independent events in Indian Creek and North Fork Holston River, resulting in a kill of several hundreds of individuals and multiple species of endangered mussels.[103] The worst sediment problems originated not directly at the stream crossings, but high in the watershed where small streams transported sediment to the larger streams. Evidence of the sediment was detected as far as two kilometers downstream of the slips. These impacts occurred despite extreme care taken by FERC, USFWS, the Virginia Department of Conservation and Recreation, and the company to ensure that state-of-the-art erosion control measures were in place.[104] Similarly, a 2014 Columbia Gas of Virginia project to add a 12-inch pipeline adjacent to an existing 6-inch pipeline along Peter's Mountain near a portion of the Jefferson National Forest in Giles County, Virginia, led to extreme sedimentation impacts.[105] Inspection reports by the US Forest Service describe sediment movement that "looked like a lava flow" and note that the inspector had "never seen that much sediment move off site before."[106] Much of the sediment became embedded in a nearby stream.[107] These impacts occurred despite the existence of comprehensive erosion control plans, implementation of Best Management Practices, and weekly inspections by the company to ensure proper implementation.[108]	See above CO-24j comment response

CO-24	Appalachian Mountain Advocates	
CO-24j	Additionally, construction of Dominion's G-150 and TL-589 gas pipelines in West Virginia led to slope failure at pipeline stream crossing locations during and post construction, resulting in harm to streams despite the application of industry-standard erosion and sediment control practices. West Virginia Department of Environmental Protection Consent Order No. 8078, dated October 1, 2014, addressed a series of 13 locations in West Virginia where lower slope slippage or landslides along pipeline construction right-of-ways introduced sediment into streams in violation of regulations concerning conditions not allowable in waters of the State, specifically sediment deposits. Likewise, the Stonewall Gathering Line, a 36-inch pipeline constructed in the central part of the state, racked up 53 violations from the West Virginia Department of Environmental Protection (WVDEP) for failure to maintain sediment and erosion controls, not using the proper best management practices and failing to comply with their stormwater pollution prevention plan and groundwater protection plan. The same story occurred in Pennsylvania with construction of Tennessee Gas Pipeline's (TGP) 300 Line Project, part of the Susquehanna West Project.[109] In May of 2010, FERC issued an environmental assessment for the 300 Line Project, finding there would be no significant impacts when TGP crossed streams in northeast and north-central Pennsylvania. FERC relied on TGP's plan to follow construction guidelines created by the Corps, USDA, NRCS, and FERC. In addition, FERC imposed its own conditions. However, despite what FERC believed to be adequate measures, TGP's construction violated Pennsylvania's Clean Water Law multiple times. The majority of the project's compliance reports contained at least one violation of the project plans, but the plan was never enforced.[110] Whether the plan was inadequate in its substance or inadequately enforced, the end result is the same; the pipeline's stream crossings, which FERC believed would cause no significant environmental impact, resulted in numerous violations and an $800,000 penalty settlement with the Pennsylvania DEP.[111]	See above CO-24j comment response

CO-24	Appalachian Mountain Advocates	
CO-24j	More recently, construction of the Rover Pipeline resulted in the WVDEP having to issue a Cease and Desist Order issued on July 17, 2017, after numerous violations for failure to maintain erosion control devices which allowed sediment to enter nearby streams. The photos included with that order demonstrate that FERC's erosion and sedimentation control measures are insufficient to prevent significant violations of water quality standards. Importantly, the violations cited there made clear that it was not simply that Rover failed to follow its plans, but that the stormwater pollution prevention plans themselves were inadequate.[112]. Rover's violations did not end there, however. Prior to the cease and desist order being lifted, Rover was cited for additional violations of West Virginia's water quality standards associated with sediment discharges and failure of BMPs.[113] These consistent failures make clear that FERC cannot reasonably rely on its standard erosion and sediment control measures to conclude that impacts to aquatic resources will not be significant. FERC must instead calculate the amount of sedimentation that would occur in the absence of controls, the expected reductions to be achieved by those controls, and how the uncontrolled sediment would affect aquatic resources in terms of increased turbidity, sediment deposition on stream bottoms, lowered dissolved oxygen levels, and other known consequences of increased erosion and sedimentation. FERC's failure to do so means that its DEIS does not satisfy NEPA's hard look standard.	See above CO-24j comment response
CO-24k	**V. The DEIS Fails to Adequately Analyze Impacts to Sensitive Wildlife Species** FERC has not provided sufficient information in the DEIS for Commenters to assess the actual impacts to listed species, or to assess the *not likely to adversely affect* determination was made. Therefore, FERC has failed to provide the "hard look" required in an EIS, and has thereby precluded the public from having sufficient information on which to base comments on the impacts that the Project will have on these species. Providing the public with sufficient information to analyze the circumstances and impacts of a proposed project is essential to the NEPA process.	See response GEN-4 and T&E-2 in appendix I.2. A majority of species surveys have been completed by Mountain Valley and section 4.7 of the EIS has been updated with this information. Our analysis of impacts to T&E species has been updated; however, survey data did not alter our determinations in section 4.7.1. Federal agency compliance for the Endangered Species Act (ESA) Section 7, including concurrence of determinations of effect by the FWS, would be required as described in section 4.7.1 of the EIS

CO-24	Appalachian Mountain Advocates	
CO-24k	FERC may not gloss over the impacts to listed species that may be adversely affected by the Project. By declaring that it will gather more information on such impacts at a later time, and/or will begin or complete formal consultation with the U.S. Fish and Wildlife Service on certain species at a later time, FERC is in direct violation of 40 C.F.R. §1502.25(a), which states that "[t]o the fullest extent possible, agencies shall prepare draft environmental impact statements concurrently with and integrated with environmental impact analysis and related surveys and studies required by the Fish and Wildlife Coordination Act (16 U.S.C. 661 et seq.), the National Historic Preservation Act of 1966 (16 U.S.C. 470 et seq.), the Endangered Species Act of 1973 ("ESA")(16 U.S.C. 1531 et seq.), and other environmental review laws and executive orders." The concurrency requirement for the NEPA and ESA process is essential for public involvement. There is no opportunity for public comment on the development of a Biological Assessment or Biological Opinion; therefore, it is only through the NEPA process that the public may comment on the impacts to listed species. Furthermore, in order to fully assess the cumulative impacts of the proposal as NEPA requires, all impacts must be fully vetted in the NEPA documents. FERC has undermined this analysis by failing to fully analyze them in the DEIS, and by failing to provide a sufficient Biological Assessment. While FERC has provided a discussion within the DEIS that it claims to be its "Biological Assessment," it is readily apparent that FERC has failed to provide a "hard look" at the impacts that the MVP Southgate will have on listed species as required by NEPA. Pursuant to NEPA, FERC must analyze whether the project will have impacts on species that are listed as endangered or threatened under the Endangered Species Act, 16 U.S.C. §§ 1531–1544. *See* 40 C.F.R. § 1508.27(b)(9). A federal agency's legal obligations under NEPA and the ESA are entirely separate; compliance with the ESA Section 7's prohibition against jeopardizing a species' continued existence, 16 U.S.C. § 1536(a)(2), does not simultaneously satisfy NEPA's requirements to analyze significant impacts short of the threat of extinction. *See Greater Yellowstone Coalition v. Flowers*, 359 F.3d 1257, 1275–76 (10th Cir. 2004) (recognizing FWS conclusion that action not likely to cause jeopardy does not necessarily mean impacts are insignificant); *Makua v. Rumsfeld*, 163 F. Supp. 2d 1202, 1218 (D. Haw. 2001) ("A FONSI . . .	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	must be based on a review of the potential for significant impact, including impact short of extinction. Clearly, there can be a significant impact on a species even if its existence is not jeopardized."); *Portland Audubon Society v. Lujan*, 795 F. Supp. 1489, 1509 (D. Or. 1992) (rejecting agency's request for the court to "accept that its consultation with [FWS under the ESA] constitutes a substitute for compliance with NEPA."). As discussed below, FERC's analysis falls well short of what is required under NEPA. Moreover, the DEIS itself indicates that the information FERC is relying on to understand project impacts is woefully incomplete. The DEIS relies upon unspecified conservation measures to address potential impacts to these species. It catalogues numerous potentially deleterious effects of the proposed action on all of the listed species potentially inhabiting the project area, but lacks complete population surveys and/or critical impacts analyses for each listed species, and supports *not likely to adversely affect* determinations with Mountain Valley's promised adherence to implementation plans with unspecified mitigation measures. DEIS at Section 4.7.1. Further, the DEIS indicates that no construction may begin until "[FERC] staff completes ESA consultation with the FWS." *Id.* at 4-94. This indicates that such consultation has not been completed at this time. Furthermore, the DEIS indicates that surveys still need to be completed for most of the listed and proposed species at issue. Given that these biological surveys have not been completed, it remains entirely unclear how FERC has determined that many of these species are not likely to be adversely affected or whether the Project risks extensive habitat damage due to construction-related and operational impacts.	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	It is therefore evident that FERC has not undertaken the requisite hard look at the impacts of this Project on listed species, as required pursuant to both NEPA and the ESA. FERC cannot possibly make a determination as to such impacts when consultation has not yet been completed and biological surveys have not been accomplished. FERC should have had this information before it when developing its conclusions as to the Project's impacts in the DEIS. Furthermore, this precludes the public from reviewing such information and providing comments during this DEIS comment period. Rather, FERC must require that all pertinent information on impacts to listed species and their habitats be included in the DEIS, and the failure to do so renders the DEIS incomplete. For example, the DEIS indicates that surveys for the federally listed northern long-eared bat hibernacula portals were not completed prior to the drafting of the DEIS, but that Mountain Valley will continue surveys after publication of the DEIS. DEIS at 4-89. With such inadequate impacts information on record, FERC is left defending its premature *not likely to adversely affect* determinations with patently inadequate statements such as "[d]ue to the lack of hibernacula and maternity roosts in the survey area, and if no additional individuals, hibernacula, or maternity roosts are located during additional surveys . . . we find that the Project . . . *is not likely to* Moreover, FERC's use of the DEIS section on listed species as its Biological Assessment (BA) for the ESA Section 7 consultation process is inadequate, since the DEIS fails to meet the requirements for a BA. A BA is supposed to include "an analysis of the effects of the action on the species and habitat, including consideration of cumulative effects, and the results of any related studies," as well as "an analysis of alternate actions considered by the Federal agency for the proposed action." 50 CFR §402.12(f). Moreover, according to FWS' Guidance for Preparing a Biological Assessment, the BA should include a description of "how the action may affect each protected resource," and the agency should "document [the] analysis of the what, when and how the protected resources will be exposed to and how such individuals or habitat are likely to respond to this exposure."[814] The DEIS falls well short of this requirement. Not only is the information on impacts entirely incomplete – which FERC evidences by requesting that the Applicants provide more information on species locations and conservation measures as discussed above and below – but the species-specific discussions fail to include an analysis of	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	the cumulative impacts of the Project and do not discuss the potential impacts of Project operation, even though FWS' Guidance requires that the BA analysis include "effects that may occur later in time (e.g., after completion of initial construction)."[115] FERC has therefore failed to provide complete information on the impacts of the proposal and has not fulfilled its ESA or NEPA requirements. Commenters therefore insist that FERC require the Applicants to complete the required field surveys, and then provide a new or supplemental DEIS with this information and a complete Biological Assessment, and reopen the DEIS comment period once formal ESA consultation is complete, so that the public may then have the opportunity to properly participate in analyzing the cumulative environmental impacts of this proposal. **A. Northern Long-Eared Bat** The northern long-eared bat is listed as threatened under the ESA. As discussed above, the DEIS analysis of impacts to this species is entirely inadequate since it is readily apparent that FERC did not have sufficient information on which to base its conclusions. Mountain Valley never completed bat hibernacula portal surveys for the entire project prior to the preparation of the DEIS, which purports to contain the conclusions of a Biological Assessment. DEIS at 4-89. Without complete information regarding the absence or presence of this species in the project area, it is impossible for FERC to analyze the construction or operational impacts of the MVP Southgate pipeline to the species, rendering FERC's *not likely to adversely affect* determination for this species unsupported by facts, arbitrary and capricious. Furthermore, without complete information regarding the absence or presence of this species in the project area, it is impossible for FERC to satisfy its NEPA obligations to take a "hard look" at the impacts of the Project to this species. The DEIS' *not likely to adversely affect* determination for the northern long-eared bat is based, in part, on the presumed application of the 4(d) rule for this species, which prohibits incidental take within hibernacula and alteration of the hibernacula environment in a manner that causes incidental take. *Id.* Manifestly, FERC cannot make a determination as to whether incidental take in hibernacula will be avoided when hibernacula surveys have not been completed for the project area.	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	**B. Roanoke Logperch** The Roanoke logperch is listed as endangered under the ESA. The DEIS determines that the Project will cross several waterbodies in North Carolina that serve as habitat for this species, and identifies in-water work and upland construction runoff as significant turbidity and sedimentation impacts risk factors for the species. DEIS at 4-90. The DEIS anticipates potential aquatic impacts from the project, including sedimentation, turbidity, drilling fluid spills, collapse of streams, loss of stream bank cover, fuel and chemical spills, water withdrawals and blasting. The DEIS fails to quantify water withdrawal impacts to aquatic species and habitat, and does not quantify blasting impacts to aquatic species and habitat. FERC defends its *not likely to adversely affect* determination with the caveats that Mountain Valley would "attempt to avoid blasting during waterbody crossings," and that it would adhere to a SPCC spill contingency plan that would require 100-foot setbacks for equipment and fuel. DEIS at 4-85,86. However, neither of these caveats provide real assurance that blasting or spill impacts to aquatic habitat will be avoided. The DEIS bases its *not likely to adversely affect* determination for this species on the use of horizontal directional drilling ("HDD") and conventional bore drilling for stream crossings, as well as on the use of stream setbacks, vegetative buffers, sediment barriers and mulch on sloped sections of the construction right of way. However, FERC's reliance on these measures is misplaced. The use of HDD elevates the risk of drilling fluid spills in aquatic habitat for listed species. The DEIS notes an elevated risk of drilling fluid spills near the exit point of the drill for the Dan River and Stony Creek reservoir. DEIS at 4-14. FERC's reliance on stream setbacks for HDD and conventional bore drilling to support its *not likely to adversely affect* determination for this species is inappropriate, particularly where FERC has already granted Mountain Valley variances from its policy of requiring 50-foot setbacks from the stream. Furthermore, FERC's reliance on vegetative buffers for sedimentation impacts from drilling is misplaced, as these buffers are only being required by FERC where practicable. Finally, the DEIS relies on compliance with Mountain Valley's proposed HDD contingency plan to support its *not likely to adversely affect* determination is arbitrary and capricious, as the plan does nothing to prevent drilling fluid spills that result from geological features, and mostly provides means to respond to a spill after it has contaminated aquatic	See above CO-24k

CO-24	Appalachian Mountain Advocates	
CO-24k	habitat, and when it is too late to prevent adverse impacts to listed species such as the Roanoke logperch. Further, FERC's reliance on sediment barriers and mulched slopes to support its *not likely to adversely affect* determination for this or any of the other listed or proposed aquatic species is arbitrary and capricious. As the DEIS readily admits, the indirect sedimentation effects analysis has not yet been completed. Furthermore, several site-specific drilling plans have yet to be completed. As such, the DEIS did not fully consider the indirect sedimentation effects of the Project. Without knowing the results of the indirect sedimentation analysis or the particulars of the specific drilling plans involved, FERC can not determine the efficacy of sediment barriers and mulched slopes in protecting aquatic habitat, relative to the amount of sedimentation that is expected to be inflicted on the receiving water bodies. Notably, construction of the MVP mainline has already resulted in severe sedimentation in Roanoke logperch habitat. *See, e.g.*, Letter from Sierra Club *et al.* to U.S. Fish and Wildlife Service requesting stay pending review under CP16-10 (Aug. 12, 2019) (Accession No. These flaws in FERC's analysis render the *not likely to adversely affect* determination and the DEIS arbitrary and capricious. Due to the aforementioned failures of analysis, FERC's DEIS has failed to take a "hard look" at impacts to listed and proposed aquatic species. **C. Freshwater Mussels** Freshwater mussels are some of the most imperiled species in the U.S. According to the FWS website "America's Mussels: Silent Sentinels," no other group of animals is so gravely imperiled. "To put this in perspective, The Nature Conservancy reports that about 70 percent of mussels in North America are extinct or imperiled, compared to 16.5 percent of mammalian species and 14.6 percent of bird species."[116] The James spineymussel is listed as endangered under the ESA. The Atlantic pigtoe is proposed for listing as threatened under the ESA. The DEIS warns of potential turbidity, sedimentation and habitat alteration impacts to mussel habitat in and downstream from the project area. DEIS at 4-92. The proposed Project has the potential to result in significant direct impacts to streams and wetlands from runoff and erosion, and potential contamination of waterbodies through construction activities and leaks or spills of natural gas or other substances (i.e. drilling fluids), with associated impacts to downstream species and communities, including	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
	harm to listed mussels. Freshwater mussels are incredibly susceptible to sediment loading. Studies have shown that "[o]ne of the most ubiquitous factors that may adversely affect mussel populations is excessive sedimentation caused, in part, by poor land-use practices. Excessive sedimentation has been suspected as a cause of unionid mussel declines since the late 1800s."[117] Species in the Project area -- such as the James spinymussel, which has been extirpated from 90% of its historic range -- have experienced a precipitous decline over the past several decades due to development of the region. These species have a very restricted distribution, and are therefore incredibly susceptible to water quality impacts, since they are limited to areas of unpolluted water with clean sand and cobble bottom sediments.[118] FERC has failed to consider the downstream impacts of the proposed activities. These activities have the potential to increase sediment loads not only from stream crossing construction activities, but from the loss of riparian vegetation and upland construction activities, which will lead to increased erosion and sedimentation.	
CO-24k	Excessive amounts of sediments, especially fine particles that wash into streams, can potentially affect mussels through multiple mechanisms. Fine sediments can lodge between coarse grains of the substrate to form a hardpan layer,[119] thereby reducing interstitial flow rates. Silt and clay particles can clog the gills of mussels,[120] interfere with filter feeding,[121] or affect mussels indirectly by reducing the light available for photosynthesis and the production of food items.[122] Much of the region contains ecological communities characterized by thin soils and exposed parent material that result in localized complexes of bare soils and rock, herbaceous and/or shrubby vegetation, and thin, often stunted woods and sparse woodlands with shallow, drought-prone soils. Other areas are characterized by rugged, mountainous terrain with steep hills and ridges dissected by a network of deeply incised valleys. These communities are susceptible to erosion from activities that remove vegetation and disturb soil. Construction activities therefore have the potential to cause substantial sediment discharge into receiving waters that provide habitat for endangered mussels.	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	The DEIS anticipates potential aquatic impacts from the project, including sedimentation, turbidity, drilling fluid spills, collapse of streams, loss of stream bank cover, fuel and chemical spills, water withdrawals and blasting. The DEIS fails to quantify water withdrawal impacts to aquatic species and habitat, and does not quantify blasting impacts to aquatic species and habitat. FERC defends its *not likely to adversely affect* determination with the caveats that Mountain Valley would "attempt to avoid blasting during waterbody crossings," and that it would adhere to a SPCC spill contingency plan that would require 100-foot setbacks for equipment and fuel. DEIS at 4-85, 4-86. However, neither of these caveats provide real assurance that blasting or spill impacts to aquatic habitat will be avoided. Commenters are very concerned by FERC's failure to properly analyze the potential impacts to freshwater mussels. It is clear that FERC does not even have sufficient information on these species, given that the DEIS states that Mountain Valley has yet to file completed mussel population surveys for the project area in Rockingham and Alamance Counties. DEIS at 4-92. It is axiomatic that completed surveys are necessary to undertake the hard look that NEPA requires, as well as to comply with the ESA, yet FERC has made a *not likely to adversely affect* determination for the James spinymussel and Atlantic pigtoe without even knowing where these species may be. Further, FERC's NEPA analysis and *not likely to adversely affect* determination are based on compliance with the HDD contingency plan, whose terms are neither specified, nor considered in detail. *Id.* Lastly, the use of HDD elevates the risk of drilling fluid spills in aquatic habitat for listed species. The DEIS notes an elevated risk of drilling fluid spills near the exit point of the drill for the Dan River and Stony Creek reservoir. DEIS at 4-14. These drilling fluids can be comprised of any number of toxic substances, provided that FERC has approved of those additives' inclusion in the drilling fluid. DEIS at 4-15. Approval of said substances is planned to take place after the publication of the DEIS, rendering the DEIS incapable of considering the full impacts of drilling fluid spills. *Id.* Moreover, inadvertent returns can adversely impact aquatic ecosystems regardless of toxicity. FERC's willful ignorance regarding listed and proposed mussel populations in the Project area, as well as its lack of consideration of the details regarding crucial mitigation measures, amounts to arbitrary and capricious agency action and a failure under NEPA to give a "hard look" at the Project's impacts to listed and sensitive mussel species.	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24k	**D. Smooth Coneflower** The federally-endangered smooth coneflower has been documented in Rockingham County, North Carolina. FERC has acknowledged that the smooth coneflower is vulnerable to removal and crushing by construction-related activities, and to impacts from altered light exposure, altered hydrology, or sedimentation and runoff caused by the Project. DEIS at 4-93. The U.S. Fish and Wildlife Service has recommended population surveys for these plants in the section of the Project area in North Carolina. However, while Mountain Valley has identified 88.3 acres of potential suitable habitat within the Project area, it has not completed these surveys. Without knowledge of where these plants are in the Project area, FERC's *not likely to adversely affect* determination in the DEIS is arbitrary and capricious. Furthermore, for the same reason, FERC's NEPA duties to take a "hard look" at impacts to smooth coneflowers were not fulfilled. **E. Small Whorled Pogonia** The U.S. Fish and Wildlife Service has indicated that the federally-endangered small whorled pogonia may be in the Project area in Rockingham and Alamance Counties, North Carolina. The DEIS indicates that this species is vulnerable to the same impacts listed above for the smooth coneflower. DEIS at 4-92. While Mountain Valley has identified 271 acres of potential suitable habitat in the Project area, it has not completed adequate population surveys for the species. Without knowledge of where these plants are in the Project area, FERC's *not likely to adversely affect* determination in the DEIS is arbitrary and capricious. Furthermore, for the same reason, FERC's NEPA duties to take a "hard look" at impacts to small whorled pogonia were not fulfilled.	See above CO-24k comment response

CO-24	Appalachian Mountain Advocates	
CO-24l	**VI. The DEIS Inflates the Project's Economic Benefits and Understates Its Adverse Impacts** Relying in part on a study that Mountain Valley commissioned from consulting firm FTI, FERC claims that the "Project would result in temporary beneficial impacts on the state and local economics." DEIS at 4-129. That study and FERC's resulting analysis simultaneously overestimate the Project's benefits and ignore or improperly discount its adverse economic impacts to communities affected by the Project. *Id.* at 4-137—4-138. The FTI study's bias towards overestimating economic benefits is inherent in its methodology.[123] The study uses an input-output model called IMPLAN to determine the direct, indirect, and induced economic benefits of the Project. These types of models wrongly assume that all future spending and hiring decisions are made the same way that they have historically been made, such that any additional marginal income generated is assumed to be spent in local communities to the same degree as existing income, despite evidence showing that is not the case in reality.[124] This flaw leads to an overestimate of firm spending and "multiplier effects."[125] Mountain valley's study is further flawed because it uses the entire states of North Carolina and Virginia as its impact area, instead of a more appropriate region that focuses on the local communities that would be affected by the Project. The larger the impact region, the more likely that direct, indirect, or induced spending can happen within it. A much smaller subset region would more appropriately reflect potential benefits to the areas most impacted by the project. For example, "MVP Southgate may be able to buy materials in northern Virginia, over 200 miles away from where the pipeline would be located in southern Virginia, but by including all of Virginia in the impact region, the impact of that spending is still counted as direct spending and then, due to the multiplier effect, counted as additional indirect and induced spending."[126] FERC thus cannot rely on Mountain Valley's claims of economic benefits to support its conclusions.	Section 4.9 provides a discussion of socioeconomic impacts. See responses SOCIO-8, SOCIO-7, and CI-1 in appendix I.2. The cost to ratepayers is outside of the scope of this EIS. The commission will consider rates and may address this in any Order it issues for the Project.

CO-24	Appalachian Mountain Advocates	
CO-24l	Not only does the DEIS rely on inflated projections of the Project's economic benefits, it also ignores or wrongly dismisses its adverse economic impacts. First, it ignores that ratepayers will likely be on the hook for this expensive, unnecessary infrastructure and fails to disclose the socioeconomic impacts of those rate increases. Further, the DEIS fails to account for the loss in ecosystem services that is currently provided by air, water, forest, and other natural resources that will be disturbed or destroyed by Project construction and operation. Such losses were estimated at between $4.12 and $14.8 million per year for the MVP Mainline.[127] Nor does the DEIS account for the economic impacts due to the increase in greenhouse gas emissions caused by the Project, which could be monetized using the Social Cost of Carbon tool. Finally, the DEIS wrongly accepts Mountain Valley's claims that its pipeline would not adversely affect adjacent property values, which claims rely on flawed studies that do not account for importance of pristine, undeveloped character to the value of the type of rural properties that will be primarily impacted by the Project.[128] DEIS 4-126–4-128. These failures undermine the DEIS's conclusions regarding socioeconomic impact and violate NEPA.	See above CO-24l comment response
	CONCLUSION	
CO-24m	For all of the reasons stated above, FERC's DEIS for the Mountain Valley Pipeline Southgate Project does not comply with NEPA. In order to meet the requirements of that statute, FERC must remedy the flaws identified herein and reissue a revised DEIS for review and comment by the public.	See response GEN-4 in appendix I.2.

RE: OEP/DG2E/Gas 3
Mountain Valley Pipeline, LLC.
Southgate Project
Docket No. CP19-14-000

SUBJECT: Request for realignment of Southgate ATWS to avoid impacts to Little Cherrystone property

Introduction to Little Cherrystone

Little Cherrystone is a historic home located near Chatham, in Pittsylvania County, VA which was listed on the National Register of Historic Places in 1969. The portion that remains standing was described in the National Register of Historic Places Inventory-Nomination Form in 1969 as follows:

> . . . a circa 1800, two-story brick structure with gable roof and exterior and chimney. The brick is laid in three-course American bond with queen closers. The nine-over-nine sash windows have thin Federalist muntins, architrave framing and plaster flat arches with double keystones. The fine cornice with its dentils, mutules and guttae are matched by the arched entrance doorway on the east front which uses pilasters, strapwork and pierced detailings. The doorway is unfortunately in a deteriorated condition. A west porch, which until recently also existed in a deteriorated condition, ws removed and replaced by a frame wing. . . . It is in the two rooms of the circa 1800 brick section where the exterior woodwork style is continued. The interior framing of the old entrance doorway, now a window, matches the exterior arch design, but the pilasters have been removed; architrave moldings frame all doors. The south room has a marbleized dado combined with imitation ashlar. The chair rail has a frieze of alternating reeded and fluted panels. The cornice combined a cable design with a corbel motif repeated from the exterior cornice. The mantel consists of twin turned colonnettes on either side of the fireplace with a frieze of three sunbursts above, each of which swells gently outward in a low convex curve. The marbleizing is repeated around the sunbursts, and at either end of the frieze are small lancet arched tabernacles."

The old frame wing of Little Cherrystone was probably on the land when Col. Robert Wooding of Halifax gave to Thomas Hill Wooding "a parcel of land containing 200 acres of Pittsylvania County on the draughts of Great Cherrystone Creek ..." just after the latter was married in 1790. Thomas Wooding, who probably build the brick addition, was commander of his home militia in Pittsylvania in 1806 and served in the House of Delegates between 1799 and 1821.

As a collection of traditional Virginia architectural styles, Little Cherrystone is a valuable example, especially considering the pleasant contrast of size and shape among the various units. Its finely carved and painted woodwork, especially on the interior, is exceptional not only for the South Piedmont area but as an example of provincial Virginia design.

According to a Works Progress Administration of Virginia Historical Inventory published in 1938, the property owner, Col. Thomas H. Wooding was the son of Col. Robert Wooding of Halifax, commandant of Halifax's military forces during the Revolutionary War.

Please see photos of Little Cherrystone in **Attachment 1, Attachment 2,** and **Attachment 3.**

CO-25

Little Cherrystone Manor/Wooding Cemetery/Site 71-36 is mentioned on page 4-166 of the draft EIS as a NRHP-listed property and listed on table 4.10-9, with the recommendation to "avoid or mitigate." In an environmental information request issued by the FERC on October 3, 2019 we asked Mountain Valley to file either an avoidance plan or a treatment plan for Little Cherrystone Manor. In an October 18, 2019 filing, Mountain Valley stated it would be filing an avoidance plan for Little Cherrystone Manor.

CO-25	Blue Ridge Environmental Defense League	
CO-25	***Cemetery and mound at Little Cherrystone*** The Little Cherrystone property includes a family cemetery located about 275 feet southwest of the Little Cherrystone dwelling. Please see photos 2in **Attachments 4 and 5**. According to the same 1938 Works Progress Administration of Virginia Historic Inventory cited above, the cemetery at Little Cherrystone contains the graves of Thomas A. Wooding's son, George, born in 1813, and at least two other relatives, J.B. Wooding, born 1840, and Mary Nat Wooding, born 1849. Adjacent to the stone wall on the western side of the cemetery is a mound. Please see photo of this mound in **Attachment 6**. The mound is potentially significant from an archaeological standpoint in that it may contain unmarked graves, which can commonly be found on the perimeter of rural cemeteries of this era. Additionally, there is potential for the mound to have significance as a Native American burial site. ***Proximity of proposed Southgate pipeline to Little Cherrystone, cemetery, and mound*** The Southgate pipeline has been routed in close proximity to Little Cherrystone, its cemetery, and the mound adjacent to the cemetery. **Attachment 7**, a map of Little Cherrystone and the planned Southgate pipeline, illustrates that the Little Cherrystone structure, its cemetery, and the mound are all contained within the Southgate pipeline's Study Corridor Boundaries. An Additional Temporary Work Space (ATWS) is planned to be constructed and utilized within about 100 feet of the cemetery and 50 feet of the mound. ***Request to FERC*** Little Cherrystone and its accompanying cemetery and mound make important contributions to the history of Pittsylvania County. They offer the visitor a glimpse into the landscapes and architecture of 18th and 19th century Pittsylvania County, an area from which many farmers eventually migrated westward to form settlements in the Blue Ridge region of Virginia and elsewhere. It is very important for us to keep structures like Little Cherrystone and their surrounding landscape features intact, so as to inform future generations of how and where Americans lived in times past. For these reasons, BREDL requests that the edge of the Southgate pipeline's Additional Temporary Work Space (ATWS) be moved a minimum of 500 feet west of its current location, in order to buffer Little Cherrystone and its cemetery and mound from ground disturbances and visual impairment which would likely result during pipeline construction with the current position of the ATWS, as illustrated on **Attachment 7**. Thank you for your prompt attention to this matter.	See above CO-25 comment response

RE: Docket No. CP19-14-000 Draft Environmental Impact Statement for the Mountain Valley Southgate Project

Dear Secretary Bose:

Appalachian Voices and approximately 1,289 supporters, whose names are attached below, respectfully submit the following comments on the Draft Environmental Impact Statement for the proposed Mountain Valley Project Southgate Project:

CO-26a	The MVP Southgate Project is not in the public interest. Not only will it create permanent adverse impacts on the local environment, it will also contribute to several more decades of global climate pollution. Studies show that existing gas infrastructure is more than sufficient to meet regional energy needs for residents and industry. Therefore, the primary beneficiaries of the pipeline will be private companies. This is deeply concerning, given that a Certificate of Public Convenience and Necessity would allow the taking of private property for this project. The Draft Environmental Impact Statement (DEIS) issued by the Federal Energy Regulatory Commission (FERC) fails to provide adequate information for public comment and fails to fully account for all of the environmental threats posed by the MVP Southgate Project.	See response GEN-2 in appendix I.2.
CO-26b		See response GEN-4 in appendix I.2.
CO-26c	Construction of the pipeline is expected to cause heavy erosion and consequent sedimentation of local waterways. The developer has already been cited for numerous water quality violations during the construction of the MVP mainline, so FERC's assumption that the developer will comply with standard water protection measures and uphold water quality standards is misguided, undermining the credibility of the analysis.	See response GEN-6 in appendix I.2.

CO-26	Appalachian Voices	
CO-26d	Erosion and sedimentation is an ongoing concern in the Haw River basin where many of the streams are impaired due to poor aquatic life. Sedimentation, erosion and increases in stormwater velocity, has left many creeks with steep, inaccessible banks, void of healthy aquatic habitat. Cutting forested streamside buffers and wetlands increases the risks of erosion and sedimentation, increasing turbidity levels and impacting aquatic life.	See response SURF-2 in appendix I.2.
CO-26e	Much of the pipeline is in the flood zone of the Haw River, which has seen record flooding the past two years. The volume and velocity of water will be increased with less buffer protection and compacted soils from heavy machinery. The Haw River watershed has extremely variable high flow tendencies. The high and low flow points have not been factored into this review.	See response SURF-7 in appendix I.2.
CO-26f	Adjacent communities already face contaminated drinking water sourced from the Dan River, Haw River and surface water reservoirs. Additional public water supply intakes are located downstream of these stream crossings. Though these intakes are further downstream than the DEIS assessment limit of three miles, many of the contaminants that could impact drinking water quality do not break down, and, therefore, the three-mile limit for downstream impacts is arbitrary and does not provide an accurate assessment of the full scope of impacts.	See response SA-2A-2 in appendix I.3 and response SURF-4 in appendix I.2.
CO-26c	We have seen the work MVP contractors have done on the mainline and have little faith that the requirements of the erosion and sediment control plan will be met at all. Including clauses like "when practicable" leaves too much subjectivity to MVP Southgate contractors. We have seen over 300 water quality and sediment and erosion control violations committed by the same construction teams on the MVP mainline . However, leaving so much subjectivity in what is or what is not practicable allows MVP Southgate to argue that the bare minimum is all that is necessary. This is a sensitive watershed, and this project cannot be completed in a way that prevents serious watershed degradation.	See response GEN-6 in appendix I.2.
CO-26g	Construction of the pipeline would have long-term, permanent impacts to 615 acres of forested uplands, 10 acres of forested wetlands and nearly 12 acres of protected riparian forested lands in the Jordan Lake Watershed. These areas would require decades to recover from the kind of blasting, demolition and construction contemplated for this project.	Comment noted.

CO-26	Appalachian Voices	
CO-26h	FERC is ignoring the significant impacts of this project. The DEIS identifies widespread, permanent impacts like the long-lasting or permanent destruction of hundreds of acres of forests and wetlands, but then says that impacts will not be significant because mitigation measures will be used during construction. Mitigation cannot prevent or repair the significant impacts of permanent forest and wetland destruction. The agency's reliance on mitigation measures to argue that the project will cause no significant impacts is inadequate because many of the mitigation measures proposed are unspecified. In many instances, the DEIS instructs Mountain Valley Pipeline to come up with mitigation measures that are currently not defined. It is disingenuous for FERC to claim that unknown measures will prevent significant environmental impacts.	See response GEN-9 in appendix I.2.
CO-26i	FERC concludes that no significant environmental impacts would be inflicted by this project, yet it lacks the necessary information to assess what the impacts to various environmental resources would be. For example, MVP has yet to provide FERC with its feasibility studies to cross Deep Creek, a site where imperiled aquatic species are suspected to live. FERC acknowledges that MVP will use 5.9 million gallons of water in constructing the project, but MVP has not identified where it will source that water, preventing FERC from assessing the environmental impact of those water withdrawals. Lastly, archaeological surveys have not been completed for the project area, preventing analysis of impacts to cultural resources.	See response SURF-8, SURF-6, and CULT-1 in appendix I.2.

Sincerely,

Tom Cormons, J.D.
Executive Director

Re: Mountain Valley Pipeline, LLC, Docket No. CP19-14-000
Comments of Atlantic Coast Pipeline, LLC on
Draft Environmental Impact Statement for Southgate Project

Dear Ms. Bose:

CO-27a

In accordance with the procedures established in the "Notice of Availability of the Draft Environmental Impact Statement for the Proposed Southgate Project" issued in the above-captioned proceeding on July 26, 2019, the Atlantic Coast Pipeline, LLC (Atlantic) respectfully submits these comments on the draft environmental impact statement (DEIS) prepared by the Commission Staff for the Southgate Project (Southgate or the "Project") proposed by Mountain Valley Pipeline LLC (MVP).

Atlantic limits its comments on the Southgate DEIS to the discussion of System Alternatives provided in DEIS Section 3.3. As explained in the DEIS, "[s]ystem alternatives to the proposed action would make use of existing or other proposed natural gas transmission systems/facilities to meet the stated purpose of the Project. Implementing a system alternative would make it unnecessary to construct all or part of the Project, although some modifications or additions to an existing transmission system/facilities may be necessary."[1] In particular, the discussion of Atlantic Coast Pipeline (ACP) as an alternative to Southgate in DEIS Section 3.3.2.3 is inaccurate.

MVP has explained that the purposes of its Project include: meeting the growing needs of natural gas users in the southeastern U.S.; adding a new gas transmission pipeline to provide competition and to enhance the reliability and resiliency of the existing pipeline infrastructure in North Carolina and southern Virginia; and providing North Carolina and southern Virginia with direct pipeline access to Marcellus and Utica gas supplies.[2] Atlantic is serving these same important purposes with the ACP, an approximately 600-mile, 1.5 Billion Cubic Feet per day (BCF/d), pipeline certificated by the Commission and currently under construction. ACP will begin from the gas supply region in West Virginia, extend through Virginia with a lateral extending east to Chesapeake, Virginia, and then continue south into eastern North Carolina, ending in Robeson County.

See revised section 3.3.2.3 for a discussion of the Atlantic Coast Pipeline Alternative.

CO-27	Atlantic Coast Pipeline	
CO-27a	a precedent agreement for 300,000 Dekatherms per day ("Dth/d") of firm transportation capacity on Southgate. Both MVP and PSNC itself have explained the growing demand for natural gas in North Carolina generally and by PSNC in particular, as well as PSNC's desire for direct access to Marcellus and Utica supplies and for a new pipeline alternative to serve North Carolina.[3] Atlantic fully understands and appreciates these factors, which also help undergird the need for the ACP. Atlantic also readily acknowledges that PSNC has elected to contract with MVP for the incremental transportation capacity of the Project, and Atlantic does not question that decision here. Furthermore, Atlantic does not contend or believe that the Commission should "look behind" precedent agreements to judge a pipeline customer's decision. Nevertheless, the alternative of ACP should not be dismissed based on incorrect assumptions as was done in the DEIS. The DEIS recognized the under-construction ACP project as a potential system alternative, stating that the ACP route is approximately 100 miles east of Southgate's proposed delivery points at the Dan River (in Rockingham County, North Carolina) and the Haw River (in Alamance County, North Carolina).[4] Based on that location, the DEIS asserted that "a minimum of 100 miles of new pipeline and compression infrastructure would be required to modify the ACP Project to serve as an alternative to the Project."[5] And, *for that reason alone*, the DEIS concluded that ACP would not provide a significant environmental advantage to the Project and did not warrant any further study.[6] Staff should ***not*** assume when considering ACP as an alternative to Southgate that ACP would deliver gas to PSNC at the same delivery points proposed by MVP. The ACP route is close to the *eastern* side of PSNC's service area whereas the planned Southgate delivery points are to the west of that service territory.[7] Furthermore, Atlantic has leased capacity on the Piedmont system (as approved in the ACP certificate order) in Johnson County, North Carolina that can be used to transport gas from ACP directly to the PSNC system near Clayton, North Carolina.[8] Deliveries from ACP to PSNC would be on that side of the PSNC service territory (near the heart of its demand growth). There would be no need for ACP to construct a pipeline across the PSNC territory to make deliveries to the west where Southgate would be located – as is incorrectly assumed in the DEIS. Indeed, ACP could offer more effective infrastructure support for the areas of PSNC that are projected to experience demand growth, and better supply support for the PSNC system overall. Notably, Raleigh, one of PSNC's largest and fastest growing markets,[9] is only about 30 miles from the ACP route, and even closer to Clayton (the end-point of ACP's capacity leased on Piedmont). Additionally, with its location to the east side of the PSNC territory, ACP would provide greater geographical diversity (with the resulting reliability and resiliency benefits) compared to the existing Transcontinental Gas Pipe Line and Southgate route, which are in the similar vicinity to the west of the PSNC territory. Furthermore, the ACP alternative provides for direct access to Marcellus and Utica gas supplies in the most liquid natural production areas in the northeast and to Dominion Southpoint, a very active virtual trading hub.	See response CO-27a above

CO-27	Atlantic Coast Pipeline	
CO-27a	The DEIS states, at Section 3.3.1, that ACP and other potential pipeline alternatives do not have the capacity to individually or combined meet the needs served by the Project. Yet, Atlantic has available capacity of as much as 140,000 Dth/d of its own to serve PSNC's needs beyond the quantities already subscribed on ACP by PSNC. Additional gas demand for PSNC could be accommodated through limited ancillary facility enhancements on ACP which likely would be less environmentally impactful than the new facilities proposed for the Southgate Project. If it were necessary, the existing Piedmont infrastructure leased by Atlantic also could be upgraded as needed to transport additional volumes from APC to the PSNC system – which also could require less intrastate facility construction (and accompanying environmental impacts) than what may be necessary to transport gas from the proposed Southgate delivery points further downstream to the areas where needed by PSNC. The DEIS simply fails to consider any of these factors bearing on the reasonableness of ACP as an alternative to the Southgate project. Accordingly, Atlantic is filing these comments to correct for the record the viability of ACP as an alternative for the Project.	See response CO-27a above

RE: Federal Energy Regulatory Commission Draft Environmental Impact Statement for OEP/DG2E/Gas 3 Mountain Valley Pipeline, LLC Southgate Project (FERC/EIS0297D; FERC Docket Number CP19-14-000.

Dear Secretary Bose:

In response to FERC's draft Environmental Impact Statement for the MVP Southgate project Appalachian Voices engaged Dr. Pamela C. Dodds, Licensed Professional Geologist, to prepare a Hydrogeological Assessment of the Mountain Valley Pipeline Southgate Project's expected construction impacts in Virginia and North Carolina.

This report provides details and comments concerning the adverse impacts to streams and wetlands, the highlights of which are summarized here:

1. Deforestation, soil compaction, and dewatering will result in increased peak stormwater discharge, which will transport sediment to receiving streams and will cause increased downstream stream bank erosion.

2. Pre- and post-construction peak stormwater discharge calculations were not presented in the DEIS in order to evaluate the increase in peak stormwater discharge as it impacts stream bed scour and downstream stream bank erosion.

3. The minimal Best Management Practices selected by the agency will allow the transport of sediment to receiving streams, thereby degrading and destroying aquatic habitats.

CO-28a	See response SURF-2 in appendix I.2. As indicated in Table 4.13-2 of the EIS, Project construction would affect no more than 0.3 percent of any HUC-10 watershed affected by the Project. Additionally, as described in the EIS, Mountain Valley would decompact soils and revegetate areas after construction is complete. Due to the relatively small footprint of the Project and due to Mountain Valley's proposed erosion control measures, as well as measures to return areas to pre-construction condition, we determined that there would not likely be a discernable effect on peak storm water discharge.
CO-28b	See response SURF-2 in appendix I.2.

CO-28	Appalachian Voices	
CO-28c	4. Headwater areas and associated seeps and wetlands will be deforested, compacted, and dewatered, thereby destroying aquatic habitats at the base of the food chain for the river continuum.	The EIS includes an analysis of all water features affected by the Project, including wetlands (Section 4.3 and 4.4 of the EIS). No seeps were found in the Project area. Mountain Valley would follow its Plan and Procedures and E&SCP to minimize impacts on sensitive water features and aquatic habitat. The EIS discusses impacts on less mobile species, noting that there is a chance that some will be killed. However, the footprint of the Project is not large enough to have a significant impact on the food chain for the river continuum. Mountain Valley would return all areas to pre-construction condition thereby allowing aquatic habitats to recover shortly after construction.
	5. Numerous headwater areas and tributaries to specific larger streams will cumulatively impact the larger streams.	See response SURF-4 in appendix I.2.
CO-28d	In addition, the report provides details concerning the deficient and dismissive discussion of earthquake activity and soil liquefaction, as well as release of Lead-210 (radioactive) and Lead-206 (toxic) to the atmosphere during gas venting (blowdown events) for maintenance and resulting from cleaning the pipe interior with "pigs" (devices used to clean gas pipelines). You can find these conclusions and further research in the report attached.	Earthquakes and soil liquefaction are discussed in section 4.1.4 in the EIS.
CO-28e	Thank you for the opportunity to comment on this important matter. Sincerely,  Peter Anderson, Virginia Program Manager Appalachian Voices 812 E. High Street Charlottesville, VA 22903	Radon can be entrained in fossil fuels and decay into isotopes such as Lead-210 and Lead-206, which could form a thin coat on the interior of the pipeline. If the replacement or removal of portion of the pipeline or equipment should take place during maintenance, the pipeline company must comply with the Resource Conservation and Recovery Act (RCRA) to ensure that high levels of contaminants (including lead) are not disposed of improperly. In addition, cleaning "pigs" used to remove solid and liquid materials from the pipeline would be disposed of properly in compliance with the RCRA and state laws.

Attention: Ms. Kimberly D. Bose, Secretary

Reference: Mountain Valley Pipeline, LLC
Southgate Project
Docket No. CP19-14-000
Comments on Draft Environmental Impact Statement

Ladies and Gentlemen:

Transcontinental Gas Pipe Line Company, LLC (Transco) is pleased to provide the following information to assist in the Federal Energy Regulatory Commission's (Commission) review of potential alternatives to the Mountain Valley Pipeline (MVP) Southgate Project as part of its environmental review process under the National Environmental Policy Act. As described below, Transco most certainly would be able to meet the market needs of the Southgate Project with significantly less environmental impact, lower cost, and greater security and resiliency than as proposed by MVP.

CO-29a	The Commission's Draft Environmental Impact Statement (DEIS) issued in the referenced proceeding states that to meet the purpose of the Southgate Project using the Transco pipeline system, "major system modifications similar to the proposed Project would be necessary," including "approximately 40 miles of new pipeline from the Transco pipeline system to the T-21 Haw River Interconnect, mainline pipeline upgrades to the Transco pipeline system, and additional compression." The DEIS concludes that these modifications would result in environmental impacts "similar" to those that would occur as proposed by the Southgate Project, and that, therefore, a Transco alternative "would not provide a significant environmental advantage." As shown below, the DEIS has missed the mark with regard to the configuration of a Transco alternative that would provide the same firm transportation service as the Southgate Project and, accordingly, the Commission has completely overlooked the advantages that a Transco alternative would have over the Southgate Project.	See section 3.3.2.1 of the EIS for a discussion of the Transco Pipeline System Alternative.

CO-29	Transcontinental Gas Pipeline Company, LLC	
CO-29a	For the Southgate Project, MVP requests authorization to construct and operate new pipeline facilities that would provide 375,000 dt per day of new pipeline capacity from Pittsylvania County, Virginia to delivery points with Dominion Energy (formerly Public Service Company of North Carolina, Inc., a long-time customer of Transco) (PSNC) in Rockingham County, North Carolina and Alamance County, North Carolina. The Southgate Project will involve the construction of 73 miles of new, greenfield pipeline, three new greenfield interconnect facilities, and a new greenfield 29,000 horsepower compressor station in order to provide such capacity to PSNC. While the firm transportation capacity of Transco's system is currently fully subscribed, given the efficient expandability of the Transco pipeline system and the integrated operations of the Transco system with its intrastate affiliate in North Carolina, Cardinal Pipeline, Transco would be able to expand and extend its system following the existing Cardinal Pipeline right-of-way in a significantly less impactful manner than MVP Southgate. Specifically, to provide the same capacity to PSNC as being proposed by MVP, Transco would need only to install a 37.7-mile pipeline lateral, which would follow the existing Cardinal Pipeline right-of-way, and perform only *minor* modifications to *existing* compression at Transco's Compressor Station 160 in Rockingham County, North Carolina. This Transco alternative would completely eliminate the need for MVP to construct its Southgate Project, which is comprised entirely of greenfield pipeline and compression facilities, including a greenfield compressor station in Pittsylvania County, Virginia, and would thus represent a substantial reduction in required facilities and land use. And, because Transco would require no new compression, this solution would help ensure that emissions from gas-driven compression in Pittsylvania County would not be increased. Also, inasmuch as the Transco alternative could be constructed entirely within existing right-of-way and by expanding existing facilities, it would significantly reduce costs to the shippers and their customers. While MVP is proposing a recourse rate for firm transportation service consisting of a monthly reservation rate of $18.7659 per dt, Transco, in stark contrast, estimates that its monthly reservation recourse rate would be at least 40% lower, a major savings for ratepayers.[1] The Transco alternative would provide shippers with the reliability of Transco's multi-line mainline system (up to six loops in parts of our system), numerous compressor stations that are generally designed to provide bi-directional flows, and approximately 200 Bcf of directly connected operating gas storage. In contrast, the Southgate Project would only consist of a single line and one compressor station, which would not have the flexibility or reliability that Transco's system offers.	See response CO-29a above

CO-30	Virginia Forest Conservation Group

Mitigation Recommendations for Impacts of the proposed Southgate Extension of the Mountain Valley Pipeline on Virginia's Forests

developed and presented by

The Virginia Forest Conservation Partnership

26 March 2019

This is a review of the proposed Southgate extension of the Mountain Valley Pipeline (MVP Southgate) for forest fragmentation impacts, conducted by the Virginia Forest Conservation Partnership (VFCP) using the spatial representation provided by the developer's consultant, EQT Corporation, in a compressed file named "Frozen_08202018_Proposed_Route.zip." The Virginia portion of MVP Southgate is entirely within Pittsylvania County (Figure 1). The VFCP, instituted by the Virginia Secretary of

CO-30a

Figure 1. Location of the proposed MVP Southgate project in Virginia.

Natural Resources is comprised of Virginia state agency representatives and subject matter experts from the Department of Conservation and Recreation (DCR), the Department of Forestry, the Department of Game and Inland Fisheries, and the Department of Environmental Quality. This review assesses and quantifies both direct and indirect impacts of the proposed construction to forests, and provides recommendations to specifically address these impacts with long-term compensatory mitigation approaches, by comparing the proposed MVP Southgate route to features identified by the 2017 Virginia Natural Landscape Assessment (VaNLA 2017) (Figure 2). VaNLA 2017 identifies, classifies, and ranks all existing "Ecological Cores" (≥100-interior-acre forest patches) and smaller non-core (10-99-interior-acre forest patches) "Habitat Fragments" in Virginia based on several key indicators of biodiversity and ecological functions of forests. For more detail on VaNLA 2017, see http://www.dcr.virginia.gov/natural-heritage/vaconvisvnla.

Section 4.5.4.3 of the EIS discusses impacts related to forest fragmentation. This section has been updated with additional analysis on forest fragmentation. In addition, Mountain Valley has committed to minimizing impacts on forest land and continues to coordinate with VADCR on tree clearing mitigation prior to clearing trees.

CO-30	Virginia Forest Conservation Group	
CO-30a	Figure 2. Ecological Cores and Habitat Fragments from the VaNLA 2017 with the proposed MVP Southgate project route.  This review employs the same methodology used to assess forest fragmentation impacts of the main route of the MVP (i.e. the 303-mile span from northwestern West Virginia to southern Virginia). This method addresses both direct and indirect impacts by calculating forest lost, even if only temporary, as well as loss of integrity of core forest due to fragmentation that reduces interior area, increases perimeter, and/or decreases the depth of core forest. For background information and methodology specifics, see this document on the Federal Energy Regulatory Commission (FERC) docket: "Commonwealth of Virginia Department of Conservation and Recreation comments on MVP FEIS and Forest Fragmentation Impacts and Mitigation Recommendations of Virginia State Agency Staff under CP16-10" (http://elibrary.FERC.gov/idmws/file_list.asp?accession_num=20170721-5183).	See response CO-30a above

CO-30	Virginia Forest Conservation Group	
CO-30a	The proposed route of MVP Southgate aligns with an existing utility corridor in Virginia, thus, significantly minimizing potential forest impacts. The VFCP recognizes colocation as an important consideration for minimizing forest impacts. **Results** A total of 15 Ecological Cores and Habitat Fragments would be impacted by the proposed MVP Southgate project. Tables 1 and 2 summarize these features by type and rank. Table 1. Summary by type of Ecological Cores or Habitat Fragments impacted by MVP Southgate. **Type** / **Count** / **Acres** Non-Core Forest / 11 / 1,318.6 Small-sized Core Forest / 3 / 985.9 Medium-sized Core Forest / 1 / 1,516.9 Table 2. Summary by rank of Ecological Cores or Habitat Fragments impacted by MVP Southgate. **Ecological Integrity Rank** / **Count** / **Acres** C4 / 3 / 2,177.6 C5 / 12 / 1,643.7 The raw impact totals were calculated for each of the 15 Ecological Cores and Habitat Fragments intersected by MVP Southgate (Table 3). Note that indirect impacts were not estimated for Habitat Fragments because they do not qualify as cores due to insufficient interior area. Direct and indirect impacts were also separated based on the ecological integrity of the intersected cores; C1-Outstanding and C2-Very High ranked cores were treated separately than cores ranked C3, C4 and C5, to allow mitigation ratios and mitigation activities to account for the fact that some forest cores would receive disproportionately greater impacts due to having greater ecological integrity.	See response CO-30a above

CO-30	Virginia Forest Conservation Group	
CO-30a	Table 3. Raw impact summary showing direct and indirect impacts to forests by MVP Southgate. **Direct Impact Acres** / **Indirect Impact Acres** **C1 and C2 Cores**: 0 / 0 **C2 – C5 Cores**: 13.7 / 198.4 **Habitat Fragments**: 24.1 / n/a **Total**: 37.8 / 198.4 The DCR comments on the FERC docket describe three mitigation activities, their rates of implementation, and specific mitigation ratios as recommended by the VFCP for forest fragmentation impacts of the MVP. These mitigation activities are afforestation, avoided deforestation, and forest enhancement. Stated simply, afforestation is the conversion of open land to forest by planting trees, avoided deforestation is permanent protection of forestland from conversion, and enhancement is implementation of forest management to improve ecological integrity. A different ratio of mitigation acres to impact acres was identified for each of these mitigation activities, as were different rates of implementation, to ensure mitigation results in effective conservation. Separate mitigation ratios were developed to specifically account for the impacts to C1 and C2 cores; C3-C5 cores, and Habitat Fragments. Full descriptions of mitigation activities and their rates, and justifications for mitigation ratios, are provided in the DCR Comments on the FERC docket. Tables 4 and 5 summarize the mitigation activities, their ratios, and their rates of implementation, and Table 6 summarizes the recommended total mitigation acreage broken down by activity. The VFCP recommends a total of 472 acres of land be identified, placed under permanent conservation, managed, and protected as core forest as mitigation for MVP Southgate.	See response CO-30a above

CO-30 Virginia Forest Conservation Group

See response CO-30a above

CO-37	Mr. Joyner - Danville Historical Society	
CO-37a	MR. JOYNER: Since this is indeed a draft EIS, or whatever, there are a couple of issues that I have. As President of the Danville Historical Society, the historical society has never been contacted by MVP, Precision or EQT. They contacted the City of Danville and Pittsylvania Historical Society, but since it goes through the Danville region, they never contacted Danville Historical Society for comments on this. That's the first thing.	In an October 18, 2019 filing, Mountain Valley indicated that it would provide the Danville Historical Society with copies of cultural resources investigations reports covering the Project APE in Pittsylvania County, Virginia.
CO-37b	And then the second issue is--there are many issues, but I'm just gonna go over a few of them--this is, at the very beginning stages of this, there is a state and national historical property that is listed on both of them, right here in the very beginning, and it's all lays with inside of the LOD. There is a cemetery sitting right here that also has a Native American Indian ground outside of the cemetery, but it butts up to the cemetery, as well as a 1790s house right here that is affected by the LOD that's on both State and National Register of Historic Properties. So there's gonna have to be a route adjustment. They're not gonna be able to deal with this cemetery, period. Because, especially with a Native American Indian burial ground being there. And with it being inside of the t no construction workers can approach it, interpret it, sit in it, sit on the stone wall, protraction to it, etcetera, etcetera, to keep it monitored. And so that's one of the big issues right there is this historic property through here.	Little Cherrystone Manor/Wooding Cemetery/Site 71-36 is mentioned on page 4-166 of the DEIS as a NRHP-listed property and listed on table 4.10-9, with the recommendation to "avoid or mitigate." In an environmental information request issued by the FERC on October 3, 2019 we asked Mountain Valley to file either an avoidance plan or a treatment plan for Little Cherrystone Manor. In an October 18, 2019 filing, Mountain Valley stated it would be filing an avoidance plan for Little Cherrystone Manor.

CO-37	Mr. Joyner - Danville Historical Society	
CO-37c	Now, one of the other things is, is that here at Lambert station 165 is being abandoned. They're building their new substation back here behind it for the interconnect to come through. They must indeed, even though they've been given a carte blanche angle on "no special-use" permits to build lines, but the compressor station to go down to Burlington, North Carolina, requires a special-use permit through County of Pittsylvania. I mean that is just an absolute requirement.	Mountain Valley would be required to comply with all federal and federally-delegated permits. These permits along with other state and local permits are identified in table 1.4-1.
CO-37d	But we also have a secondary historic site. Other than Little Cherrystone, which is zero feet in distance away from the pipeline, we have Mountain View is another historic, 1790s home, finished and completed in 1840, and that's also in the Chatham District on Route 29, zero distance. So it's gonna affect both of these.	Historical architectural site 71-25 (Mountain View Manor) was recorded during surveys conducted by TRC for Mountain Valley between September 2018 and June 2019 (Karpynec, September 2019). It was noted as listed on the NRHP. We have revised the FEIS to reflect this new information.
CO-37e	And in the EIS, with their archeological information, whatever, is they've listed a few of the archeological sites, but they've given no indication as to any of their findings, any of their attempts to what their findings are, even though usually they consider that as what's the word, not private, but, having a brain issue	See response CO-37a.

CO-37	Mr. Joyner - Danville Historical Society	
CO-37e	here--exclusive information, no. Help me with the word. Proprietary information, to not release any of the archeological data and information. But the EIS doesn't even cover that other than these two pages of archeology in the State of Virginia to North Carolina. And that's all it is. And it doesn't tell us anything about any of the information or the sites in which then noted as prehistoric, historic, contact, post-contact, any kind of that information. And so then, just to show you--let's see, right here, that Little Cherrystone, this is through all of y'all's paperwork. Cherrystone, oh, there it is. That even in your EIS, it shows that it is already listed for both national and Virginia State historic properties. And so that requires a route adjustment to go around this historic site. And there is no route adjustment planned at this time to go around this historic location. So there's gonna be a lot of argumentation, a lot of fight against Southgate and MVP with EQT about going through this piece of property, as well as the property directly across the street here. This land owner has specifically been told they're only going to remove one fence post to allow their vehicles to come into the property, because it's fenced at both of these road accesses. And that is absolutely not	See response CO-37a.
CO-37f		See above for response in CO-37b.
CO-37g		See response LU-1 in appendix I.2.

CO-37	Mr. Joyner - Danville Historical Society	
CO-37h	along with these two additional work spaces, but this is also a Native American village site through here. And our archeological company's already been able to verify this information by doing our own study out there that we've been studying now for twelve years, as well as Native American Indian over here. So the suggested route adjustment is, from this shortest property, is that is out of the interconnect station, the compressor station that the pipeline needs to come around this way, and at one time, they were considering that, but they have, for some reason, abandoned that idea of doing a route adjustment to go away from this historic property. So the state's gonna be arguing that against MVP and EQT, also in a legal format, about protecting this particular site, because this is one of the oldest standing homes in Pittsylvania County. And then, of course, other than that, there's also the endangered species, and you know, you're gonna hear a lot of that tonight. But those are mainly my main issues that I have with Southgate, other than also the compressor station.	See response CO-37a.
CO-37i		See response T&E-3 in the appendix I.2.

CO-37	Mr. Joyner - Danville Historical Society	
CO-37j	The 155 acres that was purchased back here, there is also an additional old home site, there is an additional home site sitting right back in here, so with the 155 acres purchased, whatever, we're not sure how this new compressor station -- because we know the main line's gonna have an interconnect into Transco and then a substation, compressor station going down to Burlington, North Carolina, to pressurize it till it gets to the first main valve compressor. So we're concerned about this whole track of land back through here. It's just gonna have to go around it. And other than that, I'm not one of these jump up and down and wear the badges and get out there with a sign protesting. There are proper ways to go through these channels to deal with the EIS. Now, since this is just the draft EIS, when are they gonna come back with the final EIS? Do you have any kind of recommended date on that?	See response LU-1 in appendix I.2. This site is listed in appendix E.2 and has been purchased by Mountain Valley for use during construction.
CO-37k		Response to comments are incorporated into the FEIS.
CO-37l	Another major concern is the use of Precision Pipeline doing the construction and building of the Southgate line. It's obvious that they've already created such a havoc with the main line with over 300 violations, lot of water issues, game and wildlife issues, endangered species, that Precision Pipeline has always had a very bad reputation in doing pipeline construction. And they've already had so many violations with the main line that we're concerned that they're gonna continue to do so with the Southgate line. Because one of the first rivers that they're gonna cross is our Banister River, and that is registered as a scenic waterway, and they're gonna have to cross that twice to get even through our county.	See response GEN-6 in appendix I-1
CO-37m		Section 4.3.2 of the EIS discusses the Project's impacts on surface water resources

CO-38	Sojna Ingram: Preservation Virginia	
CO-38a	MS. INGRAM: I'm Sonja Ingram, and I work for Preservation Virginia. I'm concerned mostly about the historic resources along the route. One thing I wanted to mention is that I submitted a letter back several months ago, but I never received any response, and I don't know if that's typical, but I did wanna mention that. And another thing is, usually, Preservation Virginia, since we're the statewide non-profit and we filled out all the appropriate documents, we usually receive the archeological reports, but I haven't received any for the Southgate Pipeline, so I'd like to get those. One of the reasons is, I was reading the draft	In an October 18, 2019 filing, Mountain Valley indicated that it would provide Preservation Virginia with copies of cultural resources investigations reports covering the Project APE in Pittsylvania County, Virginia.
CO-38b	EIS and I saw there's a lot of comments back and forth between the archeology firm and DHR, but usually we are in those comments. We have an opportunity to comment on that as well. There's some sites that I noticed that were previously identified, but the archeologists have not relocated them this time.	In section 4.10.4 of the DEIS, we acknowledge that the entire pipeline route has not yet been completely inventoried for cultural resources, and recommend that the Commission Order authorizing the Project contain an environmental condition that construction may not begin until after all archaeological surveys have been completed and reviewed, and we have completed the process of compliance with the NHPA
CO38c	And another thing that I wanted to mention is there's a few really important historic resources. One is Little Cherrystone, and this is a historic house, it's one of the earliest houses in Pittsylvania County. There's a cemetery next to it, and according to the maps, it shows that the pipeline right away is very close to that house and the cemetery.	See response CO-25

CO-38	Sojna Ingram: Preservation Virginia	
CO-38c	There's also -- I know that there was a historic scatter of artifacts recovered at one point, and I don't know if that was in relation to this pipeline or to maybe the previous Williams Pipeline, but that whole area out there is so historic, and it's just the pipeline is going way too close to it. I mean the cemetery probably has more burials outside of it. There's a stonewall and also a little metal iron wall, but there's probably more graves on the outside of those walls. And there's also this really odd little mound just beside of that cemetery that I'm just curious about it. It could be where they had just piled up soil when they were digging graves, but it also looks similar to Native American mounds that I've seen in the past. So that particular site and also Mountain View, which is also another historic plantation. It's very close to that. These are some of the ones that have stood out, just from looking at the draft EIS, but like I said, I haven't had a chance to look at the archeological reports to be able to really see what was recovered and comment on those in detail. So I will be submitting the written comments, but I do wanna get those reports, too, and that's about it.	See response CO-25
CO-38d		See response CO-37d
CO-38e		See response CO-38a.

CO-39	Deep Creek Church

United States of America
Federal Energy Regulatory Commission

Attention: Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

RE: Southgate Project Mountain Valley Pipeline, LLC.
Docket No. CP19-14-000

Date: August 22, 2019

Mountain Valley has requested authorization to construct and operate approximately 73 miles of natural gas transmission pipeline, one new compressor station, and accompanying facilities, which will environmentally affect Deep Creek Church and Cemetery located in Alamance County, North Carolina.

Deep Creek Church and Cemetery offers the following comments concerns on the above-referenced docket environmental impact statement (EIS).

a. That the Deep Creek Church and Cemetery burial site remains intact and undisturbed by said Mountain Valley pipeline.
b. That future burial(s) be unimpeded by said Mountain Valley pipeline.
c. That future upkeep of the Deep Creek Church and Cemetery be unimpeded by said Mountain Valley pipeline.
d. That access to Deep Creek Church and Cemetery be unimpeded by said Mountain Valley pipeline.
e. That clear signage specify demarc between Deep Creek Church, Cemetery, and the Mountain Valley pipeline.
f. That Mountain Valley Pipeline, LLC. SHALL be fiscally responsible for any and all damage caused by the installation, the maintenance, and the transmission of said Mountain Valley Pipeline.
g. That Deep Creek Church and Cemetery receive fiscal compensation for loss of land, building structure, procuring proper demarc signage/fencing, and restoration of landscaping from Mountain Valley pipeline LLC.

Sincerely,

Crystal D. Chandler
Deep Creek Church and Cemetery
Alamance County, NC
336.253.5518

CO-39a	An avoidance plan for the Deep Creek Primitive Baptist Church and Cemetery was filed by Mountain Valley on October 23, 2019.

IND-3	Janek Patel	
	Janak Patel, Haw River, NC. Dear Secretary;	
IND-3a	I am a lodging business(Days Inn) owner of land located at 1370 Truby Drive, Haw River,NC 27258 which is off Jimmie Kerr road. Based on my understanding from FERC/EIS-0297D Truby drive dead ends to within 400 to 500 feet from proposed gas line. Being a hotel having entrance on this road and line near the hotel I am seeking more details of this project. 1) what kind of environmental impact to hotel	Access roads are discussed in sections 2.3.5 and 4.8.1.4 of the EIS. At the location off Jimmy Kerr Road, Truby Drive is an existing paved road and no improvements are anticipated. Limited and temporary noise and traffic impacts may result from the use of this access road during construction.
IND-3b	2) the exact scope of construction plan	Section 2.0 details the construction methods of the Project. Alignment sheets showing the construction plan in this area are available on the FERC elibrary using accession number 20191220-5298.
IND-3c	3)Use of Truby drive during construction	Truby Drive would be used by Mountain Valley to access temporary access road TA-AL-188.
IND-3d	4)Traffic and access impact to hotel	Traffic impacts and management are discussed in section 4.9.4 of the EIS.
IND-3e	5)Noise impact to hotel guest.	Noise impacts are discussed in section 4.11.2.3 of the EIS. There would be limited, temporary noise impact to hotel as the use of nearby roadways are likely, but the use would be temporary and limited to a few days as the work is accomplished in a given area and then moves elsewhere. Any work outside the hours of 7am to 7pm, or sunrise to sunset in non-residential areas, other than low noise generating activities would require approval from FERC.

IND-4	David Hill	

8/16/2019

FERC
MVP Southgate Project DEIS
Docket # CP19-14-000

Dear Sir or Madam:

IND-4a	I would like to comment on the MVP Southgate Project DEIS. My family and I live in Alamance County, NC and our access to drinking water is from a well located on our property. We live 1.5 miles from the Haw River and 9 miles south of the proposed terminus of the MVP Southgate pipeline. The DEIS summary states that the Project will have limited adverse environmental impacts. I totally disagree with this and it is false.	Comment noted.
IND-4b	The DEIS states that there would only be temporary or localized surface water impacts. I disagree with this and it is false. The crossing of 7.1 miles of protected watersheds and 1.5 miles of critical watersheds, within the last 20 miles of the project, endangers those watersheds. The crossing of 161 water bodies within NC is an example of the broad potential for permanent negative impacts along the Project route. The HDD crossings of major water bodies carries the risk of IR's with them.	Section 4.3.2 of the EIS discusses surface waters, watersheds, and floodplains. Section 4.3.2.7 of the EIS discusses Mountain Valley's impacts of blasting and the mitigation efforts needed if there are negative effects in the project area. Section 4.1.4.4 of the EIS discusses the potential of landslides occurring with project operations and how Mountain Valley will minimize the chances of a landslide occurring.
IND-4c	Just within the last 4 miles of the Project, there are numerous examples of potential serious, permanent surface water impacts. The last 4 miles are within ¼ mile of the Haw River. There are 5 workspaces within 50 feet of the River, including 2 at Mile Posts (MP) 70 & 73 right on the River. There are 23 crossings of tributaries of the Haw. There are 3 points where the Project is within 15 feet of the Haw. There are 7 sites of landslide concern, including MP 72.7 (52 feet from the Haw). There are 5 potential blasting sites. There are 30 sites listed as steep slopes. All of these instances are capable of causing adverse, permanent damage to the Haw River, associated tributaries, and associated groundwater.	Section 4.3.1 includes a detailed discussion of the potential impacts that construction and operation of the Project could have on groundwater resources, including aquifers.
IND-4d	The DEIS states that there would be no significant groundwater impacts. I disagree with this. The water quality of the Haw River directly affects nearby aquifers. This project would permanently damage the waters of the Haw River, and permanently damage aquifers close to the Haw River. The Project is a direct threat to the aquifer that supplies drinking water for my family.	See response SURF-7 in appendix I.2.

IND-4	David Hill	
IND-4e	With the last 4 miles of the Project, it crosses a 100 year flood plain of the Haw River. Six of the last 26 greatest recorded high water crests of the Haw River happened in 2018 alone. Major flooding of this area would devastate the pipeline, including the T-21 Interconnect and Project terminus. Right of way maintenance will use herbicides to control vegetation. These would be a potential source of toxic pollution of nearby waterways and harm to nearby citizens. There are reports that the epoxy coating used on the pipeline is very toxic.	Mountain Valley's Plan does not allow the use of herbicides within 100 feet of a wetland or waterbody except as allowed by the appropriate land management or state agency. As part of Mountain Valley's *Exotic and Invasive Plant Species Control Plan* , If specified for use by federal or state agencies near streams or wetlands, the Project will utilize herbicide applications approved for aquatic use.
IND-4f		Fusion bonded epoxy (FBE) coatings have been in use for over 50 years and have been the subject of numerous scientific studies. Epoxy coatings have undergone NSF/ANSI 61 toxicological review process and been certified for use in applications that bring them into contact with drinking water. Therefore, FBE coatings do not present a risk to human health, including when the pipe coating is exposed to groundwater that may serve as a source of drinking water.
IND-4g	The DEIS states that there would be no significant impact of the Project on property values and insurance of neighboring citizens. This is false. Construction and permanent maintenance of a pipeline owned by major corporations next door to a home will cause a significant lowering of the property values and increase the cost and availability of property insurance.	See response SOCIO-1 in appendix I.2.
IND-4h	The DEIS states that public safety of neighboring citizens would not be affected. I disagree. The County Commissioners of Alamance County, NC are opposed to the project. One of their concerns was that local volunteer fire departments would not have the resources to deal with a pipeline fire. Leaks and fires have happened with major pipelines of this nature.	See response SAFE-3 in appendix I.2.
IND-4i	The MVP pipeline in West Virginia and Virginia has had constant environmental violations during construction there. In April 2019, MVP paid over $250,000 in fines for erosion and water contamination violations in West Virginia (20 notices). The Virginia Attorney General has sued MVP for over 300 water quality violations in Virginia. A pipeline contractor, Precision Pipeline, has had repeated violations and has been fined millions of dollars. Five major construction permits for work in Virginia have been suspended since work began. The NC Department of Environmental Quality denied recently denied a water quality permit for MVP Southgate and also previously stated that there was no public need for the Project.	See response GEN-6 in appendix I.2.

IND-4	David Hill	
IND-4j	The DEIS omits a No Action Alternative. This seems to be counterintuitive to the NEPA process. The No Action Alternative is that the Project is not built.	See response ALT-1 in appendix I.2.
IND-4k	The Project will help create and maintain a market for fracked natural gas. Fracking is source of major air and water pollution where it occurs. Methane is a major cause of global climate change. The MVP Southgate Project would have many serious and permanent environmental impacts on any and all citizens and communities associated with the Project. The Project is a direct environmental threat to associated citizens and communities. This Project would have negative environmental impacts on my family. The Project should not be built.	The evaluation of the market for fracked natural gas, including induced production, is outside of the scope of the EIS. Those activities are regulated by individual states. Section 4.11 of the EIS discusses methane emissions. See response CI-1 in appendix I.2 regarding climate change.
IND-4l	Thank you very much. David Hill Graham, NC	See response GEN-1 in appendix I-2.

IND-8	Eleanor Amidon	
	Eleanor M. Amidon, Afton, VA. Like a big Swiss cheese, the Southgate DEIS is riddled with holes. The gaps in content and conditional statements are red flags identifying areas where a lot more analysis is needed. The following significant shortcomings and omissions need to be rectified and made public for a period of comment before finalizing the EIS. proposed HDD crossings	
IND-8a	The preliminary work on evaluating the proposed Dan River HDD crossing is exactly that: preliminary. Based on two geotechnical borings, the current design is deemed "feasible." (See DEIS, page 4-14.) However, ideally, borings should be spaced approximately every 500 feet. (See https://www.geoengineers.com/wp-content/uploads/2018/02/6H-The-HDD-Evaluation-and-Design-Process-Notes-1.pdf) Since the proposed Dan River HDD would be 2,523 feet, there should be three more borings, and the results of those additional three borings should be included in this DEIS.	See section 4.1.4.9 of the EIS, which has been updated with additional information.
IND-8b	That the Dan River HDD initial hydrofracture risk assessment determined that there would be an elevated risk of inadvertent returns (IRs) of drilling fluid near the exit point of the drill does not sound promising. Exactly what is this "mud-receiving pit" they propose to expand? How close is it to the Dan River? How will toxic spillage be prevented from entering and contaminating the water in the Dan River? Additional hydrofracture analysis for the HDD crossing needs to be done before proceeding, and the results should be included in this DEIS for public comment.	See sections 2.4.2.1, 4.1.4.9, 4.3.2.2, and 4.3.2.7 for further discussion on HDD crossing methods, impacts, and mitigation.
IND-8c	The total crossing length of the proposed Stony Creek Reservoir HDD would be 1,619 feet, and is considered feasible based on one geotechnical boring. Additional borings should be made and the results included for public viewing and commentary in this DEIS. Also, the Stony Creek Reservoir HDD initial hydrofracture risk assessment determined that there would be an elevated risk of inadvertent returns (IRs) of drilling fluid near the exit point of the drill. Again, they propose to expand the "mud-receiving pit." This sounds like a contamination of the Stony Creek Reservoir is inevitable. What guarantees are there, that the toxic drilling fluid won't eventually leak or spill into the reservoir? In the scheme of evaluating sites, avoidance of environmental damage is the number one priority, and mitigation comes into play only as a weak second option. In this case, with the possible contamination of a reservoir, "mitigation" is not an acceptable alternative.	See section 4.1.4.9 of the EIS, which has been updated with additional information.
IND-8d	The proposed HDD sites have not been properly vetted. Making a determination with less than 50% of the necessary data (2 of 5, or 40%, and 1 of 3, or 33% of borings for feasibility analysis) is premature and unreliable. All feasibility studies for the proposed HDD borings under the Dan River and the Stony Creek Reservoir should be completed and their results incorporated into the DEIS so that the public can read and comment on them.	See section 4.1.4.9 of the EIS, which has been updated with additional information.

IND-8	Eleanor Amidon	
IND-8e	Uranium and radioactive contamination Page 4-12 of the DEIS states, "Uranium mobilization in the environment can occur through the exposure of uranium- containing rocks and sediments to the weathering process (physical or chemical), causing uranium to be released from its parent material. Redistribution can further occur via activities and processes that move soil and rock. Therefore, background concentrations of uranium in soils, sediments, shallow bedrock, and groundwater were assessed via a review of publicly available information." The USGS National Uranium Resource Evaluation (NURE) database that was used consists of data obtained through airborne gamma-ray spectrometry, which only detects gamma rays emitted by uranium in the crust of the earth. Deeper deposits are not detected. Disturbing rock and soil, such as would be done by this proposed project, could loosen and expose as yet undetected underground uranium to rainwater. Uranium, being highly soluble, can be easily dissolved and transported into local groundwater. Contrary to the conclusion on page 4-13 of the DEIS, this could lead to significant impacts on human health and the environment. A more detailed and robust study of the amount and location of uranium is needed before unnecessarily engaging in earth-disturbing activities in Pittsylvania County, VA.	See section 4.1.4.8 of the EIS. We consulted the USGS NURE database, which contains the results of sediment and water sampling, and other resources including USGS soil geochemistry data and information obtained from the U.S. Department of Health and Human Services.
IND-8f	Although the DEIS on page 4-30 states that Mountain Valley does not not anticipate long-term or significant impacts on groundwater resources, "not anticipating" is not adequate when the damage could be huge. Water travels. If uranium (or other undisclosed proprietary industrial chemicals used in drilling) contaminate the Staunton River, Dan River, and/or Roanoke River, then Lake Gaston could be affected. Lake Gaston supplies water to a large population in Virginia Beach. Prevention is the only reasonable strategy here, namely, avoiding disturbing areas which contain uranium deposits. "Mitigation" is not an acceptable alternative, and the danger of radioactive contamination of public water supplies should be taken very seriously.	See section 4.1.4.8 of the EIS. We describe the existing conditions relative to concentrations of uranium in soils, sediment, bedrock, and groundwater that may be disturbed, as well as the behavior of and mobility of uranium in the environment.

IND-16 **IND-88**	**Heise and Dyer**

Part 1

Pg. 27/421 Draft EIS - ES-2

"The most common comments we received were on project need. The Commission's role in reviewing the details of any project is to make a determination of public convenience and necessity. The Commission bases its decisions on financing, rates, market demand, gas supply, environmental impact, and other issues concerning a proposed project. The forthcoming Commission order for the Project will address need. We also received numerous comments regarding impacts on water quality, socioeconomics, and health and safety. These resources are addressed in the draft EIS."

IND-16a	The scope of this DRAFT EIS appears to address the issues associated only with the pipeline and not the gas contained therein. This is equivalent to discussing the pipeline as if it were pumping compressed air. If this is indeed the scope of the DRAFT EIS then state it explicitly and justify the limited nature of this document. The North Carolina Department of Environmental Quality (NCDEQ), in their September 10, 2019 document submission to FERC makes this precise point when they state (page 2): *"The Department is concerned that the four alternatives proposed in the NOI excludes non-natural gas energy alternatives…Furthermore, the Project induces additional natural gas production resulting in increased direct and cumulative environmental impacts, including reasonably foreseeable indirect impacts."*	The draft and final EIS describe the potential impacts on environmental resources resulting from construction and operation of the Project. Staff considered measures to avoid, reduce, and mitigate impacts on the environment, and as appropriate, are including recommendations in the final EIS to the Commission.
IND-16b	NCDEQ explicitly uses the word "induces" and the DRAFT EIS purposefully constrains itself to the pipeline construction process with an extremely narrow summation of leak potential along the entirety of the pipeline. Production/fracking through induced/increased production at source location appears not to be considered. Additionally the major leak source, the Lambert Compressor Station, " would not result in a significant impact on local or regional air quality" (Pg. 32 Draft EIS. ES-7). However, note that by constraining the leak discussion to the more narrow issue of just the pipeline there is an "end-run" around the Mandatory Reporting of Greenhouse Gas Rule:	See response IND-4k in appendix I.3.

IND-16	
IND-88	**Heise and Dyer**

Pg 320/421 DRAFT EIS - 4-191

> *Potential GHG emissions from the Lambert Compressor Station would be greater than 25,000 metric tpy (see table 4.11-3). However, the rule establishes reporting requirements based on actual emissions. Mountain Valley would monitor emissions in accordance with the reporting rule. If actual emissions exceed the 25,000 metric tpy threshold, GHG emissions would be reported to the EPA as required.*

IND-16c	A discussion juxtaposing potential and actual may be missing the purpose of the DRAFT EIS. A statement of probable/expected leakage rates based on other compressor stations leakage rates would be more appropriate.	Section 4.11.1.5 includes discussion of potential emissions of the Lambert Compressor Station, including fugitives from incidental leaks.
IND-16d	By segmenting the DRAFT EIS to address just the pipeline project by eliminating discussion of gas production leak issues in totality (from fracking to consumption), the impact of reporting requirements as a result of meeting certain thresholds can be minimized, thereby allowing the FERC to conclude that the environmental impacts are minimal. **Part 2** There appears to be a disturbingly dismissive undertone to the DRAFT EIS that is decidedly uncharacteristic of a factual undertaking.	The evaluation of upstream and downstream markets and consumption impacts is outside the scope of this EIS. As appropriate, issues outside the scope of an EIS may be addressed in any Order the Commission may issue.

Pg. 187/421 DRAFT EIS - 4-57

> *We received a comment from the Roanoke River Basin Association (RRBA), which suggested mitigation for tree removal at a 5:1 ratio to offset the GHG effects of pipe leakage. The RRBA estimated that five new trees should be planted for every tree removed for construction of the pipeline right-of-way. Their estimate is based on their findings of 1% leakage rates of methane gas from other pipelines. RRBA states that methane is 25 times stronger than carbon dioxide in its effect as a greenhouse gas, and while it would be better to eliminate pipe leakage, the leakage should be offset with tree mitigation until the pipe leakage can be eliminated. We note that Virginia has 15.72 million acres of forestland (Virginia Department of Forestry [VADOF]) and North Carolina has 18.8 million acres of forests (North Carolina Forestry Association [NCFA]). Within this context, we conclude that impacts on forests would be long-term but would not be significant.*

IND-16e	As published in Science, (R. A. Alvarez *et al.*, *Science* 10.1126/science.aar7204 (2018).), https://science.sciencemag.org/content/361/6398/186 actual emissions for the total infrastructure gas production and transmission appear to be much higher. I seriously doubt that the RRBA made the "findings" of a 1% leakage rate, rather they researched the issue. The Science article lists an additional 77 references. RRBA statement of methane being 25 times stronger ghg than CO_2 may be conservative. (https://www.sciencedaily.com/releases/2018/06/180621141154.htm). The 25 time stronger estimate seems to come from a GWP_{100} rather than a GWP_{20} (Global Warming Potential - years measurement). A GWP_{20} estimate for methane impact is much higher as the methane has not degraded into CO_2 thereby lessening its impact.	See response CI-1 in appendix I.2. Emissions are discussed in section 4.11.1.5 and climate change is discussed in section 4.13.2.9

IND-16 IND-88	Heise and Dyer	
IND-16f	The quoted paragraph above then states the acreage of forest in Virginia and North Carolina as if the millions of trees has an impact on assessing methane emissions and thereby dismisses the 5:1 ratio offset. Frankly a 5:1 ratio may be vastly underselling the offset required to mitigate the methane releases from production, transmission leakage and combustion. It is not the existence of forests that offset additional methane release, it is the creation of new forests that offer the potential to mitigate new methane releases. **Part 3** Pg. 81 DRAFT EIS - 2-29 *During public scoping, a comment was submitted regarding the potential for Mountain Valley to further expand the Project and eventually export natural gas. Mountain Valley stated that it has no plans at this time to either expand or abandon the proposed facilities, nor is the Project able or designed to export natural gas. If Mountain Valley proposes any expansion or abandonment of the Project facilities, it would have to seek specific authorization for that action from the FERC. An appropriate environmental review would be conducted, and the public would have the opportunity to comment on Mountain Valley's proposal. Likewise, any proposed abandonment of any facilities approved in these dockets would require additional environmental and regulatory review under section 7(b) of the NGA.*	Mountain Valley has committed to minimizing impacts on forest land and continues to coordinate with VDCR on tree clearing mitigation prior to clearing trees
IND-16g	Having submitted prior comments along these lines, it is important to note some significant difference in these prior submitted statements on 8-23-2018 to Docket No. PF18-4-000. Specifically: *If no declaration is made, is MVP southgate barred from ever exporting gas?* *Is MVP Southgate allowed to petition, post pipeline completion, to allow export if excluded initially?* *Are the MVP investors allowed to increase exports to other outlets as an offset to any restrictions specifically made to the MVP Southgate project?* These questions were posed for a couple of reasons. MVP is an LLC that proposes to sell gas to PSNC for residential consumption. PSNC has since been purchased by Dominion Energy which, not incidentally, is a large shareholder in the Atlantic Coast Pipeline. Any statement or promise to not export gas from the MVP pipeline should include Dominion Energy as a whole. MVP/Dominion should be constrained to delivering gas to the Alamance terminus for distribution to the original PSNC distribution area. The Alamance terminus should not be used as a distribution point to balance excess production for exporting gas from other pipelines to other locales overseas. Additionally, trading bulk LNG through different companies to create artificial local demand is an abuse of a need requirement. If not so constrained, Rockingham and Alamance County residents, landowners and gas consumers are paying multiple times over for this pipeline. The residents would be paying higher prices for unneeded gas through an artificial demand created by export. The residents would be paying for unnecessary	See section 2.8 of the EIS

IND-16 **IND-88**	**Heise and Dyer**	
	discusses the impact of the gas production and consumption as induced by the pipeline?	
IND-16g	Finally, it is unusual to see this DRAFT EIS include a discussion about export when the purported intent of this DRAFT EIS was relegated to environmental issues associated with the pipeline. This leaves one to wonder if this was a mistake on the part of the writers' of the DRAFT EIS or whether the issue of restrictions on export will be addressed in the "Commission order for the Project." Additionally, will there be a comment period on the "Commission order for the Project" and will there be an EIS that discusses the impact of the gas production and consumption as induced by the pipeline?	See above IND-16 comment response

IND-19	Katie Whitehead

Docket No. CP19-14-000

General Comment Regarding the MVP Southgate Project

Draft Environmental Impact Statement

Submitted September 10, 2019 by Katie Whitehead

IND-19a	**The Federal Energy Regulatory Commission (FERC) knows that its process for reviewing interstate natural gas pipelines is flawed, yet the agency is repeating its mistakes as it goes through the motions of assessing whether the Mountain Valley Pipeline Southgate Extension would, on balance, provide a vital public benefit.** In February 2017 former Commissioner and FERC Chairman Norman Bay recommended that FERC look at how the Commission determines whether there is a need for new pipelines and conducts environmental reviews. Bay acknowledged that "the Commission has largely relied on the extent to which potential shippers have signed precedent agreements for capacity on the proposed pipeline," in spite of a "litany of other factors to consider." Bay's letter did not slow FERC approval of the highly controversial Mountain Valley Pipeline (MVP) and Atlantic Coast Pipeline (ACP), now poster children for the need for FERC policy reform. Residents of Virginia, West Virginia and North Carolina are experiencing the havoc and controversy that result from a failed initial review as federal and state agencies and courts address charges of regulatory and constitutional violations and project costs soar. Former Commissioner Cheryl LaFleur dissented, a rare move on the Commission, in the 2-1vote approving MVP and ACP in October 2017. She was unconvinced of the need for the pipelines and cited FERC's failure to look at alternatives with less environmental impact. In November 2017 an Analysis Group report described how the gas industry has changed since FERC instituted its now-outdated 1999 policies, under which Commissioners have approved over 400 new pipelines and rejected two. In December 2017 then FERC Chairman Kevin McIntyre announced that FERC would review its 1999 Statement of Policy on Certification of New Interstate Gas Pipeline Facilities. In April 2018 FERC solicited comments on possible reform to better meet its policy's aim "to appropriately consider the enhancement of competitive transportation alternatives, the possibility of over building, the avoidance of unnecessary disruption of the environment, and the unneeded exercise of eminent domain." Predictably, the gas industry spoke for the status quo. Noteworthy among those commenting in support of change were Senators Mark Warner and Tim Kaine; Giles and Roanoke Counties; 61 Public Interest Organizations; and the Niskanen Center, a policy think tank. Frequently expressed concerns were that FERC does not adequately scrutinize project need, investigate alternatives, justify use of eminent domain, evaluate environmental impacts, or facilitate public participation. The comment period ended in late July 2018; there's been no evidence of further action by FERC.	See responses GEN-2 and GEN-4 in appendix I.2.

IND-19	Katie Whitehead	
	Meanwhile, under FERC's old policies, MVP Southgate appears to be moving toward an unscrutinized rubber-stamp approval. Mountain Valley Pipeline, LLC (Mountain Valley) has applied to FERC for certification of the MVP Southgate Extension, 73 miles of natural gas pipeline that could transport as much as 375 million cubic feet of gas per day from the MVP mainline through a new compressor station near Chatham in Pittsylvania County, VA, to Dominion Energy delivery points near Eden in Rockingham County and Graham in Alamance County, NC. **FERC is now soliciting public comment on its Southgate Project Draft Environmental Impact Statement (DEIS). Reading the 700-page DEIS is not just daunting, it's disheartening.** In the DEIS, FERC does not question the purpose and need for Southgate; it merely reports: "In general, as described by Mountain Valley, the purpose and need for the Southgate Project is to meet the specific requests for natural gas transportation service of its anchor shipper, Dominion Energy, a local natural gas distribution company. Mountain Valley states that the Project will provide additional firm natural gas transportation services for Dominion Energy to meet its growing supply needs via interconnections with the under construction Mountain Valley Pipeline project in southern Virginia and the interstate pipeline of East Tennessee in North Carolina to two new delivery points on the Dominion Energy distribution system in Rockingham and Alamance Counties, North Carolina." *(DEIS section 1.1)*	
IND-19b		See response GEN-2 in appendix I.2.
	The DEIS states that FERC has two options: (1) approve the project with or without conditions, or (2) deny approval – the "No Action Alternative." According to the DEIS, No Action would mean no construction, no environmental impacts, and the project's stated purpose not being met. The DEIS then speculates, "If the Project is not constructed, shippers may seek other means to obtain an equivalent supply of natural gas from new or existing pipeline systems … (which) may result in the expansion of existing natural gas transportation systems or the construction of new infrastructure; both of which are likely to result in impacts comparable to those described in … this draft EIS. … Therefore, we dismiss (the No Action Alternative) from further consideration." Poof! Just like that, FERC dismisses any other means of meeting the incremental growth in gas demand that may arise in North Carolina.	
IND-19c		See response ALT-1 in appendix I.2.
	Here is another example in which FERC avoids its job of evaluating alternatives: "Some commenters recommended that we evaluate the potential for energy efficiency, energy conservation programs, and renewable energy (e.g., wind, solar) to eliminate or meet the need for the Southgate Project. … However, because the purpose of the Project is to transport natural gas, and (these) are not transportation alternatives, they cannot function as a substitute for the Project and are not considered further in this analysis." *(DEIS section 3.1.1)* Poof! Dismissed!	
IND-19d		See response ALT-2 in appendix I.2.

IND-19	Katie Whitehead	
IND-19e	As former gas and electric utility executive Thomas Hadwin has pointed out, "The National Environmental Policy Act requires (FERC) to consider issues outside of their normal jurisdiction when reviewing alternatives to the proposed project." Yet FERC dismisses all possible alternatives because they are not a pipeline delivering gas from the precise production zone in West Virginia used by Mountain Valley to connection points in North Carolina proposed by Mountain Valley.	See response ALT-1 in appendix I.2.
IND-19f	**FERC has a unique capacity to take the big picture view and abrogates its opportunity and responsibility.** Whereas FERC's DEIS rejects existing pipeline systems as alternatives, Hadwin emphasized the common-sense advantages of using the Transco (Transcontinental Gas Pipe Line, LLC) system: "The future capacity additions that might be needed by PSNC(recently purchased by Dominion Energy, Inc.) can be most easily and certainly less expensively obtained by incremental additions using the existing connections to Transco. Connecting to any of the new pipelines (such as MVP) in the region will add unnecessary expenses for PSNC(Dominion) ratepayers to bear and result in substantial overcapacity. PSNC has been reliably served by Transco for decades. Transco has abundant capacity to continue to do so. … There is no evidence of unreliable supplies of gas to North Carolina that would justify the need for a new pipeline to serve the area … a new pipeline that adds millions or billions to the energy costs of the ultimate gas customers. … The Transco alternative is one that should be fully examined by the Commission before rendering any judgment about the necessity and public convenience of the MVP-Southgate project." Hadwin cited the 2016 Synapse Energy Economics study, "which determined that the expansions to the existing pipeline system would provide more than sufficient capacity for Virginia and the Carolinas through 2030, even under an unlikely 'high demand scenario.'" **There is no reason that alternatives should exactly meet the precise stated purpose of the MVP Southgate project. What's important is to meet North Carolina's energy needs without undue burden on landowners, communities, our environment, and utility customers.** Hadwin's system alternatives involving Transco "are all superior to the proposed project. Although not every option has its primary source of gas from the same production zone as the proposed project, they have access to production zones that offer equivalent prices and more options. They are less expensive, can be accomplished sooner, and can provide a graduated increase in capacity rather than requiring years of payments of $160 million per year for unused capacity from MVP/Southgate that provides no benefit to the customers of PSNC(Dominion). Little or no construction is required by these various alternatives, thus, environmental impacts and intrusion upon landowners is much less or non-existent."	See section 3.3.2.1 of the EIS for an analysis of the Transco Alternative.

IND-19	Katie Whitehead	
IND-19f	FERC does not investigate any of these options. The only Transco option FERC imagines is one contorted to mimic MVP Southgate, which it then dismisses out of hand as having essentially the same environmental impacts. Quoting Hadwin once again, describing one Transco alternative, "Transco could transport the gas to North Carolina and provide appropriate capacity additions to PSNC whenever they are actually needed via existing or upgraded connections. This option would avoid the expense of building the Southgate pipeline and would also avoid the high cost of transportation on the MVP. Dominion Energy would avoid burdening its electricity ratepayers in Virginia with over $4 billion in higher energy costs for a pipeline they don't need, and lower the cost of pipeline transportation for the customers of its new subsidiary, PSNC." **Why doesn't FERC ask Transco how it can meet an increase in gas demand in North Carolina if and when such an increase occurs?** In a petition for rehearing and/or reconsideration of the Atlantic Coast Pipeline, Transco stated, "Factually, **Transco has the infrastructure and pipeline in place to serve the Southeast**, including South Carolina, **for many years.** It is obvious Dominion intends to install duplicative infrastructure and pipeline to serve the ratepayers of South Carolina at great monetary expense to the ratepayers of South Carolina." No doubt, the same could be said for MVP Southgate and the ratepayers of North Carolina. **FERC's Southgate Project Draft Environmental Impact Statement makes no sense. It makes no sense to evaluate the potential environmental impacts of MVP Southgate as if it is the best and only solution to a problem that, according to an increasingly large body of evidence*, does not exist. FERC leaves the question of public need to a later determination, dismisses alternatives that could meet any actual public need, accepts the pipeline developer's word that it will comply with best management practices and FERC conditions, and includes no mention of egregious violations by the same developer during construction of the MVP mainline. FERC concludes that approval of the MVP Southgate would, "through implementation of (FERC) recommendations and Mountain Valley's proposed avoidance, minimization, and mitigation measures," result in "less-than-significant" adverse environmental impacts. That's absurd. And disheartening.**	See above IND-19f comment response

IND-28	Maury Johnson	

MY MVP Southgate Draft Comments Please feel free to make comments, suggestions or edits Thanks Maury

September 16, 2019

Ms. Kimberly Bose, Secretary
Federal Energy Regulatory Commission
888 First St, Washington, DC

Dear Ms. Bose,

As a registered inteventor for the Mountain Valley Pipeline Southgate Extension project, FERC Docket CP19-14-000, I wish to have the following complaints and statements placed on the FERC Docket for the DEIS comments.

IND-28a	I have been told by friends in Alamance County, NC that the proposed Mountain Valley Pipeline Southgate extension construction through the northern part of that county would destroy most of the remaining native artifacts, burial mounds left there by ancient Native American cultures. A number of cultures/tribes use to inhabit this area, including the Sissipihaw, Saponi, Shakori, Occaneechi and many more. Unfortunately, the 1986 Alamance County Archaeological Survey Project mentions only a few of the Native American burial sites in Alamance County.	Section 4.10 of the EIS provides a detailed discussion of archaeological surveys and resources identified for the Project.
IND-28b	Legend has it that in early 1700's, settler John Lawson traveled through the Piedmont area of North Carolina. (From Wikipedia -- **John Lawson** (1674? – 1711) was an English explorer, naturalist and writer. He played an important role in exploring the interior of colonial North Carolina, South Carolina and Georgia, publicizing his expeditions in a book. He founded two settlements in North Carolina: Bath and New Bern, both located on rivers in the coastal plain. He was killed by Tuscarora people, who were beginning to resist European encroachment.) You can read more at this link: http://en.wikipedia.org/wiki/John_Lawson_(explorer) Lawson described the land as "extraordinarily rich" and said that no man could have any reason to dislike it. He recorded 27 species of mammals, including buffalo, elk, wolf and panther, which have long vanished from the area. According to Lawson, the Haw River was named for the Sissipahau Indians who lived near and along this stream. Their passage way became known as the Great Trading Path, it ran from Fort Henry (now Petersburg VA) in Virginia to cross the Haw River near the present town of Swepsonville, NC just outside of present day Burlington NC. This is the path that all colonizers and corporate enterprises seem to follow time and time again. The proposed MVP Right-of-Way would largely follow the Native American trading path down the Haw River. It is imperative that the citizens and government agencies protect this historically significant path. Alamance County is named after the Great Alamance Creek which was named by Native Americans. It was called "Alamance" after an old local Native American word used to describe the blue-colored mud in the bottom of the creek. Alamance County is known for its rich Native American history; however, it will not be if the MVP Southgate is allowed to destroy that rich history. It will be known as the county that let the MVP destroy its history and FERC will be complicit in that destruction, to the benefit of an out of state corporation to build an environmentally destructive, unwanted and unneeded pipeline.	Comment noted.

IND-28	Maury Johnson	
IND-28c	The proposed Mountain Valley Pipeline Southgate FERC DOCKET CP19-14-000, project will disrupt over 230 streams and permanently destroy forests and pristine farmland along its path, while releasing over 100,000 tons of greenhouse gases each year if constructed. That statement alone should be enough to cancel this project. This pipeline is a dangerous and unnecessary pipeline and not only threatens the people of southern VA and North Carolina, but it would help push the climate to the brink of complete catastrophe as we race towards the mark where human life on this planet would not be able to exist.	Impacts to streams are discussed in section 4.3.2; forest impacts are discussed in Section 4.5 and 4.8.1; and farmland impacts are discussed in section 4.8.1. The Project's climate change impacts are discussed in section 4.13.2.9.
IND-28d	Mountain Valley Pipeline (MVP) Docket CP16-10-0000 has already caused over 300 documented water quality violations in Virginia, and at least that many more in West Virginia. I have documented over 150 E & S Failures on a small part of Spread F (mostly over a four mile section in Monroe and Summers County WV). It has received multiple stop-work orders during the construction of its main line in VA and was fined nearly $266,000.00 for water quality violation in WV from April 2018 through November of 2018. Even then they continue to rack up NOVs in WV.. The proposed Southgate project is not needed to meet demands for natural gas in North Carolina or anywhere else, and MVP has proven they cannot build a pipeline without severely impacting the environment and local water supplies.	See response GEN-6 in appendix I.2.
IND-28e	The MVP Southgate will put important water resources at risk, including but not limited to the Jordan Lake, the Dan and Haw Rivers all sources for clean water for many families and farms in Virginia and North Carolina. It also will put lots of family farms and the families who live there at risk to multiple impacts including explosions, tainted water, air and land.	Section 4.3.2 describes the effects of the Projects on surface waterbodies. We recognize that in-stream construction would cause temporary and localized impacts on surface water.
IND-28f	The MVP Southgate extension has significant lengths of the proposed pipeline route running over karst terrain with potential cave systems and steep slopes. It will run through watersheds prone to flash flooding. The DEIS makes it clear that the pipeline is at risk of failure due to sinkholes, landslides, and flooding. Even worse, the DEIS points out that the extensive blasting of bedrock during construction will increase the risk of landslides. Blasting poses a threat to private residents and the pipeline itself.	As stated in section 4.1.4.5, no karst features (e.g., caves, sinkholes) were identified.
IND-28g		See response SURF-7 in appendix I.2.
IND-28h		See response GEO-2 in appendix I.2.
IND-28i	Construction of the pipeline is will cause heavy erosion, leading to the pollution of local waterways. MVP construction on the mainline in WV and VA has caused hundreds of documented E & S control failures, with probably thousands of undocumented failures, there is no reason to believe that anything will be different on the Southgate extension. FERC's assumption in the DEIS that the developer will comply with standard water protection measures and uphold water quality standards is misguided and has no basis in reality.	See response GEN-6 in appendix I.2.
IND-28j	MVP Southgate will cross more than water bodies, 3 of which are major water bodies, including designated water supply, high quality, and/or nutrient sensitive water bodies. In addition, MVP is requesting to run the pipeline parallel and within 15 feet of a waterbody in 28 locations, even though FERC standard is greater than 15 feet. Allowing for less than a 50 foot setback is also against the Jordan Lake Rules which are in place to protect streams from nutrient and sediment impairment. Erosion and sedimentation is an ongoing concern in the Haw River basin, and many of our streams are impaired due to poor benthic life. Sedimentation, erosion, and increases in stormwater velocity, has left many creeks with steep, inaccessible banks, void of healthy aquatic habitat. Cutting forested streamside buffers and wetlands increases the risks of erosion and sedimentation, making the water muddier and impacting aquatic life.	See responses SURF-1, SURF-2, and SURF-3 in appendix I.2.
IND-28k	Much of the pipeline is in the flood zone of the Haw River, which has seen record flooding the past two years. This volume and velocity of water will be increased with less buffer protection and compacted soils from heavy machinery. The Haw River watershed has extremely flashy flow tendencies. The high and low flow points have not been factored into this review..	See response SURF-7 in appendix I.2.

IND-28	Maury Johnson	
IND-28l	Blasting and heavy equipment can damage infrastructure and make well water unsafe. Landowner well surveys have not been completed and locations of wells and springs are unknown and therefore impacts cannot be assessed. This is vitally important due to the fact that MVP construction in WV and VA has tainted numerous springs, wells and other water sources.	See response GW-1 in appendix I.2.
IND-28m	Being an impacted landowner and citizen monitor on the MVP mainline (FERC DOCKETCP16-10-0000), I have seen firsthand the work MVP contractors have done on the mainline and have little faith that the requirements of the erosion and sediment control plan will be met at all. Including clauses/statements like "when practicable" leaves too much subjectivity to MVP Southgate contractors. There are over 600 documented water quality and erosion and sediment erosion control violations on the mainline done by the same teams. However, leaving so much subjectivity in what is or what is not practicable allows MVP Southgate to argue the bare minimum is all that is necessary. There are sensitive watersheds along the MVP Southgate and this project and the MVP developers have demonstrated that they are incapable of completing this project in a way that prevents serious watershed or environmental degradation.	See response GEN-6 in appendix I.2.
IND-28n	The construction of the MVP Southgate pipeline extension will have a long term impact on over 25 acres of wetlands. In addition to the pipeline construction, Mountain Valley is asking for a waiver of FERC's wetland protection setbacks and plans to locate 23 additional temporary workspaces within 50 foot wetlands. This is not protective of the sensitive watersheds and should not be allowed. Furthermore,	See response WET-1 in appendix I.2.
IND-28o	construction of the pipeline would have long-term, permanent impacts to 615 acres of forested uplands, 10 acres of forested wetlands and nearly 12 acres of protected riparian forested lands in the Jordan Lake Watershed. These habitats require decades to recover from the kind of blasting, demolition and construction contemplated for this project.	Section 4.5 of the EIS discusses impacts to forests and other vegetation types.
IND-28p	Constructing this project would disturb about 1,439 acres of wildlife habitat, much of which would be permanently destroyed by the project. The project would also cross 21 perennial waterbodies containing fisheries of special concern such as the James River Spiney Mussell and the Roanoke Log Perch, which is one of the Endangered Species that has caused the USFWS to reinitiate consultation on the MVP mainline project and may lead to a loss of the ESA Permit.	Federal agency compliance for the Endangered Species Act (ESA) Section 7 is described in section 4.7.1 of the EIS.
IND-28q	The U.S. Fish & Wildlife Service told Mountain Valley to minimize impacts to vulnerable migratory bird species which uses the project area such as bald eagles, northern bobwhite, and red-headed woodpecker by avoiding clearing vegetation during the peak migratory bird nesting season (March 15 - August 15 in Virginia and April 1 - August 31 in North Carolina). Mountain Valley has defied the agency's guidance and has proposed clearing vegetation during peak nesting season, from March 15 – April 30 and from August 16-31. FERC's DEIS (CP19-14-000) ignored the obvious impacts to migratory birds that would result from this reckless activity.	Section 4.6.3.2 of the EIS discusses impacts on migratory birds.
IND-28r	As mentioned earlier construction of the Southgate extension would harm numerous aquatic species, including the Roanoke logperch, James River Spiney Mussel. It would also put in danger the Atlantic Pigtoe and smooth coneflower which is listed on the Endangered Species list or under consideration for listing, ie the Atlantic Pigtoe.	See response IND-28p
IND-28s	The construction of the MVP Southgate would leave a 72-mile long, 100-foot wide scar across VA and NC for a needless project. It would be a visual blight on the landscape and degrade the lands along its path.	Visual impacts are discussed in section 4.8.4 of the EIS.

IND-28	Maury Johnson	
IND-28t	Residents, landowners and visitors/tourist to the area would be stuck looking at the pipeline every day. It would continue the destruction of the visual impacts to the region and the loss of the use of the land by landowners, much like it already has on over 300 miles of the MVP mainline. Residents will lose the privacy and visual screens of large trees and hedgerows to construction; the pipeline and its numerous new roads that would needed to be built and operated directly next to scores of homes – and will pass right through one home; construction will render many property owners' land unusable for farming, habitation or other uses. Even so, the DEIS make the dubious claim that there will be no impacts on local property values.	See response LU-1 in appendix I.2.
IND-28u	The pipeline would also impact the experiences of countless recreational users of public parks, recreation and conservation areas by generating dust and noise pollution, scaring off wildlife, and disrupting public access during construction. Users of National Wild & Scenic River candidates like the Dan and Haw Rivers; future designated recreational water trails like the Banister River; and public trails like the Mountains-to-Sea Trail and a planned public trail in Alamance County would all be affected. The project would also clear trees within view of the Colonial Heritage Byway (Route 150 in Rockingham County), causing permanent impacts.	Impacts on recreational and special use lands are discussed in section 4.8.4 of the EIS
IND-28v	Construction of the project will cause long term impacts to the environment, yet it is unlikely to provide any positive long term effects to local unemployment rates. FERC found that any potential benefits to local economies would be temporary and minor. Long term operation of the project would create about 6 permanent jobs in each state of Virginia and North Carolina. In addition, construction schedule would overlap with peak tourism season, potentially negatively impacting the tourism economy in the area. Local employment will not be increased, property values will decrease, and any positive impacts to the surrounding economy will be short lived while the long term damage will take decades to overcome, if at all.	See section 4.9.1 of the EIS for discussion of employment. See also responses SOCIO-1, SOCIO-2, and SOCIO-8 in appendix I.2.
IND-28w	In the DEIS, FERC states they have "not yet completed the process of complying with the National Historic Preservation Act" and that miles of the proposed Southgate pipeline route are still not surveyed for cultural resources that could be damaged. In numerous instances for potential archeological sites and historic structures, FERC referenced mitigation as a solution however nowhere in the DEIS does FERC explain what mitigation measures must be or the timeline they must be completed. FERC should pursue communications with the interested indigenous tribes and should complete the process to comply with the National Historic Preservation Act before taking any additional steps on the approval process for the Southgate project. This rush to start the MVP Southgate is unnecessary as the MVP mainline currently under construction has been seriously delayed by loss of permits and other legal challenges and its completion is in doubt. Therefore MVP Southgate extension should not be approved until all legal challenges to the MVP mainline has been resolved and its future has been determined.	See response CULT-1 in appendix I.2.
IND-28x	The Lambert compressor station has the potential to emit 125,000 tons of greenhouse gases, 3.5 tons of formaldehyde each year and over 10 tons of particulate matter each year, putting nearby communities at risk for cardiovascular issues and asthma. The compressor station will be built in proximity to two Transco compressor stations already in operation. Cumulative impacts and the potential to impact human health with two minor source polluting facilities and one Title V facility (pending FERC approval) have not been adequately evaluated to assume that human and environmental health will not be adversely impacted. The added GHG emissions alone should disqualify this project from being approved. If approved it will be the cause of future litigation and probable cancelation of the project as we simply cannot continue down this path and survive as a species in the face of global climate change, largely caused by GHG emissions.	See response AIR-2 and CI-4 in appendix I.2.

IND-28	Maury Johnson	
IND-28y	The DEIS merely states that pipeline developers would comply with minimum construction and operation standards. The developers have not exhibited that they can construct the mainline in an environmentally friendly manner. There is no indication they would change their methods to construct the Southgate any differently. Why would you think the operation or construction of Southgate extension would be any different? Therefore, it gives no reason for people living within the blast radius of either project to feel safe. The National Transportation Safety Board documents interstate pipeline accidents, and its database includes numerous recent natural gas pipeline ruptures, leaks, and explosions. Moreover, studies show a spike in accidents involving new pipelines in recent years. The majority of the pipeline would be in Class 1 population density areas, meaning it would mandate the lowest safety standards and put those living near the pipeline at an even greater risk.	See response SAFE-1 in appendix I.2.
IND-28z	FERC states that impacts from construction and operation of the pipeline will be temporary and localized. However, this assessment failed to take into account the long term cumulative impacts that will occur across the region. The impacts to forest, water resources and visual degradation would most likely be severe. This is borne out by what has already happened on the MVP mainline in WV and VA. The nearly three miles of in stream work paired with the removal of vegetation along streams will have long term negative impacts to already impacted water resources.	See response CI-1 in appendix I.2.
IND-28aa	FERC is being naïve at best and ignoring the significant impacts of this project. The DEIS describes widespread, permanent impacts like the long-lasting or permanent destruction of hundreds of acres of forests and wetlands, but then turns around and says that impacts won't be significant because mitigation measures will be used during construction. Mitigation cannot prevent the significant impacts that permanent forest and wetland destruction cause. Mitigation simplify cannot be done, once these impacts have occurred, they are forever. The DEIS' reliance on mitigation measures to argue that the project will cause no significant impacts falls short because many of the mitigation measures proposed to prevent significant impacts to local resources are unknown. In many instances, the DEIS instructs Mountain Valley Pipeline to come up with mitigation measures that are currently not defined. FERC cannot claim that unknown measures will prevent significant environmental impacts. One only has to examine the MVP mainline construction In WV and VA to see that the above assessment by FERC is totally false and nowhere close to reality on the ground.	See response GEN-9 in appendix I.2.
IND-28bb	Finally the conclusion by FERC that no significant environmental impacts would be inflicted by this project while lacking the necessary information to even assess what those impacts might be is disingenuous. For example, Archaeological surveys have not been completed for the project area, preventing analysis of impacts to cultural resources. Impacted streams a site where imperiled aquatic species are suspected to live need further studies and consultation with the USFWS per the recently litigation concerning ESA permit along the MVP mainline. FERC acknowledges that MVP will use 5.9 million gallons of water in constructing the project, but has no idea where MVP will get that water from, preventing FERC from assessing the environmental impact of those water withdrawals.	See response GEN-4 in appendix I.2.

Subject: Reject the Proposed Mountain Valley Pipeline and Southgate Extension -- Draft Environmental Impact Statement for the Southgate Project (CP19-14-000)

To Federal Energy Regulatory Commission (FERC) Chairman Neil Chatterjee:

IND-30a	The Mountain Valley Pipeline (MVP) Southgate Project is not in the public interest and the Federal Energy Regulatory Commission's draft environmental impact statement (DEIS) for the MVP Southgate Extension is woefully inadequate. The DEIS fails to provide adequate information for public comment, does not properly assess climate-altering greenhouse gas emissions or the effect of those emissions on the environment, and fails to fully account for all of the environmental threats posed by the MVP extension. It also minimizes the risk of impacts to private well owners' water quality. Blasting and heavy equipment can damage infrastructure and make well water unsafe. This is not a risk that affected communities and landowners should be forced to bear.	See responses GEN-2 and GEN-4 in appendix I.2.
IND-30b	*"Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method."* *-- Theodore Roosevelt*	Section 4.3.1 of the EIS includes a detailed discussion of the potential impacts water supply wells. The EIS discusses blasting and associated impacts in section 4.3.1.2. Mountain Valley would adhere to its General Blasting Plan to minimize impacts from blasting.
IND-30c	Not only will the Southgate Project create permanent adverse impacts on the local environment, it will also contribute to several more decades of global climate pollution. Studies show that existing gas infrastructure is more than sufficient to meet regional energy needs for residents and industry. Therefore, the primary beneficiaries of the pipeline will be private companies. This is deeply concerning, given that a Certificate of Public Convenience and Necessity would allow the taking of private property for this project.	See response GEN-2 in appendix I.2.
IND-30d		See response GEN-7 in appendix I.2.

IND-30	Christopher Lish	
IND-30e	*"It is horrifying that we have to fight our own government to save the environment."* *-- Ansel Adams* Construction of the pipeline is expected to cause heavy erosion and consequent sedimentation of local waterways. Yet the DEIS assumes that if MVP complies with FERC's Mountain Valley Pipeline Project Erosion and Sediment Control Plan, it would adequately avoid or minimize damage to surface waters. But current construction of the MVP main line has proven these plans and procedures are inadequate, and that MVP is	See responses SURF-2 in appendix I.2.
IND-30f	unwilling to comply. In Phase I of this project, MVP has already violated commonsense water quality protections over 300 times in West Virginia and Virginia, and is being sued by Virginia's Attorney General. Time after time, pollution and mudslides have run off their worksites and into streams, waterways, and even the homes of people living nearby. FERC's assumption in the DEIS that the developer will comply with standard water protection measures and uphold water quality standards is misguided and undermines the credibility of the DEIS' environmental analysis. If MVP has had so many problems with the first phase of this project, why should we expect that construction of this extension will be any less damaging? *"Our government is like a rich and foolish spendthrift who has inherited a magnificent estate in perfect order, and then has left his fields and meadows, forests and parks to be sold and plundered and wasted."* *-- John Muir*	See response GEN-6 in appendix I.2.
IND-30g	Erosion and sedimentation is an ongoing concern in the Haw River basin, and many of the streams are impaired due to poor aquatic life. Sedimentation, erosion, and increases in stormwater velocity have left many creeks with steep, inaccessible banks which are devoid of healthy aquatic habitat. Cutting forested streamside buffers and wetlands increases the risks of erosion and sedimentation, increasing turbidity levels and impacting aquatic life. Much of the pipeline is in the flood zone of the Haw River, which has seen record flooding during the past two years. This volume and velocity of water will be increased with less buffer protection and compacted soils from heavy machinery. The Haw River watershed has extremely variable high flow tendencies. The high and low flow points have not been factored into this review. *"If some are prosecuted for abusing children, others deserve to be prosecuted for maltreating the face of nature committed to their care."* *-- Henry David Thoreau*	See response SURF-2 and SURF-7 in appendix I.2.

IND-30	Christopher Lish	
IND-30h	Adjacent communities already face contaminated drinking water sourced from the Dan River, Haw River, and surface water reservoirs. Additional public water supply intakes are located downstream of these stream crossings. Though these intakes are further downstream than the DEIS assessment limit of three miles, many of the contaminants that could impact drinking water quality do not break down, and, therefore, the three mile limit for downstream impacts is arbitrary and does not provide an accurate assessment of the full scope of impacts. *"An unwritten compact between the dead, the living and the unborn requires that we leave the unborn something more than…depleted natural resources."* *-- A Washington State Court decision*	See response SURF-4 in appendix I.2 and SA-2a-2 in appendix I.3. See also section 4.3.2.1 of the EIS for discussion of public water supply intakes.
IND-30i	The work MVP contractors have done on the mainline is wholly inadequate and no one should have any faith that the requirements of the erosion and sediment control plan will be met at all. Including clauses like "when practicable" leaves too much subjectivity to MVP Southgate contractors. However, leaving so much subjectivity in what is or what is not practicable allows MVP Southgate to argue that the bare minimum is all that is necessary. This is a sensitive watershed, and this project cannot be completed in a way that prevents serious watershed degradation. *"The ultimate test of a moral society is the kind of world that it leaves to its children."* *-- Dietrich Bonhoeffer*	See response GEN-6 in appendix I.2.
IND-30j	FERC is ignoring other significant impacts of this project. The DEIS describes widespread, permanent impacts--like the long-lasting or permanent destruction of 615 acres of forested uplands, ten acres of forested wetlands and nearly twelve acres of protected riparian forested lands in the Jordan Lake Watershed--but then turns around and says that these impacts won't be significant because mitigation measures will be used during construction. Mitigation cannot prevent or repair the significant impacts of permanent forest and wetland destruction and these habitats will require decades to recover from the kind of blasting, demolition, and construction contemplated for this project. *"As we peer into society's future, we—you and I, and our government—must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow."* *-- Dwight D. Eisenhower*	See response GEN-4 and GEN-9 in appendix I.2.

IND-30	Christopher Lish	
IND-30k	The DEIS' reliance on mitigation measures to argue that the project will cause no significant impacts is inadequate because many of the mitigation measures proposed to prevent significant impacts to local resources are unspecified. In many instances, the DEIS instructs MVP to come up with mitigation measures that are currently not defined. It's disingenuous for FERC to claim that unknown measures will prevent significant environmental impacts. *"Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish—indeed, all the living creatures of prairie and woodland and seashore—from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."* *-- Theodore Roosevelt*	See response GEN-9 in appendix I.2.
IND-30l	FERC concluded that no significant environmental impacts would be inflicted by this project while lacking the necessary information to assess what the impacts to various environmental resources would be. For example, MVP has yet to provide FERC with its feasibility studies for its plan to cross Deep Creek with the pipeline, a site where imperiled aquatic species are suspected to live. FERC acknowledges that MVP will use 5.9 million gallons of water in constructing the project, but MVP has not identified where	Mountain Valley provided feasibility studies and crossing plans for each of the waterbodies to be crossed by HDD or conventional bore. We have updated section 4.3.2.2 of the EIS with this information.
IND-30m	it will source that water, preventing FERC from assessing the environmental impact of those water withdrawals. Lastly, archaeological surveys have not been completed for the project area, preventing analysis of impacts to cultural resources. *"Do not suffer your good nature, when application is made, to say 'Yes' when you should say 'No'. Remember, it is a public not a private cause that is to be injured or benefited by your choice."* *-- George Washington* I urge FERC to reject MVP's request for a certificate of public convenience and necessity. This dirty, dangerous fracked gas pipeline is a serious threat to the water we drink, the air we breathe, and the fabric of our communities. The record of MVP has proven there's no safe way to build this pipeline. *"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."* *-- Aldo Leopold* Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources. Sincerely, Christopher Lish San Rafael, CA	See response SURF-6 in appendix I.2.

IND-36	Katie Whitehead	
IND-36a	**Docket No. CP19-14-000** **Specific Comments Regarding the MVP Southgate Project** **Draft Environmental Impact Statement** **Submitted September 16, 2019 by Katie Whitehead** Commenting on specific aspects of the proposed MVP Southgate Extension Project is difficult. FERC's Southgate Project DEIS doesn't stand alone. I feel sure that I have not found all the references to my family's property in Mountain Valley's November 2018 application, FERC's repeated requests for more information, and Mountain Valley's multiple responses, supplemental materials, and comments submitted up through just last week. Coded names for land, property owners, access roads, workspaces, streams, etc. are hard to decipher and keep track of. Multiple submissions referencing, changing and amending earlier documents make it almost impossible to know whether I am addressing the current plan. For example, the November 2018 application seems to be the only place to find the proposed route broken down by mileposts, and even that is on a scale too small to show what happens on a particular property. Has the plan for my family's property changed since then? I don't know. Where there is different information within a document or between two documents, does it represent a change or a sloppy inconsistency? There is no one place to look to confirm what is being proposed. Consequently, my comments may not be entirely up to date. I have made my best effort in the time available. I would appreciate more time. Among my primary concerns is the lack of close attention given by Mountain Valley or FERC to the co-location of Southgate with the existing Williams Transco right of way. There is no evidence that Williams Transco, which already delivers gas to Dominion Energy North Carolina, cannot continue to provide the needed gas reliably. There is also no evidence that anyone has recognized and acknowledged the fact that the Williams Transco ROW has ample space for another gas pipeline. Mountain Valley's maps are inconsistent in whether any Williams Transco pipelines are shown; yet, typically, if one is shown, it is drawn at the ROW boundary line, not its actual location, which, on our property is forty feet away.	The most recent information regarding the proposed Project design and layout is available from the FERC eLibrary using accession numbers 20191023-5022 and current alignment sheets are available using accession number 20191220-5298.
IND-36b		See section 3.3.2.1 of the EIS for an analysis of the Transco Alternative.
IND-36c		The existing pipeline right-of-way may or may not be defined on any given parcel. In some circumstances, the right-of-way is defined off the exact location of a specific pipeline per the easement with the landowner and additionally, the maintained right-of-way that is visible on the alignment sheets and in the field may not represent the actual width of the easement. Mountain Valley is utilizing the best available information to route the pipeline, providing 50 feet of spacing from the estimated location of the closest Williams pipeline and the centerline of the pipeline easement, which is an Interstate Natural Gas Association of America (INGAA) standard for parallel facilities. Mountain Valley continues to coordinate with Williams on the location of its pipelines and extent of its easements and anticipates that line locating will take place prior to the start of construction.
IND-36d	Another concern is presumed need for a 100' construction easement. Southern Virginia is not steep terrain. In 2007 Williams Transco was able to install a 42" line from, for the most part, a 40-foot cleared area on one side and piled dirt and rock on the other side – over an existing pipeline. Installing a 24" line alongside should not require clearing 100' of trees.	In its application and as described in the final EIS, Mountain Valley has adequately justified the need for proposed construction workspace.

IND-36	Katie Whitehead	
IND-36e	As I have told FERC staff repeatedly in person, by telephone, and through written comment, my family's land is a tree farm. To use your terminology, our land is in a timber management program; it is a pine plantation; it is silviculture. The proposed Southgate route on our land is through loblolly pines and hardwoods – all of which are growing for production. I see no evidence in any documents that this land use is recognized, much less the impact of Southgate on our trees.	Section 4.8.1.1 discusses impacts to silviculture lands. The section has been updated to clarify that this would include loblolly pines and hardwoods grown for production.
IND-36f	Below I try to show in graphic detail the proposed co-location of Southgate with Williams Transco. As proposed, there is no benefit to co-location. I also show what would be possible if FERC and Mountain Valley and Williams Transco actually look at the existing ROW, the proposed route for a 24" Southgate pipe and cooperate to minimize the impact on the environment and landowners. I use the layout on my family's property; however, I feel sure this situation exists more generally. The entire co-location route should be analyzed and revised.	Comment noted.
IND-36g	Below I also address mistakes regarding proposed Mountain Valley temporary workspaces and an access road on the Williams Transco ROW. This is all I have time for. There's more. I intend to provide additional specific comments.	The EIS has been updated as appropriate.

IND-37	Jeannie Ambrose

Draft Environmental Impact Statement [DEIS] for the Mountain Valley Pipeline-Southgate Project
Docket No. CP19-14-000

Public Comments
September 16, 2019

GENERAL COMMENT.

On August 22nd, 2019, I attended the scoping hearing at the Vailtree Conference Center, Haw River. Unfortunately, no MVP-SG engineer was available at this meeting to answer a few questions that I had. The MVP staffers suggested that I speak to a FERC representative. The FERC personnel were able to direct me to some information in the tables in the appendices.

THE MVP-SG PROJECT IS NOT NECESSARY AND, CERTAINLY, NOT IN THE PUBLIC INTEREST.

IND-37a	I have serious concerns that the adverse impacts to natural resources and public health and personal wealth posed by the construction and operation of the proposed Southgate extension project would outweigh any real benefits to the communities along the pipeline route. The potential risks are especially troubling since the need for the Project is unsubstantiated. According to the NC Department of Environmental Quality and other stakeholders, the existing and upgraded natural gas infrastructure is adequate to handle current and projected regional energy demands. The transition in NC from a 24-inch to 16-inch diameter natural gas transmission pipeline running from the Eden area to Graham seems to indicate the possible lack of demand for extra gas from any new commercial and industrial end user in central NC other than PSNC. The smaller diameter pipeline, currently proposed, no longer required the proposed construction of the Russell Compressor in NC. In addition, the processing of some of the compliance requirements from state and federal cooperating agencies is incomplete. There were items missing in different sections of the draft as noted in bold face. This made it difficult to determine if the applicant adequately satisfied the criteria required for FERC's issuance of a Certificate of Public Convenience and Necessity.	See response GEN-2 in appendix I.2.
IND-37b		See response GEN-4 in appendix I.2.

4.1. GEOLOGY.

IND-37c	Along with soil type, the topography and drainage of the river basins can lead to flash flooding with high velocity flows creating erosion and sedimentation problems.	See response SURF-7 in appendix I.2.
IND-37d	Blasting hard bedrock at some stream crossings during excavation can cause additional erosion.	See response GEO-2 in appendix I.2.

4.2. SOILS.

IND-37e	The proposed pipeline traverses 20 miles of erodible soil in Alamance Co. Erosion and sediment from land-disturbing construction activities is a serious problem. Bare and unprotected soil surfaces are more susceptible to moderate to severe erosion. This is made worse by heavy machinery compacting the soil during construction.	Impacts on soils are discussed in section 4.2.2 of the EIS.

IND-37	Jeannie Ambrose	
IND-37f	**4.3. WATER RESOURCES.** • 81 stream crossings 1. The Haw River and Jordan Lake already have nutrient and sedimentation problems from runoff and erosion that impair aquatic life. 2. Locating pipelines within 15 feet of a water body in 28 locations, including within the Jordan Lake watershed, essentially eliminates the effectiveness of riparian buffers to control water pollution and stabilize the streambank. Less stream buffer protection and more deforestation increases the potential to accelerate erosion and sediment flow and transport. Runoff of sediments into waterways increases turbidity that impairs aquatic life. Water with more suspended particles heats up more than clear water. Nutrient laden runoff and warmer water encourage oxygen-depleting blue-green algal [cyanobacteria] blooms as they decompose.	Section 4.3.2 describes the effects of the Projects on surface waterbodies.
IND-37g	2. Construction and operation of the proposed Project in the flood zone of the Haw River could further degrade water quality in the watershed and disrupt functioning ecosystem services provided by wetlands. Surface and subsurface disturbances from excavation, re-routing of the watercourse, and blasting of stream bedrock could alter pathways of groundwater. The full impacts to land owners who rely on water wells and springs for domestic and agricultural water supplies are unknown since the location of all these water sources have not been completed.	See response SURF-7, GEO-2, and GW-1 in appendix I.2.
IND-37h	3. The construction of the Project will require 5.9 M gallons of water. The potential environmental impacts cannot be determined since the source(s) of the water withdrawal is unknown.	Water sources are addressed in 4.3.2.6 of the EIS.
IND-37i	4. PFAS-related chemicals and 1,4-Dioxane, two of the emerging chemicals of concern, are detectable in our drinking water and agricultural fields. Chemical pollution from the application of Earth Guard Edge, an erosion control product used in West Virginia, and the breakdown of toxic chemicals from exterior, epoxy pipe coating exposed to soil moisture and groundwater could contribute to further environmental degradation. All of these contamination problems affect communities downstream.	See response IND-4f in appendix I.3. EarthGuard Edge pellets contain linear polyacrylamide (PAM) which is synthetic soil stabilizer. According to the VADEQ Erosion and sediment Control Handbook and NCDEQ Erosion and Sediment Control Planning and Design Manual, synthetic soil stabilizers are identified as an option for use in conjunction with mulch as a best management practice for soil stabilization. According to the manufacturer, EarthGuard Edge is non-toxic, 100 percent biodegradable, and meets National Sanitation Foundation (NSF) drinking-water standards.
IND-37j	5. A decision on the 404 permit for dredged or fill material into waters of the U.S. is forthcoming.	Comment noted. Mountain Valley would be required to acquire all necessary federal permits prior to commencing construction.
IND -37k	**4.4. WETLANDS.** • Permanent impact to 10 acres of forested wetlands We cannot afford to lose more wetlands. Intact wetlands are important for biodiversity and provide benefits that improve water quality by slowing water flow, act as a carbon sink, filter pollution, and can be a destination for wildlife enthusiasts that enjoy being in nature.	Comment noted. Section 4.4.2 discusses impacts to wetlands.

IND-37	Jeannie Ambrose	
IND-37l	**4.5. VEGETATION.** Permanent impacts: • 615 acres of forested upland • ~12 acres of protected riparian forested lands in the Jordan Lake 1. As stated in the DEIS, ~39 miles of the pipeline route would be constructed adjacent to existing rights-of-ways. Over a 1/3 of the ~74 mile-long pipeline route is forested. Green field construction would lead to deforestation and destruction of natural habitats. Loss of vegetation can increase the speed of water flowing across surfaces into waterways. 2. Habitat fragmentation can result in the loss of natural plant communities that support wildlife.	Interior forests, habitat fragmentation, and impact to wildlife are discussed in detail in section 4.5.4.3 and 4.6.1.1of the EIS.
IND-37m	3. Easements can act as corridors for dispersal and spread of invasive species. Routine maintenance to control growth of weeds and trees in R-O-Ws may require toxic chemical application that can contaminate the water and/or the soil.	As detailed in section 4.5.4.1, Mountain Valley would follow measures outlined in its Exotic and Invasive Plant Species Control Plan.
IND-37n	**4.6. WILDLIFE AND FISHERIES.** • 1,439 acres of wildlife habitat will be disturbed. 1. Parts of the NC Forest Legacy Areas, Piedmont Land Conservancy Easements in NC, and Virginia Forest Bloc Complex Important Bird Area could be affected. 2. Pipeline crossings occur at 21 perennial water bodies with fisheries of special concern with 8 in Virginia and 13 in NC	Impacts and mitigation to wildlife and fisheries are described throughout section 4.6 of the EIS.
IND-37o	**4.7. THREATENED, ENDANGERED, AND OTHER SPECIES.** 1. Greater riparian buffers are needed if rare species are present. 2. The constant noise and light of a compressor station, running 24/7, negatively affects both people and wildlife populations especially in rural areas. 3. As many as 20 threatened and endangered species of birds like the bald eagle and northern bobwhite. The Roanoke logperch and other fish, mussels and plants could be affected by land disturbance and loss of habitat.	See section 4.7 of the EIS for a discussion of impacts to listed species. See also response T&E-1, T&E-2, and NOISE-1 in appendix I.2.
IND-37p	**4.8. LAND USE, SPECIAL INTEREST AREAS, AND VISUAL IMPACTS.** • 1,300 acres of land disturbance during construction • 452 acres for pipeline operation 1. There may be limited/restricted practical land use for landowners along clear-cut 125-feet easements. 2. The future use of property passed to heirs may be limited.	See response LU-1 in appendix I.2.
IND-37q	**4.9. SOCIOECONOMICS.** *Our streams are too important to our economy & community to risk them to polluting companies.* 1. The economic benefits from any jobs and spending are often short-term gains, ending after the construction phase is completed. It is expected that as few as six permanent jobs in each state of VA & NC will be created. 2. Property values will be reduced by over 10% along the proposed pipeline route. 3. Local governments and residents may eventually bear the brunt of remediation costs for any damages and cleanups not covered by the company. 4. Utility customers should not end up paying for the buildup of unneeded utility infrastructure. MVP should be held accountable for stranded assets. 5. Communities have invested in marketing outdoor recreation to increase tourism. Construction along water bodies detracts from the natural beauty and aesthetics that visitors want to experience.	Socioeconomics are discussed in section 4.9 o f the EIS. See also responses SOCIO-1, SOCIO-6, and SOCIO-2 in appendix I.2.

IND-37	Jeannie Ambrose	
IND-37r	**4.10. CULTURAL RESOURCES.** To protect their natural and cultural resources from potential risks, the Alamance Co. commissioners unanimously voted in 2018 on a resolution against the proposed 20-mile extension into their county. 1. While the survey process for culture resources is being completed, damage to potential archeological sites and historic structures could occur. 2. What mitigation measures would be taken and when would they be completed?	See response CULT-1 in appendix I.2. Section 4.10 of the EIS has been updated with additional information regarding cultural resource surveys and consultations.
IND-37s	**4.11. AIR QUALITY AND NOISE.** Poor air quality is a significant global public health concern. CO, NO_X, volatile organic compounds, coarse and fine particulates, hazardous air pollutants and greenhouse gases are emitted from diesel engines and released from the proposed compressor station. Human exposure to these harmful air pollutants can exacerbate pre-existing health conditions in certain sensitive populations and cause cardiovascular and respiratory problems over time in others.	See response AIR-2 in appendix I.2.
IND-37t	**4.12. RELIABILITY AND SAFETY.** 1. The event of a pipeline emergency may be rare but it can be catastrophic when pipelines rupture, leak, or explode causing loss of life and property [as in Durham, NC, this year]. The pipeline route would mostly run through Class 1 population density areas. Lower safety standards are specified for Class 1: thinner walled pipes and fewer shut-off valves or manual shut-off valves. I live in close proximity to the boundary of the "blast" or "incineration" zone and receive periodic leak recognition and response safety notices. When the gas transmission pipeline was installed in our rural area decades ago, we were classified as Class 1. Since that time, the density of residential homes has increased but I have not been notified of any pipeline upgrades. Are we now at greater risk as this buried pipeline ages? Does the local emergency response team have the expertise and equipment to safely handle a hazardous pipeline accident? Currently, the local fire department has been able to contain but not extinguish a smoldering fire in a nearby development. 2. FERC's DEIS for the MVP-SG assumes that the adverse impacts of pipeline construction will have on natural and cultural resources can be minimized or avoided by following its recommended mitigation plans or procedures. There is no assurance that this is likely based on the hundreds of state and federal water quality violations already reported for the construction work done by the Mountain Valley Pipeline contractors in Virginia and West Virginia. 3. Restoring and maintaining the health of the environment "when practical" are unacceptable responses from the contractors.	See section 4.12 of the EIS for discussion on reliability and safety. See also SAFE-1, SAFE-2, SAFE-3, and GEN-6.
IND-37u	**4.13. CUMULATIVE IMPACTS.** There are information gaps from cooperating federal and state agencies that are not able to submit their survey findings until after the public comment period. Their results would add more evidence for all the environmental threats this pipeline extension poses. This documentary material is needed to fully assess cumulative environmental impacts. Land disturbances can contribute to cumulative impacts associated with the Project's pipeline construction that are detrimental to natural ecosystems and future land use.	See response CI-1 in appendix I.2.

IND-37	Jeannie Ambrose	
	5.0. CONCLUSIONS OF THE DEIS. *We conclude that approval of the Project would result in some adverse environmental impacts, but these impacts would be reduced to less-than-significant levels through implementation or our recommendations and Mountain Valley's proposed avoidance, minimization, and mitigation measures.*	
IND-37v	1. What are these mitigation measures? 2. How will these measures prevent significant environmental impacts?	See response GEN-9 in appendix I.2.
IND-37w	**POINTS NOT INCLUDED IN DEIS.** 1. DEIS fails to fully assess all the environmental threats to our natural resources from the construction and operation of the proposed Southgate project.	See response GEN-4 in appendix I.2.
IND-37x	2. A review of a no-action alternative is missing. For example, what economic benefits could come from improving the energy efficiency of the existing infrastructure? Are there safer and more cost-effective ways to meet our energy needs that can both reduce our dependence on fossil fuels and provide more permanent jobs in our communities.	Section 3.2 discusses the No Action Alternative. See also response ALT-2 in appendix I.2.
IND-37y	3. Assessment of environmental justice issues and demographics on health disparities from pollution exposure in local communities are not provided (e.g. Green Level's Black community). 4. Methane is a component of natural gas and a more potent greenhouse gas than carbon dioxide contributing to the global climate crisis. The assumption that another pipeline is needed to transport fracked gas produced in the Marcellus and Utica shale regions to meet energy demands in NC is questionable. We face an uncertain future if GHG emissions continue at the current rate or begin to accelerate even faster. The rising economic cost of more frequent and intense weather extremes are already being felt. Investing in natural gas infrastructure prolongs our dependence on fossil fuels and away from a sustainable future. The burning of fossil fuels is emerging as a driving force in altering the Earth's atmospheric chemistry.	The Green Level Community is not crossed by the Project. Air quality impacts on public health are discussed in detail in section 4.11.1.7. Additionally, potential air quality impacts on vulnerable populations are discussed in section 4.9.8 of the EIS. See the revised Socioecomic section 4.9.8 for further information on Environmental justice
IND-37z	Reject the MVP's application request for the Southgate expansion for all these reasons. Thank you for the opportunity to submit public comments to communicate our concerns. Jeannie Ambrose Pittsboro, NC 27312	Climate change and greenhouse gas impacts are discussed in section 4.13.2.9. See also response CI-1 in appendix I.2.

IND-41	Katie Whitehead

Docket No. CP19-14-000 - MVP Southgate Project Draft Environmental Impact Statement

Follow-up Comments (per FERC staff recommendation)

Regarding Co-location of the Proposed MVP Southgate Pipeline and Existing Williams Transco Pipelines

Submitted November 17, 2019 by Katie Whitehead

It's generally understood that FERC Commissioners are responsible for determining whether a proposed interstate pipeline project meets a critical public need that justifies taking private land. But Commissioners should also be accountable for what land along a proposed pipeline route is truly needed. Pipeline companies should not be granted the power of eminent domain and the authority to impose damaging environmental impacts on any more land than is necessary for pipeline construction and maintenance. Companies routinely tout the benefits of co-location, as if co-location automatically minimizes environmental impact. As currently proposed, MVP Southgate does not use co-location to minimize environmental impact.

In response to my September 16 comment on the DEIS, FERC asked Mountain Valley for additional information on Resource Report 10 - Alternatives 49.a. and referred Mountain Valley to my comment. Mountain Valley responded, but only partially. When I pointed this out to FERC project manager Amanda Mardiney, she recommended that I submit a follow-up comment to the FERC docket restating my requests and concerns and clarifying that my comment applies beyond one alignment sheet and my family's property. Due diligence requires that FERC address co-location on all affected properties and revisit the temporary workspace width on all properties.

The alignment sheet copied below, showing the proposed MVP Southgate route and construction areas on my family's tree farm, is an example of co-location of MVP Southgate with the existing Williams Transco right of way through Pittsylvania County, VA and into Rockingham County, NC. We would appreciate further efforts by FERC to minimize environmental impact on our family's tree farm. The same effort should be applied to all properties targeted for co-location on the MVP Southgate route.

Location of Williams Transco Pipelines

If one zooms in to about 300% on the alignment sheet on page four below, one may be able to make out the small print and thin lines identified in the legend.

The map shows the "EXISTING PIPELINE" (labeled "Williams Transco Pipeline") as a single broken black line with vertical bars located near the proposed "WORK SPACE LIMITS" indicated by a broken red line. The single broken black line with vertical bars, in fact, marks the SE boundary of the Williams Transco ROW, a 155' corridor containing four pipelines, a fiber optic cable, and an electric cable. The nearest Williams Transco Pipeline (D-Line) is 40' from the line shown on the map. Not all co-location properties have four Williams Transco pipelines (some have three) or a 155' ROW (many are undefined); nevertheless, the same error occurs on other alignment sheets: the single broken black line with vertical bars is far from the actual location of the closest Williams Transco gas line.

The red cloud-like outline along the bottom of the map appears to indicate an access road on the Williams Transco ROW and work area that were eliminated from the project on our property. We are grateful that Mountain Valley cancelled this part of its plan.

Width of Temporary Workspace

According to MVP's October 18 response, "The Project offers to reduce temporary workspace from 100 feet to 75 feet for the entire distance on this property due to the sensitivity of tree clearing." We are grateful for this offer. Such a reduction would seem appropriate for other properties on the MVP Southgate route, as well. We encourage FERC scrutiny of the full length of the Southgate project.

Need for Metes and Bounds - Where does Mountain Valley propose locating the Southgate pipeline?

In its response to FERC, Mountain Valley did not respond to my inquiry and request regarding where the company proposes locating the Southgate pipeline. Mountain Valley has never indicated precisely where its proposed temporary or permanent ROWs would be located on the ground and in relation to the Williams Transco gas lines. As far as I can tell, **no metes and bounds are provided on the alignment sheets or anywhere else.** This concern relates to my family's property and to all other properties targeted for co-location.

IND-41a	See response IND-36c.
IND-41b	Mountain Valley was able to make this adjustment due to the route, topography, and presence of other environmental features specific to this property. Mountain Valley has reduced workspace in many other locations along the project for multiple reasons, including per the request of landowners through collaborative negotiations.
	Information such as metes as bounds would be included in exhibits prepared for the easement package for land acquisition.

IND-41	Katie Whitehead	
IND-41d	**Distance between Pipelines – What does Mountain Valley propose?** Mountain Valley originally proposed a distance of 80' between the two companies' gas lines and a 15' permanent gap between the two companies' ROWs on our land. (!) Mountain Valley's offer "to reduce temporary workspace from 100 feet to 75 feet for the entire distance on this property" provides no information about the distance between the pipelines or the distance (if any) between the two companies' permanent ROWs. **True Co-location – FERC's Responsibility** My September 16 comment pointed to the appropriateness of reducing the space between the Williams Transco D-Line and the proposed MVP Southgate line to the minimum necessary for safety purposes. **Please ask Mountain Valley to locate its pipeline the standard 25' minimum distance from the existing pipeline, measured from the center of Williams Transco D-Line as illustrated on page five.** • There is approximately 25' between the existing Williams Transco pipelines and cables, which I understand is standard industry practice. • There is no need for more than 25' between the nearest existing Williams Transco line and the MVP Southgate line. I understand that some large gas pipelines are 15' apart. • Williams Transco has a 40' buffer next to its existing D-Line on my family's land. Though this might appear to be space Williams Transco could reserve for a fifth line, it isn't – because the company does not have comparable space on other properties. • I've been told that neither Williams Transco nor Mountain Valley would want the other company to install a pipeline between the existing Williams Transco line and the Southgate line. If there were 25' between the two lines, this would not be an issue. Both companies would be protected. • Using the UNUSED portion of the Williams Transco ROW would significantly reduce environmental impact of MVP Southgate and preserve silviculture. Reducing Mountain Valley's originally proposed 80' distance between the pipelines to 25' would greatly reduce the number of trees to be clear-cut and the permanent loss of silviculture. True co-location could greatly reduce environmental, economic, and other impacts on landowners - both during construction and long-term. FERC Commissioners cannot claim that taking private land is justified if they fail to require true co-location.	See response IND-36c. Alignment sheets note a distance of 50 feet between Transco's pipeline and the proposed Southgate pipeline. placing separate pipelines from differing operators less than 50 feet from one another creates safety concerns and operational difficulties. 50 feet of spacing is the INGAA standard for parallel pipeline facilities. Mountain Valley would use workspace within the Transco permanent right-of-way easement temporarily for spoil storage during construction based on arrangements with Transco. Typical drawings of the Project configuration are provided in Appendix B.2 of the EIS. Standard distances between utilities have been maintained by Mountain Valley as depicted in the Project alignment drawings.
IND-41e	**Spillway – Not Mentioned in Previous Comment** I did not mention in my September 16 comment the mislabeling of a "stream," visible on the alignment sheet at approximately MP4.8. The Williams Transco ROW crosses the spillway for the small lake shown in the aerial view. With the heavy rains of 2018 the spillway was, at times, a stream. We are in negotiation with Williams Transco regarding restoration and maintenance of the spillway.	The spillway is identified as S-E18-4, a surface water feature with intermittent flow on the alignments and in appendix B.5. This feature would be treated as a surface water crossing during construction.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Neil Chatterjee, Chairman;
Richard Glick, Bernard L. McNamee,
and James P. Danly.

Mountain Valley Pipeline, LLC Docket No. CP19-14-000

ORDER ISSUING CERTIFICATE

(Issued June 18, 2020)

1. On November 6, 2018, Mountain Valley Pipeline, LLC (Mountain Valley) filed an application pursuant to section 7(c) of the Natural Gas Act (NGA)[1] and Part 157 of the Commission's regulations[2] for authorization to construct and operate approximately 75.1 miles of natural gas pipeline and associated aboveground facilities in Pittsylvania County, Virginia, and Rockingham and Alamance Counties, North Carolina (Southgate Project). The Southgate Project is designed to provide up to 375,000 dekatherms (Dth) per day of firm transportation service.

2. For the reasons discussed below, we will grant the requested authorizations, subject to the conditions described herein.

I. Background

3. Mountain Valley,[3] a Delaware limited liability company, does not currently provide any services subject to the Commission's jurisdiction. On October 13, 2017, the Commission issued a certificate of public convenience and necessity authorizing Mountain Valley to construct and operate a new 303.5-mile-long, 42-inch-diameter interstate pipeline system to provide up to 2,000,000 Dth per day of firm natural gas transportation service from Wetzel County, West Virginia, to an interconnection with Transcontinental Gas Pipe

[1] 15 U.S.C. § 717f(c) (2018).

[2] 18 C.F.R. pt. 157 (2019).

[3] Five companies own Mountain Valley: (1) EQM Midstream Partners, LP (45.5%); (2) NextEra Energy (31%); (3) Con Edison Transmission, Inc. (12.5%); (4) WGL Midstream (10%); and (5) RGC Midstream, LLC (1%).

Line, LLC's (Transco) Compressor Station 165 in Pittsylvania County, Virginia (Mainline System).[4]

4. In early 2018, Commission staff authorized Mountain Valley to commence construction of the Mainline System, and, in February 2018, Mountain Valley commenced construction.[5] On July 27, 2018, the U.S. Court of Appeals for the Fourth Circuit issued an order vacating authorizations issued by the Department of the Interior's Bureau of Land Management (BLM) and the Department of Agriculture's Forest Service (Forest Service) for the Mainline System.[6] Thereafter, on August 3, 2018, Commission staff issued a Notification of Stop Work Order for the Mainline System.[7] Subsequently, on August 29, 2018, Commission staff authorized partial construction to resume based on staff's assessment that completing construction and restoration as quickly as possible would best protect the environment.[8]

5. On October 3, 2018, Mountain Valley informed the Commission that the U.S. Court of Appeals for the Fourth Circuit had issued an order vacating the U.S. Army Corps of Engineers (Army Corps) Huntington District's Nationwide Permit 12 for the project, and that it was suspending construction in waters of the United States in the

[4] *Mountain Valley Pipeline, LLC*, 161 FERC ¶ 61,043 (2017), *order on reh'g*, 163 FERC ¶ 61,197 (2018) (*Mountain Valley*), *aff'd sub nom.*, *Appalachian Voices v. FERC*, No. 17-1271, 2019 WL 847199 (D.C. Cir. Feb. 19, 2019).

[5] *See* Mountain Valley's Weekly Status Report Nos. 14 and 15 (filed February 7 and 15, 2018, respectively, in Docket No. CP16-10-000) (construction did not commence until after February 2, 2018).

[6] *Sierra Club, Inc. v. U.S. Forest Serv.*, 897 F.3d 582 (4th Cir. 2018) (vacating the permit for the pipeline to cross 3.6 miles of the Jefferson National Forest in West Virginia and Virginia).

[7] *Mountain Valley Pipeline, LLC*, Notification of Stop Work Order, Docket No. CP16-10-000 (August 3, 2018) (delegated order).

[8] *Mountain Valley Pipeline, LLC*, Partial Authorization to Resume Construction, Docket No. CP16-10-000 (August 29, 2018) (delegated order) (allowing construction except for the area containing the 3.5 miles of pipeline route across the Jefferson National Forest, in Monroe County, West Virginia and Giles County, Virginia, between milepost 196.0 and milepost 221.0).

Army Corps' Huntington District.[9] Subsequently, Mountain Valley notified the Commission that the Army Corps' Norfolk and Pittsburgh Districts had suspended their nationwide permits issued for the Mainline System, and that, consequently, Mountain Valley was suspending construction in waters of the United States in those Army Corps districts as well.[10]

6. On August 15, 2019, Mountain Valley voluntarily suspended new construction activities in certain watersheds to avoid potential impacts on listed threatened and endangered aquatic species.[11] On August 28, 2019, the Commission requested that the U.S. Fish and Wildlife Service (FWS) reinitiate consultation under section 7 of the Endangered Species Act (ESA) with respect to the Mainline System project.

7. On October 11, 2019, the United States Court of Appeals for the Fourth Circuit issued an order granting a stay of the FWS's 2017 Biological Opinion and Incidental Take Statement (Biological Opinion) issued for the Mainline System and granting the Department of the Interior's motion to hold the litigation in abeyance until completion of reinitiated ESA consultation.[12] In response to the court's stay of the 2017 Biological Opinion, the Director of the Office of Energy Projects notified Mountain Valley that it

[9] Mountain Valley's October 3, 2018 Letter, Docket No. CP16-10-000 (providing opinion of the U.S. Court of Appeals for the Fourth Circuit, *Sierra Club v. U.S. Army Corps of Eng'rs*, 905 F.3d 285 (4th Cir. 2018)).

[10] Mountain Valley's October 9 and 22, 2018 Letters, Docket No. CP16-10-000 (providing the Army Corps' Norfolk and Pittsburg Districts' notices suspending authorization, respectively).

[11] Mountain Valley's August 15, 2019 Voluntary Suspension Letter, Docket No. CP16-10-000 (suspending work within mileposts 107.5-122.5, 196.3-201.8, and 218.6-293.3). The FWS issued a Biological Opinion for the Mainline System on November 21, 2017. Since issuance of the Biological Opinion, the candy darter, which is known to inhabit streams in the project area, was listed as endangered by the FWS. New information on the possible effects of the Mainline System on certain species covered by the Biological Opinion (i.e., Roanoke logperch, Indiana bat, and Northern long-eared bat) has also been identified in the interim (e.g., new information regarding impacts from sedimentation and slips).

[12] *Wild Virginia v. Department of the Interior*, Order, 4th Cir. No. 19-1866 (Oct. 11, 2019) (order granting stay and holding case in abeyance). On September 11, 2019, the FWS accepted the Commission's August 28, 2019 request to reinitiate consultation pursuant to section 7 of the ESA regarding impacts to certain species covered in the 2017 Biological Opinion (i.e., the candy darter, Roanoke logperch, Indiana bat, and Northern long-eared bat).

must cease all construction activity along the entirety of the Mainline System and in all work areas except for restoration and stabilization activities.[13] At that time, Mountain Valley had completed construction (trenched, installed, and backfilled the pipeline) on about 78% of the Mainline System right-of-way and final restoration on about 51% of the Mainline System.

8. Currently, Mountain Valley is not authorized to recommence construction of the Mainline System, as reinitiated ESA consultation is ongoing. In addition, Mountain Valley cannot construct the portion of the Mainline System that crosses the Jefferson National Forest in West Virginia and Virginia, or that is in waters of the United States subject to the Army Corps' Nationwide Permit 12.

9. While we are authorizing the Southgate Project with this order, we are directing the Office of Energy Projects to not issue any notice to proceed with construction[14] of the Southgate Project until Mountain Valley receives the necessary federal permits for the Mainline System, and the Director of the Office of Energy Projects, or the Director's designee, lifts the stop-work order and authorizes Mountain Valley to continue constructing the Mainline System.

10. Upon commencing operations on its Mainline System, Mountain Valley will become a natural gas company within the meaning of section 2(6) of the NGA.[15]

II. Southgate Project Proposal

11. Mountain Valley proposes to construct and operate the Southgate Project to provide up to 375,000 Dth per day of firm transportation service from an interconnect approximately 0.1 mile upstream of the terminus of the Mainline System in Pittsylvania County, Virginia, to Dominion Energy North Carolina's (Dominion)[16] local distribution

---

[13] *Mountain Valley Pipeline LLC*, Cessation of Certain Activities, Docket No. CP16-10-000 (October 15, 2019) (delegated order).

[14] Construction activities include tree-clearing. *See, e.g.*, *PennEast Pipeline Co., LLC*, 164 FERC ¶ 61,098, n.136 (2018) ("PennEast is prohibited from commencing construction, including any tree clearing activities . . . .").

[15] 15 U.S.C. § 717(a)(6) ("a 'natural gas company' means a person engaged in the transportation of natural gas in interstate commerce . . . .").

[16] Dominion is a local distribution company primarily engaged in the purchase, transportation, distribution, and sale of natural gas to customers in North Carolina. Following a January 2, 2019 merger, Dominion Energy, Inc. acquired the Public Service Company of North Carolina and changed the company name to Dominion Energy North

facilities, via the Dan River Interconnect and the Haw River Interconnect in Rockingham and Alamance Counties, North Carolina, respectively. The proposed project will provide Dominion access to natural gas produced in the Marcellus and Utica shale regions, and a connection to East Tennessee Natural Gas, LLC's (East Tennessee) pipeline system.[17] Specifically, Mountain Valley proposes to construct:

- approximately 0.5 mile of 24-inch-diameter natural gas pipeline in Pittsylvania County, Virginia;
- approximately 30.7 miles of new 24-inch-diameter natural gas pipeline in Pittsylvania County, Virginia, and Rockingham County, North Carolina;
- approximately 43.9 miles of new 16-inch-diameter natural gas pipeline in Rockingham and Alamance Counties, North Carolina;
- one new 28,915-horsepower compressor station, including two natural gas-fired turbine-driven compressor units, in Pittsylvania County, Virginia (Lambert Compressor Station);
- four new interconnects and associated meter stations, enabling the Southgate Project to receive natural gas from Mountain Valley's Mainline System (Mainline Interconnect) and East Tennessee's LN 3600 (East Tennessee Interconnect),[18] and to deliver natural gas to Dominion's T-15 Dan River facilities (Dan River Interconnect) and T-21 Haw River facilities (Haw River Interconnect); and

Carolina. For ease of reference, we will refer to the project shipper as Dominion throughout.

[17] Currently, Dominion accesses gas it stores in Spectra Energy Partner's Saltville Storage facility, which is located on East Tennessee's pipeline system, through secondary firm backhaul transportation on Transco's pipeline system to Dominion's local distribution system. The Southgate Project would provide Dominion with a primary receipt and delivery forward haul transportation path between East Tennessee's system and Dominion's local distribution system.

[18] The project will provide for the receipt of 250,000 Dth per day of natural gas from the Mainline System and 50,000 Dth per day of natural gas from the East Tennessee Interconnect.

- ancillary facilities including pig launchers and receivers,[19] mainline block valves, and cathodic protection beds.

Mountain Valley estimates that the Southgate Project will cost approximately $468 million.[20]

12. Mountain Valley conducted a binding open season for firm transportation service from April 11 through May 11, 2018. As a result, Mountain Valley executed a binding precedent agreement with Dominion for 300,000 Dth per day of firm transportation on the project. The precedent agreement requires Dominion to execute a 20-year term firm transportation service agreement. Dominion has elected to pay negotiated rates.

13. Mountain Valley proposes to provide Firm (Rate Schedule FTS), Interruptible (Rate Schedule ITS), and Interruptible Parking and Lending (Rate Schedule ILPS) transportation services under a separate rate zone called the Southgate System.

III. Procedural

A. Notice, Interventions, Protests, and Comments

14. Notice of Mountain Valley's application was published in the *Federal Register* on November 26, 2018.[21] A number of timely motions to intervene were filed.[22] Robert McNutt, Mark Ruffin, Renee Womack, the Sappony Tribe, and the Monacan Indian Nation filed late motions to intervene, which were granted by notice issued on April 23, 2019. On January 31, 2020, Transco filed a late motion to intervene, which was denied by notice issued on April 6, 2020.[23]

---

[19] A "pig" is a device used to clean or inspect the interior of a pipeline.

[20] Mountain Valley's November 6, 2018 Application, Exhibit K at 1 (Application).

[21] 83 Fed. Reg. 60,420 (Nov. 26,2018).

[22] Timely, unopposed motions to intervene and notices of intervention are granted by operation of Rule 214 of the Commission's Rules of Practice and Procedure. 18 C.F.R. § 385.214(c)(1) and 385.214(a)(2) (2019). Timely motions to intervene include those filed dealing with environmental issues during the comment period for the draft environmental impact statement (EIS). *See id*. § 380.10(a)(1)(i). Because Bobby Pulliam, Eleanor Amidon, Food and Water Watch, and the City of Burlington filed motions to intervene during the comment period for the draft EIS, their motions are deemed timely.

[23] Mountain Valley filed an answer in opposition to Transco's request to intervene out-of-time on February 14, 2020. On February 28, 2020, Transco filed an answer to Mountain Valley's answer. Because Transco's motion to intervene late was denied, we

15. The North Carolina Utilities Commission (North Carolina Commission) protests Mountain Valley's proposed recourse rates for the Southgate Project because it contends that the two largest components of the proposed rates – the return on equity (ROE) and the depreciation rate – are not adequately supported.[24] The Appalachian Mountain Advocates, Appalachian Voices, the Center for Biological Diversity, the Chesapeake Climate Action Network, the Haw River Assembly, and the Sierra Club (collectively, Appalachian Mountain Advocates) jointly filed a protest in opposition to the project in its entirety, asserting that the project is not needed and is likely to adversely impact a range of environmental resources.[25] We will discuss the merits of these protests below.[26]

16. Numerous entities, including landowners and individuals, filed comments raising concerns over the environmental impacts of the project. These comments are addressed in the final Environmental Impact Statement (EIS) and, as appropriate, below. In addition, the North Carolina Economic Development Association and the North Carolina Chamber filed comments in support of the Southgate Project based on the project's job creation benefits; the final EIS addressed these comments.

B. Answers

17. Mountain Valley and Dominion filed answers to the North Carolina Commission's and the Appalachian Mountain Advocates' protests.[27] Although the Commission's Rules of Practice and Procedure do not permit answers to protests or answers to answers, we find good cause to waive our rules and accept the answers because they provide information that has assisted in our decision-making process.[28]

---

consider Transco's filings as comments and Mountain Valley's response as an answer to them; accordingly, concerns raised in the filings are addressed below in the environmental analysis section.

[24] North Carolina Commission's December 10, 2018 Notice of Intervention and Protest at 4 (North Carolina Commission Protest).

[25] Appalachian Mountain Advocates' December 10, 2018 Motion to Intervene and Protest at 7-8 (AMA Protest).

[26] *See infra* PP 29-51 (project need) and 53-64 (recourse rates).

[27] Dominion's December 28, 2018 Answer (Dominion Answer); Mountain Valley's January 8, 2019 Answer (Mountain Valley Answer).

[28] *See* 18 C.F.R. § 385.213(a)(2).

C. Requests for Formal Hearing

18. The North Carolina Commission and Appalachian Mountain Advocates request a formal hearing on Mountain Valley's Southgate Project application that would address, respectively, whether Mountain Valley's proposed recourse rates comply with Commission policy,[29] and whether the project is needed.[30]

19. An evidentiary, trial-type hearing is necessary only where there are material issues of fact in dispute that cannot be resolved on the basis of the written record.[31] Neither the North Carolina Commission nor Appalachian Mountain Advocates have raised a material issue of fact that the Commission cannot resolve on the basis of the written record. As demonstrated by the discussion below, the existing written record provides a sufficient basis to resolve the issues relevant to this proceeding. The Commission has satisfied the hearing requirement by giving all interested parties a full opportunity to participate through evidentiary submission in written form.[32] Therefore, we will deny the North Carolina Commission's and the Appalachian Mountain Advocates' requests for a formal hearing.

D. Request for Technical Conference

20. In comments filed March 27, 2020, Transco requests a technical conference to allow it to explain "its safety, integrity, and operational concerns" regarding the portion of the proposed Southgate Project that would be collocated with Transco's existing pipeline right-of-way.[33] In a response filed May 8, 2020, Mountain Valley asserts that a technical conference is not necessary where, as is the case here, the questions raised can be resolved through the written record.[34] Mountain Valley responds to Transco's general concerns regarding construction practices in the collocated segments, and maintains it is more appropriate for Mountain Valley and Transco to work together to discuss and

[29] *See* North Carolina Commission Protest at 16-17.

[30] *See* AMA Protest at 15-16.

[31] *See, e.g., Southern Union Gas Co. v. FERC*, 840 F.2d 964, 970 (D.C. Cir. 1988); *Dominion Transmission, Inc.,* 141 FERC ¶ 61,183, at P 15 (2012).

[32] *Moreau v. FERC*, 982 F.2d 556, 568 (D.C. Cir. 1993).

[33] *See* Transco's March 27, 2020 Comments at 3.

[34] *See* Mountain Valley's May 8, 2020 Comments at 1-2.

resolve engineering and technical issues related to construction and operation of their collocated pipelines than to hold a conference.[35]

21. Because the merits of this matter can be adequately addressed based on the information in the record in this proceeding, we find no need to convene a technical conference. Transco's concerns regarding collocation of the Southgate Project pipeline with Transco's existing right-of-way are discussed further in the environmental section of this order.[36]

IV. Discussion

22. Because the proposed facilities will be used to transport natural gas in interstate commerce, subject to the jurisdiction of the Commission, the construction and operation of the facilities are subject to subsections (c) and (e) of the NGA.

A. Application of the Certificate Policy Statement

23. The Certificate Policy Statement provides guidance for evaluating proposals to certificate new construction.[37] The Certificate Policy Statement establishes criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explains that, in deciding whether to authorize the construction of new pipeline facilities, the Commission balances the public benefits against the potential adverse consequences. The Commission's goal is to appropriately consider the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain in evaluating new pipeline construction.

24. Under this policy, the threshold requirement for existing pipelines proposing new projects is that the pipeline must be prepared to financially support the project without relying on subsidization from existing customers. The next step is to determine whether the applicant has made efforts to eliminate or minimize any adverse effects the project might have on the applicant's existing customers, existing pipelines in the market and their captive customers, or landowners and communities affected by the proposed route

[35] *See id*. at 2.

[36] *See infra* PP 127-133.

[37] *Certification of New Interstate Natural Gas Pipeline Facilities*, 88 FERC ¶ 61,227; *corrected,* 89 FERC ¶ 61,040 (1999), *clarified*, 90 FERC ¶ 61,128; *further clarified*, 92 FERC ¶ 61,094 (2000) (Certificate Policy Statement).

or location of the new pipeline facilities. If residual adverse effects on these interest groups are identified after efforts have been made to minimize them, the Commission will evaluate the project by balancing the evidence of public benefits to be achieved against the residual adverse effects. This is essentially an economic test. Only when the benefits outweigh the adverse effects on economic interests will the Commission proceed to complete the environmental analysis where other interests are considered.

1. Subsidization and Impacts on Existing Customers

25. As discussed above, the threshold requirement is that the applicant must be prepared to financially support the project without relying on subsidization from its existing customers. Mountain Valley proposes to establish a separate rate zone for service on the Southgate Project. The design of the Southgate Project allows only for the physical flow of gas from the Mainline System to the Southgate Project facilities. [38] Thus, the Southgate System rates will apply to all facilities downstream of the Mainline System (i.e., the Lambert Compressor Station, the Mainline Interconnect, the East Tennessee Interconnect, the Haw River Interconnect, and the Dan River Interconnect). Mountain Valley has designed the initial recourse rates for the Southgate System as a separate rate zone to ensure that the cost of the project, and the risks inherent in it, are borne by Mountain Valley and the Southgate Project customers, and not its Mainline System customers. Therefore, once operation of the Mainline System commences, there would be no risk that existing Mainline System customers would be subsidizing service on the Southgate Project, and no degradation of service to those customers.

2. Existing Pipelines and Their Customers

26. We find that there will be no adverse impact on other pipelines in the region or their captive customers. The Southgate Project will provide up to 375,000 Dth per day of incremental firm transportation service in North Carolina and southern Virginia. No transportation service provider or captive customer has protested this project.[39] Therefore, we find that the Southgate Project will have no adverse impact on existing pipelines or their captive customers.

3. Landowners and Communities

27. We are satisfied that Mountain Valley has taken appropriate steps to minimize adverse impacts on landowners. As discussed in greater detail in the final EIS and below, Mountain Valley's proposed project will disturb approximately 1,466 acres of land

[38] Application at 15.

[39] In PP 128–133 below, we address Transco's comments regarding the collocation of the Southgate pipeline with Transco's mainline.

during construction, and approximately 450 acres of land during operation.[40] Mountain Valley participated in the Commission's pre-filing process and has actively worked with local stakeholders, including homeowners and landowners, as well as with federal and state agencies, to develop the proposed pipeline route, culminating in more than 190 route adjustments and the elimination of a second compressor station that had originally been proposed in pre-filing to be located near milepost 26 in North Carolina.[41] Mountain Valley obtained permission to survey, and completed field surveys of, approximately 96% of the route[42] and has committed to minimizing the use of eminent domain to the greatest extent possible by negotiating easement agreements for the permanent and temporary easements necessary to construct and operate the project.[43] Approximately 49% (i.e., 36.8 miles) of the proposed pipeline route would be collocated with existing utility corridors and rights-of-way.[44]

28. Several commenters question the appropriateness of granting private pipeline companies the power of eminent domain, and request that the Commission not grant Mountain Valley that authority. The Commission itself does not confer the right of eminent domain. Under NGA section 7, the Commission has jurisdiction to determine if the construction and operation of proposed interstate pipeline facilities are in the public convenience and necessity. Once the Commission makes that determination, NGA section 7(h) authorizes a certificate holder to acquire the necessary land or property to construct the approved facilities by exercising the right of eminent domain if it cannot

[40] Final EIS at 4-114 (Table 4.8-1).

[41] Application at 12.

[42] Final EIS at 1-3.

[43] Application at 11.

[44] Final EIS at 2-3.

acquire the easement by an agreement with the landowner.[45] Thus, the NGA, not the Commission, grants certificate holders the right to take property by eminent domain.[46]

4. Need for the Project

29. Mountain Valley has entered into a long-term, firm precedent agreement with Dominion for 300,000 Dth per day of firm transportation service, 80% of the project capacity.

30. Appalachian Mountain Advocates, the North Carolina Department of Environmental Quality (North Carolina DEQ), Friends of the Central Shenandoah, and various commenters challenge the need for the Southgate Project on several grounds. These parties and commenters maintain that existing infrastructure is available to meet the demand for natural gas in North Carolina, a demand which they believe Mountain Valley overstates, and ask the Commission to evaluate new pipeline infrastructure projects on a regional basis. They also seek heightened scrutiny of Mountain Valley's precedent agreement with the project shipper, Dominion, due to Dominion's former affiliate status.[47]

a. Ability of Existing Infrastructure to Meet Demand

31. Appalachian Mountain Advocates assert that a surplus of pipeline capacity exists when existing pipelines, projects under construction, and applications in the regulatory

[45] 15 U.S.C. § 717f(h) ("When *any holder of a certificate of public convenience and necessity* cannot acquire by contract, or is unable to agree with the owner of property to the compensation to be paid for, the necessary right-of-way . . . it may acquire the same by the exercise of the right of eminent domain . . . .") (emphasis added); *see also Midcoast Interstate Transmission, Inc. v. FERC*, 198 F.3d 960, 973 (D.C. Cir. 2000) (holding that the Commission does not have the discretion to deny a certificate holder the power of eminent domain); *Appalachian Voices v. FERC*, No. 17-1271, 2019 WL 847199 at *2 (noting that eminent domain power is conferred to the certificate holder under section 7(h) of the NGA).

[46] *Islander East Pipeline Co.*, 102 FERC ¶ 61,054, at PP 124-31 (2003).

[47] *Compare* Application at 4 (explaining that on November 6, 2018, Dominion's predecessor owned a 30% interest in the Southgate Project's Series B ownership structure) *and* Mountain Valley's December 20, 2018 Change in Ownership Notification (notifying the Commission that Dominion "no longer has any equity interest in the Southgate Project").

queue are considered as a whole.[48] As in previous Commission proceedings,[49] commenters, including Appalachian Mountain Advocates, Friends of the Central Shenandoah, Blue Ridge Environmental Defense League, and Katie Whitehead, cite to a study by Synapse Energy Economics, Inc. (Synapse Study) that Southern Environmental Law Center and Appalachian Mountain Advocates commissioned, which asserts that existing gas pipeline capacity, existing storage in Virginia and the Carolinas, and the future operation of Transco's Atlantic Sunrise Project and Columbia's WB Xpress Project can satisfy the growing peak demand in that region.[50] The Synapse Study concludes that the natural gas infrastructure capacity of the Virginia and the Carolinas region is more than sufficient to meet expected future peak demand. Appalachian Mountain Advocates and Katie Whitehead also cite to a study by the Institute for Energy Economics and Financial Analysis (IEEFA), which argues, in part, that interstate pipeline infrastructure constructed to ship natural gas from the Marcellus and Utica region is overbuilt.[51] Finally, Appalachian Mountain Advocates cites a Department of Energy

[48] AMA Protest at 11.

[49] *See Atl. Coast Pipeline, LLC*, 161 FERC ¶ 61,042, at P 30 (2017), *order on reh'g*, 164 FERC ¶ 61,100, at PP 53-44 (2018); *Mountain Valley*, 161 FERC ¶ 61,043 at P 37, *order on reh'g*, 163 FERC ¶ 61,197 at PP 45-47.

[50] Synapse Energy Economics, Inc., *Are the Atlantic Coast Pipeline and the Mountain Valley Pipeline Necessary*? An examination of the need for additional pipeline capacity into Virginia and Carolinas, (2016) (filed as Exhibit A of AMA Protest) (Synapse Study). The Commission previously considered the findings of the Synapse Study and found that the study makes an unlikely assumption that all gas is flowed by primary customers along their contracted paths, and fails to consider the use of regional pipeline capacity by shippers outside of Virginia and the Carolinas through interruptible service or capacity release. *Mountain Valley*, 161 FERC ¶ 61,043 at P 41 n.47, *order on reh'g*, 163 FERC ¶ 61,197 at P 47.

[51] Institute for Energy Economics and Financial Analysis, *Risks Associated With Natural Gas Expansion in Appalachia*, *Proposed Atlantic Coast and Mountain Valley Pipelines Need Greater Scrutiny* (Apr. 2016) (filed as Exhibit E of AMA Protest) (IEEFA Study). The Commission previously considered the findings of the IEEFA Study and determined that the study "speaks in generalities" and suggests that pipelines like the proposed project may serve to aid in the delivery of lower-priced natural gas to higher-priced markets – a result which would serve the public interest. *Mountain Valley*, 163 FERC ¶ 61,197 at P 47.

study in support of its argument that, through 2022, pipeline capacity will exceed by over 50% production capacity in the Appalachian Basin.[52]

32. North Carolina DEQ and Appalachian Mountain Advocates argue that, even if capacity needs increase alongside projected population growth, Dominion's capacity needs can be met through its existing contracted capacity.[53] In support of its claim that natural gas demand will only experience a nominal increase in the future, Appalachian Mountain Advocates point to Energy Information Administration (EIA) forecasts that residential use of natural gas will decline by 0.6% per year over the next two decades, while commercial and industrial uses will respectively increase 0.4% and 0.6% per year.[54]

33. Mountain Valley filed its own market demand study (Wood Mackenzie Study),[55] estimating that demand growth for natural gas capacity in the Southeast will reach 8.3 billion cubic feet (Bcf) per day[56] by 2030.[57] The study also posits that much of the gas needed to meet this demand would be from the Marcellus and Utica shale regions, thus requiring additional pipeline capacity.[58] Appalachian Mountain Advocates, Friends

---

[52] AMA Protest at 12 n.4 (quoting U.S. Dep't of Energy, Natural Gas Infrastructure Implications of Increased Demand from the Electric Power Sector (Feb. 2015), http://energy.gov/epsa/downloads/report-natural-gas-infrastructure-implications-increased-demand-electric-power-sector) (DOE Study). The Commission previously considered the findings of the DOE Study and concluded that although the study notes that natural gas companies are increasingly using underutilized capacity on existing pipelines, re-routing natural gas flows, and expanding existing pipeline capacity, the study does not contend that this supplants the need to build new infrastructure. *Mountain Valley*, 161 FERC ¶ 61,043 at P 40 n.47, *order on reh'g*, 163 FERC ¶ 61,197 at P 47.

[55] Wood Mackenzie, Inc., Southeast U.S. Natural Gas Market Demand in Support of the Mountain Valley Pipeline Project (Jan. 2016) (filed as Exhibit I of Mountain Valley's Application) (Wood Mackenzie Study).

[56] A volumetric capacity of 8.3 Bcf per day is equivalent to 8,300,000,000 Dth per day.

[57] Wood Mackenzie Study at 6.

[58] *See id.* at 20-21.

of the Central Shenandoah, and other commenters question the usefulness of the Wood Mackenzie Study because it covers a seven-state region in the Southeast, while the Southgate Project will only serve a portion of central North Carolina.

34. Appalachian Mountain Advocates submitted an analysis performed by the Applied Economics Clinic (AEC Report)[59] to counter Mountain Valley's projections showing increasing natural gas demand in the future. As Mountain Valley has not indicated that gas delivered by the project will be used for electric generation,[60] Appalachian Mountain Advocates explains that the AEC Report focuses on gas demand for residential, commercial, and industrial end-use customers.[61] Specifically, the AEC Report takes issue with Mountain Valley's (i) reliance on a nationwide, rather than regional, projection of gas demand;[62] (ii) failure to exclude gas consumption for electric generation from North Carolina's expected annual growth in gas demand; [63] and (iii) use of a purportedly inflated projection of future population growth in North Carolina and failure to consider the steady downward trend in per capita gas consumption attributed to increased energy efficiency and other advances.[64]

35. Commenters contend that the Commission must conduct an independent evaluation of actual market demand.[65] As part of this independent evaluation of whether expected gas demand can be met by existing pipeline capacity, Appalachian Mountain Advocates asserts that the Commission should evaluate the potential for production

---

[59] Elizabeth A. Stanton, PhD and Eliandro Tavares, *Analysis of the Mountain Valley Pipeline Southgate Project* (Jul. 2019) (filed as Exhibit A of Appalachian Mountain Advocates' September 16, 2019 Comments on Draft EIS) (AEC Report).

[60] Mountain Valley states that the natural gas transported by the Southgate Project will be used to make bundled gas sales primarily to residential and small- and medium-sized commercial customers for heating, cooking, and other end-uses typical of natural gas local distribution company customers. Mountain Valley's March 15, 2019 Data Request Response at 3.

decline in the Marcellus and Utica shale formations.[66] Commenters further suggest that the Commission should assess the ability of renewable energy sources and energy efficiency to meet electric demand over the life of the proposed pipelines.[67] Noting that market forces indicate that LNG exports will increase in future years, Blue Ridge Environmental Defense League argues that the Mountain Valley's statements that it has no plans to export natural gas and the draft EIS's observation that there is no direct connection from the Southgate Project's terminus to Cove Point LNG – the nearest export terminal located approximately 190 miles away in Calvert County, Maryland – are an insufficient guarantee that LNG exports are not necessary to financially sustain the project.[68]

36. Finally, Appalachian Mountain Advocates and Friends of the Central Shenandoah recommend that the Commission evaluate the need for new pipeline infrastructure on a regional basis because failure to do so will lead to the development of unnecessary pipelines.[69]

37. In its January 8, 2019 answer, Mountain Valley asserts that Dominion's binding, 20-year precedent agreement for 80% of the Southgate Project's capacity is "significant evidence of demand for [a] project."[70] Mountain Valley notes that the Commission previously evaluated the Synapse and U.S. Department of Energy studies submitted by Appalachian Mountain Advocates and observed that commenter depictions of the

[66] AMA's September 16, 2019 Comments at 4.

[67] *See, e.g.*, AMA's September 16, 2019 Comments at 4; Friends of the Central Shenandoah's April 1, 2019 Comments at 5; Southern Environmental Law Center's September 16, 2019 Comments on the Draft EIS at 2-3 (SELC's September 16, 2019 Comments).

[68] Blue Ridge Environmental Defense League's September 16, 2019 Comments on the Draft EIS at 12-13 (Defense League's September 16, 2019 Comments).

[69] AMA's September 16, 2019 Comments at 3-4; Friends of the Central Shenandoah's April 1, 2019 Comments at 22. In addition, the Synapse Study asserts that considering each new pipeline proposal in isolation ignores important alternatives, such as upgrades to existing pipelines and storage facilities, which would increase regional natural gas supply capacity and avoid the adverse impacts on communities or the environment. Synapse Study at 4. Similarly, the IEEFA Study argues that the Commission should evaluate regional requirements for additional pipeline capacity similar to other infrastructure programs such as electric transmission and highways. IEEFA Study at 6-7.

[70] Mountain Valley Answer at 10 (quoting Certificate Policy Statement, 88 FERC at 61,744).

findings of the studies were overstated.[71] Mountain Valley counters that the Wood Mackenzie Study forecasts that local distribution company and other non-electric generation gas usage in the Southeast will expand at a 1.6% annual growth rate[72] and further contends that Dominion needs the project's additional pipeline capacity to meet its design-day requirements, which are expected to increase 11% as a result of population growth in North Carolina.[73]

38. Mountain Valley argues that the Southgate Project will: (i) provide North Carolina and southern Virginia access to new natural gas supplies in the Marcellus and Utica shale regions; (ii) provide the opportunity to serve commercial and industrial load in Virginia and North Carolina not currently served by natural gas; (iii) provide new interconnects that improve the interstate grid and increase reliability and resiliency of North Carolina's gas infrastructure; (iv) eliminate a bottleneck by allowing Dominion to transport gas received from East Tennessee on a firm forward haul basis, rather than relying on backhauls on Transco's system; and (v) introduce a new entrant into the North Carolina interstate pipeline market, which may foster competition and lower consumer costs.[74] The company states that the North Carolina Commission has recognized the public benefits of the Southgate Project and has authorized payment under Dominion's precedent agreement with Mountain Valley.[75] Mountain Valley argues that the North Carolina Commission's approval warrants deference and "boosts the [precedent agreement's] probative value."[76]

39. It is well established that precedent agreements are significant evidence of demand for a project.[77] As the court stated in *Minisink Residents for Environmental Preservation*

[78] *Minisink Residents*, 762 F.3d 97, 110 n.10 (D.C. Cir. 2014); *see also Myersville Citizens*, 783 F.3d at 1311. Further, Ordering Paragraph (C)(4) of this order requires that Mountain Valley file a written statement affirming that it has executed contracts for service at the levels provided for in their precedent agreements prior to commencing construction.

[79] *See, e.g., Adelphia Gateway, LLC*, 169 FERC ¶ 61,220, at P 35 (2019), *order denying reh'g*, 171 FERC ¶ 61,049, at P 12 (2020); *Tenn. Gas Pipeline Co., L.L.C.*, 169 FERC ¶ 61,230, at P 19 (2019), *order denying reh'g*, 170 FERC ¶ 61,142, at P 10 (2020). In addition to precedent agreements, applicants may rely on a variety of relevant factors to demonstrate need. Certificate Policy Statement, 88 FERC at 61,747. These factors might include, but are not limited to, demand projections, potential cost savings to consumers, or a comparison of projected demand with the amount of capacity currently serving the market. *Id.* at 61,747.

[80] *Id.* at 61,744 (citing *Transcon. Gas Pipe Line Corp.*, 82 FERC ¶ 61,084, at 61,316 (1998)).

40. Here, Mountain Valley has entered into a long-term, firm precedent agreement with Dominion for 300,000 Dth per day of firm transportation service – 80% of the project's design capacity.[81] To further confirm this showing of need, Ordering Paragraph (C)(4) of this order requires that Mountain Valley file a written statement affirming that it has executed contracts for service at the levels provided for in its precedent agreements prior to commencing construction. Dominion, the sole project shipper, is a local distribution company that has determined, based on its assessment of the long-term needs of its customers and market, that there is a market for the natural gas to be transported and that the Southgate Project is the preferred means for delivering or receiving that gas. In addition, the project's interconnect with East Tennessee will allow Dominion to access gas it stores in the Saltville Storage facility on a more reliable firm forward haul basis. We find that Mountain Valley has sufficiently demonstrated that there is market demand for its project.

41. We disagree with commenters' assertion that the Commission should examine the need for pipeline infrastructure on a region-wide basis. Commission policy is to examine the merits of individual projects and assess whether each project meets the specific need demonstrated. While the Certificate Policy Statement permits the applicant to show need in a variety of ways, it does not suggest that the Commission should examine a group of projects together and pick which project(s) best serve an estimated future regional demand. Projections regarding future demand often change and are influenced by a variety of factors, including economic growth, the cost of natural gas, environmental regulations, and legislative and regulatory decisions by the federal government and individual states. Given the uncertainty associated with long-term demand projections, including those presented in the studies noted by commenters and applicant above, where an applicant has precedent agreements for long-term firm service, the Commission deems the precedent agreements to be the better evidence of demand.[82] The Commission evaluates individual projects based on the evidence of need presented in each proceeding. Where, as here, it is demonstrated that specific shippers have entered into precedent agreements for project service, the Commission places substantial reliance on those agreements to find that the project is needed.

42. Nor are we persuaded by commenters' contention that there is insufficient supply in the Appalachian Basin to support the pipeline. Although Mountain Valley has stated that the intended source of supply for the Southgate Project will be production in the

[81] Prior to the Certificate Policy Statement, the Commission required a new pipeline project to have contractual commitments for at least 25% of the proposed project's capacity. *See* Certificate Policy Statement, 88 FERC at 61,743. Mountain Valley would have satisfied this prior, more stringent, requirement.

[82] *Atl. Coast Pipeline, LLC*, 161 FERC ¶ 61,042 at P 56; *Mountain Valley*, 161 FERC ¶ 61,043 at P 42, *order on reh'g*, 163 FERC ¶ 61,197 at PP 46-47.

Appalachian Basin, the Southgate Project is also connected to other interstate pipelines, such as East Tennessee and – by virtue of its connection with the Mainline System – Equitrans, which could potentially supply gas to the project from other areas of supply. Additionally, because the amount of gas that will be produced from the region is reflective of, among other things, the price of natural gas, projections regarding the amount of gas available for the Southgate Project are speculative.

43. Allegations that the project is not needed because gas that is transported by it may be exported through an LNG terminal are not persuasive. There is no evidence in the record that indicates that the project will be used to transport natural gas for export. The project shipper is a local distribution company, which will locally distribute gas to residential, commercial, and industrial end-use customers. Thus, even if there was evidence that some of the gas would be exported, that fact would not undercut our finding here that the project is necessary for the transportation of natural gas in interstate commerce.[83]

44. We also disagree with commenters' claim that the project is not needed because of the availability of existing capacity on other pipelines or due to the Commission's approval of the Atlantic Coast Pipeline Project (ACP Project). The EIS analyzed whether existing natural gas transmission pipelines in the project area, including the authorized ACP Project, could possibly be used as system alternatives for the Southgate Project.[84] The EIS concluded that these existing pipeline systems are fully subscribed and cannot provide firm transportation of the required volumes of gas to the area that Mountain Valley is proposing to serve.[85] Thus, contrary to commenters' assertions, we are not persuaded that authorization of the Southgate Project would lead to the overbuilding of pipeline infrastructure. The EIS further found that expansion of these systems would likely result in environmental impacts similar to the Southgate Project's anticipated impacts.[86] Therefore, the EIS concluded that utilization of existing pipeline systems would not offer a significant environmental advantage.[87]

---

[83] Moreover, no gas can be exported from the United States without a finding by the Secretary of Energy that such export is not inconsistent with the public interest. *Sierra Club v. FERC*, 827 F.3d 36, 40 (D.C. Cir. 2016) (*Freeport LNG*) (citing 15 U.S.C. § 717b(a)).

[84] Final EIS at 3-3 to 3-6.

[85] *Id*. at 5-14.

[86] *Id*.

[87] *See id*. at 3-3 to 3-6.

45. Additionally, renewable energy sources would not accomplish the project purpose of providing natural gas transportation service.[88] The Commission cannot require individual energy users to use different or specific energy resources.[89]

b. Precedent Agreement with Affiliated Shipper

46. Appalachian Mountain Advocates and North Carolina DEQ argue that because Dominion is affiliated with Mountain Valley, the Commission should exercise heightened scrutiny in reviewing whether there is actual market demand for the project. Appalachian Mountain Advocates assert that Mountain Valley's precedent agreement with Dominion should be viewed with skepticism, and afforded less weight, because Dominion had acquired a 30% ownership interest in Mountain Valley after executing the precedent agreement.[90]

47. In response, Mountain Valley points to its December 2018 filing, notifying the Commission that Dominion "no longer has any equity interest in the Southgate Project," and is "no longer an affiliate of Mountain Valley."[91] Thus, Mountain Valley contends, any concerns regarding Dominion's affiliate status are moot.

48. In its December 28, 2018 answer, Dominion confirmed that it is no longer affiliated with Mountain Valley.[92] Additionally, Dominion put into the record testimony

[88] *See id*. at 3-2 (concluding that generation of electricity from renewable energy sources or the gains realized from increased energy efficiency and conservation are not transportation alternatives and cannot function as a substitute for the proposed project); *see also Columbia Gas Transmission, LLC*, 164 FERC ¶ 61,036, at P 65 and n.147 (2018), *order denying reh'g*, 170 FERC ¶ 61,247 (2020) ("As we have concluded with respect to other natural gas transportation infrastructure projects, we do not find that the potential for energy conservation and renewable energy sources to be practical alternatives."); *Mountain Valley*, 161 FERC ¶ 61,043 at P 43 (recognizing that "renewable energy is not a comparable replacement for the transportation of natural gas").

[89] *RH energytrans, LLC*, 165 FERC ¶ 61,218, at P 21 (2018).

[90] AMA Protest at 14-15; North Carolina DEQ's December 10, 2018 Intervention at 3.

[91] Mountain Valley Answer at 11 (citing Mountain Valley's December 20, 2018 Change in Ownership Notification).

[92] Dominion Answer at 3.

and pleadings from two proceedings before the North Carolina Commission,[93] which Dominion offers as evidence that the North Carolina Commission has authorized Dominion's payment of compensation to Mountain Valley under a service agreement for the Southgate Project.[94] Dominion explains that the 2018 North Carolina Commission testimony states that "[Dominion] projects that by the winter of 2019-20 it will need additional interstate capacity to serve expected peak-day requirements," and includes a table showing the forecasted peak-day demand requirements for winter seasons from 2017-18 through 2022-23.[95] Dominion further explains that the table shows a deficit of 7,710 Dth per day beginning in 2019-20, increasing to 62,111 Dth per day by 2022-23.[96] Additionally, Dominion notes, a significant amount of the subscribed capacity reflected in the table is for secondary firm service as backhaul,[97] which has a lower scheduling priority than the capacity that would be provided by the Southgate Project.[98] According to Dominion, the secondary nature of this capacity "takes on greater significance as flows become increasingly bidirectional on the pipelines that [Dominion] uses."[99]

49. As Dominion "no longer has an equity interest in the Southgate Project,"[100] we agree with Mountain Valley that the affiliate concerns are moot. In any event, the fact that a project shipper is affiliated with a project sponsor does not require the Commission to look behind the precedent agreements to evaluate project need.[101] As the court

---

[93] *Id*. (Exhibits A-D).

[99] *Id*. at 4.

[100] Mountain Valley's December 20, 2018 Change in Ownership Notification.

[101] *Millennium Pipeline Co., L.P.*, 100 FERC ¶ 61,277, at P 57 (2002) ("as long as the precedent agreements are long-term and binding, we do not distinguish between pipelines' precedent agreements with affiliates or independent marketers in establishing the market need for a proposed project"); *see also* Certificate Policy Statement,

affirmed in *Minisink Residents*, the Commission may reasonably accept the market need reflected by the applicant's existing contracts with shippers and not look behind those contracts to establish need.[102] And in *Appalachian Voices v. FERC*, the court affirmed the Commission's determination that "[a]n affiliated shipper's need for new capacity and its obligation to pay for such service under a binding contract are not lessened just because it is affiliated with the project sponsor."[103] When considering applications for new certificates, the Commission's primary concern regarding affiliates of the pipeline as shippers is whether there may have been undue discrimination against a non-affiliate shipper.[104] Here, no such allegations have been made, nor have we found that the project sponsor engaged in any anticompetitive behavior. As discussed above, Mountain Valley held a binding open season for capacity on the project and all potential shippers had the opportunity to contract for service.

50. Finally, commenters question the probative value of the contract between Mountain Valley and Dominion, arguing that, as a regulated utility, Dominion will seek recovery of its Southgate Project-related costs from "captive ratepayers," resulting in guaranteed rates, and the ability to reallocate the financial risk of the Southgate Project from the project owner to captive ratepayers.[105] However, this argument glosses over the important role of the North Carolina Commission, which is responsible for setting retail rates for Dominion. The North Carolina Commission will disallow costs that are not justified according to North Carolina state law after considering, in the judgment of the

[105] *See, e.g.*, AMA Protest at 14-15; Friends of the Central Shenandoah's April 1, 2019 Comments at 22-23. As we previously noted, Dominion is no longer affiliated with Mountain Valley; however, commenters warn that Dominion could purchase a portion of the Southgate Project following certificate issuance.

North Carolina Commission, the interests of North Carolina ratepayers.[106] Matters relating to Dominion's retail rates are for the North Carolina Commission and are not within the Commission's jurisdiction.[107] Therefore, it is reasonable for the Commission to rely on the contract between Mountain Valley and Dominion as evidence of need to conclude that the project is in the public interest.[108]

51. In conclusion, we find that the precedent agreement signed by Dominion for approximately 80% of the Southgate Project's capacity adequately demonstrates that the project in needed.

5. Certificate Policy Statement Conclusion

52. The proposed project will enable Mountain Valley to provide 375,000 Dth per day of incremental firm transportation service, of which 80% is subscribed. We find that Mountain Valley has demonstrated a need for the Southgate Project and further, that the project will not have adverse economic impacts on existing shippers or other pipelines and their existing customers, and that the project's benefits will outweigh any adverse economic effects on landowners and surrounding communities. Therefore, we conclude that the project is consistent with the criteria set forth in the Certificate Policy Statement and analyze the environmental impacts of the project below.[109]

---

[106] The North Carolina Commission has the jurisdiction to regulate the sale and transportation of natural gas within North Carolina, including regulating Dominion, the sole entity that has contracted to take service on the Southgate Project. *See* North Carolina Commission Protest at 2-3.

[107] *NEXUS,* 164 FERC ¶ 61,054 at P 39.

[108] The North Carolina Commission's approval of the contract boosts its probative value. *See Guardian Pipeline, L.L.C*, 91 FERC ¶ 61,285, at 61,966-67 (2000) ("It is also the Commission's preference not to second guess the business decisions of end users or challenge the business decision of an end user on whether it is economic to undertake direct service from a pipeline supplier, *particularly when that decision has been approved by the appropriate state regulatory body*.") (emphasis added) (citing *Southern Natural Gas Co.*, 76 FERC ¶ 61,122, at 61,635 (1996)).

[109] *See* Certificate Policy Statement, 88 FERC at 61,745-46 (explaining that only when the project benefits outweigh the adverse effects on the economic interests will the Commission then complete the environmental analysis).

B. Rates

1. Initial Recourse Rates

53. Mountain Valley proposes to provide firm (Rate Schedule FTS), interruptible (Rate Schedule ITS), and interruptible lending and parking (Rate Schedule ILPS) transportation services under a separate rate zone called the Southgate System. Mountain Valley developed its proposed cost of service utilizing a capital structure of 50% debt and 50% equity, a proposed cost of debt of 6%, an ROE of 14%, and a 5% depreciation rate based on the 20-year contract life of the executed agreement with Dominion. Mountain Valley utilizes a straight fixed-variable rate design to derive its rates based on the full project design capacity of 375,000 Dth per day and a first-year cost of service of $84,889,100.[110] In its revised Exhibit P, Mountain Valley calculates a maximum monthly firm reservation recourse charge of $18.7651 per Dth and a firm usage charge of $0.0033 per Dth.[111] Mountain Valley proposes a maximum daily interruptible and interruptible lending and parking recourse charge of $0.6202 per Dth based on the maximum daily Rate Schedule FTS reservation charge plus the Rate Schedule FTS usage charge.

54. We have reviewed Mountain Valley's proposed cost of service and rates and find that they reasonably reflect current Commission policy, as modified below.

a. Return on Equity

55. On December 10, 2018, the North Carolina Commission filed a protest stating that Mountain Valley failed to provide substantial evidence to justify its proposed 14% ROE. The North Carolina Commission notes that Mountain Valley's only support are the facts that the Commission approved a 14% ROE for the Mountain Valley Mainline System and that a 14% ROE is consistent with the Commission's policy with respect to greenfield pipelines.[112] The North Carolina Commission states that simply citing cases where the Commission has allowed the use of a 14% ROE is inadequate and conflicts with the statutory requirement that an applicant demonstrate that its recourse rates are in the public convenience and necessity.[113] The North Carolina Commission states that

[110] In its August 22, 2019 Data Request Response, Mountain Valley submitted a revised Exhibit P with a corrected operating and maintenance expense calculation.

[111] In its revised Exhibit P, Schedule 2, Mountain Valley breaks down the total cost of service into $84,443,026 for fixed costs and $446,074 for variable costs.

[112] North Carolina Commission Protest at 8.

[113] *Id.* at 9.

Mountain Valley has failed to provide any analysis of current financial markets or current investor expectations, nor has Mountain Valley provided an analysis of the specific risks the pipeline faces. In addition, the North Carolina Commission questions whether the proposed rates, based on an ROE not supported by current market data, provided the necessary check on the potential exercise of market power at the time Mountain Valley entered into the negotiated rate agreement with Dominion, as required by the Commission's Alternative Rates Policy Statement.[114]

56. In its January 8, 2019 answer, Mountain Valley states that because the Mountain Valley Mainline System is not yet in service and Mountain Valley is not yet an established pipeline company with an existing revenue base, the Southgate Project is more akin to a new greenfield project than to the expansion of an existing system, given the business risks associated with the project.[115] Mountain Valley states that a 14% ROE for a new pipeline project is not only consistent with Commission precedent, but has also been upheld by the U.S. Court of Appeals for the District of Columbia Circuit in *Sierra Club vs. FERC*.[116] In addition, Mountain Valley states that its proposed ROE is consistent with Commission precedent, citing *Rockies Express Pipeline, LLC*, where the Commission allowed the company to use the same 13% ROE approved as part of its greenfield certificate application for two expansion projects.[117] Mountain Valley argues that it did not exercise any alleged market power when signing an agreement with Dominion at a negotiated rate and that the parties negotiated based on an estimated recourse rate dependent on numerous factors and Dominion's independent research of marketplace rates for similar capacity.[118]

---

[114] *Id*. at 11-12 (citing *Alternatives to Traditional Cost-of-Service Ratemaking for Natural Gas Pipelines; Regulation of Negotiated Transportation Services of Natural Gas Pipelines*, 74 FERC ¶ 61,076, *order granting clarification*, 74 FERC ¶ 61,194, *order on reh'g and clarification*, 75 FERC ¶ 61,024, *reh'g denied*, 75 FERC ¶ 61,066, *reh'g dismissed*, 75 FERC ¶ 61,291 (1996), *petition denied sub nom. Burlington Res. Oil & Gas Co. v. FERC*, 172 F.3d 918 (D.C. Cir. 1998) (Alternative Rate Policy Statement)).

[115] Mountain Valley Answer at 5.

[116] *Id*. (citing *Sabal Trail*, 867 F.3d 1357).

[117] *Id*. (citing *Rockies Express Pipeline LLC,* 116 FERC ¶ 61,272*,* at P 44 (2006) (addressing preliminary non-environmental issues for REX-West expansion); *Rockies Express Pipeline LLC,* 119 FERC ¶ 61,069 (2007) (certificating REX-West expansion)*; Rockies Express Pipeline LLC,* 123 FERC ¶ 61,234, at P 55 (2008) (certificating REX-East expansion)).

[118] Mountain Valley Answer at 9.

57. We will approve Mountain Valley's proposed 14 ROE. Though the Southgate Project is an extension from the previously certificated Mountain Valley Mainline System, the Mainline System is not in service. Thus, just as was the case when it proposed its initial Mainline System, Mountain Valley is not an established pipeline company and has no existing revenue base. Without cash flows from existing operations and a proven track record, we find that, with respect to the Southgate Project, Mountain Valley faces a capital funding outlook similar to other companies constructing new pipeline systems. The reasoning the Commission has relied upon in other instances for authorizing lower ROEs for extension of existing pipeline systems is not applicable under this fact pattern, as those pipelines obtained revenues for service on their existing systems. Therefore, for purposes of establishing initial rates, we believe it is appropriate to treat Mountain Valley, whose Mainline System is not in service, in the same manner as we would an applicant proposing its initial greenfield system, because there are no established operations or revenue streams that would reduce the risk to the level experienced by natural gas companies whose existing systems are in service.

b. Depreciation

58. The North Carolina Commission protests Mountain Valley's proposed five percent depreciation rate for the Southgate Project, which is based on the 20-year term of Mountain Valley's contract with Dominion. The North Carolina Commission recognizes that there have been instances where the Commission has found it appropriate to base the depreciation rate for new, incremental projects on contract life but explains that those instances involve delivery laterals built on behalf of specific customers.[119] Noting that Dominion has only contracted for 300,000 of the 375,000 Dth per day of capacity to be created by the Southgate Project and that Mountain Valley anticipates executing agreements with other potential shippers for additional capacity in the future, the North Carolina Commission asserts "there is no basis to presume that the useful life of the facilities will end when the primary contract term ends."[120] Mountain Valley responds that the five percent depreciation rate is appropriately based on a 20-year life of the project because, while it continues to market unsubscribed capacity, a primary purpose of the Southgate Project is to serve Dominion's needs.[121] According to Mountain Valley, the North Carolina Commission overstates Commission precedent by suggesting the Commission only approves contract life depreciation rates for delivery laterals, but rather that the Commission has approved contract life depreciation rates for incrementally-

[119] North Carolina Commission Protest at 14.

[120] *Id*.

[121] Mountain Valley Answer at 7.

priced projects like the Southgate Project.[122] Specifically, Mountain Valley notes that in *Equitrans, L.P.* (*Equitrans*),[123] the Commission approved depreciation rates based on the life of the contract for an expansion project that was integrated with the rest of Equitrans's mainline system.

59. The Commission's general policy with respect to depreciation for pipeline expansions is to use the pipeline's last approved depreciation rate.[124] Although the Commission has deviated from this general policy and allowed the depreciation rate to be based on the life of the contract with respect to delivery laterals built on behalf of specific customers,[125] we do not find Mountain Valley's use of a five percent depreciation rate based on its 20-year contract term with Dominion appropriate. In addition to serving the needs of Dominion, Mountain Valley states that the purpose of the Southgate Project is to "provide North Carolina and southern Virginia with direct pipeline access to the Marcellus and Utica gas regions in West Virginia, Ohio and southwestern Pennsylvania," and to "meet the growing needs of natural gas users in the southeastern U.S."[126] Mountain Valley designed the Southgate Project so that it will have the ability to provide additional capacity to other potential shippers at or prior to the Dan River Interconnect[127] and states that it has engaged in discussions with additional potential shippers and anticipates that it will execute agreements for the additional 75,000 Dth per day of available capacity in the future.[128] Thus, this mainline expansion will not function merely as a delivery lateral to serve Dominion, but instead will have the potential to meet increased demand and serve other customers.

---

[126] Application at 2.

[127] *Id*. at 9.

[128] *Id*. at 2.

60. We acknowledge that in *Equitrans* the Commission authorized Equitrans to extend its mainline system and approved the pipeline's proposed depreciation rate based on the life of the shipper's 20-year contract term.[129] However, the Commission did so without explanation, and that case is inconsistent with our general policy, discussed above. We note that in *Tennessee Gas Pipeline Co., L.L.C.*,[130] the Commission recently reaffirmed its policy to use the last stated and approved depreciation rate for incremental expansion projects.

61. In sum, we find that Mountain Valley has not shown that its 20-year contract term with Dominion is determinative of the useful life of the Southgate Project facilities. Accordingly, we direct Mountain Valley to revise its rates for the Southgate System using the 2.5% depreciation rate underlying its currently-approved Mainline System rates.

c. Section 7 Recourse Rate Review

62. In its protest, the North Carolina Commission argues that the Commission has repeatedly erred in relying on *Atlantic Refining Co. v. Pub. Serv. Comm'n of N.Y.*[131] a case regarding the Commission's discretion in NGA section 7 proceedings to approve initial rates that will "hold the line" until just and reasonable rates are adjudicated under sections 4 or 5 of the NGA.[132] The North Carolina Commission claims that, by declining to do a more thorough review of proposed recourse rates in a section 7 proceeding and deferring to a section 4 proceeding to ensure that the rates are just and reasonable, the Commission fails to ensure that the recourse rates available to Dominion when it negotiated its precedent agreement provided the necessary check on the exercise of market power by the pipeline at the time those negotiations occurred.[133] The North Carolina Commission also argues that the "hold the line" approach affirmed in *CATCO* was only found to be warranted because the Commission had ensured that the consuming public would be protected while awaiting adjudication of just and reasonable rates. The North Carolina Commission asserts that in the instant project proposal, given that the two

[129] *See Equitrans L.P.,* 153 FERC ¶ 61,381, at P 17 n.18.

[130] 169 FERC ¶ 61,230, at PP 33-34 (2019).

[131] 360 U.S. 378 (1959) (*CATCO*).

[132] North Carolina Commission Protest at 15.

[133] *Id.*

largest cost-of-service elements are significantly overstated, there are no assurances that the consuming public will be protected from excessive rates.[134]

63. We disagree with the North Carolina Commission's assertion that the Commission's reliance on the *CATCO* decision is in error. The existence of negotiated rates does not negate the Commission's discretion to approve initial rates in this proceeding under the public convenience and necessity standard, pending the adjudication of just and reasonable rates in Mountain Valley's next general NGA section 4 rate case. In *CATCO*, the Court compared the less rigorous public convenience and necessity standard of review employed under section 7 to assess initial rates for new service or facilities with the just and reasonable standard of review for rate changes under sections 4 and 5.[135] The less exacting standard used in a section 7 certificate proceeding is intended to mitigate the delay associated with a full evidentiary rate proceeding, and, as here, the Commission has discretion to approve initial rates that will "hold the line" while awaiting the adjudication of just and reasonable rates.[136]

64. As explained above, we are requiring Mountain Valley to revise its proposed recourse rates to reflect a reduction to its depreciation rate as requested by the North Carolina Commission. Subject to Mountain Valley making that change addressed above, we will approve Mountain Valley's rates for the Southgate Project.

2. Fuel

65. Mountain Valley states that it will implement a retainage factor to track and recover actual experienced fuel and lost and unaccounted for gas on the Southgate System. The company states that the initial retainage factor for the Southgate System will be 1.66%, based on the submitted fuel study, and that it will adjust the Retainage Factor quarterly to reflect actual fuel and lost and unaccounted for gas. We approve Mountain Valley's proposed initial fuel retainage percentage of 1.66% for the Southgate Project.

3. Reporting Incremental Costs

66. We will require Mountain Valley to keep separate books and accounting of costs and revenues attributable to the proposed services and capacity created by the Southgate

[134] *Id.* at 16.

[135] *See CATCO*, 360 U.S. at 390-91.

Project, as required by section 154.309 of the Commission's regulations.[137] The books should be maintained with applicable cross-reference and the information must be in sufficient detail so that the data can be identified in Statements G, I, and J in any future NGA section 4 or 5 rate case, and the information must be provided consistent with Order No. 710.[138]

4. Negotiated Rate Agreements

67. Mountain Valley proposes to provide service to the project shipper under a negotiated rate agreement. Mountain Valley must file either its negotiated rate agreement or tariff records, setting forth the essential terms of the agreement associated with the Project, in accordance with the Alternative Rate Policy Statement[139] and the Commission's negotiated rate policies.[140] Mountain Valley must file the negotiated rate agreement or tariff record no earlier than 60 days and no later than 30 days prior to the proposed effective date for such rates.[141]

5. *Pro Forma* Tariff Records

68. Mountain Valley included in Exhibit P *pro forma* tariff records reflecting the addition of the separate Southgate System rate zone. We approve the *pro forma* tariff records included in Exhibit P, except as detailed above, and direct Mountain Valley to file the tariff records no earlier than 60 days and no later than 30 days prior to the in-service date of the facilities.

C. Environmental Analysis

1. Pre-filing Review

69. On May 18, 2018, Commission staff granted Mountain Valley's request to use the pre-filing process in Docket No. PF18-4-000. As part of the pre-filing review, on August 9, 2018, the Commission issued a *Notice of Intent to Prepare an Environmental Impact Statement for the Planned MVP Southgate Project, and Request for Comments on Environmental Issues, and Notice of Public Scoping Sessions* (NOI). The NOI was published in the *Federal Register* on August 15, 2018[142] and sent to more than 1,100 interested parties, including representatives of federal, state, and local agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners; concerned citizens; and local libraries and newspapers. The NOI announced the date, time, and location of three public scoping sessions, and established September 10, 2018, as the deadline for public comments on the project.

70. A total of 68 people provided oral comments at the public scoping sessions.[143] In addition, we received 69 written or electronically-filed comment letters and 65 form letters during the public scoping period.[144]

2. Application Review

71. On November 6, 2018, following the pre-filing process, Mountain Valley filed an application for authorization to construct and operate the Southgate Project.

72. To satisfy the requirements of the National Environmental Policy Act of 1969 (NEPA),[145] Commission staff evaluated the proposed project's potential environmental impacts in an EIS, with respect to which the Army Corps and the FWS's Virginia and North Carolina Field Offices participated as cooperating agencies.

---

[142] 83 Fed. Reg. 40,509 (Aug. 15, 2018).

[143] Between August 20-23, 2018, Commission staff held public scoping sessions in Reidsville, North Carolina; Chatham, Virginia; and Haw River, North Carolina. Transcripts for the public comment sessions were placed in the public record for the proceeding.

[144] Table 1.3-1 of the final EIS provides a detailed and comprehensive list of issues raised during scoping.

[145] 42 U.S.C. §§ 4321 *et seq.* (2018). *See also* the Commission's NEPA-implementing regulations at Title 18 of the Code of Federal Regulations, Part 380.

73. On July 26, 2019, Commission staff issued a draft EIS addressing the issues raised during the scoping period and including staff's independent analysis of the project's environmental impacts. Notice of the draft EIS was published in the *Federal Register* on August 2, 2019, establishing a 45-day public comment period that ended on September 16, 2019.[146] Commission staff held three public comment sessions between August 19-22, 2019, to receive comments on the draft EIS.[147] Approximately 65 people provided oral and written comments at the public comment sessions. Transcripts of the public comment sessions were placed in the Commission's public record for this proceeding. In addition, we received 77 written or electronically-filed comments.[148]

74. In October 2019, after issuance of the draft EIS, Mountain Valley filed a number of minor route modifications to reduce environmental and cultural resources impacts, to accommodate landowner requests, or for constructability reasons. On November 15, 2019, Commission staff mailed letters to 24 landowners affected by the route modifications (including 14 newly affected landowners), requesting comments on the route modifications during a supplemental comment period that ended December 15, 2019. None of the landowners affected by these route modifications filed comments.

75. On February 14, 2020,[149] Commission staff issued the final EIS for the project, addressing all of the substantive environmental comments received on the draft EIS.[150] The final EIS addresses geology; soils; water resources; wetlands; vegetation; wildlife and fisheries; threatened, endangered, and other special status species; land use, recreation and visual resources; socioeconomics; cultural resources; air quality and noise; reliability and safety; cumulative impacts; and alternatives. In addition to the environmental comments, several commenters raised concerns about the scope of the analysis in the EIS and the NEPA process generally.

76. The final EIS concludes that if the Southgate Project is constructed and operated in accordance with applicable laws and regulations, the project will result in limited adverse environmental impacts; however, these impacts would be reduced to less-than-significant

---

[146] 84 Fed. Reg. 37,859 (Sept. 16, 2019).

[147] Commission staff held public comment meetings on the draft EIS in Wentworth and Haw River, North Carolina and Chatham, Virginia.

[148] The Commission received additional comments on the draft EIS after the close of the comment period, which were addressed in the final EIS to the extent possible.

[149] Notice of the final EIS was issued in the *Federal Register* on February 26, 2020. 85 Fed. Reg. 11,064 (Feb. 26, 2020).

[150] Final EIS at Appendices I.1, I.2, and I.3.

levels with the implementation of Mountain Valley's proposed and Commission staff's recommended avoidance, minimization, and mitigation measures, which are included as conditions in the appendix to this order.

77. Between issuance of the final EIS and May 31, 2020, the Commission received comments on the final EIS from the applicant, the U.S. Environmental Protection Agency (EPA), Transco, the Monacan Indian Nation and the Sappony Tribe, Roger Sisson, Katie Whitehead, and the Blue Ridge Environmental Defense League. To the extent they raise substantive issues, these comments are discussed below.

3. Comments on the Scope of Analysis in the EIS

a. Completeness of Draft EIS and Requests for Revised or Supplemental Draft EIS

78. Some entities requested an extension of the draft EIS comment period.[151] The Commission's standard draft EIS comment period is 45 days, which is consistent with the Council for Environmental Quality's (CEQ) regulations implementing NEPA.[152] Moreover, in preparing the final EIS, Commission staff considered late-filed comments on the draft EIS to the extent practicable.[153] In addition, due to route modifications submitted by Mountain Valley in October 2019, Commission staff initiated a supplemental 30-day comment period to allow landowners affected by the route modifications (including 14 newly affected landowners) the opportunity to comment and to file motions to intervene in the proceeding. This supplemental comment period closed on December 15, 2019, nearly 90 days following Commission staff's issuance of the draft EIS. Any substantive comments filed during this time, regardless of whether the commenter was a newly affected landowner, were considered and addressed in the final EIS.

79. Some commenters allege that the draft EIS contained "substantial deficiencies"[154] that precluded meaningful public participation in the NEPA process, including a failure to evaluate the need for the Southgate Project, insufficient information about the project's

[151] *See, e.g.*, Defense League's September 16, 2019 Comments at 3; Katie Whitehead's August 8, 2019 Comments.

[152] 40 C.F.R. § 1506.10(c) (2019).

[153] *See supra* note 148.

[154] Sierra Club's January 28, 2020 Request for Revised or Supplemental Draft EIS (Sierra Club's January 28, 2020 Comments).

environmental impacts, and incomplete or draft plans regarding mitigation.[155] In addition, Sierra Club argues that Commission staff issued the draft EIS prematurely, pointing to environmental information requests issued by Commission staff following issuance of the draft EIS and additional information submitted by Mountain Valley providing information responsive to these information requests.[156] For these reasons, Sierra Club and others argue that a revised or supplemental draft EIS should have been issued for comment.[157]

80. We find that a revised or supplemental draft EIS was not warranted because the draft EIS was adequate and allowed for meaningful analysis. The draft EIS is a draft of the agency's proposed final EIS and, as such, its purpose is to elicit suggestions for change. A draft is adequate when it allows for "meaningful analysis" and "make[s] every effort to disclose and discuss" major points of view on the environmental impacts.[158] NEPA does not require a complete mitigation plan be actually formulated at the onset, but only that the proper procedures be followed for ensuring that the environmental consequences have been fairly evaluated.[159] In addition, NEPA does not require every study or aspect of an analysis to be completed before an agency can issue a final EIS, and

[155] *See, e.g.*, *id.* at 5.

[156] *See id.* at 6-7. In particular, Sierra Club takes issue with staff's November 15, 2019 additional information request that accompanied a revised notice of schedule for completion of the environmental review for the Southgate Project. This additional information request, and the revised schedule, were appropriate and timely responses to Mountain Valley's October 2019 submittal of minor route modifications. These minor route modifications, and any related environmental impacts, were fully disclosed and analyzed in the final EIS.

[157] *See, e.g.*, Sierra Club's January 28, 2020 Comments; SELC's September 16, 2019 Comments at 6, 13.

[158] 40 C.F.R. § 1502.9(a) (2019); *see also Nat'l Comm. for the New River, Inc. v. FERC*, 373 F.3d 1323, 1328 (D.C. Cir. 2004) (*Nat'l Comm. for the New River*) (holding that FERC's draft EIS was adequate even though it did not have a site-specific crossing plan for a major waterway where the proposed crossing method was identified and thus provided "a springboard for public comment") (quoting *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989) (*Methow Valley Citizens Council*)).

[159] *See Methow Valley Citizens Council*, 490 U.S. at 352-53.

the courts have held that agencies do not need perfect information before taking any action.[160]

81. The draft EIS identified baseline conditions for all relevant resources. To ensure that the final EIS included the most up to date information, the draft EIS recommended the filing of supplemental information prior to the end of the draft EIS comment period. However, as stated in section 5.2 of the draft EIS, Commission staff did not expect that the updated information and documents would materially change any of the conclusions in the draft EIS. Final mitigation plans will not present new environmentally significant information nor pose substantial changes to the proposed action that would otherwise require a supplemental EIS.

82. We also disagree that there was a need to issue a revised draft EIS. CEQ regulations require agencies to prepare a supplement to either a draft or final EIS if: (i) the agency makes substantial changes to the proposed action that are relevant to environmental concerns; or (ii) there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impact.[161] Here, the final EIS, which incorporates comments filed on the draft EIS, contains ample information for the Commission to fully consider and address the environmental impacts associated with the Southgate Project. As discussed further below, the final EIS recommends, and we require in this order, that Mountain Valley not

[160] *U.S. Dep't of the Interior v. FERC*, 952 F.2d 538, 546 (D.C. Cir. 1992); *Alaska v. Andrus*, 580 F.2d 465, 473 (D.C. Cir. 1978), *vacated in part sub nom. W. Oil & Gas Ass'n v. Alaska*, 439 U.S. 922 (1978) ("NEPA cannot be 'read as a requirement that [c]omplete information concerning the environmental impact of a project must be obtained before action may be taken.'") (quoting *Jicarilla Apache Tribe of Indians v. Morton*, 471 F.2d 1275, 1280 (9th Cir. 1973)).

[161] 40 C.F.R. § 1502.9(c).

commence construction of the Southgate Project until it provides specified information[162] and confirms it has received all applicable authorizations required under federal law.[163]

b. Project Purpose and Need, and Range of Alternatives

83. Several commenters contend that the EIS defined the purpose and need of the project too narrowly, which led to an insufficient analysis of the project alternatives.[164] An agency's environmental document must include a brief statement of the purpose and need to which the proposed action is responding.[165] An agency uses the purpose and need statement to define the objectives of a proposed action and then to identify and consider legitimate alternatives.[166] CEQ has explained that "[r]easonable alternatives include those

[162] *See, e.g.*, Environmental Conditions 13-16. Environmental Condition 14, for example, requires Mountain Valley to file with the Commission the locations of all private water wells and springs identified within 150 feet of the project work areas. This submittal must identify the status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts for each private water well or spring identified. Environmental Condition 16 requires Mountain Valley to file for Commission approval a final list of water sources to be used for project purposes (e.g., dust control, hydrostatic testing, and horizontal directional drill operations), which identifies intake location, waterbody name, withdrawal rate and method, and measures to minimize aquatic species entrainment.

[163] *See* Environmental Condition 10. Further, as stated above, we are directing the Office of Energy Projects to not issue any notice to proceed with construction of the Southgate Project until Mountain Valley receives the necessary federal permits for the Mainline System, and the Director of the Office of Energy Projects lifts the stop-work order and authorizes Mountain Valley to continue construction on the Mainline System. *See supra* P 9.

that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant."[167]

84. Courts have upheld federal agencies' use of applicants' project purpose and need as the basis for evaluating alternatives.[168] When an agency is asked to consider a specific plan, the needs and goals of the parties involved in the application should be taken into account.[169] We recognize that a project's purpose and need should not be so narrowly defined as to preclude consideration of what may actually be reasonable alternatives.[170] Nonetheless, an agency need only consider alternatives that will bring about the ends of the proposed action, and the evaluation is "shaped by the application at issue and by the function that the agency plays in the decisional process."[171]

85. For the Southgate Project, the EIS appropriately relied on the applicant's stated purpose and need. We find that doing so did not predetermine from the outset the results of the alternatives analysis for the Southgate Project.[172] In fact, Commission staff identified numerous reasonable alternatives to the project, which were evaluated in the EIS.[173] Staff concluded that none of the alternatives analyzed would meet the project's purpose and need, be technically feasible, and offer a significant environmental advantage.[174]

[170] *Id.* at 196.

[171] *Id.* at 199; *see also Sierra Club v. U.S. Forest Serv.*, 897 F.3d 582 (finding the statement of purpose and need for a Commission-jurisdictional natural gas pipeline project that explained where the gas must come from, where it will go, and how much the project would deliver, allowed for a sufficiently wide range of alternatives but was narrow enough that there were not an infinite number of alternatives).

[172] *See* North Carolina DEQ's September 16, 2019 Comments at 4.

[173] *See* final EIS at 3-1 to 3-45.

[174] *See id.* at 3-45.

86. We also reject the Southern Environmental Law Center's (SELC) argument that because the EIS "only considered alternatives that transport natural gas, the [Commission] has not taken a hard look at the No Action Alternative—or the possibility that the project is not constructed, as required by NEPA."[175] Contrary to SELC's contention, the EIS states that under the no-action alternative the Southgate Project would not be constructed, and that the environmental impacts associated with the project would not occur.[176] Moreover, the resource-by-resource discussion in section 4 of the final EIS first details the existing state of each resource and then describes the environmental impacts of the preferred alternative.[177] Section 5 of the final EIS summarizes staff's conclusions about those impacts.[178] By providing a description of the existing state of each resource and a description of the environmental impacts of the preferred alternative, the EIS provides the Commission with a meaningful comparison of the harm to be avoided under a no-action alternative.

87. Some commenters state that the EIS failed to evaluate the public benefit or market need for the project. These commenters conflate the balancing of economic benefits (market need) and effects under the Certificate Policy Statement with the description of the purpose and need in the EIS.[179] The purpose and need statement in the final EIS complied with CEQ's regulations, which provide that this statement "shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed actions" for purposes of its environmental analysis.[180] The public interest determination, including market need, for the pipeline lies with the Commission. Neither NEPA nor the NGA requires the Commission to make its determination of whether a project is required by the public convenience and necessity before its final order. The final EIS appropriately explained that the determination of

[180] 40 C.F.R. § 1502.13 (2019).

whether the Southgate Project satisfied a showing of market need according to the Certificate Policy Statement was beyond the scope of the environmental document.[181]

c. Segmentation

88. Some commenters argue that the Commission impermissibly segmented its NEPA review of the Southgate Project by failing to consider Mountain Valley's Mainline System and Southgate Project in a single EIS.[182] Appalachian Mountain Advocates assert that the Southgate Project and the Mainline System are "connected actions," and argues that the Commission's failure to evaluate the two projects in a single EIS renders the Commission's significance findings incomplete.[183]

89. CEQ regulations require the Commission to include "connected actions," "cumulative actions," and "similar actions" in its NEPA analyses. An agency impermissibly 'segments' NEPA review when it divides connected, cumulative, or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.[184] "Connected actions" include actions that: (a) automatically trigger other actions, which may require an EIS; (b) cannot or will not proceed without previous or simultaneous actions; or (c) are interdependent parts of a larger action and depend on the larger action for their justification.[185]

90. Assertions that we segmented our environmental review by not re-examining the Mainline System's impacts alongside the Southgate Project's impacts in a single EIS are misplaced. The Commission's consideration of Mountain Valley's two projects did not overlap. The Commission completed a comprehensive analysis of the environmental impacts of Mountain Valley's Mainline System between 2016 and 2017, culminating in the issuance of a final EIS in June 2017 and certificate authorization in October 2017. Commission staff's review of the environmental impacts of the Southgate Project began during the pre-filing process in mid-2018, continuing with Mountain Valley's filing of an

application for the Southgate Project in November 2018, and culminating in staff's issuance of the final EIS in February 2020.

91. The final EIS for the Mainline System fully analyzed the environmental impacts of Mountain Valley's mainline pipeline as originally proposed. Issued over two and a half years later, the final EIS for the Southgate Project fully analyzed the environmental impacts of Mountain Valley's proposed expansion of its mainline system. Moreover, the Southgate Project's EIS thoroughly examined whether the Southgate Project's impacts would result in a cumulative impact on the environment when combined with the impacts of other past, present, and reasonably foreseeable future projects, including Mountain Valley's Mainline System.[186]

92. CEQ defines cumulative impacts as "the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions."[187] A cumulative environmental impact results from the effect of the current project along with any other actions "*in the same geographic area* as the project under review."[188]

93. The EIS disclosed impacts associated with the Southgate Project and identified the geographic scope of the cumulative impacts analysis based on the resources affected by project construction and operation. Specifically, Commission staff defined resource-specific geographic scopes for its cumulative impacts analysis to include projects or actions within 0.25 mile of construction activities for impacts to air quality and noise; within the same HUC-12 watershed area[189] for impacts to groundwater, wetlands, vegetation, and wildlife; and within the same HUC-10 watershed for impacts to surface water, fisheries and aquatic resources.[190] The EIS explained that only a small portion of the Mainline System's southern terminus falls within the Southgate Project's resource-specific geographic scopes.[191] Accordingly, the EIS evaluated the cumulative impacts of

[189] A HUC is the acronym for Hydrologic Unit Code, designated by the U.S. Geological survey, which identifies hydrological features, such as a drainage basin or watershed. HUC-10 refers to a watershed typically 40,000-250,000 acres in area, while HUC-12 refers to more local sub-watershed, typically ranging from 10,000 to 40,000 acres.

[190] Final EIS at 4-227 to 4-229 (Table 4.13-1).

[191] *Id*. at 4-236.

Mountain Valley's Southgate Project and Mainline System across all resource areas. The final EIS concluded that – when added to the impacts of other past, present, and reasonably foreseeable future actions, including Mountain Valley's Mainline System – the Southgate Project's impacts would not result in any significant cumulative impacts on environmental resources within the geographic scopes affected by the Southgate Project.[192]

94. For these reasons, the concerns central to a segmented NEPA review, namely the dividing of one project into several in order to reduce the true scope of a project's environmental impacts, are not present here. Thus, the Commission appropriately did not consider the impacts of the Mainline System and Southgate Project in a single NEPA document.

d. Greenhouse Gas Emissions and Climate Change Impacts

95. Appalachian Mountain Advocates and others argue that we did not take a hard look at the Southgate Project's greenhouse gas (GHG) emissions and climate impacts. In support of this claim, Appalachian Mountain Advocates points to the EIS's failure to provide estimates of the project's upstream[193] and downstream[194] GHG emissions. Appalachian Mountain Advocates argues that the EIS's failure to assess the project's indirect GHG emissions "is contrary to NEPA's goals of informed decisionmaking and informed public comment" and undermines the Commission's environmental analysis.[195] Last, Appalachian Mountain Advocates asserts that the EIS fails to assess the significance of the Southgate Project's GHG emissions on climate change, in violation of the NEPA requirements.[196]

96. NEPA requires agencies to consider indirect effects or impacts that "are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable."[197] With respect to causation, "NEPA requires 'a reasonably close causal relationship' between the environmental effect and the alleged cause"[198] in order "to

make an agency responsible for a particular effect under NEPA."[199] As the Supreme Court has explained, "a 'but for' causal relationship is insufficient [to establish cause for purposes of NEPA]."[200] Thus, "[s]ome effects that are 'caused by' a change in the physical environment in the sense of 'but for' causation," will not fall within NEPA if "the causal chain is too attenuated."[201] Further, the Court has stated that "where an agency has no ability to prevent a certain effect due to its limited statutory authority over the relevant actions, the agency cannot be considered a legally relevant 'cause' of the effect."[202] Regarding reasonable foreseeability, courts have found that an impact is reasonably foreseeable if it is "sufficiently likely to occur that a person of ordinary prudence would take it into account in reaching a decision."[203] Although courts have held that NEPA requires "reasonable forecasting,"[204] an agency "is not required to engage in speculative analysis"[205] or "to do the impractical, if not enough information is available to permit meaningful consideration."[206]

97. As we have previously concluded in other natural gas infrastructure proceedings and affirm with respect to the Southgate Project, the environmental effects resulting from natural gas production are generally neither caused by a proposed pipeline project nor are they reasonably foreseeable consequences of our approval of an infrastructure project, as

contemplated by CEQ regulations, where the supply source is unknown.[207] Because the Southgate Project will receive natural gas from other interstate pipelines (Mountain Valley's Mainline System and East Tennessee's system), the specific source of natural gas to be transported via the project is currently unknown and will likely change throughout the project's operation. Moreover, there is no evidence in the record that would help the Commission determine the origin of the natural gas that will be transported on the Southgate Project, let alone predict the number and location of any additional wells that would be drilled as a result of any production demand associated with the project. Nor is there evidence that, absent approval of the Southgate Project, this gas would not be brought to the market by other means. Therefore, we conclude that the environmental impacts of upstream natural gas production are not an indirect effect of the project.[208] Last, where there is not even an identified general supply area for the gas that will be transported on the project, any analysis of production impacts would be so generalized it would be meaningless.[209]

98. As to downstream emissions from gas consumption, the U.S. Court of Appeals for the D.C. Circuit in *Sierra Club v. FERC* held that where it is known that the natural gas transported by a project will be used for a specific end-use combustion, the Commission should "estimate[] the amount of power-plant carbon emissions that the pipelines will

[207] *See, e.g., Central New York Oil and Gas Co., LLC*, 137 FERC ¶ 61,121, at PP 81-101 (2011), *order on reh'g*, 138 FERC ¶ 61,104, at PP 33-49 (2012), *petition for review dismissed sub nom. App'x. 472, 474-75 (2d Cir. 2012) (unpublished opinion); *see also Adelphia Gateway, LLC*, 169 FERC ¶ 61,220, at P 243 (2019), *order on reh'g*, 171 FERC ¶ 61,049, at P 89 (2020).

[208] *Birckhead v. FERC*, 925 F.3d 510, 518 (D.C. Cir. 2019) (holding the Commission did not violate NEPA in not considering upstream impacts where there was no evidence to predict the number and location of additional wells that would be drilled as a result of a project). *See generally Transco,* 171 FERC ¶ 61,032 (2020) (McNamee Comm'r concurrence) (elaborating on the purpose of the NGA and that one of its purposes is to facilitate the development of and access to natural gas; as well as an analysis of consideration of indirect effects under NEPA).

[209] *See Sierra Club v. U.S. Dep't of Energy*, 867 F.3d 189, 198-99 (D.C. Cir. 2017) (accepting Department of Energy's "reasoned explanation" as to why the indirect effects pertaining to induced natural gas production were not reasonably foreseeable where the Department noted the difficulty of predicting both the incremental quantity of natural gas that might be produced and where at the local level such production might occur, and that an economic model estimating localized impacts would be far too speculative to be useful).

make possible."[210] However, in *Birckhead v. FERC* (*Birckhead*), a case that did not involve a known specific end use, the D.C. Circuit stated that "emissions from downstream gas combustions are [not], as a categorical matter, always a reasonably foreseeable indirect effect of a pipeline project."[211] The court in *Birckhead* also noted that "NEPA . . . requires the Commission to at least attempt to obtain the information necessary to fulfill its statutory responsibilities," but, citing to *Delaware Riverkeeper Network*, the court acknowledged that NEPA does not "demand forecasting that is not meaningfully possible."[212]

99. In this case, because the end-use of the contracted for volumes is unknown, any potential GHG emissions associated with the ultimate combustion of the transported gas are not reasonably foreseeable, and therefore, not an indirect impact of the Southgate Project. The Commission requested information from Mountain Valley about the ultimate end use of the gas to be transported by the Southgate Project.[213] However, as discussed in the final EIS, most of the gas will serve North Carolina end-users, primarily by residential and small and medium-sized commercial customers, and that some volumes will go to North Carolina and Virginia, but that the end-use of the gas is unknown.[214] Beyond serving North Carolina end-users, we do not know how Dominion will be utilizing the gas, and there remains a range of possible uses for the gas to be delivered by the project. Accordingly, we find this generalized information insufficient to render the emissions associated with any consumption of the gas to be transported a reasonably foreseeable indirect effect of the project.

100. In any event, since the Southgate Project will receive gas from the Mainline System and East Tennessee's system, Mountain Valley contends it is not necessary to provide an estimate of the GHG emissions associated with the end use combustion of the gas to be transported on the project.[215] Mountain Valley points out that the Commission previously quantified the GHG emissions that could result from the end use consumption of the volumes transported on Mountain Valley's Mainline System, and previously

[215] Mountain Valley's March 31, 2020 Comments at 1-2.

evaluated the environmental impacts associated with the volumes transported on East Tennessee's system.[216] Thus, Mountain Valley asserts, quantifying the downstream GHG emissions associated with the Southgate Project would lead to "double counting" of emissions.[217] We note that the final EIS for the Mountain Valley Mainline System, which is expected to source approximately 80% of the gas transported on the Southgate Project facilities, conservatively estimated the GHG emissions associated with the full combustion of the volume of natural gas transported on its mainline system.[218] This underscores the point that, given the connected nature of the interstate pipeline system, the transportation capacity associated with a new pipeline does not necessarily represent, on a national level, incremental capacity. It further underscores our determination that providing upper bound estimates of downstream GHG emissions on individual pipelines may be misleading and does not provide meaningful information regarding a pipeline project's impact on GHG emissions and climate change.

101. Some commenters assert that the Commission's NEPA analysis is flawed because the EIS does not use the Social Cost of Carbon, or a similar tool, to evaluate climate change impacts.[219] Appalachian Mountain Advocates, the Institute for Policy Integrity at New York University School of Law, and others assert that the Commission erroneously claims there is no reliable method for evaluating climate impacts.[220] Commenters further argue that the Commission's failure to use the Social Cost of Carbon or a similar methodology renders NEPA's "hard look" requirement unmet.[221]

---

[216] *Id.* at 2.

[217] *Id.*

[218] *Mountain Valley*, 161 FERC ¶ 61,043 at P 293. The Commission noted that this estimate represents an upper bound for the amount of end-use combustion that could result from the gas transported by these projects and we reiterate that providing upper bound estimates of downstream effects using worst-case scenarios of peak use does not meaningfully inform its decision. *See Columbia Gas Transmission*, 170 FERC ¶ 61,246, at P 47 (2020).

[219] *See, e.g.*, AMA's September 16, 2019 Comments at 11-24; Institute for Policy Integrity at New York University School of Law's September 16, 2019 Comments (Institute for Policy Integrity's September 16, 2019 Comments).

[220] AMA's September 16, 2019 Comments at 18-22; Institute for Policy Integrity's September 16, 2019 Comments at 1.

[221] *See, e.g.*, AMA's September 16, 2019 Comments at 11.

102. The Social Cost of Carbon has been described as an estimate of the monetized climate change damage associated with an incremental increase in carbon dioxide (CO_2) emissions in a given year.[222] The Commission has provided extensive discussion on why the Social Cost of Carbon is not appropriate in project-level NEPA review, and cannot meaningfully inform the Commission's decisions on natural gas infrastructure projects under the NGA.[223] We adopt that reasoning here. As the Commission has previously explained, the Social Cost of Carbon is not appropriate for use in any project-level NEPA review for the following reasons:

(1) the EPA states that "no consensus exists on the appropriate [discount] rate to use for analyses spanning multiple generations"[224] and consequently, significant variation in output can result;[225]

(2) the tool does not measure the actual incremental impacts of a project on the environment; and

[222] Interagency Working Group on the Social Cost of Greenhouse Gases, *Technical Support Document – Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis – Under Executive Order 12866* at 3 (Aug. 2016), https://www.epa.gov/sites/production/files/2016-12/documents/sc_co2_tsd_august_2016.pdf

[223] *Mountain Valley*, 161 FERC ¶ 61,043 at P 296, *order on reh'g*, 163 FERC ¶ 61,197, at PP 275-297, *aff'd sub nom., Appalachian Voices v. FERC*, No. 17-1271, 2019 WL 847199 at *2 ("[The Commission] gave several reasons why it believed petitioners' preferred metric, the Social Cost of Carbon tool, is not an appropriate measure of project-level climate change impacts and their significance under NEPA or the Natural Gas Act. That is all that is required for NEPA purposes.").

[224] *See* EPA, Fact Sheet: *Social Cost of Carbon* (November 2013), https://19january2017snapshot.epa.gov/climatechange/social-cost-carbon_.html.

[225] Depending on the selected discount rate, the tool can project widely different present-day cost to avoid future climate change impacts. *See generally Transco,* 171 FERC ¶ 61,032 (2020) (McNamee, Comm'r, concurring at n.142) ("The Social Cost of Carbon produces wide-ranging dollar values based upon a chose discount rate, and the assumptions made. The Interagency Working Group on Social Cost of Greenhouse Gases estimated in 2016 that the Social Cost of one ton of carbon dioxide for the year 2020 ranged from $12 to $123.").

(3) there are no established criteria identifying the monetized values that are to be considered significant for NEPA reviews.[226]

Moreover, the Commission has explained it does not use monetized cost-benefit analyses as part of its NEPA review.[227] In any event, there is no universally accepted methodology for evaluating the Southgate Project's impacts on climate change. As the Commission has previously concluded, it cannot determine a project's incremental physical impacts on the environment caused by GHG emissions.[228] We have also previously concluded the Commission cannot determine whether an individual project's contribution to climate change would be significant.[229] That situation has not changed.

4. Comments Received After Issuance of Final EIS

103. As noted above, between issuance of the final EIS and May 31, 2020, the Commission received substantive comments on the final EIS from the applicant, the EPA, Transco, the Monacan Indian Nation and the Sappony Tribe, Roger Sisson, Katie Whitehead, and the Blue Ridge Environmental Defense League.[230] We address the issues raised in these comments below.

---

[226] *See generally Transco*, 171 FERC ¶ 61,032 (2020) (McNamee, Comm'r, concurring at P 66) ("When the Social Cost of Carbon estimates that one metric ton of CO_2 costs $12 (the 2020 cost for a discount rate of five percent), agency decision-makers and the public have no objective basis or benchmark to determine whether the cost is significant. Bare numbers standing alone simply *cannot* ascribe significance.") (emphasis in original) (footnote omitted).

[227] *See Florida Southeast Connection, LLC*, 162 FERC ¶ 61,233, at PP 39-44 (2018).

[229] *Id*.

[230] We received a few comments raising general concerns about the Novel Coronavirus Disease (COVID-19) pandemic. Because the comments do not raise project-specific concerns we do not address them herein. However, the Commission

a. Applicant's Final EIS Clarifications and Supplemental Filing

104. In its comments on the final EIS, Mountain Valley provided some minor clarifications responding to information contained in the final EIS. Mountain Valley's clarifications addressed its proposed construction schedule and work hours, and its proposed construction corridor for certain wetland crossings.[231]

105. Mountain Valley states that in section 2.5 of the final EIS, *Construction Schedule and Workforce*, the construction schedule description should be clarified to note that Mountain Valley anticipates conducting construction work seven days per week.[232] Mountain Valley's application and residential construction plans both contemplated construction occurring six days per week. This was the schedule reviewed and recommended in the final EIS and this is the schedule approved herein. Although we have, on a case-by-case basis, approved construction schedules where an applicant has demonstrated a need to perform limited construction activities seven days per week,[233] Mountain Valley has not provided a sufficient demonstration here. Therefore, we are not revising the authorized construction schedule.

106. Referencing section 2.4 of the final EIS, *Construction Procedure*s, Mountain Valley clarifies that its *Wetland and Waterbody Construction and Mitigation Procedures*[234] requested a greater than 75-foot-wide construction corridor at five wetland locations, rather than four.[235] Although the final EIS stated that "[t]here are four locations where Mountain Valley is requesting a greater than 75-foot-wide construction corridor in wetlands," the final EIS analyzed all five individual wetlands where Mountain

---

continues to closely monitor the situation and is committed to ensuring the health and safety of the public and the continued reliability of the nation's energy sector.

[231] Mountain Valley's March 31, 2020 Comments at 2-3.

[233] *See, e.g.*, *Algonquin Gas Transmission, LLC*, 158 FERC ¶ 61,061, at P 217 (2017) (explaining, in the context of the noise analysis for horizontal directional drill (HDD) construction, that "[w]hile we encourage applicants make reasonable efforts to comply with state and local noise regulations, to the extent practicable, HDD construction is primarily a 24-hour per day activity.").

[234] Mountain Valley's October 23, 2019 Supplemental Filing.

[235] Final EIS at 2-13 (stating that Mountain Valley requested a greater than 75-foot-wide construction corridor at four wetland locations).

Valley requested a greater than 75-foot-wide construction corridor.[236] The final EIS evaluated four locations, one of which included two individual wetland crossings that were considered to be at the same general location due to their proximity, site conditions, and justification provided by Mountain Valley. Accordingly, we grant the requested clarification. Neither of the foregoing clarifications changes the conclusions in the final EIS.

107. On April 21, 2020, Mountain Valley filed changes to the Southgate Project, including slight realignments of the pipeline route at waterbody crossings and minor changes in workspace locations.[237] Because this route modification request was received at such a late stage in the proceeding and because it is not clear that Mountain Valley has obtained landowner approval for the modifications requested, we are not approving the April 21 realignments as part of the pipeline route certificated herein. Should Mountain Valley choose to resubmit these route realignments as part of its Implementation Plan required by Environmental Condition 6 or as part of a variance request in accordance with Environmental Condition 5, which requires landowner approval, Commission staff will review the requested modifications at that time.

b. Agency and Tribal Consultation

108. EPA recommends incorporating in the record of decision the results of the Commission's consultation or coordination efforts related to aquatic resources, endangered species, historic preservation, and tribes.[238] EPA also states that every effort should be made to minimize impacts on tribal interests within the vicinity of the proposed project. On April 27, 2020, Cultural Heritage Partners filed comments on behalf of the Monacan Indian Nation and the Sappony Tribe concerning the Commission's consultation with the tribes. These comments are addressed below.

109. The final EIS, prepared in coordination with cooperating agencies Army Corps and FWS, contains a comprehensive evaluation of the various resource areas identified by EPA and discusses the Commission's consultation efforts through publication of the

[236] *Id*. at 4-57.

[237] Mountain Valley's April 21, 2010 Supplemental Filing.

[238] EPA's March 23, 2020 Comments at 1.

final EIS.[239] Below, we summarize the results of our efforts to consult under the ESA, under the National Historic Preservation Act, and with tribes.

i. Endangered Species Act

110. With respect to consultation under the ESA, the final EIS identifies six species that are federally listed as threatened or endangered (or are identified as proposed for federal listing) and may occur in or near the project area.[240] No critical habitat has been designated in the project area for any of these species.[241] Commission staff determined that the project is *not likely to adversely affect* any proposed or listed species.[242] The final EIS also identifies two federally designated species of concern[243] that could occur in the project area and concludes that the project would not likely impact these species.[244] On March 19, 2020, the FWS's Raleigh Ecological Services Field Office filed a letter concurring with the final EIS's determinations of effect on five of the six federally listed or proposed species that potentially occur in the project area.[245] The final EIS considers the sixth species, the northern long-eared bat, and concludes that there are no known hibernacula or maternity roosts in the survey area and, with the application of FWS's final 4(d) rule,[246] the project *may affect but is not likely to adversely affect* the northern long-eared bat.

---

[239] *See* final EIS at sections 4.3 (water resources); 4.7.1 – 4.7.6 (federally listed threatened, endangered, and other species of concern); 4.9.8 (environmental justice); and 4.10.1 (cultural resources and tribal consultations).

[240] *Id*. at 4-97 (Table 4.7-1).

[241] *Id*. at 4-96.

[242] *Id*. at 4-96.

[243] "Species of concern" is an informal term used by FWS to refer to species that have been identified as important to monitor, but do not have endangered, threatened or candidate status and thus receive no legal protection.

[244] *Id*. at 4-97 (Table 4.7-1).

[245] FWS's March 19, 2020 Letter.

[246] In January 2016, the FWS finalized a rule under authority of section 4(d) of the ESA that provides measures that are necessary and advisable to provide for the conservation of the northern long-eared bat. *See* final EIS at 4-98.

111. ESA consultation with the FWS is not yet complete. FWS has not yet responded to staff's request for concurrence with staff's ESA determination that the project is not likely to adversely affect the northern long-eared bat. Further, because access was denied on some properties, a limited number of areas may require surveys following issuance of the certificate. Last, Mountain Valley has indicated that water required for construction and hydrostatic test would be primarily obtained from the Dan River (which contains federally listed species).[247] Environmental Condition 16 requires Mountain Valley to provide written concurrence from the FWS for any water withdrawals from the Dan River. As required by Environmental Condition 19, Mountain Valley may not commence construction activities until it files with the Secretary the results of all outstanding biological surveys, the staff completes ESA consultation with the FWS, and Mountain Valley has received written notification from the Director of OEP, or the Director's designee, that construction or mitigation activity may begin.

ii. National Historic Preservation Act and Tribal Consultation

112. The Commission's consultation efforts in compliance with section 106 of the National Historic Preservation Act (NHPA)[248] and its implementing regulations[249] are documented in the final EIS. As described in section 4.10.3 of the final EIS, Commission staff consulted with the State Historic Preservation Officers (SHPO) of Virginia and North Carolina, interested Indian tribes, and other consulting parties prior to making determinations regarding National Register of Historic Places (NRHP) eligibility and project effects.[250] The final EIS recommends, and we require in Environmental Condition 20, that Mountain Valley not begin construction of facilities or use of any staging, storage, temporary work areas, or new or to-be-improved access roads until: (1) Mountain Valley files with the Commission all remaining cultural resources survey reports, site evaluations, and avoidance or treatment plans for NRHP-listed or eligible sites, as necessary, and comments on those reports and plans from the SHPOs, interested

[247] FWS's March 19, 2020 Letter indicates that additional ESA surveys and consultation may be needed as the result of certain project modifications, such as "changing from municipal water supplies to surface water intakes." FWS's March 19, 2020 Letter at 1. The final EIS explains that Mountain Valley has not yet finalized its water sources to be used for project purposes (e.g., dust control, hydrostatic testing, and horizontal directional drilling) nor has Mountain Valley obtained permission from the FWS for any water withdrawals from the Dan River. *See* final EIS at 4-48.

[248] 54 U.S.C. § 306108 (2018).

[249] 36 C.F.R. pt. 800 (2019).

[250] *See* final EIS at 4-154 to 4-173.

Indian tribes, and other consulting parties; and (2) Commission staff reviews and approves all cultural resources reports, studies, and plans, and notifies Mountain Valley in writing that treatment plans and mitigation measures may be implemented and/or construction may proceed.

113. The final EIS concludes that although construction and operation of the Southgate Project would have adverse effects on historic properties, an agreement document would be developed with the goal of resolving those impacts.[251] On November 14, 2019, Commission staff notified the Advisory Council on Historic Preservation (Advisory Council) that the Southgate Project may have adverse effects on historic properties, and invited the Advisory Council to participate in the resolution of adverse effects through the development of an agreement document. By letter filed December 11, 2019, the Advisory Council declined to participate in the consultation to resolve adverse effects.[252] Commission staff then prepared a draft programmatic agreement that was sent to the SHPOs and other consulting parties on January 8, 2020. After addressing the Virginia and North Carolina SHPOs' comments on the draft agreement, Commission staff sent a final programmatic agreement to the SHPOs and other consulting parties on March 10, 2020. The North Carolina SHPO signed the agreement on March 24, 2020.

114. By letter dated April 1, 2020,[253] the Virginia SHPO requested that the Commission consider comments on the final agreement that the Virginia SHPO stated it received on March 25, 2020, from Cultural Heritage Partners on behalf of the Monacan Indian Nation and the Sappony Tribe.[254] Commission staff responded to these comments in an April 10, 2020 letter to the Virginia SHPO and requested the SHPO's signature on the final agreement. The Virginia SHPO signed the agreement on May 17, 2020. Execution of the programmatic agreement by the Commission, the North Carolina SHPO, and the Virginia SHPO[255] concludes the NHPA section 106 process. The programmatic agreement provides a mechanism for the review of future cultural resources investigations to cover the entire area of potential effect for the undertaking, avoidance or treatment for historic properties, and future consultations among the

[251] *Id*. at 5-11.

[252] Advisory Council's December 11, 2019 Response to Notice of Adverse Effect.

[253] The Virginia SHPO's letter was filed in the public docket on April 9, 2020.

[254] Neither tribe submitted substantive comments on the text of the draft agreement document directly to the Commission.

[255] The executed programmatic agreement was placed into the public record for this proceeding on May 19, 2020.

consulting parties. Environmental Condition 20 requires Mountain Valley to implement the stipulations of the programmatic agreement.

115. On April 24, 2020, Cultural Heritage Partners filed comments on behalf of the Monacan Indian Nation and the Sappony Tribe (collectively, Tribes).[256] The Tribes argue that the Commission process for developing the programmatic agreement "failed to comply with the letter and spirit of Section 106 of the [NHPA] . . . ."[257] The Tribes believe that since they have obligations under the programmatic agreement, they should be recognized as invited signatories to the agreement.

116. Pursuant to the section 106 implementing regulations, the agency must consult with the SHPO and other consulting parties (including interested Indian tribes) to seek ways to avoid, minimize, or mitigate the undertaking's adverse effects.[258] If they agree on how to resolve the adverse effects, the agency and the SHPO must execute an agreement document.[259] By developing and executing an agreement document with the North Carolina and Virginia SHPOs, in order to resolve adverse effects on historic properties affected by the Southgate Project, the Commission has complied with both the letter and spirit of section 106 of the NHPA.

117. The required signatories to a section 106 agreement document include the agency official, the appropriate SHPO, and, if participating in the consultation, the Advisory Council.[260] Generally, if the project were to occur on or affect historic properties on tribal lands, the tribe would also be a signatory to the agreement.[261] That is not the case here. Section 800.6(c)(2) of the section 106 implementing regulations allows, but does not require, the Commission to invite additional consulting parties to be signatories to a

[256] Cultural Heritage Partners also filed comments on the Tribes' behalf commenting on the Commission's development of the programmatic agreement on January 16, and February 7, 2020.

[257] Monacan Indian Nation's and Sappony Tribe's April 27, 2020 Letters at 1.

[258] 36 C.F.R. § 800.6(b)(1)(i) (2019).

[259] *Id.* § 800.6(b)(1)(iv).

[260] *Id.* § 800.6(c)(1). As noted above, the Advisory Council declined to participate in the consultation for the Southgate Project by letter filed December 11, 2019.

[261] *See* 36 C.F.R. §§ 800.6(c)(1) and 800.2(c)(2)(i) (2019).

section 106 agreement document (i.e., "invited signatories").[262] Citing Advisory Council guidance, the Tribes argue that they should be invited signatories because they have obligations under the programmatic agreement.[263] However, the Advisory Council's guidance further underscores that it is within the Commission's discretion to determine whether to invite additional parties to sign an agreement document, explaining that "[f]ederal agencies . . . should weigh the decision carefully, since an invited signatory who actually signs an agreement has the same ability to amend or terminate the agreement as other signatories."[264] Accordingly, the Commission acted within its discretion, and in accord with the NHPA and its implementing regulations, by limiting the signatories to the programmatic agreement to those required under section 800.6(c)(1).[265] Nevertheless, because the Monacan Indian Nation and the Sappony Tribe are considered to be consulting parties, the Commission invited the tribes to sign the agreement as concurring parties. To date, neither tribe has done so.

118. The Tribes also take issue with Commission staff's development of the programmatic agreement, stating that the programmatic agreement was presented as a "done deal" and "appears to be nothing more than a standard FERC template."[266]

119. As described above, a draft programmatic agreement was circulated among consulting parties on January 8, 2020. The purpose of distributing the draft agreement was to elicit substantive comments and edits from the consulting parties. Commission staff made substantial changes to the final programmatic agreement based on comments received from the Virginia and North Carolina SHPOs. Moreover, the use of a common

template for the same type of program or undertaking, such as for natural gas projects, is contemplated by the section 106 implementing regulations.[267]

120. The Tribes assert that the Commission has not engaged in meaningful government to government consultation.[268] They also take issue with certain aspects of Mountain Valley's *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* (Unanticipated Discovery Plan).[269]

121. Commission staff initiated consultation on August 8, 2018, by mailing the NOI for the Southgate Project to a wide variety of stakeholders, including the Virginia and North Carolina SHPOs and potentially interested Indian tribes. On October 16, 2018, staff supplemented the information contained in the NOI by sending individual letters to 25 federally recognized tribes, including the Monacan Indian Nation.[270] In response, staff received comments from five tribes. Commission staff held meetings, in person or via teleconference, with three federally recognized Indian tribes, including a January 17, 2019 meeting with representatives of the Monacan Indian Nation in Richmond, Virginia. On February 21, 2019, Mountain Valley provided the Monacan Indian Nation and the Sappony Tribe copies of the cultural resources investigations reports prepared for the project.[271] Both Tribes commented on the cultural resources reports in July 2019.[272] Both Tribes also commented on the draft EIS. Staff addressed the Tribes' comments in the final EIS.[273]

---

[267] *See* 36 C.F.R. § 800.14(b)(4) (2019) (describing the use of a "prototype programmatic agreement" for the "same type of program or undertaking in more than one case or area").

[268] Monacan Indian Nation's and Sappony Tribe's April 27, 2020 Letters at 2.

[269] *Id.*

[270] The Sappony Tribe is a North Carolina state-recognized tribe.

[271] *Id*. at 4-159; *see also* Mountain Valley's March 5, 2019 Information Request Response at 127.

[272] *See* Monacan Indian Nation's July 1, 2019 Comments on Cultural Resources Reports (filed as privileged); Sappony Tribe's July 1, 2019 Comments on Cultural Resources Reports (filed as privileged).

[273] *See* final EIS, Appendix I.3 at I.3-62 to I.3-67 (addressing Sappony Tribe's September 16, 2019 Comments on the draft EIS); I.3-68 to I.3-74 (addressing Monacan Indian Nation's September 16, 2019 Comments on the draft EIS); I.3-75 to I.3-77

122. Section 800.2(a)(4) of the regulations implementing section 106 of the NHPA states that "[t]he [Advisory] Council encourages the agency official to use to the extent possible existing agency procedures and mechanisms to fulfill the consultation requirements of this part."[274] By using our existing procedures, including notices, letters to and from tribes, and meetings between staff and tribal representatives, Commission staff has conducted consultation with Indian tribes. Section 4.10.1.2 of the final EIS provides a detailed account of the Commission's efforts to consult on a government-to-government basis with Indian tribes that may attach religious or cultural significance to sites in the region or may be interested in potential impacts from the Southgate Project on cultural resources.[275]

123. Mountain Valley developed its Unanticipated Discovery Plan[276] in consultation with the Virginia and North Carolina SHPOs. The plan notes that Mountain Valley "is contacting federally-recognized Native American Tribes to solicit their concerns and input regarding potential Project effects to historic properties, tribal resources, and human remains."[277] In addition, the plan sets forth the procedures to which Mountain Valley would adhere if archaeological resources or human remains are discovered during project construction. The plan includes two distinct protocols, the use of which is dependent upon whether or not the discovered cultural resources may involve human remains or funerary objects.[278] Both protocols require Mountain Valley to notify and consult with "Interested Tribes," which Mountain Valley has defined as "tribes that have asked to be

---

(addressing Monacan Indian Nation's November 11, 2019 Comments); and I.3-78 to I.3-80 (addressing Sappony Tribe's December 12, 2019 Comments).

[274] 36 C.F.R. § 800.2(a)(4) (2019).

[275] *See also* final EIS, Appendix E-3 (Table 4.10-2).

[276] Mountain Valley's original Unanticipated Discovery Plan was filed as part of its November 8, 2018 Application. *See* Application, Resource Report 4, Appendix 4-C. The Unanticipated Discovery Plan was revised in May 2019. *See* Mountain Valley's May 22, 2019 Supplemental Filing, attachment 5. In its comments on the final EIS, Mountain Valley clarified that the Unanticipated Discovery Plan has not been revised since the May 2019 version filed with the Commission. Mountain Valley's March 31, 2020 Comments at 3.

[277] Unanticipated Discovery Plan, section 3.0.

[278] *Compare* Mountain Valley's Unanticipated Discovery Plan, section 4.2 (Notification and Assessment Procedures – Not Involving Human Remains or Funerary Objects) *and* section 4.3 (Notification and Treatment Procedures – Human Remains or Funerary Objects).

consulted in the event of a discovery"[279] and "tribes that have requested consultation during the FERC review process."[280] Mountain Valley filed a revised Unanticipated Discovery Plan on May 22, 2019, which was subsequently approved by the North Carolina SHPO on August 19, 2019, and the Virginia SHPO on October 18, 2019.[281] We are satisfied that Mountain Valley has developed appropriate protocols for addressing unanticipated discoveries during project construction, and that Mountain Valley will seek input from the Tribes regarding any discoveries, as appropriate.[282] In the event of the unanticipated discovery of human remains, funerary object, sacred objects, or objects of cultural patrimony, Mountain Valley would follow the protocols set forth in the Unanticipated Discovery Plan and the executed programmatic agreement,[283] and has committed to treating any such discovery in a manner guided by the Advisory Council's *Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects* (2007) and any relevant state laws and guidelines.[284]

124. As detailed above, the Commission engaged in meaningful consultation pursuant to our obligations under NHPA section 106 and pursuant to our government-to-government

[279] Unanticipated Discovery Plan, section 3.0.

[280] Mountain Valley's October 18, 2019 Response to Environmental Information Request at 29.

[281] We note that, by letter filed May 19, 2020, the Virginia SHPO requested that Mountain Valley re-open consultation on the Unanticipated Discovery Plan to explore ways in which the Tribes may be more involved in determinations of significance of any discoveries.

[282] If the discovery is determined to be a newly identified and potentially significant archaeological site (i.e., exhibiting archaeological features, intact contacts, or patterned artifact distributions that could provide substantive information concerning prehistory or history), or if it represents information that would alter the understanding of a previously known and cleared archaeological resource, Mountain Valley must notify the Commission, the relevant SHPO, and Interested Tribes within 24 hours of the determination. *See* Unanticipated Discovery Plan, section 4.2.

[283] The programmatic agreement includes Stipulation VI.B, which states in part: "Human remains, funerary objects, sacred objects, and objects of cultural patrimony shall be treated in accordance with the [Unanticipated Discover Plan]; and repatriated to appropriate consulting Indian tribes or reburied after analysis, as determined by consultations among the signatories to this [programmatic agreement]."

[284] *See* Mountain Valley's October 18, 2019 Response to Environmental Information Request at 29.

responsibility to Indian tribes. Execution of the programmatic agreement, and implementation thereof, evidences the Commission's compliance with the section 106 review process.

c. Environmental Justice

125. EPA states that every effort should be made to minimize impacts to environmental justice communities within the vicinity of the project facilities.[285] The final EIS identified potential environmental justice communities (i.e., minority or low-income populations) in the project area consistent with EPA guidance.[286] The project pipeline would cross 35 census block groups, 15 of which contain environmental justice populations.[287] Two environmental justice populations are located within one mile of the proposed Lambert Compressor Station.[288] The EPA does not identify specific impacts to environmental justice communities that the Commission should minimize; however, the final EIS discusses factors that could affect such communities and determined that potentially adverse environmental effects would be minimized and/or mitigated.[289] Based on an evaluation of the project's potential environmental impacts on the identified environmental justice communities and finding that those impacts would be minimized or mitigated, the final EIS concludes that the project would not have a disproportionately high and adverse environmental or human health impact on minority or low-income populations.[290]

---

[285] EPA's March 23, 2020 Comments at 1.

[286] *See* final EIS at 4-144 to 4-149 (Table 4.9-7). Potential environmental justice communities include: (1) census block groups that have a minority population of more than 50% or a population that is 10 percentage points higher than their respective county; and (2) census block groups that have a household poverty rate of more than 20% or a household poverty rate that is 10 percentage points higher than their respective county. *Id.* at 4-142.

[287] *Id*. at 4-142.

[288] *Id*.

[289] *Id.* Factors that could affect environmental justice communities include air and noise impacts from construction and operation (section 4.11), visual impacts (section 4.8), and socioeconomic impacts such as traffic, loss of tourism, and crop loss (section 4.9).

[290] *See id*. at 4-153 and 5-11.

d. Hydrostatic Testing

126. EPA reiterates an earlier request for a hydrostatic testing report and recommends that Mountain Valley consider recycling the water used for hydrostatic testing.[291] The final EIS provides a description of Mountain Valley's proposed hydrostatic testing plans, including source and volume of water and discharge procedures.[292] The final EIS also notes that Mountain Valley would test the pipeline in segments, and that the water may be moved through each sequential segment along the route, or the water would be discharged.[293] If the hydrostatic test water is discharged, it would be discharged through sediment filters in vegetated uplands away from waterbodies and wetlands.[294] Prior to construction, Mountain Valley must apply for any applicable permits to discharge hydrostatic test water.

e. Collocation with Transco Pipeline

127. The Southgate Project's proposed pipeline route is adjacent to, or collocated with, Transco's existing system of three and four parallel, natural gas pipelines for approximately 33 miles. Transco and a landowner, Katie Whitehead, filed comments on the final EIS regarding the Southgate Project's proposed collocation.

i. Transco Comments

128. On March 27, 2020, Transco filed comments on the final EIS identifying several issues with collocating portions of the proposed Southgate Project with Transco's pipeline system.[295] Specifically, Transco is concerned with possible interference with Transco's cathodic protection system, the use of Transco's right-of-way for Southgate Project construction purposes (e.g., spoil storage, grading, heavy equipment, timber

[291] EPA's March 23, 2020 Comments at 1.

[292] Final EIS at 4-46 and 4-47.

[293] *Id*. at 2-20.

[294] *Id*.

[295] On January 31, 2020, Transco raised, for the first time, concerns that construction and operation of the Southgate Project would encroach on Transco's existing right-of-way and could potentially adversely affect the safety, integrity, operations, and expandability of Transco's pipeline system. Transco's January 31, 2020 Motion to Intervene Out of Time. The filing noted that Transco and Mountain Valley had executed an agreement on July 1, 2019, that set forth terms for Mountain Valley to cross Transco's right-of-way. *Id.* at 5.

storage, burning of brush, blasting impacts), and Transco's ability to access its right-of-way throughout the Southgate Project construction and restoration phase while erosion and sediment control devices remain on site.

129. On April 6, 2020, in response to staff's data request seeking detailed locations of the Transco pipeline systems, Mountain Valley filed revised alignment sheets showing that, for the majority of the proposed Southgate Project pipeline route, Mountain Valley proposes to place the Southgate Project pipeline at least 50 feet away from Transco facilities, with the exception of seven locations where the Southgate Project pipeline route would cross the Transco right-of-way and one location where the pipe would be horizontally directionally drilled under the Dan River. Mountain Valley states that it continues to coordinate with Transco at these locations. On May 8, 2020, Mountain Valley filed a response to Transco's March 27, 2020 comments.

130. We encourage collocated pipelines to minimize the space between existing and new pipelines in order to reduce the impact on natural resources and to minimize the amount of land that would need to be acquired from landowners. We note that collocated pipelines often use workspace associated with existing pipelines' permanent rights-of-way. Here, Mountain Valley has proposed placing its new pipeline at least 50 feet away from Transco facilities, with a few exceptions. Regarding Transco's safety concerns about the appropriate distances between pipelines, we note that maintaining a 50-foot separation between pipelines is not uncommon and that there are numerous examples of pipelines located less than 50 feet apart, including along Transco's own pipeline system.[296] Mountain Valley has also confirmed that the Southgate Project's proposed construction workspaces do not overlap a Transco pipeline in any location other than where the Southgate Project route would cross Transco's right-of-way. We note that the Interstate Natural Gas Association of America (INGAA) has adopted standard guidance

[296] Mountain Valley points out that Transco has collocated its own pipelines in the same right-of-way, with as little as a 25-foot separation. *See* Mountain Valley's May 8, 2020 Comments (quoting a February 4, 2019 comment filed by Transco in Docket No. CP18-186-000 for Transco's Southeastern Trail Expansion Project, in which Transco stated that "[c]urrent industry best practice is to maintain 25 feet of separation between large diameter, high-pressure natural gas transmission pipeline. This is designed to give the operating company clear access to safely excavate the pipeline for future maintenance activities (if necessary). The proposed 25-foot separation also allows construction to take place without regularly operating heavy equipment over the existing, in-service pipelines.").

calling for a 50-foot separation between pipelines.[297] The Southgate Project alignment along Transco's pipeline system is consistent with this guidance.

131. Regarding Transco's concerns about possible interference with its cathodic protection system, Mountain Valley must design, construct, operate, and maintain the Southgate Project pipeline in accordance with the U.S. Department of Transportation's (DOT) minimum federal safety standards.[298] In compliance with 49 CFR Part 192, subpart I, gas pipelines must be properly coated and have cathodic protection to prevent corrosion. The performance of cathodic protection systems must be monitored regularly with tests performed at least once per year. Records must be maintained for the life of the pipeline. Pipelines that are found to have deficient cathodic protection must be remediated in a timely manner (usually within 12 to 18 months after discovery).

132. We expect Mountain Valley's adherence to these requirements (as well as Transco's) will ensure that the location of Mountain Valley's new pipeline in proximity to Transco's existing pipelines will not result in detrimental impacts to any of the pipelines' cathodic protection systems. If any such impact occurred, the monitoring required by 49 CFR Part 192 would identify it and require remediation. Mountain Valley states that it continues to coordinate with Transco to ensure that the potential for interference and stray current between their cathodic protection systems is eliminated, and that it agrees with Transco that it would be advantageous to develop a plan to mitigate any potential risks to Transco's existing cathodic protection system.[299]

133. Mountain Valley has committed to working with Transco during construction and operation of the Southgate Project to coordinate access to the right-of-way in the event that unplanned issues arise. In response to Transco's concern that Mountain Valley's installation of erosion and sediment control devices would "unduly inhibit Transco's ability to access its right-of-way for operational and safety purposes,"[300] Mountain Valley responds that any controls within Transco's right-of-way can be temporarily removed to allow access.[301] We expect Mountain Valley to continue to coordinate with Transco to

[297] *See, e.g.,* INGAA Foundation, *Building Interstate Natural Gas Transmission Pipelines: A Primer* 87 (Jan. 2013), https://www.ingaa.org/constructionprimer.aspx.

[298] 49 C.F.R. pt. 192 (2019).

[299] *See* Mountain Valley's May 8, 2020 Comments at 2.

[301] Mountain Valley's May 8, 2020 Comments at 2.

resolve Transco's collocation and safety concerns. Based on the foregoing, we conclude that the Southgate Project, as proposed, could be constructed and operated safely.

ii. Katie Whitehead Comments

134. On April 8, 2020, landowner Katie Whitehead filed a comment in response to Mountain Valley's April 6 filing. Ms. Whitehead asserts that on the revised alignment sheets the location of Transco's existing pipelines on her property is not correct. Ms. Whitehead claims that the alignment sheets incorrectly depict the location of the Transco pipelines within Transco's right-of-way. Specifically, Ms. Whitehead believes that the Transco pipeline is located at least 40 feet from the edge of its right-of-way; therefore, based on Mountain Valley's pipeline alignment, there would be, at a minimum, a 65-foot separation between the existing Transco pipeline and the proposed Southgate Project pipeline. Ms. Whitehead states that she is unable to negotiate an appropriate easement without accurately knowing the temporary and permanent easement boundaries.[302]

135. On April 28, 2020, Mountain Valley responded that the alignment sheets are correct, based on data obtained from Transco as well as use of pipe locating equipment to determine the location of the Transco pipeline. In its filing, Mountain Valley included additional images of Ms. Whitehead's property to clarify the Transco pipeline locations with respect to the right-of-way and the proposed Southgate pipeline. In response to Ms. Whitehead, Mountain Valley stated that it has offered to make changes to the proposed route to reduce the impact on Ms. Whitehead's property and has stated that it will file the revised alignment sheets reflecting the changes as part of the project's Implementation Plan.[303]

136. On May 11, 2020, Ms. Whitehead responded, raising questions about the easement agreement process. Specifically, Ms. Whitehead's filing requests information related to agreements between Transco and Mountain Valley regarding the joint use of the right-of-way, including Mountain Valley's proposed crossing of a spillway leading from a small lake on her property[304] and Mountain Valley's plan for felled trees.

---

[302] Ms. Whitehead is specifically concerned about the excessive removal of trees and the impact on silviculture to accommodate the temporary workspace on her property. *See* Katie Whitehead's September 16, 2019 and November 17, 2019 Comments on the draft EIS.

[303] Final EIS at 3-26, Table 3.4-10 (Mountain Valley would reduce temporary workspace from 100 feet to 75 feet the entire distance on the Whitehead property).

[304] Mountain Valley identified the spillway as a surface water feature with intermittent flow. Final EIS Appendix I.3 at I.3-220. Mountain Valley will treat this

137. Mountain Valley proposes to treat the spillway on Ms. Whitehead's property as a waterbody crossing.[305] Pursuant to Mountain Valley's *Wetland and Waterbody Construction and Mitigation Procedures*, Mountain Valley will be required to restore the spillway after construction. Regarding tree felling, Environmental Condition 17 requires Mountain Valley to remove and dispose of timber and debris from the right-of-way. Mountain Valley must ensure that any timber that is not removed and remains on or adjacent to the right-of-way, as agreed to by the landowner, is located at access points where the landowner can reasonably retrieve the timber without any inadvertent impacts on the restored right-of-way, in accordance with the section III.E of the Commission's *Upland Erosion Control, Revegetation, and Maintenance Plan*.

138. The landowner easement agreement process provides an opportunity for Ms. Whitehead to express her concerns to Mountain Valley and to negotiate site-specific plans to meet her needs.[306] Environmental Condition 5 allows Mountain Valley to make minor adjustments to the route per landowner request so long as the route adjustments do not affect other landowners or sensitive environmental areas. Should Mountain Valley seek to revise its proposal based on easement negotiations with landowners, Environmental Condition 4 of this order requires Mountain Valley to file revised detailed survey alignment maps/sheets prior to the start of construction. Any changes to the approved route would be reflected on these alignment sheets.

f. Sandy Creek Crossing

139. Roger Sisson notes concerns about the Southgate Project's impacts on a spring-fed well on his property. Mr. Sisson is also concerned about the pipeline's crossing of the Sandy Creek riverbed, noting the potential for pipeline shifting and corrosion, due to the wet and sandy nature of the soil, and the possibility of flood damage.

140. Mountain Valley is required to identify all private wells and springs that are used for potable water in the project area. Accordingly, the final EIS recommends, and we

---

feature as a surface water crossing during construction, which will include a dry open-cut crossing consisting of either dam and pump or a flume. Final EIS Appendix B.5 at B.5-1.

[305] *See* Final EIS Appendix I.3 at I.3-220 and Appendix B.5 at B.5-1 (waterbody S-E18-4 at milepost 4.8).

[306] We note that NGA section 7(h) provides that a holder of a certificate of convenience and necessity, which this order issues to Mountain Valley, may acquire the needed property rights by exercise of the right of eminent domain. *See generally, Mountain Valley*, 161 FERC ¶ 61,043, at PP 59-62, *order on reh'g*, 163 FERC ¶ 61,197, at PP 48-51, *aff'd sub nom.*, *Appalachian Voices v. FERC*, No., 17-1271, 2019 WL 847199.

require in Environmental Condition 14, that Mountain Valley, prior to construction, file the locations of all private water wells and springs identified within 150 feet of the project work areas – including each water source's status, use, direction, and distance from construction workspace – and any proposed mitigation measures that would minimize or avoid impacts on the private water wells or springs.[307] To address potential impacts on groundwater wells, Mountain Valley will offer to conduct pre- and post-construction water quality testing for all water supply wells located within 150 feet of project workspaces, as described in Mountain Valley's *Water Resources Identification and Testing Plan*.[308]

141. The Southgate Project will cross Sandy Creek at milepost 12.8 in Pittsylvania County, Virginia.[309] To cross Sandy Creek, Mountain Valley will use dry-ditch methods (i.e., dam-and-pump or flume)[310] to minimize in-stream construction and surface water impacts.[311] Regarding Mr. Sisson's concerns about flood damage and risk to the pipeline from shifting in the stream bed, the final EIS explains that, although flooding itself does not generally present a risk to pipeline facilities, bank erosion and/or scour could expose the pipeline or cause sections of pipe to become unsupported. The final EIS states that the pipeline will be installed below scour depth for each waterbody crossed, and that at least four feet of cover would be maintained at waterbody crossings, except in consolidated rock, where there would be a minimum of two feet of cover.[312] The final EIS further states that flooding can also affect the pipeline by increasing buoyancy, causing the pipe to rise toward the land surface where it may become exposed.[313] To minimize and prevent impacts, Mountain Valley would implement mitigation measures such as use of concrete coating, gravel-filled blankets, or concrete weights on the pipeline to maintain negative buoyancy.[314] These measures are included in Mountain Valley's

---

[307] Final EIS at 5-3.

[308] *Id.*

[309] *Id.* Appendix B.5 at B.5-3.

[310] The dam-and-pump and flume methods are types of dry-ditch crossings that involve diverting the flow of water across construction work areas using one or more flume pipes, or a series of pumps and hoses, placed in the waterbody. *Id*. at 2-22 to 2-23.

[311] *Id.*

[312] *Id.* at 2-22.

[313] *Id.* at 4-13.

[314] *Id.* at 4-14.

Wetland and Waterbody Construction and Mitigation Procedures and project-specific *Erosion and Sediment Control Plan*, which Mountain Valley is required to follow at all waterbody crossings.

142. Cathodic protection would be installed along the entire length of the pipeline to prevent corrosion.[315] In addition, as described above, Mountain Valley will complete periodic corrosion and leak surveys.[316] Finally, Mountain Valley must design, construct, operate, and maintain the Southgate Project pipeline in accordance with DOT's minimum federal safety standards,[317] including requirements for internal, external, and atmospheric corrosion control.[318]

g. Natural Resources Conservation Service Riparian Area

143. On April 17, 2020, the Blue Ridge Environmental Defense League filed a comment on behalf of landowner Douglas Bryant, who is concerned about a riparian area on his property that would be crossed by the proposed pipeline at milepost 21.5 and that was part of a Natural Resources Conservation Service conservation program. Mr. Bryant requested that the Southgate Project pipeline route avoid this area on his property. Commission staff confirmed, through information provided by the Natural Resources Conservation Service, that this riparian area is no longer under a conservation program and does not warrant special protection. Therefore, there is no need to consider a reroute in the area. In general, to minimize impacts and restore riparian areas affected by the project, Mountain Valley would implement its *Upland Erosion Control, Revegetation and Maintenance Plan*, *Wetland and Waterbody Construction and Mitigation Procedures* and its project-specific *Erosion and Sediment Control Plan*. In addition, Environmental Condition 5 allows for Mountain Valley to make minor adjustments to the route per landowner request so long as the route adjustments do not affect other landowners or sensitive environmental areas.

5. Environmental Analysis Conclusion

144. We have reviewed the information and analysis contained in the final EIS regarding the potential environmental effects of the Southgate Project, as supplemented herein. We agree with the conclusions presented in the final EIS and find that the environmental impacts associated with the project, if constructed and operated as

---

[315] *Id.* at 4-218.

[316] *See supra* P 131.

[317] 49 C.F.R. pt. 192.

[318] *Id.* §§ 192.451-192.493 (subpart I); *see also* final EIS at 2-12.

described in the final EIS, are acceptable considering the public benefits that the project will provide. We accept the final EIS's environmental recommendations, as revised herein, and include them as conditions in the appendix to this order.

145. Based on our Certificate Policy Statement determination and our environmental analysis, we find under section 7 of the NGA that the public convenience and necessity requires approval of Mountain Valley's Southgate Project, subject to the conditions in this order.

146. Compliance with the environmental conditions appended to our orders is integral to ensuring that the environmental impacts of approved projects are consistent with those anticipated by our environmental analyses. Commission staff carefully reviews all information submitted and will only issue a notice to proceed with construction when satisfied that the applicant has complied with all applicable conditions. We also note that the Commission has the authority to take whatever steps are necessary to ensure the protection of environmental resources during construction and operation of the project, including authority to impose any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the order, as well as the avoidance or mitigation of unforeseen adverse environmental impacts resulting from project construction and operation.

147. Any state or local permits issued with respect to the jurisdictional facilities authorized herein must be consistent with the conditions of this certificate. The Commission encourages cooperation between interstate pipelines and local authorities. However, this does not mean that state and local agencies, through application of state or local laws, may prohibit or unreasonably delay the construction or operation of facilities approved by this Commission.[319]

148. At a hearing held on June 18, 2020, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application, as supplemented, and exhibits thereto, and all comments, and upon consideration of the record,

---

[319] *See* 15 U.S.C. § 717r(d) (2018) (state or federal agency's failure to act on a permit considered to be inconsistent with Federal law); *see also Schneidewind v. ANR Pipeline Co*., 485 U.S. 293, 310 (1988) (state regulation that interferes with FERC's regulatory authority over the transportation of natural gas is preempted) and *Dominion Transmission, Inc. v. Summers,* 723 F.3d 238, 245 (D.C. Cir. 2013) (noting that state and local regulation is preempted by the NGA to the extent it conflicts with federal regulation, or would delay the construction and operation of facilities approved by the Commission).

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Mountain Valley, authorizing it to construct and operate the proposed facilities, as described and conditioned herein, and as more fully described in the application, and subsequent filings by the applicant, including any commitments made therein.

(B) The construction of the Southgate Project facilities will not commence until Mountain Valley receives the appropriate federal permits for the Mainline System, and the Director of the Office of Energy Projects, or the Director's designee, lifts the stop-work order and authorizes Mountain Valley to continue constructing the remaining portions of the Mainline System.

(C) The certificate authority issued in Ordering Paragraph (A) is conditioned on:

(1) Mountain Valley's completion of construction of the proposed facilities and making them available for service within three years of the date of this order pursuant to section 157.20(b) of the Commission's regulations;

(2) Mountain Valley's compliance with all applicable Commission regulations under the NGA including, but not limited to, Parts 154, 157, and 284, and paragraphs (a), (c), (e), and (f) of section 157.20 of the Commission's regulations;

(3) Mountain Valley's compliance with the environmental conditions listed in the appendix to this order; and

(4) Mountain Valley's filing a written statement affirming that it has executed firm service agreements for volumes and service terms equivalent to those in its precedent agreements, prior to commencing construction.

(D) Mountain Valley's proposed rates for service on the Southgate System are approved, as modified above.

(E) Mountain Valley's proposal to charge an initial retainage factor to recover fuel costs associated with the Southgate System is approved.

(F) Mountain Valley is required to file actual tariff records setting forth rates and the separately-stated fuel rate for the project and other proposed changes to its tariff implementing the project no more than 60 days and no less than 30 days prior to placing the project in service.

(G) Mountain Valley shall notify the Commission's environmental staff by telephone or e-mail of any environmental noncompliance identified by other federal, state, or local agencies on the same day that such agency notifies Mountain Valley. Mountain Valley shall file written confirmation of such notification with the Secretary of the Commission within 24 hours.

(H) The North Carolina Utilities Commission's and the Appalachian Mountain Advocates' requests for a full evidentiary, trial-type hearing are denied.

(I) Transcontinental Gas Pipe Line Company, LLC's request for a technical conference is denied.

By the Commission. Commissioner Glick is dissenting in part with a separate statement attached.
Commissioner McNamee is concurring with a separate statement attached.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

Appendix

Environmental Conditions

As recommended in the final Environmental Impact Statement (EIS) for the Southgate Project (Project) and modified herein, this authorization includes the following conditions:

1. Mountain Valley shall follow the construction procedures and mitigation measures described in its application, supplemental filings (including responses to staff data requests), and as identified in the EIS, unless modified by the Order. Mountain Valley must:

    a. request any modification to these procedures, measures, or conditions in a filing with the Secretary of the Commission (Secretary);

    b. justify each modification relative to site-specific conditions;

    c. explain how that modification provides an equal or greater level of environmental protection than the original measure; and

    d. receive approval in writing from the Director of the Office of Energy Projects (OEP), or the Director's designee, **before using that modification**.

2. The Director of OEP, or the Director's designee, has delegated authority to address any requests for approvals or authorizations necessary to carry out the conditions of the Order, and take whatever steps are necessary to ensure the protection of environmental resources during construction and operation of the Project. This authority shall allow:

    a. the modification of conditions of the Order;

    b. stop-work authority; and

    c. the imposition of any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the Order as well as the avoidance or mitigation of unforeseen adverse environmental impact resulting from Project construction and operation.

3. **Prior to any construction,** Mountain Valley shall file an affirmative statement with the Secretary, certified by a senior company official, that all company personnel, environmental inspectors (EIs), and contractor personnel will be informed of the EIs' authority and have been or will be trained on the implementation of the environmental mitigation measures appropriate to their jobs **before** becoming involved with construction and restoration activities.

4. The authorized facility locations shall be as shown in the EIS, as supplemented by filed alignment sheets. **As soon as they are available, and before the start of construction**, Mountain Valley shall file with the Secretary any revised detailed survey alignment maps/sheets at a scale not smaller than 1:6,000 with station positions for all facilities approved by the Order. All requests for modifications of environmental conditions of the Order or site-specific clearances must be written and must reference locations designated on these alignment maps/sheets.

   Mountain Valley's exercise of eminent domain authority granted under Natural Gas Act Section 7(h) in any condemnation proceedings related to the Order must be consistent with these authorized facilities and locations. Mountain Valley's right of eminent domain granted under Natural Gas Act Section 7(h) does not authorize it to increase the size of its natural gas facilities to accommodate future needs or to acquire a right-of-way for a pipeline to transport a commodity other than natural gas.

5. Mountain Valley shall file with the Secretary detailed alignment maps/sheets and aerial photographs at a scale not smaller than 1:6,000 identifying all route realignments or facility relocations, and staging areas, construction support areas, new access roads, and other areas that would be used or disturbed and have not been previously identified in filings with the Secretary. Approval for each of these areas must be explicitly requested in writing. For each area, the request must include a description of the existing land use/cover type, documentation of landowner approval, whether any cultural resources or federally listed threatened or endangered species would be affected, and whether any other environmentally sensitive areas are within or abutting the area. All areas shall be clearly identified on the maps/sheets/aerial photographs. All areas must be approved in writing by the Director of OEP, or the Director's designee, **before construction in or near that area**.

   This requirement does not apply to extra workspace allowed by the Commission's *Upland Erosion Control, Revegetation, & Maintenance Plan* and/or minor field realignments per landowner needs and requirements that do not affect other landowners or sensitive environmental areas such as wetlands.

   Examples of alterations requiring approval include all facility location changes resulting from:

   a. implementation of cultural resources mitigation measures;

   b. implementation of endangered, threatened, or special concern species mitigation measures;

   c. recommendations by state regulatory authorities; and

d. agreements with individual landowners that affect other landowners or could affect sensitive environmental areas.

6. **Within 60 days of the acceptance of the Certificate and before construction begins**, Mountain Valley shall file its Implementation Plan with the Secretary, for review and written approval by the Director of OEP, or the Director's designee. Mountain Valley must file revisions to its plans as schedules change. The plans shall identify:

a. how Mountain Valley will implement the construction procedures and mitigation measures described in its application and supplements (including responses to staff data requests), identified in the EIS, and required by the Order;

b. how Mountain Valley will incorporate these requirements into the contract bid documents, construction contracts (especially penalty clauses and specifications), and construction drawings so that the mitigation required at each site is clear to on-site construction and inspection personnel;

c. the number of EIs assigned per spread and/or facility, and how Mountain Valley will ensure that sufficient personnel are available to implement the environmental mitigation;

d. company personnel, including EIs and contractors, who will receive copies of the appropriate materials;

e. the location and dates of the environmental compliance training and instructions Mountain Valley will give to all personnel involved with construction and restoration (initial and refresher training as the Project progresses and personnel change), with the opportunity for OEP staff to participate in the training session(s);

f. the company personnel (if known) and specific portion of Mountain Valley's organization having responsibility for compliance;

g. the procedures (including use of contract penalties) Mountain Valley will follow if noncompliance occurs; and

h. for each discrete facility, a Gantt or Program Evaluation Review Technique (PERT) chart (or similar Project scheduling diagram), and dates for:

1. the completion of all required surveys and reports;
2. the environmental compliance training of on-site personnel;
3. the start of construction; and
4. the start and completion of restoration.

7. Mountain Valley shall employ a team of EIs (i.e., two or more or as may be established by the Director of OEP or the Director's designee) per construction spread. The EIs shall be:

    a. responsible for monitoring and ensuring compliance with all mitigation measures required by the Order and other grants, permits, certificates, or authorizing documents;

    b. responsible for evaluating the construction contractor's implementation of the environmental mitigation measures required in the contract (see condition 6 above) and any other authorizing document;

    c. empowered to order correction of acts that violate the environmental conditions of the Order, and any other authorizing document;

    d. a full-time position separate from all other activity inspectors;

    e. responsible for documenting compliance with the environmental conditions of the Order, as well as any environmental conditions/permit requirements imposed by other federal, state, or local agencies; and

    f. responsible for maintaining status reports.

8. Beginning with the filing of its Implementation Plan, Mountain Valley shall file updated status reports with the Secretary on a **weekly** basis until all construction and restoration activities are complete. On request, these status reports will also be provided to other federal and state agencies with permitting responsibilities. Status reports shall include the following:

    a. an update on Mountain Valley's efforts to obtain the necessary federal authorizations;

    b. the construction status of each spread, work planned for the following reporting period, and any schedule changes for stream crossings or work in other environmentally sensitive areas;

    c. a listing of all problems encountered and each instance of noncompliance observed by the EIs during the reporting period (both for the conditions imposed by the Commission and any environmental conditions/permit requirements imposed by other federal, state, or local agencies);

    d. a description of the corrective actions implemented in response to all instances of noncompliance;

    e. the effectiveness of all corrective and remedial actions implemented;

    f. a description of any landowner/resident complaints which may relate to compliance with the requirements of the Order, and the measures taken to satisfy their concerns; and

g. copies of any correspondence received by Mountain Valley from other federal, state, or local permitting agencies concerning instances of noncompliance, and Mountain Valley's response.

9. Mountain Valley shall implement its environmental complaint resolution procedure. The procedure shall provide landowners with clear and simple directions for identifying and resolving their environmental mitigation problems/concerns during construction of the Project and restoration of the right-of-way. **Prior to construction**, Mountain Valley shall mail the complaint procedures to each landowner whose property will be crossed by the Project.

   a. In its letter to affected landowners, Mountain Valley shall:

      i. provide a local contact that the landowners should call first with their concerns; the letter shall indicate how soon a landowner should expect a response;

      ii. instruct the landowners that if they are not satisfied with the response, they should call Mountain Valley's Hotline; the letter shall indicate how soon to expect a response; and

      iii. instruct the landowners that if they are still not satisfied with the response from Mountain Valley's Hotline, they should contact the Commission's Landowner Helpline at 877-337-2237 or at LandownerHelp@ferc.gov.

   b. In addition, Mountain Valley shall include in its **weekly** status report a copy of a table that contains the following information for each problem/concern:

      i. the identity of the caller and date of the call;

      ii. the location by milepost and identification number from the authorized alignment sheet(s) of the affected property;

      iii. a description of the problem/concern; and

      iv. an explanation of how and when the problem was resolved, will be resolved, or why it has not been resolved.

10. Mountain Valley must receive written authorization from the Director of OEP, or the Director's designee, **before commencing construction of any Project facilities**. To obtain such authorization, Mountain Valley must file with the Secretary documentation that it has received all applicable authorizations required under federal law (or evidence of waiver thereof).

11. Mountain Valley must receive written authorization from the Director of OEP, or the Director's designee, **before placing the Project facilities into service**. Such

authorization would only be granted following a determination that rehabilitation and restoration of the areas affected by the Project are proceeding satisfactorily.

12. **Within 30 days of placing the authorized facilities in-service**, Mountain Valley shall file an affirmative statement with the Secretary, certified by a senior company official:

    a. that the facilities have been constructed in compliance with all applicable conditions, and that continuing activities will be consistent with all applicable conditions; or

    b. identifying which of the conditions of the Order Mountain Valley has complied with or will comply with. This statement shall also identify any areas affected by the Project where compliance measures were not properly implemented, if not previously identified in filed status reports, and the reason for noncompliance.

13. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, or the Director's designee, a revised *General Blasting Plan* that clarifies it will not bury excess rock fragments generated during trenching or blasting in any location other than where the rock originated. Excess rock fragments not suitable for reburial at the point of origin should be considered construction debris and should be disposed of consistent with our *Upland Erosion Control, Revegetation, & Maintenance Plan* at sections III.E and V.A.3.

14. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, or the Director's designee, the locations of all private water wells and springs identified within 150 feet of the Project work areas, including the well's or springs' status, use, distance from construction workspace, and any proposed measures to minimize or avoid impacts on the private water wells or springs.

15. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, or the Director's designee, site-specific plans detailing the enhanced erosion control measures and maintenance requirements for each location where the Project will parallel and remove vegetation within 15 feet of a waterbody.

16. **Prior to construction**, Mountain Valley shall file with the Secretary, for review and written approval by the Director of OEP, or the Director's designee, its final list of water sources to be used for the Project (dust control, hydrostatic testing, and horizontal directional drill operations), including intake location, waterbody name, withdrawal rate and method, and measures to minimize entrainment of aquatic species. Mountain Valley shall also provide written concurrence from the

U.S. Fish and Wildlife Service (FWS) for any water withdrawals from the Dan River.

17. **During construction and prior to any Project in-service approval,** Mountain Valley shall remove and dispose of timber and debris from the right-of-way. Mountain Valley must ensure that any beneficial reuse of timber that is not removed and remains on or adjacent to the right-of-way, as agreed to by the landowner, is located at access points where the landowner can reasonably retrieve timber without any inadvertent impacts on the restored right-of-way, in accordance with the FERC *Upland Erosion Control, Revegetation, and Maintenance Plan,* section III.E.

18. In order to identify locations where additional protection measures will be needed, and to inform compliance monitoring, Mountain Valley shall file with the Secretary, the results of the pre-construction bald eagle nest and colonial rookery surveys **prior to construction.**

19. Mountain Valley shall **not begin** construction activities **until**:

    a. Mountain Valley files with the Secretary the results of all outstanding biological surveys;

    b. the staff completes Endangered Species Act consultation with the FWS; and

    c. Mountain Valley has received written notification from the Director of OEP, or the Director's designee, that construction or use of mitigation may begin.

20. Mountain Valley shall **not begin** construction of facilities and/or use of all staging, storage, or temporary work areas and new or to-be-improved access roads **until**:

    a. Mountain Valley files with the Secretary:

        i. remaining cultural resources survey reports;

        ii. site evaluation reports and avoidance or treatment plans, as required; and

        iii. comments on the cultural resources reports and plans from the Virginia and North Carolina State Historic Preservation Officers and interested Indian tribes.

    b. Mountain Valley implements the stipulations of the May 17, 2020 executed programmatic agreement for the Southgate Project; and

c. The Commission staff reviews and the Director of OEP, or the Director's designee, approves the cultural resources reports and plans, and notifies Mountain Valley in writing that treatment plans/mitigation measures (including archaeological data recovery) may be implemented and/or construction may proceed.

All materials filed with the Commission containing location, character, and ownership information about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering: "**CUI//PRIV-DO NOT RELEASE**."

21. **Prior to construction**, Mountain Valley shall file its *Nighttime Construction Noise Management Plan* with the Secretary, for review and written approval by the Director of OEP, or the Director's designee, that demonstrates noise levels will be reduced below 48.6 decibels on the A-weighted scale (dBA) at night and 55 dBA day-night sound level (L_{dn}) overall at the nearest noise sensitive area (NSA), or not exceed 10 dBA over the ambient at the nearest NSA where ambient noise levels are already above 55 dBA. This plan shall indicate site-specific mitigation measures and indicate resulting noise impacts on NSAs.

22. **No later than 60 days after placing the Lambert Compressor Station (including the Interconnect) into service**, Mountain Valley shall file a noise survey with the Secretary. If a full load condition noise survey is not possible, Mountain Valley shall provide an interim survey at the maximum possible load **within 60 days** of placing the station into service and provide the full load survey **within 6 months**. If the noise attributable to the operation of the equipment at the station under interim or full load conditions exceeds an L_{dn} of 55 dBA at the nearest NSA, Mountain Valley shall file a report on what changes are needed and shall install the additional noise controls to meet the level **within 1 year** of the in-service date. Mountain Valley shall confirm compliance with the above requirement by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Mountain Valley Pipeline, LLC Docket No. CP19-14-000

(Issued June 18, 2020)

GLICK, Commissioner, *dissenting in part*:

1. I dissent in part from today's order because I believe that the Commission's action violates both the Natural Gas Act[1] (NGA) and the National Environmental Policy Act[2] (NEPA). The Commission once again refuses to consider the consequences its actions have for climate change. Although neither the NGA nor NEPA permit the Commission to assume away the climate change implications of constructing and operating this project, that is exactly what the Commission is doing here.

2. In today's order authorizing Mountain Valley Pipeline, LLC's (Mountain Valley) proposed Southgate Project (Project),[3] the Commission continues to treat greenhouse gas (GHG) emissions and climate change differently than all other environmental impacts. The Commission again refuses to consider whether the Project's contribution to climate change from GHG emissions would be significant,[4] even though it quantifies the direct GHG emissions from the Project's construction and operation.[5] That failure forms an integral part of the Commission's decisionmaking: The refusal to assess the significance of the Project's contribution to the harm caused by climate change is what allows the Commission to determine that the environmental impacts associated with the Project are "acceptable"[6] and, as a result, conclude that the Project is required by the public

[1] 15 U.S.C. § 717f (2018).

[2] National Environmental Policy Act of 1969, 42 U.S.C. §§ 4321 *et seq.*

[4] *Id.* PP 97–99.

[5] Southgate Project Final Environmental Impact Statement at 4-184–4-185 & Tables 4.11-4, 4.11-5 (EIS).

[6] Certificate Order, 171 FERC ¶ 61,232 at P 144; EIS at 5-1 ("If the Project is constructed and operated in accordance with the mitigating measures discussed in this EIS, and our recommendations, adverse environmental impacts would be reduced to less than significant levels").

convenience and necessity.[7] Claiming that a project has no significant environmental impacts while at the same time refusing to assess the significance of the project's impact on the most important environmental issue of our time is not reasoned decisionmaking.[8]

3. Making matters worse, the Commission again refuses to make a serious effort to assess the indirect effects of the Project—despite the fact that the record plainly provides that the Project will be used to transport natural gas to residential and commercial end-users in North Carolina and Virginia.[9] The United States Court of Appeals for the District of Columbia Circuit (D.C. Circuit) has repeatedly criticized the Commission for its stubborn refusal to identify and consider the reasonably foreseeable GHG emissions caused by the downstream combustion of natural gas transported through an interstate pipeline. But even so, today's order doubles down on approaches that the D.C. Circuit has already rejected. So long as the Commission refuses to heed the court's unambiguous directives, I have no choice but to dissent.

4. Finally, I disagree with the Commission's decision to grant Mountain Valley a 14 percent return on equity (ROE) for the Project's initial rates.[10] The majority's decision not only represents an unwarranted departure from recent precedent,[11] but it also does

---

[7] Certificate Order, 171 FERC ¶ 61,232 at P 145.

[8] Commissioner McNamee argues that the Commission can consider a project's direct GHG emissions under NEPA and in its public convenience and necessity determination without actually assessing whether the GHG emissions are significant. Certificate Order, 171 FERC ¶ 61,232 (McNamee, Comm'r, concurring at P 2). No matter how many times he says so, this does not constitute consideration of the impact of the Project's GHG emissions. If you refuse to consider how the project's GHG emissions will impact the environment you aren't actually examining those emissions for purposes of NEPA and the NGA.

[9] Certificate Order, 171 FERC ¶ 61,232 at n.60 ("Mountain Valley states that the natural gas transported by the Southgate Project will be used to make bundled gas sales primarily to residential and small- and medium-sized commercial customers for heating, cooking, and other end-uses typical of natural gas local distribution company customers.") (citing Mountain Valley's March 15, 2019 Data Request Response at 3); *see id.* P 43 ("The project shipper is a local distribution company, which will locally distribute gas to residential, commercial, and industrial end-use customers."); *id.* P 99 ("[A]s discussed in the final EIS, most of the gas will serve North Carolina end-users, primarily by residential and small and medium-sized commercial customers.").

[10] *Id.* P 57.

[11] In developing incremental rates for pipeline expansion projects, the Commission's general policy is to use the rate of return components approved in the

nothing but lend credence to the North Carolina Commission's concern that we offer "no assurances that the consuming public will be protected from excessive rates."[12]

I. The Commission's Public Interest Determination Is Not the Product of Reasoned Decisionmaking

5. We know with certainty what causes climate change: It is the result of GHG emissions, including carbon dioxide and methane, released in large quantities through the production, transportation, and consumption of fossil fuels, including natural gas. The Commission recognizes this relationship, finding, as it must, that "anthropogenic sources of GHGs are the primary cause of warming of the global climate system"[13] and that GHG emissions from the Project's construction and operation "would increase the atmospheric concentration of GHGs, in combination with past, current, and future emissions from all other sources globally and contribute incrementally to future climate change impacts."[14] In light of this undisputed relationship between anthropogenic GHG emissions and climate change, the Commission must carefully consider the Project's contribution to climate change, both in order to fulfill NEPA's requirements and to determine whether the Project is in the public interest.[15]

---

pipeline's last NGA section 4 rate proceeding, or in the absence of a litigated ROE on file, the most recent ROE approved in a litigated NGA section 4 rate case. *Gulfstream Natural Gas Sys., L.L.C.*, 170 FERC ¶ 61,199, at PP 18-19 (2020); *Cheyenne Connector, LLC,* 168 FERC ¶ 61,180, at PP 51-52 (2019); *Cheniere Corpus Christi Pipeline, LP,* 169 FERC ¶ 61,135, at PP 34-35.

[13] EIS at 4-176.

[14] *Id.* at 4-262.

[15] Section 7 of the NGA requires that, before issuing a certificate for new pipeline construction, the Commission must find both a need for the pipeline and that, on balance, the pipeline's benefits outweigh its harms. 15 U.S.C. § 717f. Furthermore, NEPA requires the Commission to take a "hard look" at the environmental impacts of its decisions. *See* 42 U.S.C. § 4332(2)(C)(iii); *Balt. Gas & Elec. Co. v. Nat. Res. Def. Council, Inc.*, 462 U.S. 87, 97 (1983). This means that the Commission must consider and discuss the significance of the harm from a pipeline's contribution to climate change by actually evaluating the magnitude of the pipeline's environmental impact. Doing so enables the Commission to compare the environment before and after the proposed federal action and factor the changes into its decisionmaking process. *See Sierra Club v. FERC*, 867 F.3d 1357, 1374 (D.C. Cir. 2017) (*Sabal Trail*) ("The [FEIS] needed to

6. Today's order on rehearing falls short of that standard. As part of its public interest determination, the Commission must examine the Project's impact on the environment and public safety, which includes the facility's impact on climate change.[16] That is now clearly established D.C. Circuit precedent.[17] The Commission, however, insists that it need not consider whether the Project's contribution to climate change is significant because—for want of a better explanation—it "cannot."[18] However, the most troubling part of the Commission's rationale is what comes next. Based on this alleged inability to assess the significance of the Project's impact on climate change, the Commission still summarily concludes that all of the Project's environmental impacts would be "acceptable."[19] Think about that. The Commission is simultaneously stating that it cannot assess the significance of the Project's impact on climate change[20] while concluding that all environmental impacts are acceptable to the public interest.[21] That is

---

include a discussion of the 'significance' of this indirect effect."); 40 C.F.R. § 1502.16 (a)–(b) (An agency's environmental review must "include the environmental impacts of the alternatives including the proposed action," as well as a discussion of direct and indirect effects *and their significance*. (emphasis added)).

[16] *See Sabal Trail*, 867 F.3d at 1373 (explaining that the Commission must consider a pipeline's direct and indirect GHG emissions because the Commission may "deny a pipeline certificate on the ground that the pipeline would be too harmful to the environment"); *see also Atl. Ref. Co. v. Pub. Serv. Comm'n of N.Y.*, 360 U.S. 378, 391 (1959) (holding that the NGA requires the Commission to consider "all factors bearing on the public interest").

[17] *See Allegheny Def. Project v. FERC*, 932 F.3d 940, 945-46 (D.C. Cir. 2019), *reh'g en banc granted, judgment vacated*, 2019 WL 6605464 (D.C. Cir. Dec. 5, 2019); *Birckhead v. FERC*, 925 F.3d 510, 518-19 (D.C. Cir. 2019); *Sabal Trail*, 867 F.3d at 1371-72. The history of these cases is discussed further below. *See infra* P 9.

[18] *See* Certificate Order, 171 FERC ¶ 61,232 at P 102 ("[T]he Commission cannot determine whether an individual project's contribution to climate change would be significant."); EIS at 4-263 ("Currently, there is no universally accepted methodology to attribute discrete, quantifiable, physical effects on the environment to the Southgate Project's incremental contribution to GHGs.").

[19] Certificate Order, 171 FERC ¶ 61,232 at P 144; EIS at 5-1.

[20] Certificate Order, 171 FERC ¶ 61,232 at P 102; EIS at 4-263–4-264 ("[W]e are unable to determine the significance of the Southgate Project's contribution to climate change.").

[21] Certificate Order, 171 FERC ¶ 61,232 at P 144.

unreasoned and an abdication of our responsibility to give climate change the "hard look" that the law demands.[22]

7. It also means that the volume of emissions caused by the Project does not play a meaningful role in the Commission's public interest determination, no matter how many times the Commission assures us otherwise. Using the approach in today's order, the Commission will always be able to conclude that a project will not have any significant environmental impact irrespective of the project's actual GHG emissions or those emissions' impact on climate change. So long as that is the case, a project's impact on climate change cannot, as a logical matter, play a meaningful role in the Commission's public interest determination. A public interest determination that systematically excludes the most important environmental consideration of our time is contrary to law, arbitrary and capricious, and not the product of reasoned decisionmaking.

8. Commissioner McNamee notes that he believes the D.C. Circuit cases cited above[23] were wrongly decided.[24] Although that is his prerogative, it is irrelevant to the task before us. As he has explained, we are called on to apply the law and the facts, not our personal policy preferences. But surely, implicit in that statement, is a recognition that we must apply the law as it is, not as we wish it were. The D.C. Circuit has unambiguously interpreted the "public convenience and necessity" standard in section 7 of the NGA to encompass the authority to consider and, if appropriate, act upon "the direct and indirect environmental effects" of a proposed pipeline.[25] As Commissioners,

Cir. 2015) (explaining that agencies cannot overlook a single environmental consequence if it is even "arguably significant"); *see also Michigan v. EPA*, 135 S. Ct. 2699, 2706 (2015) ("Not only must an agency's decreed result be within the scope of its lawful authority, but the process by which it reaches that result must be logical and rational." (internal quotation marks omitted)); *Motor Vehicle Mfrs. Ass'n, Inc. v. State Farm Mut. Auto. Ins. Co*., 463 U.S. 29, 43 (1983) (explaining that agency action is "arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem, [or] offered an explanation for its decision that runs counter to the evidence before the agency").

[23] *Supra* notes 16-17.

[24] *See* Certificate Order, 171 FERC ¶ 61,232 (McNamee, Comm'r, concurring at PP 12-13).

[25] *E.g., Sabal Trail*, 867 F.3d at 1373.

our job is to apply that law, not to attack binding judicial precedent in favor of an interpretation that was, in fact, expressly rejected by the court.[26]

II. The Commission's NEPA Analysis of the Project's Contribution to Climate Change Is Deficient

9. The Commission's NEPA analysis is similarly flawed. In order to evaluate the environmental consequences of the Project under NEPA, the Commission must consider the harm caused by its GHG emissions[27] and "evaluate the 'incremental impact' that [those emissions] will have on climate change or the environment more generally."[28] The D.C. Circuit has repeatedly instructed the Commission that the GHG emissions caused by the reasonably foreseeable combustion of natural gas transported through a pipeline are an indirect effect and must, therefore, be included within the Commission's NEPA analysis.[29] While the Commission quantifies the Project's direct GHG emissions from construction and operation,[30] it refuses to even disclose the Project's indirect GHG emissions from downstream combustion. Once again the Commission takes the position that if it does not know the exact volume and end-use of the natural gas, any associated GHG emissions are categorically not reasonably foreseeable.[31] What's more, the

---

[26] *Id.*; *see Birckhead*, 925 F.3d at 519 (explaining that in "the pipeline certification context the Commission does have statutory authority to act" on the reasonably foreseeable GHG emissions caused by the pipeline (citing *Sabal Trail*, 867 F.3d at 1373)).

[27] When conducting a NEPA review, an agency must consider both the direct and the indirect effects of the project under consideration. 40 C.F.R. §§ 1502.16(b), 1508.8(b); *Sabal Trail*, 867 F.3d at 1371.

[28] *See Ctr. for Biological Diversity,* 538 F.3d at 1216 ("While the [environmental document] quantifies the expected amount of CO2 emitted . . . , it does not evaluate the 'incremental impact' that these emissions will have on climate change or on the environment more generally . . . ."); *Klamath-Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt.*, 387 F.3d 989, 995 (9th Cir. 2004) ("A calculation of the total number of acres to be harvested in the watershed is a necessary component . . . , but it is not a sufficient description of the actual environmental effects that can be expected from logging those acres.").

[29] *See Allegheny Def. Project*, 932 F.3d at 945-46; *Birckhead*, 925 F.3d at 518-19; *Sabal Trail*, 867 F.3d at 1371-72.

[30] EIS at 4-184–4-185 & Tables 4.11-4, 4.11-5.

[31] Certificate Order, 171 FERC ¶ 61,232 at P 99 (stating that "because the end-use of the contracted for volumes is unknown, any potential GHG emissions associated with

Commission even goes so far as to suggest that, because constructing any new pipeline *may* not increase the interstate transportation system's overall capacity, estimating the pipeline's downstream GHG emissions is not just needless, but "misleading."[32] This is nothing more than another version of the Commission's argument that *Sabal Trail* "is narrowly limited to the facts of that case"—an argument that the D.C. Circuit rejected emphatically in *Birckhead*.[33] Indeed, *Birckhead* rejected as a "total non-sequitur" the argument that the potential for increased natural gas transportation capacity to reduce GHG emissions by displacing existing natural gas supplies or more GHG-intensive forms of electricity generation somehow renders the downstream GHG indirect emissions from a natural gas pipeline not reasonably foreseeable.[34] Even in the face of some uncertainty, the courts have required the Commission to use its "best efforts" to identify and consider the full scope of a project's environmental impact, an exercise which may require using educated assumptions.[35]

10. Instead, the Commission's overly narrow and circular definition of indirect effects[36] disregards the Project's central purpose—to facilitate additional natural gas

---

the ultimate combustion of the transported gas are not reasonably foreseeable, and therefore, not an indirect impact of the Southgate Project").

[32] *Id.* P 100.

[33] *Birckhead*, 925 F.3d at 518-19.

[34] *Id.*

[35] *Sabal Trail*, 867 F.3d at 1374 ("We understand that emission estimates would be largely influenced by assumptions rather than direct parameters about the project, but some educated assumptions are inevitable in the NEPA process. And the effects of assumptions on estimates can be checked by disclosing those assumptions so that readers can take the resulting estimates with the appropriate amount of salt." (internal citations and quotation marks omitted)).

[36] *See San Juan Citizens All. et al. v. U.S. Bureau of Land Mgmt.*, No. 16-CV-376-MCA-JHR, 2018 WL 2994406, at *10 (D.N.M. June 14, 2018) (holding that it was arbitrary for the Bureau of Land Management to conclude "that consumption is not 'an indirect effect of oil and gas production because production is not a proximate cause of GHG emissions resulting from consumption'" as "this statement is circular and worded as though it is a legal conclusion"). The Commission must use its "best efforts" to identify and quantify the full scope of the environmental impacts and, as the U.S. Court of Appeals for the District of Columbia found in *Sierra Club v. FERC*, educated assumptions are inevitable in the process of emission quantification. *See* 867 F.3d 1357, 1374 (D.C. Cir. 2017) (*Sabal Trail*).

consumption.[37] The Commission cannot ignore the fact that adding firm transportation capacity is likely to "spur demand" for natural gas[38]—a fact that Mountain Valley certainly recognizes[39]—and, for that reason, the Commission must at least examine the effects that an expansion of pipeline capacity might have on consumption and production.[40] Indeed, if a proposed pipeline neither increases the supply of natural gas available to consumers nor decreases the price that those consumers would pay, it is hard to imagine why that pipeline would be "needed" in the first place.

11. Recognizing this fact, Mountain Valley instead claims that it would be "double counting" to consider the Project's downstream GHG emissions here, because the Commission "previously quantified" these emissions when it authorized the Mountain Valley mainline system.[41] But, as I argued in that proceeding, while the Commission may have quantified the GHG emissions, at no point did the Commission consider them

---

[37] *See supra* note 9; *see also* Certificate Order, 171 FERC ¶ 61,232 at P 38 (Mountain Valley argues that the Project "will . . . provide North Carolina and southern Virginia access to new natural gas supplies" and "provide the opportunity to serve commercial and industrial load in Virginia and North Carolina not currently served by natural gas.").

[38] *Barnes v. U.S. Dep't of Transp.*, 655 F.3d 1124, 1138 (9th Cir. 2011) (holding that it "is completely inadequate" for an agency to ignore a project's "growth inducing effects" where the project has a unique potential to spur demand); *id.* at 1139 (distinguishing *City of Carmel-by-the-Sea v. U.S. Dep't of Transp.*, 123 F.3d 1142 (9th Cir. 1997), which the majority relies on in today's order) ("[O]ur cases have consistently noted that a new runway has a unique potential to spur demand, which sets it apart from other airport improvements, like changing flight patterns, improving a terminal, or adding a taxiway, which increase demand only marginally, if at all."); *id.* at 1139 ("[E]ven if the stated purpose of [a new airport runway project] is to increase safety and efficiency, the agencies must analyze the impacts of the increased demand attributable to the additional runway as growth-inducing effects.").

[39] *See* Certificate Order, 171 FERC ¶ 61,232 at P 38.

[40] As the United States Court of Appeals for the Eighth Circuit explained in *Mid States Coal. for Progress v. Surface Transp. Bd.*—a case that also involved the downstream emissions from new infrastructure for transporting fossil fuels—when the "nature of the effect" (end-use emissions) is reasonably foreseeable, but "its extent is not" (specific consumption activity producing emissions), an agency may not simply ignore the effect. 345 F.3d 520, 549 (8th Cir. 2003).

[41] Certificate Order, 171 FERC ¶ 61,232 at P 100.

in making its public interest determination.[42] Simply asserting that a project is in the public interest without any discussion why is not reasoned decisionmaking. The Commission's utter failure to actually consider these emissions as part of its public interest determination renders Mountain Valley's argument empty and unconvincing.

12. I remain baffled by the Commission's continued refusal to take any step towards considering indirect downstream emissions and their impact on climate change unless specifically and expressly directed to do so by the courts (and even that does not always seem to be the case[43]). Here there are plenty of steps that the Commission could take to consider the GHGs associated with the Project's incremental capacity if the Commission were actually inclined to take a 'hard look' at climate change. At a minimum, we know that the vast majority, 97 percent, of all natural gas consumed in the United States is combusted[44]—a fact that, on its own might be sufficient to make downstream emissions reasonably foreseeable, at least absent contrary evidence. After all, the D.C. Circuit has recognized that NEPA does not require absolute certainty and that "some educated assumptions are inevitable in the NEPA process."[45] Moreover, the record here makes this a relatively easy case: Mountain Valley states that the natural gas transported by the Project will be sold "primarily to residential and small- and medium-sized commercial customers for heating, cooking, and other end-uses typical of natural gas local distribution company customers."[46] That would seem to be more-than-sufficient to confirm that the gas is highly likely to be combusted, making the resulting GHG emissions reasonably foreseeable.

[43] *El Paso Natural Gas Co., L.L.C.*, 169 FERC ¶ 61,133 (2019) (Glick, Comm'r, dissenting in part at PP 10-11) (criticizing the Commission for failing to follow the D.C.'s guidance in *Birckhead* and consider GHG emissions associated with natural gas transportation capacity that it was told would be used to serve electricity generation).

[44] U.S. Energy Info. Admin., *September 2019 Monthly Energy Review* 22, 97 (2019) (reporting that, in 2018, 778 Bcf of natural gas had a non-combustion use compared to 29,956 Bcf of total consumption), *https://www.eia.gov/totalenergy/data/monthly/archive/00351908.pdf*.

[45] *Sabal Trail*, 867 F.3d at 1374; *see id.* (stating that "the effects of assumptions on estimates can be checked by disclosing those assumptions so that readers can take the resulting estimates with the appropriate amount of salt").

[46] Certificate Order, 171 FERC ¶ 61,232 at n.60; Mountain Valley March 15, 2019 Data Request Response at 3.

13. In any case, even where the Commission quantifies the Project's construction and operational GHG emissions, it still fails to "evaluate the 'incremental impact' that [those emissions] will have on climate change or the environment more generally."[47] In *Sabal Trail*, the court explained that the Commission was required "to include a discussion of the 'significance' of" the indirect effects of the project, including its GHG emissions.[48] That makes sense. Identifying and evaluating the consequences that a project's GHG emissions may have for climate change is essential if NEPA is to play the disclosure and good government roles for which it was designed.[49] But neither the Commission's orders in this proceeding nor the accompanying EIS provide that discussion or even attempt to assess the significance of the Project's GHG emissions.

14. Instead, the Commission insists that it need not assess the significance of the Project's GHG emissions because it lacks a "universally accepted methodology" for evaluating the project's impact on climate change.[50] But that does not excuse the Commission's failure to evaluate these emissions let alone to determine the significance of the Project's environmental impact from these emissions. As an initial matter, the lack of a single methodology does not prevent the Commission from adopting *a* methodology, even if that methodology is not universally accepted. One possible methodology endorsed by the courts is comparing a project's GHG emissions against a known benchmark, such as a state emission reduction requirement, an approach the Commission

Zinke*, No. CV 16-1724 (RC), 2019 WL 1273181, at *1 (D.D.C. Mar. 19, 2019) (explaining that the agency was required to "provide the information necessary for the public and agency decisionmakers to understand the degree to which [its] decisions at issue would contribute" to the "impacts of climate change in the state, the region, and across the country").

[48] *Sabal Trail*, 867 F.3d at 1374.

[49] *See, e.g.*, *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989) (explaining that one of NEPA's purposes is to ensure that "relevant information will be made available to the larger audience that may also play a role in both the decisionmaking process and the implementation of that decision"); *Lemon v. Geren*, 514 F.3d 1312, 1315 (D.C. Cir. 2008) ("The idea behind NEPA is that if the agency's eyes are open to the environmental consequences of its actions and if it considers options that entail less environmental damage, it may be persuaded to alter what it proposed.").

[50] Certificate Order, 171 FERC ¶ 61,232 at P 102; EIS at 4-263 ("[T]here is no universally accepted methodology to attribute discrete, quantifiable, physical effects on the environment to the Southgate Project's incremental contribution to GHGs.").

has relied on in the past[51] but inexplicably fails to undertake here, even though the Commission recognizes that both North Carolina and Virginia have GHG emissions reduction targets.[52] Armed with a known target, the Commission has all the information necessary to "compare the emissions from this project to emissions from other projects, to total emissions from the state" and make a determination about significance.[53] As the D.C. Circuit stated in *Sabal Trail*, "[w]ithout such comparisons, it is difficult to see how [the Commission] could engage in 'informed decision making' with respect to the greenhouse-gas effects of this project, or how 'informed public comment' could be possible."[54] Instead of doing so here, the Commission disregards its prior position and asserts that "[w]ithout the ability to determine discrete resource impacts, we are unable to determine the significance of the Southgate Project's contribution to climate change."[55] This defies logic. The Commission cannot simultaneously argue an established benchmark is necessary to determine significance and, then, when a benchmark is provided, argue the relevant comparison is not useful. Moreover, the Commission often relies on percentage comparisons when it comes to other environmental impacts as the basis for determining significance.[56] Refusing to apply the same consideration when it comes to GHG emissions and climate change is arbitrary and capricious.

---

[51] *Fl. Se. Connection, LLC*, 164 FERC ¶ 61,099, at PP 19-21 (2018) (Glick, Comm'r, dissenting) (arguing that the Commission's refusal to assess the significance of a project's GHG emissions, despite having compared project emissions to state and national emission inventories, is not reasoned decisionmaking); *PennEast Pipeline Co.*, 164 FERC ¶ 61,098, at PP 118-121 (2018) (Glick, Comm'r, dissenting) (same); *Venture Global Calcasieu Pass, LLC*, 166 FERC ¶ 61,144 (2019) (Glick, Comm'r, dissenting) (same). In each of the orders cited above, the Commission offered reasoning, similar to that advanced in today's order, in an attempt to justify the Commission's refusal to determine the significance of the projects' respective contributions to climate change. And, yet, in each of these cases the Commission compared the project emissions to national, and in some cases state, emission inventories. The Commission offers nothing in today's order to explain its refusal to similarly disclose and compare project emissions in this case.

[52] EIS at 4-263.

[53] *Sabal Trail*, 867 F.3d at 1374.

[54] *Id.*

[55] EIS at 4-263–4-264.

[56] See, for example, the Commission's environmental analysis of Columbia Gas Transmission's Buckeye XPress Project, where the Commission finds that impacts amounting to one percent of the overall prime farmland affected would be "permanent,

15. Independent of whether there are established GHG reduction targets, the Commission has several tools to assess the harm from the Project's contribution to climate change, including, for example, the Social Cost of Carbon. By measuring the long-term damage done by a ton of carbon dioxide, the Social Cost of Carbon links GHG emissions to actual environmental effects from climate change, thereby facilitating the necessary "hard look" at the Project's environmental impacts that NEPA requires.

16. Especially when it comes to a global problem like climate change, a measure for translating a single project's climate change impacts into concrete and comprehensible terms plays a useful role in the NEPA process by putting the harms from climate change in terms that are readily accessible for both agency decisionmakers and the public at large. The Commission, however, continues to ignore the tools at its disposal, relying on deeply flawed reasoning that I have previously critiqued at length.[57]

17. Regardless of the tools, methodologies, or targets available, the Commission can use its expertise to consider all factors and determine, quantitatively or qualitatively, whether the Project's GHG emissions have a significant impact on climate change. That is precisely what the Commission does in other aspects of its environmental review. Consider, for example, the Commission's findings that the Project will not have a significant effect on issues as diverse as "wildlife,"[58] and "forests,"[59] and "property values,"[60] without relying on a specific federal or state benchmark. Notwithstanding the lack of any "universally accepted methods" to assess these impacts, the Commission managed to use its judgment to conduct a qualitative review and assess the significance

---

but not significant." Buckeye Xpress Project Environmental Assessment, Docket No. CP18-137-000, at B-33; *see also Columbia Gas Transmission, LLC*, 170 FERC ¶ 61,045, at P 138 (2020). Notwithstanding the fact that there are no universally accepted or objective standards or targets to compare this impact to, the Commission was able to determine that the project's environmental impact was not significant based on this proportionate effect. It is clear that it is only when it comes to climate change that the Commission suddenly gets cold feet about using percentages to determine significance.

[57] *See, e.g.*, *Transcontinental Gas Pipe Line Co., LLC*, 167 FERC ¶ 61,110 (2019) (Glick, Comm'r, dissenting in part at P 6 & n.11) (noting that the Social Cost of Carbon "gives both the Commission and the public a means to translate a discrete project's climate impacts into concrete and comprehensible terms"); *Fla. Se. Connection, LLC*, 164 FERC ¶ 61,099 (2018) (Glick, Comm'r, dissenting).

[58] EIS at 4-95.

[59] *Id.* at 4-62–4-71.

[60] *Id.* at 4-137–4-138. 4-153.

of the Project's effect on those considerations.[61] The Commission's refusal to, at the very least, exercise similar qualitative judgment to assess the significance of GHG emissions here is arbitrary and capricious.[62]

18. That refusal is even more mystifying because NEPA "does not dictate particular decisional outcomes."[63] NEPA "'merely prohibits uninformed—rather than unwise—agency action.'"[64] In other words, taking the matter seriously—and rigorously examining a project's impacts on climate change—does not necessarily prevent any Commissioner from ultimately concluding that a project meets the public interest standard.

19. Even if the Commission were to determine that a project's GHG emissions are significant, that would not be the end of the inquiry nor would it mean that the project is not in the public interest or required by the public convenience and necessity. Instead, the Commission could require mitigation—as the Commission often does with regard to other environmental impacts. The Supreme Court has held that, when a project may cause potentially significant environmental impacts, the relevant environmental impact statement must "contain a detailed discussion of possible mitigation measures" to address adverse environmental impacts.[65] The Court explained that, "[w]ithout such a discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects" of a project, making an examination of possible mitigation measures necessary to ensure that the agency has taken a "hard look" at the environmental consequences of the action at issue.[66] The Commission not only has the obligation to discuss mitigation of adverse environmental impacts under NEPA, but also

---

[61] *See also supra* note 56 and accompanying discussion describing the Commission's use of just such a technique regarding impacts to farmland.

[62] After all, the standard the Commission typically uses for evaluating significance is whether the adverse impact would result in a substantial adverse change in the physical environment. Surely that standard is open to some subjective interpretation by each Commissioner. What today's order does not explain is why it is appropriate to exercise subjective interpretation and judgment when it comes to potential impacts such as those to property values and forests, but not climate change.

the authority to condition certificates under section 7 of the NGA,[67] which could encompass measures to mitigate a project's GHG emissions.[68]

20. My colleague, Commissioner McNamee, seems to relish in constantly reminding us that Congress has failed to enact more than 70 bills proposed to reduce GHG emissions. Somehow that must suggest that climate change is not worthy of consideration and mitigation under the Natural Gas Act's public interest standard. But as science tells us and, in fact the Commission's orders admit, increased GHG emissions cause climate change.[69] And, as is the case with regard to numerous other environmental impacts for which Congress has not established regulatory regimes,[70] this Commission has the duty to ensure that impacts attributable to the Project's direct and indirect GHG emissions are sufficiently mitigated or, if they cannot be mitigated, that the Project's benefits outweigh those impacts. Commissioner McNamee argues that the Commission

---

[67] 15 U.S.C. § 717f(e); Certificate Order, 171 FERC ¶ 61,232 at P 146 ("[T]he Commission has the authority to take whatever steps are necessary to ensure the protection of environmental resources . . . , including authority to impose any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the order, as well as the avoidance or mitigation of unforeseen adverse environmental impacts resulting from project construction and operation.").

[68] Commissioner McNamee implies that, as part of a mitigation mechanism, I want the Commission to consider imposing a carbon tax or a cap-and-trade like system. Certificate Order, 171 FERC ¶ 61,232 (McNamee, Comm'r, concurring at P 52). That is a red herring. To my knowledge, no one has suggested that the Commission can impose a carbon tax or something similar under NGA section 7. My point is that the Commission could consider discrete measures that offset the adverse effects of the Project itself, just like it does for a host of other adverse environmental impacts. For example, the project developer could purchase renewable energy credits or plant trees sufficient to sequester the Project's GHG emissions. Tailored programs that offset the actual emissions from the Project are a far cry from a comprehensive emissions-trading scheme and have much in common with other forms of mitigation routinely required by the Commission, including the mitigation contained in this order.

[69] *See supra* notes 13 and 14 and accompanying text.

[70] Take, for example, the Commission's analysis of the Project's impacts on "forests," for which there is no congressionally-established regulatory regime. Notwithstanding this fact, the Commission concludes that, "in the context" of the total number of acres of forestland in Virginia and North Carolina, impacts on forests, including the clearing of 597.5 acres of forested uplands and the permanent conversion of 18.5 acres of interior forest, would be long-term but mitigated to less than significant levels. *See* EIS at 4-62–4-71.

cannot require mitigation for the Project's GHG emissions without a congressionally endorsed mitigation program with established limits.[71] But the absence of such a regime has not stopped the Commission—with Commissioner McNamee's support—from requiring the mitigation it determined to be necessary in the past.[72] After all, section 7 of the NGA gives the Commission the express "power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require."[73] That climate impacts continue to be treated differently serves only to highlight this Commission's stubborn refusal to identify any potential climate mitigation measures or discuss how such measures might affect the magnitude of the Project's impact on climate change.

21. Furthermore, a rigorous examination and determination of significance regarding climate change impacts would bolster any finding of public interest by providing the Commission a more complete set of information necessary to weigh benefits against adverse effects. By refusing to assess significance, however, the Commission short circuits any discussion of mitigation measures for the Project's GHG emissions, eliminating a potential pathway for us to achieve consensus on whether the Project is consistent with the public interest.

III. The Commission's Initial Rate Determination Is an Unwarranted Departure from Commission Precedent

22. I disagree with the Commission's decision to authorize Mountain Valley's proposed 14 percent ROE, because I believe it is unwarranted and gratuitous and will ultimately come at the expense of end-users, such as the residential, commercial, and industrial customers this project is meant to serve. In approving 14 percent ROEs for greenfield pipeline projects, the Commission has held that it is an appropriate rate of return because it reflects the fact that new entrants developing greenfield projects experience greater risk than existing pipeline companies.[74] In contrast, the Commission's general policy in developing rates for incremental expansion projects is to require a pipeline to use the ROE approved in its last NGA section 4 rate proceeding, or, if the

---

[72] *See Jordan Cove Energy Project L.P.*, 170 FERC ¶ 61,202, at PP 139, 279 & envtl. condition 28 (2020) (requiring certificate applicant to mitigate adverse impacts on short-term housing by hiring a professional housing coordinator to address the Commission's housing concerns).

[73] 15 U.S.C. § 717f(e).

[74] *Cheniere Corpus Christi Pipeline, LP,* 169 FERC ¶ 61,135 at P 34.

pipeline has not filed a rate case, the ROE from the last litigated NGA section 4 rate case.[75] The Commission departs from its general policy in today's order, by allowing Mountain Valley to use a 14 percent ROE in setting rates for the Project—an incremental expansion of Mountain Valley's mainline system—when Mountain Valley already received the right to charge this higher rate for service on its mainline system.[76] What is more, the company has since executed binding service contracts with shippers for the mainline system's full design capacity, providing a level of revenue certainty that applicants for greenfield projects do not typically have.

23. Mountain Valley has more in common with an existing pipeline company proposing an expansion project than a new market entrant proposing to construct a greenfield pipeline. For this reason, I would have applied the Commission's current policy and required Mountain Valley to use the 10.55 percent ROE approved in *El Paso Natural Gas Co.*[77]—the most recent NGA section 4 rate case litigated before the Commission—to design the initial rates for the Project.[78] Mountain Valley has not provided any evidence justifying a departure from the Commission's current policy, which it has recently applied to multiple similar incremental pipeline expansion

[75] *See Cheyenne Connector, LLC*, 168 FERC ¶ 61,180 at PP 51-52 (rejecting Rockies Express's proposal to use a 13 percent ROE approved as part of its greenfield certificate authorization to an incremental pipeline expansion project, and instead requiring Rockies Express to revise its incremental recourse rates to reflect a 10.55 percent ROE from the last litigated rate case); *see also Gulfstream Natural Gas Sys., L.L.C.*, 170 FERC ¶ 61,199 at P 19 (rejecting Gulfstream Natural's proposal to use a 14 percent ROE, found to be appropriate for its greenfield project, to an incremental pipeline expansion project, and instead requiring use of use the most recent ROE approved by the Commission in a litigated NGA section 4 rate case, 10.55 percent); *Cheniere Corpus Christi Pipeline, LP,* 169 FERC ¶ 61,135 at PP 34-35 ("It is not appropriate to use the 14 percent ROE approved in Cheniere Pipeline's initial certificate authorizations in determining the cost of service for [an incremental expansion project] because it would not adequately reflect the lower risks associated with expanding an existing pipeline system.").

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Mountain Valley Pipeline, LLC Docket No. CP19-14-000

(Issued June 18, 2020)

McNAMEE, Commissioner, *concurring*:

1. Today's order issues Mountain Valley Pipeline, LLC (Mountain Valley) a certificate to construct and operate its proposed Southgate Project.[1] The Southgate Project is designed to provide up to 375,000 dekatherms (Dth) per day of firm transportation service.[2] Additionally, this order directs the Office of Energy Projects (OEP) to not issue any notice to proceed with construction of the Southgate Project until Mountain Valley receives necessary federal permits for the Mainline System[3], and the Director of OEP, or the Director's designee, lifts the stop-work order and authorizes Mountain Valley to continue constructing the Mainline System.[4] I agree that the order complies with the Commission's statutory responsibilities under the Natural Gas Act (NGA) and the National Environmental Policy Act (NEPA). The order determines that the Project is in the public convenience and necessity, finding that the project will not adversely affect Mountain Valley's existing customers or competitor pipelines and their captive customers, and the project's benefits will outweigh any adverse economic effects on landowners and surrounding communities.[5] The order also finds that the environmental impacts associated with the project, if constructed and operated as described in the Environmental Impact Statement (EIS), are acceptable considering the public benefits that the project will provide.[6] Consistent with the holding in *Sierra Club v. FERC* (*Sabal Trail*),[7] the Commission quantified and considered the greenhouse gas

[7] 867 F.3d 1357 (D.C. Cir. 2017). This case is commonly referred to as "Sabal

(GHG) emissions associated with the construction and operation of the Project and found that because the end-use of the contracted volumes is unknown, any potential GHG emissions are not reasonably foreseeable.[8] The Commission also found that the Social Cost of Carbon is not a suitable methodology to determine whether the Project would have a significant impact on climate change.[9]

2. Although I fully support this order, I write separately to address what I perceive to be a misinterpretation of the Commission's authority under the NGA and NEPA. There have been contentions that the NGA authorizes the Commission to deny a certificate application based on the environmental effects that result from the upstream production and downstream use of natural gas, that the NGA authorizes the Commission to establish measures to mitigate GHG emissions, and that the Commission violates the NGA and NEPA by not determining whether GHG emissions significantly affect the environment. I disagree.

3. A close examination of the statutory text and foundation of the NGA demonstrates that the Commission does not have the authority under the NGA or NEPA to deny a pipeline certificate application based on the environmental effects of the upstream production or downstream use of natural gas nor does the Commission have the authority to unilaterally establish measures to mitigate GHG emissions. Further, the Commission has no objective basis to determine whether GHG emissions will have a significant effect on climate change nor the authority to establish its own basis for making such a determination.

4. It is my intention that my discussion of the statutory text and foundation will assist the Commission, the courts, and other parties in their arguments regarding the meaning of the "public convenience and necessity" and the Commission's consideration of a project's effect on climate change. Further, my review of appellate briefs filed with the court and the Commission's orders suggests that the court may not have been presented with the arguments I make here. Before I offer my arguments, it is important that I further expound on the current debate.

I. Current debate

5. When acting on a certificate application, the Commission has two primary statutory obligations: (1) to determine whether the project is required by the "public

---

Trail" because the Sabal Trail Pipeline is one of the three pipelines making up the Southeast Market Pipelines Project.

[8] Certificate Order, 171 FERC ¶ 61,232 at P 99; Final Environmental Impact Statement at 4-263.

[9] *Id.* P 102.

convenience and necessity" as required by the NGA;[10] and (2) to take a "hard look" at the direct,[11] indirect,[12] and cumulative effects[13] of the proposed action as required by NEPA and the Council on Environmental Quality's (CEQ) implementing regulations. Recently, there has been much debate concerning what factors the Commission can consider in determining whether a proposed project is in the "public convenience and necessity," and whether the effects of upstream production and downstream use of natural gas are indirect effects of a certificate application as defined by NEPA.

6. Equating NGA section 7's "public convenience and necessity" standard with a "public interest" standard, my colleague has argued that NGA section 7 requires the Commission to weigh GHGs emitted from project facilities and related to the upstream production or downstream use of natural gas.[14] In support of his contention, my colleague has cited the holding in *Sabal Trail* and dicta in *Atlantic Refining Co. v. Public Service Commission of State of New York* (*CATCO*).[15] My colleague has argued that the NGA requires the Commission to determine whether GHG emissions have a significant impact on climate change in order for climate change to "play a meaningful role in the Commission's public interest determination."[16] And he argues that by not determining the significance of those emissions, the "public interest determination [] systematically

---

[10] 15 U.S.C. § 717f(e) (2018).

[11] Direct effects are those "which are caused by the action and occur at the same time and place." 40 C.F.R. § 1508.8(a) (2019).

[12] Indirect effects are those "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." 40 C.F.R. § 1508.8(b) (2019). The U.S. Supreme Court held that NEPA requires an indirect effect to have "a reasonably close causal relationship" with the alleged cause; "a 'but for' causal relationship is insufficient to make an agency responsible for a particular effect under NEPA and the relevant regulations." *Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 767 (2004).

[13] Cumulative effects are those "which result[] from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions." 40 C.F.R. § 1508.7 (2019).

[14] *See, e.g.*, *Adelphia Gateway, LLC*, 169 FERC ¶ 61,220 (2019) (Glick, Comm'r, dissenting at P 3) (Adelphia Dissent); *Cheyenne Connector, LLC*, 168 FERC ¶ 61,180 (2019) (Glick, Comm'r, dissenting at P 4) (Cheyenne Connector Dissent).

[15] Adelphia Dissent P 4 n.7 (citing *CATCO*, 360 U.S. 378, 391 (1959)). The case *Atlantic Refining Co. v. Public Service Commission of State of New York* is commonly known as "*CATCO*" because the petitioners were sometimes identified by that name.

[16] Adelphia Dissent P 5.

excludes the most important environmental consideration of our time" and "is contrary to law, arbitrary and capricious" and is not "the product of reasoned decision making."[17]

7. My colleague has also argued that the emissions from all downstream use of natural gas are indirect effects of a project and must be considered in the Commission's NEPA environmental documents.[18] In other proceedings, he has argued that the Commission must also consider as indirect effects GHG emissions from upstream natural gas production.[19] He has asserted that NEPA requires the Commission to determine whether GHG emissions will have a significant effect on climate change and that the Commission could make that determination using the Social Cost of Carbon or its own expertise.[20] Further, he has contended that the Commission could mitigate any GHG emissions in the event that it made a finding that the GHG emissions had a significant impact on climate change.[21]

8. Several recent cases before the United States Court of Appeals for the D.C. Circuit have also considered the Commission's obligations under NGA section 7 and NEPA as they apply to what environmental effects the Commission is required to consider under NEPA.[22] In *Sabal Trail*, the D.C. Circuit vacated and remanded the Commission's order issuing a certificate for the Southeast Market Pipelines Project, finding that the Commission inadequately assessed GHGs emitted from downstream power plants in its EIS for the project. [23] The court held that the downstream GHG emissions resulting from burning the natural gas at the power plants were a reasonably foreseeable indirect effect

---

[17] *Id.*

[18] *Id.* P 6.

[19] Cheyenne Connector Dissent P 10.

[20] Adelphia Dissent PP 8-10.

[21] *Id.* P 12.

[22] The courts have not explicitly opined on whether the Commission is required to determine whether GHG emissions will have a significant impact on climate change or whether the Commission must mitigate GHG emissions. The D.C. Circuit, however, has suggested that the Commission is not required to determine whether GHG emissions are significant. *Appalachian Voices v. FERC*, 2019 WL 847199, *2 (D.C. Cir. Feb. 19, 2019) (unpublished) ("FERC provided an estimate of the upper bound of emissions resulting from end-use combustion, and it gave several reasons why it believed petitioner's preferred metric, the Social Cost of Carbon, is not an appropriate measure of project-level climate change impacts and their significance under NEPA or the Natural Gas Act. That is all that is required for NEPA purposes.").

[23] *Sabal Trail*, 867 F.3d 1357.

of authorizing the project and, at a minimum, the Commission should have estimated those emissions.

9. Further, the *Sabal Trail* court found the Commission's authorization of the project was the legally relevant cause of the GHGs emitted from the downstream power plants "because FERC could deny a pipeline certificate on the ground that the pipeline would be too harmful to the environment."[24] The court stated the Commission could do so because, when considering whether pipeline applications are in the public convenience and necessity, "FERC will balance 'the public benefits against the adverse effects of the project,' *see Minisink Residents for Envtl. Pres. & Safety v. FERC*, 762 F.3d 97, 101-02 (D.C. Cir. 2014) (internal quotation marks omitted), including adverse environmental effects, *see Myersville Citizens for a Rural Cmty. v. FERC*, 783 F.3d 1301, 1309 (D.C. Cir. 2015)."[25] Relying on its finding that the Commission could deny a pipeline on environmental grounds, the court distinguished *Sabal Trail* from the Supreme Court's holding in *Public Citizen,* where the Court held "when the agency has no *legal* power to prevent a certain environmental effect, there is no decision to inform, and the agency need not analyze the effect in its NEPA review"[26] and the D.C. Circuit's decision in *Sierra Club v. FERC* (*Freeport*), where it held "that FERC had *no legal authority to prevent* the adverse environmental effects of natural gas exports."[27]

10. Based on these findings, the court concluded that "greenhouse-gas emissions are an indirect effect of authorizing this project, which FERC could reasonably foresee, and which the agency has legal authority to mitigate."[28] The court also held "the EIS for the Southeast Market Pipelines Project should have either given a quantitative estimate of the downstream greenhouse emissions . . . or explained more specifically why it could not have done so."[29] The court impressed that "[it did] not hold that quantification of greenhouse-gas emissions is required *every* time those emissions are an indirect effect of an agency action" and recognized that "in some cases quantification may not be feasible."[30]

[28] *Id.* at 1374 (citing 15 U.S.C. § 717f(e)).

[29] *Id.*

[30] *Id.* (emphasis in original).

11. More recently, in *Birckhead v. FERC*,[31] the D.C. Circuit commented in dicta on the Commission's authority to consider downstream emissions. The court stated that because the Commission could "'deny a pipeline certificate on the ground that the pipeline would be too harmful to the environment, the agency is the legally relevant cause of the direct and indirect environmental effects of pipelines it approves'—even where it lacks jurisdiction over the producer or distributor of the gas transported by the pipeline."[32] The court also examined whether the Commission was required to consider environmental effects related to upstream gas production, stating it was "left with no basis for concluding that the Commission acted arbitrarily or capriciously or otherwise violated NEPA in declining to consider the environmental impacts of upstream gas production."[33]

12. I respect the holding of the court in *Sabal Trail* and the discussion in *Birckhead*, and I recognize that the *Sabal Trail* holding is binding on the Commission. However, I respectfully disagree with the court's finding that the Commission can, pursuant to the NGA, deny a pipeline based on environmental effects stemming from the upstream production or downstream use of natural gas, and that the Commission is therefore required to consider such environmental effects under the NGA and NEPA.[34]

13. The U.S. Supreme Court has observed that NEPA requires an indirect effect to have "a reasonably close causal relationship" with the alleged cause.[35] Whether there is a reasonably close causal relationship depends on "the underlying policies or legislative intent" of the agency's organic statute "to draw a manageable line between those causal changes that may make an actor responsible for an effect and those that do not."[36] Below, I review the text of the NGA and subsequent acts by Congress to demonstrate that the "public convenience and necessity" standard in the NGA is not so broad as to include

---

[31] 925 F.3d 510 (D.C. Cir. 2019).

[32] *Id.* at 519 (citing *Sabal Trail*, 867 F.3d at 1373) (internal quotations omitted).

[33] *Id.* at 518.

[34] Though the D.C. Circuit's holding in *Sabal Trail* is binding on the Commission, it is not appropriate to expand that holding through the dicta in *Birckhead* so as to establish new authorities under the NGA and NEPA. The Commission is still bound by the NGA and NEPA as enacted by Congress, and interpreted by the U.S. Supreme Court and the D.C. Circuit. Our obligation is to read the statutes and case law in harmony. This concurrence articulates the legal reasoning by which to do so.

[35] *Metro. Edison Co. v. People Against Nuclear Energy*, 460 U.S. 766, 774 (1983).

[36] *Id.* at 774 n.7.

environmental effects of the upstream production or downstream use of natural gas, and that the Commission cannot be responsible for those effects.

14. As for GHGs emitted from pipeline facilities themselves, I believe that the Commission can consider such emissions in its public convenience and necessity determination and is required to consider them in its NEPA analysis. As I set forth below, however, the Commission cannot unilaterally establish measures to mitigate GHG emissions, and there currently is no suitable method for the Commission to determine whether GHG emissions are significant.

II. The NGA does not permit the Commission to deny a certificate application based on environmental effects related to the upstream production or downstream use of natural gas

15. To interpret the meaning of "public convenience and necessity," we must begin with the text of the NGA.[37] I recognize that the Commission[38] and the courts have equated the "public convenience and necessity" standard with "all factors bearing on the public interest."[39] However, the phrase "all factors bearing on the public interest" does not mean that the Commission has "broad license to promote the general public welfare"[40] or address greater societal concerns. Rather, the courts have stated that the words must "take meaning from the purposes of regulatory legislation."[41] The Court has

[37] 15 U.S.C. § 717f(e) (2018). *See infra* PP 42-48. It is noteworthy that the phrase "public interest" is not included in NGA section 7(c)(1)(A) (requiring pipelines to have a certificate) or NGA section 7(e) (requiring the Commission to issue certificates). Rather, these provisions use the phrase "public convenience and necessity." NGA section 7(c)(1)(B) does refer to public interest when discussing how the Commission can issue a temporary certificate in cases of emergency. *Id.* § 717f(c)(1)(B). Congress is "presumed to have used no superfluous words." *Platt v. Union Pac. R.R. Co.*, 99 U.S. 48, 58 (1878); *see also U.S. ex rel. Totten v. Bombardier Corp.*, 380 F.3d 488, 499 (D.C. Cir. 2004) ("It is, of course, a 'cardinal principle of statutory construction that a statute ought, upon the whole, to be so construed that, if it can be prevented, no clause, sentence, or word shall be superfluous, void, or insignificant.'" (citing *Alaska Dep't of Envtl. Conservation v. EPA*, 540 U.S. 461, n.13 (2004))).

[38] *See, e.g.*, *North Carolina Gas Corp.*, 10 FPC 469, 475 (1950).

[39] *CATCO*, 360 U.S. at 391 ("This is not to say that rates are the only factor bearing on the public convenience and necessity, for § 7(e) requires the Commission to evaluate all factors bearing on the public interest."). The Court never expounded further on that statement.

[40] *NAACP v. FPC*, 425 U.S. 662, 669 (1976).

[41] *Id.*; *see also Office of Consumers' Counsel v. FERC*, 655 F.2d 1132, 1147 (D.C.

made clear that statutory language "cannot be construed in a vacuum. It is a fundamental canon of statutory construction that the words of a statute must be read in their context and with a view to their place in the overall statutory scheme."[42] The Court has further instructed that one must "construe statutes, not isolated provisions."[43]

16. Indeed, that is how the Court in *CATCO* – the first U.S. Supreme Court case including the "all factors bearing on the public interest" language – interpreted the phrase "public convenience and necessity." In that case, the Court held that the public convenience and necessity requires the Commission to closely scrutinize initial rates *based on the framework and text* of the NGA.[44]

17. Following this precedent, the phrase "public convenience and necessity" must therefore be read within the overall statutory scheme of the NGA. As set forth below, construing the NGA *as a statute* demonstrates that Congress determined the public

---

Cir. 1980) ("Any such authority to consider all factors bearing on the 'public interest' must take into account what the 'public interest' means in the context of the Natural Gas Act. FERC's authority to consider all factors bearing on the public interest when issuing certificates means authority to look into those factors which reasonably relate to the purposes for which FERC was given certification authority. It does not imply authority to issue orders regarding any circumstance in which FERC's regulatory tools might be useful.").

[42] *Davis v. Mich. Dep't of Treasury*, 489 U.S. 803, 809 (1989).

[43] *Graham Cty. Soil & Water Conservation Dist. v. U.S. ex rel. Wilson*, 559 U.S. 280, 290 (2010) (quoting *Gustafson v. Alloyd Co.*, 513 U.S. 561, 568 (1995)).

[44] *CATCO*, 360 U.S. 378, 388-91. The Court stated "[t]he Act was so framed as to afford consumers a complete, permanent and effective bond of protection from excessive rates and charges." *Id.* at 388. The Court found that the text of NGA sections 4 and 5 supported the premise that Congress designed the Act to provide complete protection from excessive rates and charges. *Id.* ("The heart of the Act is found in those provisions requiring . . . that all rates and charges 'made, demanded, or received' shall be 'just and reasonable.'"); *id.* at 389 ("The overriding intent of the Congress to give full protective coverage to the consumer as to price is further emphasized in § 5 of the Act . . . ."). The Court recognized that the Commission's role in setting initial rates was a critical component of providing consumers complete protection because "the delay incident to determination in § 5 proceedings through which initial certificated rates are reviewable appears nigh interminable" and "would provide a windfall for the natural gas company with a consequent squall for the consumers," which "Congress did not intend." *Id.* at 389-90.

interest required (i) the public to have access to natural gas and (ii) economic regulation of the transportation and sale of natural gas to protect such public access.

A. The text of the NGA does not support denying a certificate application based on the environmental effects of the upstream production or downstream use of natural gas

1. NGA section 1(a)—limited meaning of "public interest"

18. Section 1 of the NGA sets out the reason for its enactment. NGA section 1(a) states, "[a]s disclosed in reports of the Federal Trade Commission [(FTC)] made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is declared that the business of transporting and selling natural gas for ultimate distribution to the public *is affected with a public interest,* and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the *public interest*."[45]

19. A review of the FTC Report referred to in NGA section 1 demonstrates that the NGA was enacted to counter activities that would limit the public's access to natural gas and subject the public to abusive pricing. Specifically, the FTC Report states "[a]ll communities and industries within the capacity and reasonable distance of existing or future transmission facilities should be assured a natural-gas supply and receive it at fair, nondiscriminatory prices."[46]

20. The FTC Report further states "[a]ny proposed Federal legislation should be premised, in part at least, on the fact that natural gas is a valuable, but limited, natural resource in Nation-wide demand, which is produced only in certain States and limited areas, and the conservation, production, transportation, and distribution of which, therefore, under proper control and regulation, are matters charged with high national public interest."[47]

21. The text of NGA section 1(a) and its reference to the FTC Report make clear that "public interest" is directly linked to ensuring the public's access to natural gas through

---

[45] 15 U.S.C. § 717(a) (2018) (emphasis added).

[46] FEDERAL TRADE COMMISSION, UTILITY CORPORATIONS FINAL REPORT OF THE FEDERAL TRADE COMMISSION TO THE SENATE OF THE UNITED STATES PURSUANT TO SENATE RESOLUTION NO. 83, 70TH CONGRESS, 1ST SESSION ON ECONOMIC, CORPORATE, OPERATING, AND FINANCIAL PHASES OF THE NATURAL-GAS-PRODUCING, PIPE-LINE, AND UTILITY INDUSTRIES WITH CONCLUSIONS AND RECOMMENDATIONS NO. 84-A at 609 (1936) (FTC Report), https://babel.hathitrust.org/cgi/pt?id=ien.35556021351598&view=1up&seq=718.

[47] *Id.* at 611.

regulating its transport and sale. Moreover, the NGA is designed to promote the "public interest" primarily through economic regulation. This is apparent in the text of the NGA and by its reference to the FTC Report that identifies the concern with monopolistic activity that would limit access to natural gas.[48]

22. Therefore, there is no textual support in NGA section 1 for the claim that the Commission may deny a pipeline application due to potential upstream and downstream effects of GHG emissions on climate change. But, this is not the end of the analysis. We must also examine the Commission's specific authority under NGA section 7.

2. NGA section 7—Congress grants the Commission and pipelines authority to ensure the public's access to natural gas

23. Like NGA section 1, the text of NGA section 7 makes clear that its purpose is to ensure that the public has access to natural gas. A review of the various provisions of NGA section 7 make this point evident:

- Section 7(a) authorizes the Commission to "direct a natural-gas company to extend or improve its transportation facilities, to establish physical connection of its transportation facilities with the facilities of, and sell natural gas . . . to the public . . . ."[49] The Commission has stated that "[s]ection 7(a) clearly established the means whereby the Commission

[48] 15 U.S.C. § 717(a) (2018) ("Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest"). The limited, economic regulation meaning of "public interest" was clear at the time the NGA was adopted. The NGA's use of the phrase "affected with the public interest" is consistent with the States' use of this phrase when enacting laws regulating public utilities. Historically, state legislatures used the phrase "affected with the public interest" as the basis of their authority to regulate rates charged for the sale of commodities, rendered services, or use of private property. *Munn v. Illinois*, 94 U.S. 113, 125-26 (1876). The Court found that businesses affected with a public interest or "said to be clothed with a public interest justifying some public regulation" include "[b]usinesses, which, though not public at their inception, may be fairly said to have risen to be such and have become subject in consequence to some government regulation." *Charles Wolff Packing Co. v. Court of Indus. Relations*, 262 U.S. 522, 535 (1923). In essence, these businesses became quasi-public enterprises and were determined to have an "indispensable nature." *Id.* at 538. Such a conclusion also meant that if these businesses were not restrained by the government, the public could be subject to "the exorbitant charges and arbitrary control to which the public might be subjected without regulation." *Id.*

[49] 15 U.S.C. § 717f(a) (2018).

could secure *the benefits* of gas service for certain communities, markets and territories adjacent to those originally established by the gas industry, where in the public interest."[50]

- Section 7(b) requires Commission approval for a natural gas pipeline company to "abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities."[51] That is, Congress considered access to natural gas to be so important that it even prohibited natural gas pipeline companies from abandoning service without Commission approval.

- Section 7(c)(1)(B) authorizes the Commission to "issue a temporary certificate in cases of emergency, to assure maintenance of adequate service or to serve particular customers, without notice or hearing, pending the determination of an application for a certificate."[52] The underlying presumption of this section is that the need for natural gas can be so important that the Commission can issue a certificate without notice and hearing.

- Section 7(e) states "a certificate *shall* be issued" when a project is in the public convenience and necessity,[53] leaving the Commission no discretion after determining a project meets the public convenience and necessity standard.

- Section 7(h) grants the pipeline certificate holder the powers of the sovereign to "exercise of the right of eminent domain in the district court of the United States."[54] By granting the power of eminent domain, Congress made clear the importance of ensuring that natural gas could be delivered from its source to the public by not allowing traditional property rights to stand in the way of pipeline construction. Furthermore, the sovereign's

[50] *Arcadian Corp. v. Southern Nat. Gas Co.*, 61 FERC ¶ 61,183, at 61,676 (1992) (emphasis added). The Commission's analysis in this regard was unaffected by the opinion in *Atlanta Gas Light Co. v. FERC*, 140 F.3d 1392 (11th Cir. 1998) (vacating the Commission's 1991 and 1992 orders on other grounds).

[51] 15 U.S.C. § 717f(b) (2018).

[52] *Id.* § 717f(c)(1)(B).

[53] *Id.* § 717f(e) (emphasis added).

[54] *Id.* § 717f(h).

power of eminent domain must be for a public use[55] and Congress considered natural gas pipelines a public use.

24. Each of these textual provisions illuminate the ultimate purpose of the NGA: to ensure that the public has access to natural gas because Congress considered such access to be in the public interest.[56] To now interpret "public convenience and necessity" to mean that the Commission has the authority to deny a certificate for a pipeline due to upstream or downstream emissions because the pipeline may result in access to, and the use of, natural gas would radically rewrite the NGA and undermine its stated purpose.

3. NGA section 1(b) and section 201 of the Federal Power Act (FPA)—authority over environmental effects related to the upstream production and downstream use of transported natural gas reserved to States

25. Statutory text also confirms that control over the physical environmental effects related to the upstream production and downstream use of natural gas are squarely reserved for the States. NGA section 1(b) provides that "[t]he provisions of this chapter . . . shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities for such distribution or to the production or gathering of natural gas."[57] The Ninth Circuit and the D.C. Circuit have interpreted the reference to distribution as meaning that States have exclusive authority over the gas

[55] *Miss. & Rum River Boom Co. v. Patterson*, 98 U.S. 403, 406 (1878) ("The right of eminent domain, that is, the right to take private property for public uses, appertains to every independent government.").

[56] This interpretation is also supported by the Commission's 1999 Certificate Policy Statement. *Certification of New Interstate Natural Gas Pipeline Facilities*, 88 FERC ¶ 61,227, 61,743 (1999), *clarified*, 90 FERC ¶ 61,128, *further clarified*, 92 FERC ¶ 61,094 (2000) (Certificate Policy Statement) ("[I]t should be designed to foster competitive markets, protect captive customers, and avoid unnecessary environmental and community impacts *while serving increasing demands for natural gas*.") (emphasis added); *id.* at 61,751 ("[T]he Commission is urged to authorize new pipeline capacity to meet an anticipated increase in demand for natural gas . . . .").

[57] 15 U.S.C. § 717(b) (2018); *see Pennzoil v. FERC*, 645 F.2d 360, 380-82 (5th Cir. 1981) (holding that FERC lacks the power to even interpret gas purchase agreements between producers and pipelines for the sale of gas that has been removed from NGA jurisdiction).

once the gas moves beyond high-pressure mainlines.[58] Likewise, FPA section 201 specifically reserves the authority to make generation decisions to the States.[59]

26. U.S. Supreme Court precedent and legislative history confirm that the regulation of the physical upstream production and downstream use of gas is reserved for the States.[60] The Court has observed that Congress enacted the NGA to address "specific evils" related to non-transparent rates for the interstate transportation and sale of natural gas and the monopoly power of holding companies that owned natural gas pipeline company stock.[61] The Court has also found that Congress enacted the NGA to

---

[58] *See S. Coast Air Quality Mgmt. Dist. v. FERC*, 621 F.3d 1085, 1092 (9th Cir. 2010) ("In sum, the history and judicial construction of the Natural Gas Act suggest that all aspects related to the direct consumption of gas . . . remain within the exclusive purview of the states."); *Pub. Utils. Comm'n of Cal. v. FERC*, 900 F.2d 269, 277 (D.C. Cir. 1990) ("[T]he state . . . has authority over the gas once it moves beyond the high-pressure mains into the hands of an end user."). I note that the court in *Sabal Trail* did not discuss or distinguish *Public Utilities Commission of State of Cal v. FERC*.

[59] 16 U.S.C. § 824(b)(1) (2018) ("The Commission . . . shall not have jurisdiction, except as specifically provided in this subchapter and subchapter III of this chapter, over facilities used for the generation of electric energy . . . ."). Despite Congress explicitly denying the Commission jurisdiction over generation decisions in the FPA, some argue that the Commission has the authority to prevent natural gas generation through general language in the NGA regarding public convenience and necessity. Such an approach violates the principle that explicit language trumps general provisions. *See, e.g.*, *Passamaquoddy Tribe v. State of Me.*, 897 F. Supp. 632, 635 ("In this case, the unequivocal language in the Maine Settlement Act clearly trumps the Gaming Act's general provisions that are silent as to Maine.").

[60] Some will argue that the Court's dicta in *FPC v. Hope Natural Gas Co.* (*Hope*)—"[t]he Commission is required to take account of the ultimate use of the gas," 320 U.S. 591, 639 (1944)—means that the Commission can consider environmental effects related to the downstream use of natural gas. However, such argument takes the Court's statement out of context. In fact, that Court makes that statement in support of its argument that while the 1942 amendments to the NGA eliminated the language, "the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest," "there is nothing to indicate that it was not and is still not an accurate statement of purpose of the Act." *Id.* at 638. Such argument further supports that Congress enacted the NGA to provide access to natural gas and to protect consumers from monopoly power.

[61] *Id.* at 610 ("state commissions found it difficult or impossible to discover what

> fill the regulatory void created by the Court's earlier decisions prohibiting States from regulating interstate transportation and sales for resale of natural gas, while at the same time leaving undisturbed the recognized power of the States to regulate all in-state gas sales directly to consumers. Thus, the NGA "was drawn with meticulous regard for the continued exercise of state power, not to handicap it any way."[62]

27. In *Transco*,[63] the Court also recognized that "Congress did not desire that an important aspect of this field be left unregulated."[64] Thus, the Court held that where

---

it cost interstate pipe-line companies to deliver gas within the consuming states"); *id.* ("[T]he investigations of the Federal Trade Commission had disclosed the majority of the pipe-line mileage in the country used to transport natural gas, together with an increasing percentage of the natural gas supply for pipe-line transportation, had been acquired by a handful of holding companies."). Senate Resolution 83, which directed the FTC to develop the report that the NGA is founded on, also demonstrates that Congress was only concerned with consumer protection and monopoly power. The resolution directed the FTC to investigate capital assets and liabilities of natural gas companies, issuance of securities by the natural gas companies, the relationship between company stockholders and holding companies, other services provided by the holding companies, adverse impacts of holding companies controlling natural gas companies, and potential legislation to correct any abuses by holding companies. FTC Report at 1.

[62] *Gen. Motors Corp. v. Tracy*, 519 U.S. 278, 292 (1997) (internal citations omitted) (quoting *Panhandle E. Pipeline Co. v. Pub. Serv. Comm'n of Ind.*, 332 U.S. 507, 516-22 (1947) (*Panhandle*)); *see also Nw. Cent. Pipeline v. State Corp. Comm'n*, 489 U.S. 493, 512 (1989) ("The NGA 'was designed to supplement state power and to produce a harmonious and comprehensive regulation of the industry. Neither state nor federal regulatory body was to encroach upon the jurisdiction of the other.'" (quoting *Panhandle*, 332 U.S. at 513)); *Panhandle*, 332 U.S. at 520 (In recognizing that the NGA articulated a legislative program recognizing the respective responsibilities of federal and state regulatory agencies, the Court noted that the NGA does not "contemplate ineffective regulation at either level as Congress meant to create a comprehensive and effective regulatory scheme, complementary in its operation to those of the states and in no manner usurping their authority."). Congress continued to draw the NGA with meticulous regard to State power when it amended the NGA in 1954 to add the Hinshaw pipeline exemption so as "to preserve state control over local distributors who purchase gas from interstate pipelines." *Louisiana Power & Light Co. v. Fed. Power Comm'n*, 483 F.2d 623, 633 (5th Cir. 1973).

[63] *Transco*, 365 U.S. 1 (1961).

[64] *Id.* at 19.

congressional authority is not explicit and States cannot practicably regulate a given area, the Commission can consider the issue in its public convenience and necessity determination.[65]

28. Based on this rule, and legislative history,[66] the *Transco* Court found that in its public convenience and necessity determination, the Commission appropriately considered whether the end-use of the gas in a non-producing state was economically wasteful as there was a regulatory gap and no State could be expected to control how gas is used in another State.[67] The Court also impressed that

> The Commission ha[d] not attempted to exert its influence over such "*physically*" wasteful practices as improper well spacing and the flaring of unused gas which result in the entire loss of gas and are properly of concern to the producing State; nor has the Commission attempted to regulate the "economic" aspects of gas used within the producing State.[68]

29. In contrast, there is no legislative history to support the Commission considering environmental effects related to the upstream production or downstream use of gas. Furthermore, the field of environmental regulation of such activities is not one that has been left unregulated.[69] Unlike in *Transco*, States can reasonably be expected to regulate

---

[65] *Id*. at 19-20.

[66] *Id.* at 10-19.

[67] *Id.* at 20-21.

[68] *Id.* at 20 (emphasis added).

[69] I note that the Federal Power Commission, the Commission's predecessor, at times previously considered environmental impacts in its need analysis when weighing the beneficial use of natural gas between competing uses. The Federal Power Commission did not consider negative environmental impacts of downstream end use as a reason to deny the use of natural gas. *See, e.g.*, *El Paso Natural Gas Co.*, 50 FPC 1264 (1973) (denying a certificate because the proposed project would impact existing customers dependent on natural gas and use of gas was not needed to keep sulfur emissions within the national ambient air quality standards); *Transwestern Pipeline Co.*, 36 FPC 176 (1966) (discussing use of gas instead of oil or coal and noting potential air pollution benefits); *El Paso Nat. Gas Co.*, 22 FPC 900, 950 (1959) ("[T]he use of natural gas as boiler fuel in the Los Angeles area should be considered as being in a different category than gas being used for such a purpose in some other community where the smog problem does not exist and that the use of gas for boiler fuel in this area should not be considered an inferior use."); *see also* FPC ANNUAL REP. at 2 (1966) ("Any showing that additional gas for boiler fuel use would substantially reduce air

air emissions from the upstream production or downstream use of natural gas: "air pollution control at its source is the primary responsibility of States and local governments."[70] The Clean Air Act vests States with authority to issue permits to regulate stationary sources related to upstream and downstream activities.[71] In addition, pursuant to their police powers, States have the ability to regulate environmental effects related to the upstream production and downstream use of natural gas within their jurisdictions.[72] The FTC Report referenced in NGA section 1(a) recognizes States' ability to regulate the use of natural gas.[73] And, various States have exercised this ability. For example, Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont participate in the Regional Greenhouse Gas

---

pollution merits serious consideration. Important as this factor may be, however, it cannot be considered in isolation."). Often these orders discussed sulfur and smog air pollution that occurred in the area where the natural gas would be transported when determining need as compared to the need or use of natural gas somewhere else. All of this was premised on the Commission's NGA authority to use its public convenience and necessity authority to provide access to natural gas and to conserve gas by preventing economic waste. The Commission appears to have stopped this analysis in the late-1970s. It is noteworthy that the U.S. Environmental Protection Agency (EPA) was established in 1970, Congress established more comprehensive air emissions regulation by amending the Clean Air Act in 1970 and 1977 (Pub. L. 91-604, 84 Stat. 1676 (1970); Pub. L. 95-95, 91 Stat. 685 (1977)), and Congress enacted the Department of Energy Organization Act, which replaced the Federal Power Commission with the Federal Energy Regulatory Commission, 42 U.S.C. §§ 7101 *et seq*.

[70] 42 U.S.C. § 7401 (2018).

[71] *Id.* § 7661e ("Nothing in this subchapter shall prevent a State, or interstate permitting authority, from establishing additional permitting requirements not inconsistent with this chapter."). The Act defines "permitting authority" as "the Administrator or the air pollution control agency authorized by the Administrator to carry out a permit program under this subchapter." *Id.* § 7661.

[72] *Huron Portland Cement Co. v. Detroit*, 362 U.S. 440, 442 (1960) ("Legislation designed to free from pollution the very air that people breathe clearly falls within the exercise of even the more traditional concept of what is compendiously known as the police power.").

[73] FTC Report at 716 (describing Louisiana) ("The department of conservation be, and it is hereby, given supervision over the production and use of natural gas in connection with the manufacture of carbon black in other manufacturing enterprises and for domestic consumption.").

Initiative (RGGI), which requires power plants with a capacity over 25 megawatts to hold allowances equal to their CO_2 emissions over a three-year control period.[74]

30. Some may make the argument that "considering" the environmental effects related to upstream production and downstream use is hardly "regulating" such activities. I disagree. For the Commission to consider such effects would be an attempt to exert influence over States' regulation of physical upstream production or downstream use of natural gas, which the Court in *Transco* suggested would be encroaching upon forbidden ground. If, for example, the Commission considered and denied a certificate based on the GHG emissions released from production activities, the Commission would be making a judgment that such production is too harmful for the environment and preempting a State's authority to decide whether and how to regulate upstream production of natural gas. Furthermore, for the Commission to consider and deny a project based on emissions from end users, the Commission would be making a judgment that natural gas should not be used for certain activities.[75] Such exertion of influence is impermissible: "when the Congress explicitly reserves jurisdiction over a matter to the states, as here, the Commission has no business considering how to 'induc[e] a change [of state] policy' with respect to that matter."[76]

31. Hence, there is no jurisdictional gap in regulating GHG emissions for the Commission to fill. The NGA reserves authority over the upstream production and downstream use of natural gas to the States, and States can practicably regulate GHGs emitted by those activities. And, even if there were a gap that federal regulation could fill, as discussed below, it is nonsensical for the Commission to attempt to fill a gap that

---

[75] *See also Myersville Citizens for a Rural Cmty., Inc. v. FERC*, 783 F.3d 1301, 1320 (D.C. Cir. 2015) ("The Commission's power to preempt state and local regulation by approving the construction of natural gas facilities is limited by the Natural Gas Act's savings clause, which provides that the Natural Gas Act's terms must not be construed to 'affect[] the rights of States' under the Clean Air Act. 15 U.S.C. § 717b(d)(2)."); *Dominion Transmission, Inc. v. Summers*, 723 F.3d 238, 243 (D.C. Cir. 2013) ("But Congress expressly saved states' [Clean Air Act] powers from preemption.").

[76] *Altamont Gas Transmission Co. v. FERC*, 92 F.3d 1239, 1248 (D.C. Cir. 1996); *see ANR Pipeline Co. v. FERC*, 876 F.2d 124, 132 (D.C. Cir. 1989) ("We think it would be a considerable stretch from there to say that, in certifying transportation that is necessary to carry out a sale, the Commission is required to reconsider the very aspects of the sale that have been assessed by an agency specifically vested by Congress with authority over the subject.").

Congress has clearly meant for the EPA to occupy.[77] Therefore, because GHG emissions from the upstream production and downstream use of natural gas are not properly of concern to the Commission, the Commission cannot deny a certificate application based on such effects.

B. Denying a pipeline based on upstream or downstream environmental effects would undermine other acts of Congress

32. Since enactment of the NGA and NEPA, Congress has enacted additional legislation promoting the production and use of natural gas and limiting the Commission's authority over the natural gas commodity. Each of these legislation enactments indicates that the Commission's authority over upstream production and downstream use of natural gas has been further limited by Congress. Arguments that the Commission can rely on the NGA's public convenience and necessity standard and NEPA to deny a pipeline application so as to prevent the upstream production or downstream use of natural gas would undermine these acts of Congress.

1. Natural Gas Policy Act of 1978

33. Determining that federal regulation of natural gas limited interstate access to the commodity, resulting in shortages and high prices, Congress passed the Natural Gas Policy Act of 1978 (NGPA). The NGPA significantly deregulated the natural gas industry.[78] Importantly, NGPA section 601(c)(1) states, "[t]he Commission may not deny, or condition the grant of, any certificate under section 7 of the Natural Gas Act based upon the amount paid in any sale of natural gas, if such amount is deemed to be just and reasonable under subsection (b) of this section."[79]

34. Besides using price deregulation to promote access to natural gas, Congress gave explicit powers to the President to ensure that natural gas reached consumers. NGPA section 302(c) explicitly provides, "[t]he President may, by order, require any pipeline to transport natural gas, and to construct and operate such facilities for the transportation of

[77] *See infra* PP 53-58.

[78] Generally, the NGPA limited the Commission's authority over gas that is not transported in interstate commerce, new sales of gas, sales of gas and transportation by Hinshaw pipelines, and certain sales, transportation and allocation of gas during certain gas supply emergencies. *See, e.g.*, NGPA sections 601(a)(1)(A)-(D), 15 U.S.C. § 3431(a)(1)(A)-(D) (2018).

[79] *Id.* § 3431(c)(1) (2018). In addition, section 121(a) provides, "the provisions of subtitle A respecting the maximum lawful price for the first sale of each of the following categories of natural gas shall, except as provided in subsections (d) and (e), cease to apply effective January 1, 1985." 15 U.S.C. § 3331(a), *repealed by* the Wellhead Decontrol Act of 1989, Pub. L. 101-60 § 2(b), 103 Stat. 157 (1989).

natural gas, as he determines necessary to carry out any contract authorized under subsection (a)."[80] Similarly, the NGPA gave authority to the Secretary of Energy to promote access to natural gas.[81]

35. There can be no doubt about the plain language of the NGPA: the Court observed that Congress passed the NGPA to "promote gas transportation by interstate and intrastate pipelines."[82] Furthermore, the NGPA was "intended to provide investors with adequate incentive to develop new sources of supply."[83]

2. Powerplant and Industrial Fuel Use Act of 1978

36. With respect to natural gas as a fuel source for electric generation, in 1987 Congress repealed sections of the Powerplant and Industrial Fuel Use Act of 1978 (Fuel Use Act),[84] which had restricted the use of natural gas in electric generation so as to conserve it for other uses. With the repeal of the Fuel Use Act, Congress made clear that natural gas could be used for electric generation and that the regulation of the use of natural gas by power plants unnecessary.[85]

[85] The Commission need not look any further than the text of the statutes to determine its authority. In the case of the repeal of the Fuel Use Act, the legislative

3. Natural Gas Wellhead Decontrol Act of 1989

37. If there were any remaining doubt that the Commission has no authority to consider the upstream production of natural gas and its environmental effects, such doubt was put to rest when Congress enacted the Wellhead Decontrol Act.[86] In this legislation, Congress specifically removed the Commission's authority over the upstream production of natural gas.[87]

38. But the Wellhead Decontrol Act was not merely about deregulating upstream natural gas production. Congress explained that the reason for deregulating natural gas at the wellhead was important to ensuring that end users had access to the commodity. The Senate Committee Report for the Wellhead Decontrol Act states "the purpose (of the legislation) is to promote competition for natural gas at the wellhead *to ensure consumers an adequate and reliable supply of natural gas at the lowest reasonable price*."[88] Similarly, the House Committee Report to the Wellhead Decontrol Act notes, "[a]ll sellers must be able to reasonably reach the highest-bidding buyer in an increasingly

---

history is informative as to Congress's reasoning. *See* H.R. Rep. 100-78 *2 ("By amending [Fuel Use Act], H.R. 1941 will remove artificial government restrictions on the use of oil and gas; allow energy consumers to make their own fuel choices in an increasingly deregulated energy marketplace; encourage multifuel competition among oil, gas, coal, and other fuels based on their price, availability, and environmental merits; preserve the 'coal option' for new baseload electric powerplants which are long-lived and use so much fuel; and provide potential new markets for financially distressed oil and gas producers."); *id.* *6 ("Indeed, a major purpose of this bill is to allow individual choices and competition and fuels and technologies . . . ."); *see also* President Ronald Reagan's Remarks on Signing H.R. 1941 Into Law, 23 WEEKLY COMP. PRES. DOC. 568, (May 21, 1987) ("This legislation eliminates unnecessary restrictions on the use of natural gas. It promotes efficient production and development of our energy resources by returning fuel choices to the marketplace. I've long believed that our country's natural gas resources should be free from regulatory burdens that are costly and counterproductive.").

[86] Pub. L. 101-60, 103 Stat. 157 (1989).

[87] The Wellhead Decontrol Act amended NGPA section 601(a)(1)(A) to read, "[f]or purposes of section 1(b) of the Natural Gas Act, the provisions of the Natural Gas Act and the jurisdiction of the Commission under such Act shall not apply to any natural gas solely by reason of any first sale of such natural gas." 15 U.S.C. § 3431(a)(1)(A), *amended by*, Pub. L. 101-60 § 3(a)(7)(A), 103 Stat. 157 (1989). *United Distrib. Cos. v. FERC*, 88 F.3d 1105, 1166 (D.C. Cir. 1996) ("That enactment contemplates a considerably changed natural gas world in which regulation plays a much reduced role and the free market operates at the wellhead.").

[88] S. Rep. No. 101-39 at 1 (emphasis added).

national market. All buyers must be free to reach the lowest-selling producer, and obtain shipment of its gas to them on even terms with other suppliers."[89] The House Committee Report also states the Commission's "current competitive 'open access' pipeline system [should be] maintained."[90] With this statement, the House Committee Report references Order No. 436 in which the Commission stated that open access transportation "is designed to remove any unnecessary regulatory obstacles and to facilitate transportation of gas to any end user that requests transportation service."[91]

4. Energy Policy Act of 1992

39. In the Energy Policy Act of 1992 (EPAct 1992), Congress also expressed a preference for providing the public access to natural gas. EPAct section 202 states, "[i]t is the sense of the Congress that natural gas consumers and producers, and the national economy, are best served by a competitive natural gas wellhead market."[92]

40. The NGA, NGPA, the repeal of the Fuel Use Act, the Wellhead Decontrol Act, and EPAct 1992 each reflect Congressional mandates to promote the production, transportation, and use of natural gas. None of these acts, and no other law, including NEPA, modifies the presumption in the NGA to facilitate access to natural gas. And, it is not for the Commission to substitute its judgment for that of Congress in determining energy policy.

C. "Public convenience and necessity" does not support consideration of environmental effects related to upstream production or downstream use of natural gas

41. In addition to considering the text of the NGA as a whole and subsequent-related acts, we must interpret the phrase "public convenience and necessity" as used when enacted. As discussed below, "public convenience and necessity" has always been understood to mean "need" for the service. To the extent the environment is considered, such consideration is limited to the effects stemming from the construction and operation of the proposed facilities and is not as broad as some would believe.[93]

---

[89] H.R. Rep. No. 101-29 at 6.

[90] *Id.* at 7.

[91] *Regulation of Natural Gas Pipelines After Partial Wellhead Decontrol*, Order No. 436, 50 Fed. Reg. 42,408, 42,478 (Oct. 18, 1985) (Order No. 436).

[92] Pub. L. No. 102-486, 106 Stat. 2776 (1992).

[93] Some will cite the reference to environment in footnote 6 in *NAACP v. FPC* to argue that the Commission can consider the environmental effects of upstream production and downstream use of natural gas. *NAACP v. FPC*, 425 U.S. 662, 670 n.6.

42. When Congress enacted the NGA, the phrase "public convenience and necessity" was a term of art used in state and federal public utility regulation.[94] In 1939, one year after the NGA's enactment, the Commission's predecessor agency, the Federal Power Commission, defined public convenience and necessity as "a public need or benefit without which the public is inconvenienced to the extent of being handicapped in the pursuit of business or comfort or both, without which the public generally in the area involved is denied to its detriment that which is enjoyed by the public of other areas similarly situated."[95] To make such showing, the Commission required certificate applicants to demonstrate that the public needed its proposed project, the applicant could perform the proposed service, and the service would be provided at reasonable rates.[96]

43. To the extent that public convenience and necessity included factors other than need, they were limited and directly related to the proposed facilities, not upstream or downstream effects related to the natural gas commodity. Such considerations included the effects on pipeline competition, duplication of facilities, and social costs, such as misuse of eminent domain and environmental impacts resulting from the creation of the

---

The Court's statement does not support that argument. The Court states that the environment could be a subsidiary purpose of the NGA and FPA by referencing FPA section 10, which states the Commission shall consider whether a hydroelectric project is best adapted to a comprehensive waterway by considering, among other things, the proposed *hydroelectric project's effect* on the adequate protection, mitigation, and enhancement of fish and wildlife. Nothing in the Court's statement or the citation would support the consideration of upstream and downstream impacts. *See supra* note 67 (explaining that the Federal Power Commission previously considered environmental impacts of downstream end use when weighing the beneficial use of natural gas between competing uses).

[94] William K. Jones, *Origins of the Certificate of Public Convenience and Necessity: Developments in the States, 1870-1920*, 79 COLUM. L. REV. 426, 427-28 (1979) (Jones).

[95] *Kan. Pipe Line & Gas Co.*, 2 FPC 29, 56 (1939).

[96] *See* Order No. 436, at 42,474 (listing the requirements outlined in *Kan. Pipe Line & Gas Co.*: "(1) they possess a supply of natural gas adequate to meet those demands which it is reasonable to assume will be made upon them; (2) there exist in the territory proposed to be served customers who can reasonably be expected to use such natural-gas service; (3) the facilities for which they seek a certificate are adequate; (4) the costs of construction of the facilities which they propose are both adequate and reasonable; (5) the anticipated fixed charges or the amount of such fixed charges are reasonable; and (6) the rates proposed to be charged are reasonable.").

right-of-way or service.[97] For example, the Commonwealth of Massachusetts considered environmental impacts resulting from the creation of the right-of-way and service in denying an application to build a railroad along a beach. The Commonwealth found that "the demand for train service was held to be outweighed by the fact the beach traversed 'will cease to be attractive when it is defaced and made dangerous by a steam railroad.'"[98]

44. The Commission's current guidance for determining whether a proposed project is in the public convenience and necessity is consistent with the historic use of the term. As outlined in its 1999 Certificate Policy Statement, the Commission implements an economic balancing test that is focused on whether there is a need for the facilities and adverse economic effects stemming from the construction and operation of the proposed facilities themselves. The Commission designed its balancing test "to foster competitive markets, protect captive customers, and avoid unnecessary environmental and community impacts while serving increasing demands for natural gas."[99] The Commission also stated that its balancing test "provide[s] appropriate incentives for the optimal level of construction and efficient customer choices."[100] To accomplish these objectives, the Commission determines whether a project is in the public convenience and necessity by balancing the public benefits of the project against the adverse economic impacts on the applicant's existing shippers, competitor pipelines and their captive customers, and landowners.[101]

45. Although the Certificate Policy Statement also recognizes the need to consider certain environmental issues related to a project, it makes clear that the environmental impacts to be considered are related to the construction and operation of the pipeline itself and the creation of the right-of-way.[102] As noted above, it is the Commission's objective to avoid *unnecessary* environmental impacts, meaning to route the pipeline to avoid environmental effects where possible and feasible, not to prevent or mitigate environmental effects from the upstream production or downstream use of natural gas. This is confirmed when one considers that, if the project had unnecessary adverse

[101] *Id.*

[102] *See also Ctr. for Biological Diversity v. U.S. Army Corps of Eng'rs*, 941 F.3d 1288, 1299 (11th Cir. 2019) ("Regulations cannot contradict their animating statutes or manufacture additional agency power.") (citing *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120, 125-26 (2000)).

environmental effects, the Commission would require the applicant to reroute the pipeline: "If the environmental analysis following a preliminary determination indicates a preferred route other than the one proposed by the applicant, the earlier balancing of the public benefits of the project against its adverse effects would be reopened to take into account the adverse effects on landowners who would be affected by the changed route."[103]

46. Further, the Certificate Policy Statement provides, "[i]deally, an applicant will structure its proposed project to avoid adverse economic, competitive, environmental, or other effects on the relevant interests from the construction of the new project."[104] And that is what occurred in this case. Mountain Valley modified its pipeline route to reduce impacts on various landowners[105] and eliminated a compressor station that had originally been proposed in pre-filing to be located near milepost 26 in North Carolina.[106] Additionally, Mountain Valley co-located 49 percent of the proposed pipeline route with existing utility corridors and rights-of-way. [107] Further, during the pre-filing period, Mountain Valley assessed numerous route alternatives. Mountain Valley adopted 101 route alternative segments and/or minor route variations into its proposed Project design for various reasons, including landowner requests, avoidance of sensitive environmental resources (such as archaeological sites or wetlands), avoidance of areas of steep terrain or side slopes, and engineering considerations.[108]

47. In sum, the meaning of "public convenience and necessity" does not support weighing the public need for the project against effects related to the upstream production or downstream use of natural gas.

D. NEPA does not authorize the Commission to deny a certificate application based on emissions from the upstream production or downstream use of transported natural gas

48. The text of the NGA, and the related subsequent acts by Congress, cannot be revised by NEPA or CEQ regulations to authorize the Commission to deny a certificate

application based on effects from the upstream production and downstream use of natural gas.

49. The courts have made clear that NEPA does not expand a federal agency's substantive or jurisdictional powers.[109] Nor does NEPA repeal by implication any other statute.[110] Rather, NEPA is a merely procedural statute that requires federal agencies to take a "hard look" at the environmental effects of a proposed action before acting on it.[111] NEPA also does not require a particular result. In fact, the Supreme Court has stated, even if a NEPA analysis identifies an environmental harm, the agency can still approve the project.[112]

50. Further, CEQ's regulations on indirect effects cannot make the GHG emissions from upstream production or downstream use part of the Commission's public convenience and necessity determination under the NGA. As stated above, an agency's obligation under NEPA to consider indirect environmental effects is not limitless. Indirect effects must have "a reasonably close causal relationship" with the alleged cause, and that relationship is dependent on the "underlying policies or legislative intent."[113] NEPA requires such reasonably close causal relationship because "inherent in NEPA and

---

[109] *Nat. Res. Def. Council, Inc. v. EPA*, 822 F.2d 104, 129 (D.C. Cir. 1987) ("NEPA, as a procedural device, does not work a broadening of the agency's substantive powers. Whatever action the agency chooses to take must, of course, be within its province in the first instance.") (citations omitted); *Cape May Greene, Inc. v. Warren*, 698 F.2d 179, 188 (3d Cir. 1986) ("The National Environmental Policy Act does not expand the jurisdiction of an agency beyond that set forth in its organic statute."); *Gage v. U.S. Atomic Energy Comm'n*, 479 F.2d 1214, 1220 n.19 (D.C. Cir. 1973) ("NEPA does not mandate action which goes beyond the agency's organic jurisdiction."); *see also Flint Ridge Dev. Co. v. Scenic Rivers Ass'n of Okla.*, 426 U.S. 776, 788 (1976) ("where a clear and unavoidable conflict in statutory authority exists, NEPA must give way").

[110] *U.S. v. Students Challenging Regulatory Agency Procedures*, 412 U.S. 669, 694 (1973).

[111] *Vt. Yankee Nuclear Power Corp. v. Nat. Res. Def. Council, Inc.*, 435 U.S. 519, 558 (1978) ("NEPA does set forth significant substantive goals for the Nation, but its mandate to the agencies is essentially procedural.").

[112] *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) ("Although these procedures are almost certain to affect the agency's substantive decision, it is now well settled that NEPA itself does not mandate particular results, but simply prescribes the necessary process.").

[113] *Metro. Edison Co. v. People Against Nuclear Energy*, 460 U.S. 766, 774 n.7 (1983).

its implementing regulations is a 'rule of reason,'"[114] which "recognizes that it is pointless to require agencies to consider information they have no power to act on, or effects they have no power to prevent."[115] Thus, "where an agency has no ability to prevent a certain effect due to its limited statutory authority over the relevant actions, the agency cannot be considered a legally relevant 'cause' of the effect."[116]

51. The Commission has no power to deny a certificate for effects related to the upstream production or downstream use of natural gas. As explained above, the Commission's consideration of adverse environmental effects is limited to those effects stemming from the construction and operation of the pipeline facility and the related right-of-way. For the Commission to deny a pipeline based on GHGs emitted from the upstream production or downstream use of natural gas would be contrary to the text of the NGA and subsequent acts by Congress. The NGA reserves such considerations for the States, and the Commission must respect the jurisdictional boundaries set by Congress. Suggesting that the Commission can consider such effects not only risks duplicative regulation but in fact defies Congress.

III. The NGA does not contemplate the Commission establishing mitigation for GHG emissions from pipeline facilities

52. My colleague has also suggested that the Commission should require the mitigation of GHG emissions from the certificated pipeline facilities and the upstream production and downstream use of natural gas transported on those facilities.[117] I understand his suggestions as proposing a carbon emissions fee, offsets or tax (similar to the Corps' compensatory wetland mitigation program), technology requirements (such as

[117] *Transcontinental Gas Pipe Line Company, LLC, (Transco)* 171 FERC ¶ 61,031 (2020) (Comm'r, Glick, dissenting at P 17).

scrubbers or electric-powered compressor units),[118] or emission caps. Some argue that the Commission can require such mitigation under NGA section 7(e), which provides "[t]he Commission shall have the power to attach to the issuance of the certificate . . . such reasonable terms and conditions as the public convenience and necessity may require."[119]

53. I disagree. The Commission cannot interpret NGA section 7(e) to allow the Commission to unilaterally establish measures to mitigate GHG emissions because Congress, through the Clean Air Act, assigned the EPA and the States exclusive authority to establish such measures. Congress designated the EPA as the expert agency "best suited to serve as primary regulator of greenhouse gas emissions," [120] not the Commission.

54. The Clean Air Act establishes an all-encompassing regulatory program, supervised by the EPA to deal comprehensively with interstate air pollution.[121] Congress entrusted the Administrator of the EPA with significant discretion to determine appropriate emissions measures. Congress delegated the Administrator the authority to determine whether pipelines and other stationary sources endanger public health and welfare; section 111 of the Clean Air Act directs the Administrator of the EPA "to publish (and from time to time thereafter shall revise) a list of categories of stationary sources. He shall include a category of sources in such list if in *his judgment* it causes, or contributes significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare"[122] and to establish standards of performance for the identified stationary sources.[123] The Clean Air Act requires the Administrator to conduct complex balancing when determining a standard of performance, taking into consideration what is technologically achievable and the cost to achieve that standard.[124]

---

[118] It is also important to consider the impact on reliability that would result from requiring electric-compressor units on a gas pipeline. In the event of a power outage, a pipeline with electric-compressor units may be unable to compress and transport gas to end-users, including power plants and residences for heating and cooking.

[119] *Id.* § 717f(e) (2018).

[120] *American Elec. Power Co., Inc. v. Conn.*, 564 U.S. 410, 428 (2011).

[121] *See id.* at 419.

[122] 42 U.S.C. § 7411(b)(1)(A) (2018).

[123] *Id.* § 7411(b)(1)(B).

[124] *Id.* § 7411(a)(1).

55. In addition, the Clean Air Act allows the Administrator to "distinguish among classes, types, and sizes within categories of new sources for the purpose of establishing such standards."[125] The Act also permits the Administrator, with the consent of the Governor of the State in which the source is to be located, to waive its requirements "to encourage the use of an innovative technological system or systems of continuous emission reduction."[126]

56. Congress also intended that States would have a role in establishing measures to mitigate emissions from stationary sources. Section 111(f) notes that "[b]efore promulgating any regulations . . . or listing any category of major stationary sources . . . the Administrator shall consult with appropriate representatives of the Governors and of State air pollution control agencies."[127]

57. Thus, the text of the Clean Air Act demonstrates it is improbable that NGA section 7(e) allows the Commission to establish GHG emission standards or mitigation measures out of whole cloth. To argue otherwise would defeat the significant discretion and complex balancing that the Clean Air Act entrusts in the EPA Administrator, and would eliminate the role of the States.

58. Furthermore, to argue that the Commission may use its NGA conditioning authority to establish GHG emission mitigation—a field in which the Commission has no expertise—and address climate change—an issue that has been subject to profound debate across our nation for decades—is an extraordinary leap. The Supreme Court's "major rules" canon advises that agency rules on issues that have vast economic and political significance must be treated "with a measure of skepticism" and require Congress to provide clear authorization.[128] The Court has articulated this canon because Congress does not "hide elephants in mouseholes"[129] and "Congress is more likely to have focused upon, and answered, major questions, while leaving interstitial matters to answer themselves in the course of the statute's daily administration."[130]

[130] *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 12, 159 (quoting Justice

59. Courts would undoubtedly treat with skepticism any attempt by the Commission to establish GHG emission mitigation measures. Congress has introduced climate change bills since at least 1977,[131] over four decades ago. Over the last 15 years, Congress has introduced and failed to pass 70 legislative bills to reduce GHG emissions—29 of those were carbon emission fees or taxes.[132] For the Commission to suddenly declare such climate mitigation power resides in the long-extant NGA and that Congress's efforts were superfluous strains credibility. Establishing a carbon emissions fee or tax, or GHG mitigation out of whole cloth would be a major rule, and Congress has made no indication that the Commission has such authority.

60. Some may make the argument that the Commission can develop mitigation measures without establishing a standard. I disagree. Establishing mitigation measures requires determining how much mitigation is required – i.e., setting a limit, or establishing a standard, that quantifies the amount of GHG emissions that will adversely affect the human environment. Some may also argue that the Commission has unilaterally established mitigation in other contexts, including wetlands, soil conservation, and noise. These examples, however, are distinguishable. Congress did not exclusively assign the authority to establish avoidance or restoration measures for mitigating effects on wetlands or soil to a specific agency. The Corps and the EPA developed a wetlands mitigation bank program pursuant to section 404 of the Clean Water Act.[133] Congress endorsed such mitigation.[134] As for noise, the Clean Air Act

assigns the EPA Administrator authority over determining the level of noise that amounts to a public nuisance and requires federal agencies to consult with the EPA when its actions exceed the public nuisance standard.[135] The Commission complies with the Clean Air Act by requiring project noise levels in certain areas to not exceed 55 dBA Ldn, as required by EPA's guidelines.[136]

61. Accordingly, there is no support that the Commission can use its NGA section 7(e) authority to establish measures to mitigate GHG emissions from proposed pipeline facilities or from the upstream production or downstream use of natural gas.[137]

IV. The Commission has no standard for determining whether GHG emissions significantly affect the environment

62. My colleague has argued that the Commission violates the NGA and NEPA by not determining the significance of GHG emissions that are effects of a project.[138] He has challenged the Commission's explanation that it cannot determine significance because there is no standard for determining the significance of GHG emissions.[139] He has argued that the Commission can adopt the Social Cost of Carbon[140] to determine whether GHG emissions are significant or rely on its own expertise as it does for other

1990, Pub. L. 101-640, § (a)(18)(C), 104 Stat. 4604, 4609 (1990).

[135] 42 U.S.C. § 7641(c) ("In any case where any Federal department or agency is carrying out or sponsoring any activity resulting in noise which the Administrator determines amounts to a public nuisance or is otherwise objectionable, such department or agency shall consult with the Administrator to determine possible means of abating such noise.").

[136] *See Williams Gas Pipelines Cent., Inc.*, 93 FERC ¶ 61,159, at 61,531-52 (2000).

[137] In addition, requiring a pipeline to mitigate emissions from the upstream production or downstream use of natural gas would not be "a reasonable term or condition as the public convenience and necessity may require." 15 U.S.C. § 717f(e) (2018). It would be unreasonable to require a pipeline to mitigate an effect it has no control over. Further, as discussed above, emissions from the upstream production and downstream use of natural gas are not relevant to the NGA's public convenience and necessity determination.

environmental resources, such as soils, groundwater, and wetland resources.[141] He has suggested that the Commission does not make a finding of significance in order to deceptively find that a project is in the public convenience and necessity.[142]

63. I disagree. The Social Cost of Carbon is not a suitable method for determining whether GHG emissions that are caused by a proposed project will have a significant effect on climate change, and the Commission has no authority or reasoned basis using its own expertise to make such determination.

A. Social Cost of Carbon is not a suitable method to determine significance

64. The Commission has found, and I agree, that the Social Cost of Carbon is not a suitable method for the Commission to determine significance of GHG emissions.[143] Because the courts have repeatedly upheld the Commission's reasoning,[144] I will not restate the Commission's reasoning here.

---

[141] *Dominion Energy Transmission, Inc.*, 169 FERC ¶ 61,229 (2019) (Comm'r, Glick, dissenting at P 10).

[142] *Id.* P 2. The dissent uses the phrase "public interest"; however, as noted earlier, the Commission issues certificates when required by the public convenience and necessity. NGA section 7(e) does not include the phrase "public interest." To the extent that the courts and the Commission have equated the "public convenience and necessity" with "public interest," the "public convenience and necessity" is not as broad as some would argue. *See supra* P 16.

Bernhardt*, No. CV 19-12-M-DWM, 2020 WL 1139674, *6 (D. Mont. March 9, 2020) (upholding the agency's decision to not use the Social Cost of Carbon because it is too uncertain and indeterminate to be useful); *Citizens for a Healthy Cmty. v. U.S. Bureau of Land Mgmt.*, 377 F. Supp. 3d 1223, 1239-41 (D. Colo. 2019) (upholding the agency's decision to not use the Social Cost of Carbon); *WildEarth Guardians v. Zinke*, 368 F. Supp. 3d 41, 77-79 (D.D.C. 2019) (upholding the agency's decision to not use the Social Cost of Carbon); *High Country Conservation Advocates v. U.S. Forest Serv.*, 333 F. Supp. 3d 1107, 1132 (D. Colo. 2018) vacated and remanded on

65. However, I will address the suggestion that the Social Cost of Carbon can translate a project's impact on climate change into "concrete and comprehensible terms" that will help inform agency decision-makers and the public at large.[145] The Social Cost of Carbon, described as an estimate of "the monetized damages associated with an incremental increase in carbon emissions in a given year,"[146] may appear straightforward. On closer inspection, however, the Social Cost of Carbon and its calculated outputs are not so simple to interpret or evaluate.[147] When the Social Cost of Carbon estimates that one metric ton of CO_2 costs $12 (the 2020 cost using a discount rate of 5 percent),[148] agency decision-makers and the public have no reasoned basis or benchmark to determine whether that cost is significant. Bare numbers standing alone simply *cannot* ascribe significance.

---

other grounds 2020 WL 994988 (10th Cir. March 2, 2020) ("[T]he *High Country* decision did not mandate that the Agencies apply the social cost of carbon protocol in their decisions; the court merely found arbitrary the Agencies' failure to do so without explanation.").

[145] Cheyenne Connector Dissent P 13 n.27.

[146] Interagency Working Group on the Social Cost of Greenhouse Gases, *Technical Support Document – Technical Update of the Social Cost of Carbon for Regulatory impact Analysis – Under Executive Order 12866* at 1 (Aug. 2016), https://www.epa.gov/sites/production/files/2016-12/documents/sc_co2_tsd_august_2016.pdf (2016 Technical Support Document).

[147] In fact, the website for the Climate Framework for Uncertainty Negotiation and Distribution (FUND) – one of the three integrated assessment models that the Social Cost of Carbon uses – states "[m]odels are often quite useless in unexperienced hands, and sometimes misleading. No one is smart enough to master in a short period what took someone else years to develop. Not-understood models are irrelevant, half-understood models are treacherous, and mis-understood models dangerous." FUND-Climate Framework for Uncertainty, Negotiation and Distribution, http://www.fund-model.org/ (LAST VISITED NOV. 18, 2019).

[148] *See* 2016 Technical Support Document at 4. The Social Cost of Carbon produces wide-ranging dollar values based upon a chosen discount rate, and the assumptions made. The Interagency Working Group on Social Cost of Greenhouse Gases estimated in 2016 that the Social Cost of one ton of carbon dioxide for the year 2020 ranged from $12 to $123. *Id.*

B. The Commission has no authority or reasoned basis to establish its own framework

66. Some argue that the lack of externally established targets does not relieve the Commission from establishing a framework or targets on its own. Some have suggested that the Commission can make up its own framework, citing the Commission's framework for determining return on equity (ROE) as an example. However, they overlook the fact that Congress designated the EPA, not the Commission, with exclusive authority to determine the amount of emissions that are harmful to the environment. In addition, there are no available resources or agency expertise upon which the Commission could reasonably base a framework or target.

67. As I explain above, Congress enacted the Clean Air Act to establish an all-encompassing regulatory program, supervised by the EPA to deal comprehensively with interstate air pollution. Section 111 of the Clean Air Act directs the Administrator of the EPA to identify stationary sources that "in his judgment cause[], or contribute[] significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare"[149] and to establish standards of performance for the identified stationary sources.[150] Thus, the EPA has exclusive authority for determining whether emissions from pipeline facilities will have a significant effect on the environment.

68. Further, the Commission is not positioned to unilaterally establish a standard for determining whether GHG emissions will significantly affect the environment when there is neither federal guidance nor an accepted scientific consensus on these matters.[151] This inability to find an acceptable methodology is not for a lack of trying. The Commission

[149] 42 U.S.C. § 7411(b)(1)(A) (2018).

[150] *Id.* § 7411(b)(1)(B).

[151] The Council on Environmental Quality's 2019 Draft Greenhouse Gas Guidance states, "[a]gencies need not undertake new research or analysis of potential climate effects and may rely on available information and relevant scientific literature." CEQ, *Draft National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions*, 84 Fed. Reg. 30,097, 30,098 (June 26, 2019); *see also* CEQ FINAL GUIDANCE FOR FEDERAL DEPARTMENTS AND AGENCIES ON CONSIDERATION OF GREENHOUSE GAS EMISSIONS AND THE EFFECTS OF CLIMATE CHANGE IN NATIONAL ENVIRONMENTAL POLICY ACT REVIEWS at 22 (Aug. 1, 2016) ("agencies need not undertake new research or analysis of potential climate change impacts in the proposed action area, but may instead summarize and incorporate by reference the relevant scientific literature"), https://ceq.doe.gov/docs/ceq-regulations-and-guidance/nepa_final_ghg_guidance.pdf.

reviews the climate science, state and national targets, and climate models that could inform its decision-making.[152]

69. Moreover, assessing the significance of project effects on climate change is unlike the Commission's determination of ROE. Establishing ROE has been one of the core functions of the Commission since its inception under the FPA as the Federal Power Commission.[153] And, setting ROE has been an activity of state public utility commissions, even before the creation of the Federal Power Commission.[154] The Commission's methodology is also founded in established economic theory.[155] In contrast, assessing the significance of GHG emissions is not one of the Commission's core missions and there is no suitable methodology for making such determination.

70. It has been argued that the Commission can establish its own methodology for determining significance, pointing out that the Commission has determined the significance of effects on soils, groundwater, and wetland resources, using its own expertise and without generally accepted significance criteria or a standard methodology.

71. I disagree. As an initial matter, it is important to note that when the Commission states it has no suitable methodology for determining the significance of GHG emissions, the Commission means that it has no reasoned basis for making such finding. The Commission's findings regarding significance for soils, groundwater, and wetland resources have a reasoned basis. For example, for groundwater resources, using information provided by the U.S. Geological Service, the Commission identified major groundwater aquifers, water supply wells, and springs crossed by the project.[156] The Commission also used information published by the EPA to identify contaminated

[155] *Inquiry Regarding the Commission's Policy for Determining Return on Equity*, 166 FERC ¶ 61,207 (2019) (describing the Commission's use of the Discounted Cash Flow model that was originally developed in the 1950s as a method for investors to estimate the value of securities).

[156] Final EIS at 4-27 to 4-33.

groundwater resources within .25 miles of the Project.[157] Based on this information, the Commission identified a location nearby the Project with an active or unresolved contamination concern.[158] The Commission found that use of proper spill, containment, and handling procedures in Mountain Valley's Spill, Prevention, Control, and Countermeasures Plan would minimize the chance of spills and leaks.[159] Additionally, the Commission found that temporary and minor impacts could result during trenching activities in areas with shallow groundwater but Mountain Valley would implement best management practices to protect groundwater resources and would adhere to applicable federal, state, and local requirements to protect groundwater resources.[160] Based on this information, the Commission had a reasoned basis to find that the Project would not result in significant impacts on groundwater resources.[161]

72. In contrast, the Commission has no reasoned basis to determine whether a project has a significant effect on climate change. To assess a project's effect on climate change, the Commission can only quantify the amount of project emissions and compare that number to national emissions to calculate a percentage of national emissions. That calculated number cannot inform the Commission on climate change effects caused by the project, e.g., increase of sea level rise, effect on weather patterns, or effect on ocean acidification. Nor are there acceptable scientific models that the Commission may use to attribute every ton of GHG emissions to a physical climate change effect.

73. Without adequate support or a reasoned target, the Commission cannot ascribe significance to particular amounts of GHG emissions. To do so would not only exceed our agency's authority, but would risk reversal upon judicial review. Courts require agencies to "consider[] the relevant factors and articulate[] a rational connection between the facts found and the choice made."[162] Simply put, stating that an amount of GHG

emissions appears significant without any support fails to meet the agency's obligations under the Administrative Procedure Act (APA).

V. Conclusion

74. This concurrence is intended to assist the Commission, courts, and other parties in their consideration of the Commission's obligations under the NGA and NEPA. The Commission cannot act *ultra vires* and claim more authority than the NGA provides it, regardless of the importance of the issue sought to be addressed.[163] The NGA provides the Commission no authority to deny a certificate application based on the environmental effects from the upstream production or downstream use of natural gas. Congress enacted the NGA, and subsequent legislation, to ensure the Commission provided public access to natural gas. Further, Congress designed the NGA to preserve States' authority to regulate the physical effects from the upstream production and downstream use of natural gas, and did not leave that field unregulated. Congress simply did not authorize the Commission to judge whether the upstream production or downstream use of gas will be too environmentally harmful.

75. Nor does the Commission have the ability to establish measures to mitigate GHG emissions. Pursuant to the Clean Air Act, Congress exclusively assigned that authority to the EPA and the States. Finally, the Commission has no reasoned basis for determining whether GHG emissions are significant that would satisfy the Commission's APA obligations and survive judicial review.

76. I recognize that some believe the Commission should do more to address climate change. The Commission, an energy agency with a limited statutory authority, is not the appropriate authority to establish a new regulatory regime.

For these reasons, I respectfully concur.

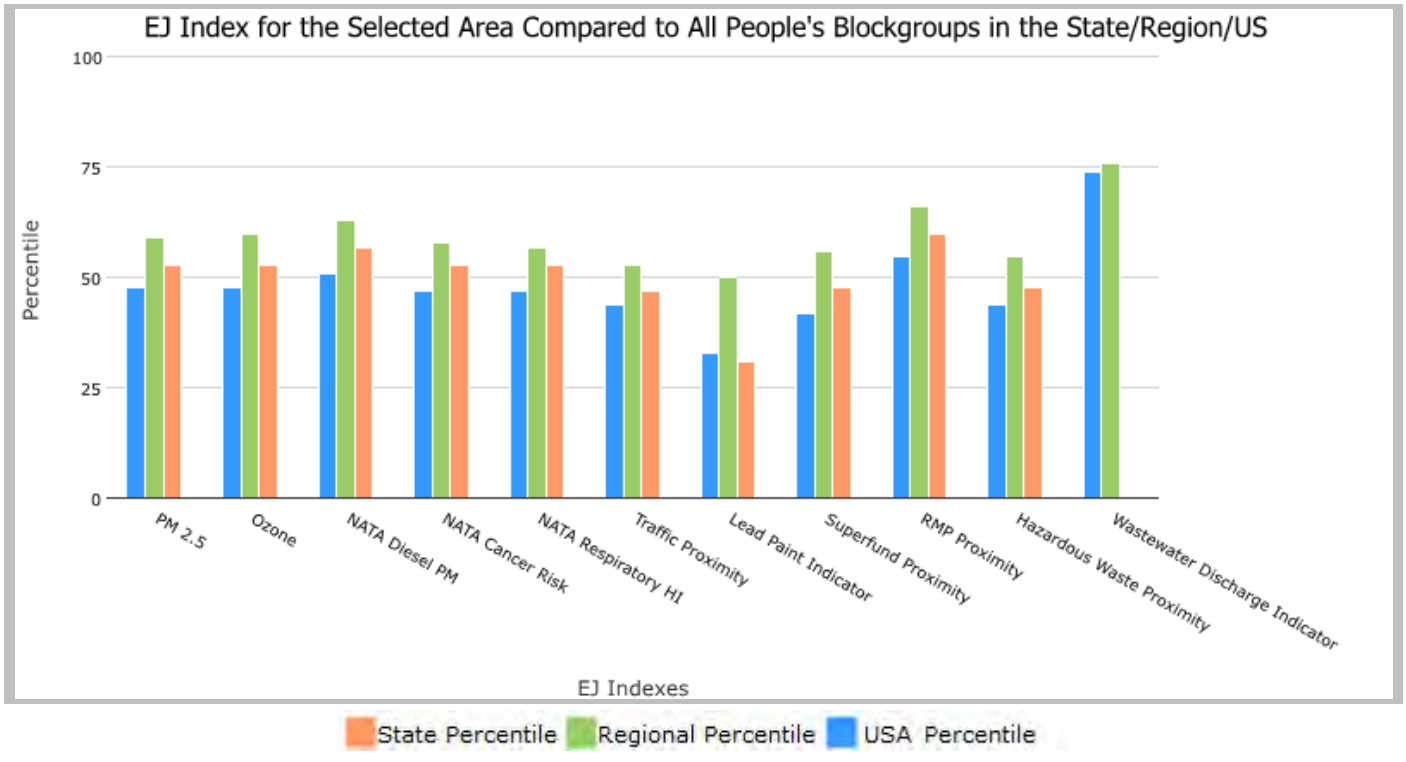
EJ Index for Wastewater Discharge Indicator	N/A	76	74



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

* The National-Scale Air Toxics Assessment (NATA) is EPA's ongoing, comprehensive evaluation of air toxics in the United States. EPA developed the NATA to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that NATA provides broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the NATA analysis can be found at: https://www.epa.gov/national-air-toxics-assessment.

For additional information, see: www.epa.gov/environmentaljustice

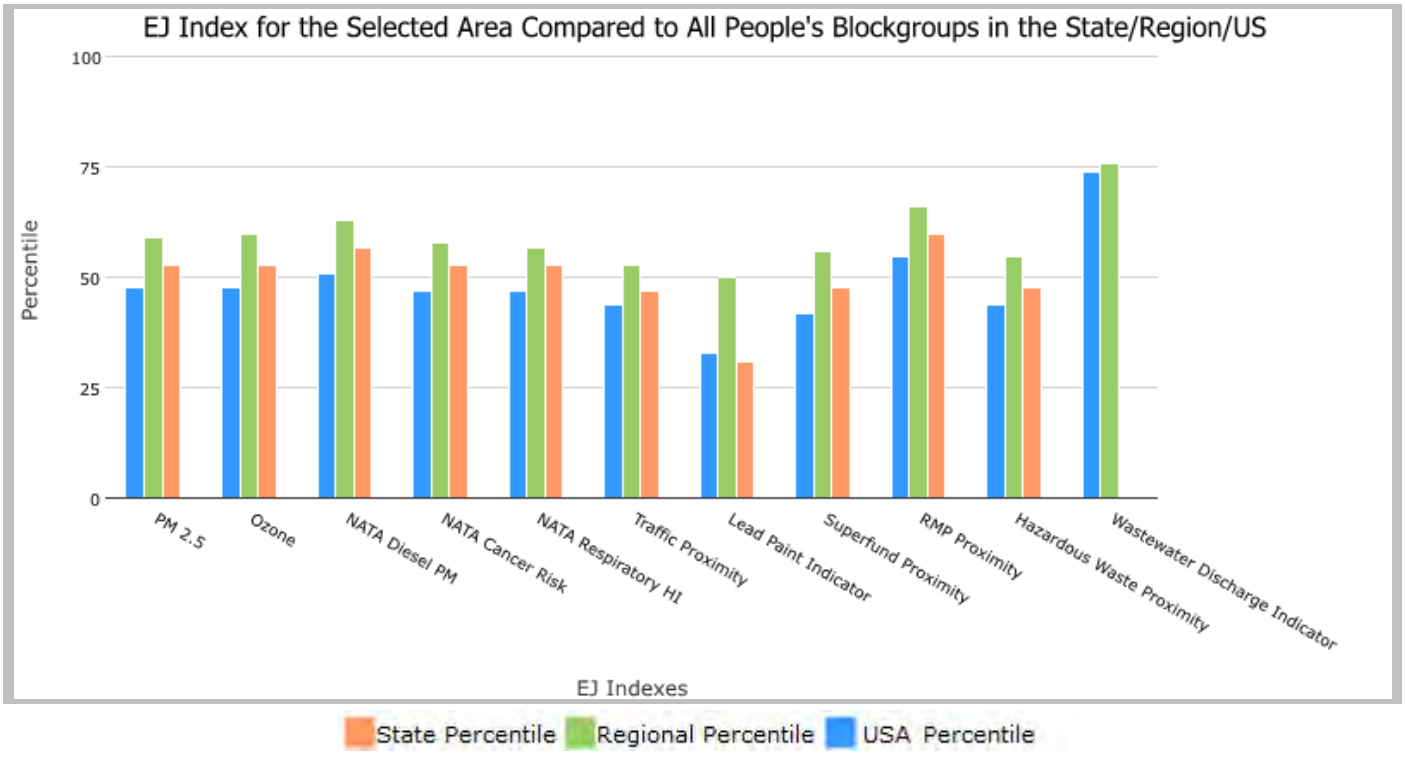
EJSCREEN Report (Version 2019)

Blockgroup: 511430105001, VIRGINIA, EPA Region 3

Approximate Population: 1,176

Input Area (sq. miles): 24.40

Selected Variables	State Percentile	EPA Region Percentile	USA Percentile
EJ Indexes			
EJ Index for PM2.5	53	59	48
EJ Index for Ozone	53	60	48
EJ Index for NATA* Diesel PM	57	63	51
EJ Index for NATA* Air Toxics Cancer Risk	53	58	47
EJ Index for NATA* Respiratory Hazard Index	53	57	47
EJ Index for Traffic Proximity and Volume	47	53	44
EJ Index for Lead Paint Indicator	31	50	33
EJ Index for Superfund Proximity	48	56	42
EJ Index for RMP Proximity	60	66	55
EJ Index for Hazardous Waste Proximity	48	55	44
EJ Index for Wastewater Discharge Indicator	N/A	76	74



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

* The National-Scale Air Toxics Assessment (NATA) is EPA's ongoing, comprehensive evaluation of air toxics in the United States. EPA developed the NATA to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that NATA provides broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the NATA analysis can be found at: https://www.epa.gov/national-air-toxics-assessment.

MVP Southgate Project

Docket No. CP19-XX-000

Resource Report 1

Appendix 1-L

Public, Stakeholder, and Agency Participation Plan

MVP Southgate Project

Public, Stakeholder, and Agency Participation Plan

November 2018

TABLE OF CONTENTS

1.0 PLAN PURPOSE

The purpose of this Public, Stakeholder and Agency Participation Plan is to identify stakeholders and potential issues related to the proposed MVP Southgate Project ("Project" or "Southgate Project"), determine appropriate and effective methods of communication with stakeholders, identify responsible parties, document the public consultation process, and adhere to communication protocols. The Southgate Project team is dedicated to seeking out greater involvement from the various affected groups early in the planning so that those who are interested may participate in the decision-making process. The Project's goal is to work with stakeholders to achieve consensus and settlements on mutually acceptable Project designs. The Southgate Project team believes an early and more collaborative approach will lead to Project designs that minimize impacts to landowners, communities, and the environment, while enabling us to develop more comprehensive applications for submittal to the Federal Energy Regulatory Commission ("FERC") and other agencies.

2.0 PROJECT SCOPE

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the FERC" or "Commission pursuant to Section 7(c) of the Natural Gas Act to construct and operate the Southgate Project. The Project will provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States, including for the Project's anchor shipper, PSNC Energy, a wholly-owned subsidiary of SCANA Corporation, a local distribution company serving customers in North Carolina. The Southgate Project is expected be in service by late 2020. The Project is a separate project from the 303-mile Mountain Valley Pipeline that is currently under construction. The Southgate Project will be developed, constructed, and owned by Mountain Valley and will be operated by EQM Midstream Partners, LP.

The Southgate Project includes an approximate 0.4-mile-long 24-inch-diameter pipeline (H-605), 73 miles of 24- and 16-inch-diameter natural gas pipeline (H-650), a new 28,915 nominal horsepower compressor station (Lambert Compressor Station), meter stations and other ancillary facilities (e.g. contractor yards and access roads) required for the safe and reliable operation of the pipeline. The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, in North Carolina.

3.0 OUTREACH PLAN GOAL

Mountain Valley and the Southgate Project team know that stakeholder outreach and public consultation are essential elements of the permitting process and will play an important role in the overall successful development of the Project.

The Southgate Project team has developed a comprehensive stakeholder list and public participation plan. The plan is built around the fundamental principle that open, honest and proactive communication is simply the right thing to do and necessary for the sound development of the Project. The Project strives to be a good neighbor and a good corporate citizen, and believes that every person, organization, and institution that might be affected by the Project has the right to be informed and should have an opportunity to participate in the decisions that might affect them.

The Southgate Project team, including land agents and survey crews, will participate in Public Consultation Training. This training includes appropriate communication, participation and documentation practices with stakeholders.

The Southgate Project team will also be trained in appropriate research methods about determining property ownership and legal descriptions. They will receive training on landowner negotiations, including effective listening skills. These skills are a fundamental part of the communication process between stakeholder and agent.

4.0 OUTREACH AND PUBLIC PARTICIPATION PLAN

It is the Southgate Project's objective to ensure that all potential federal, state and community stakeholders are informed of our intentions relative to the proposed Project in a timely manner. The Public, Stakeholder, and Agency Participation Plan, herein outlined, has the following objectives:

- *Identify all key stakeholders along the proposed pipeline route*. While landowners are the most obvious and directly affected stakeholders, many additional individuals and organizations along the proposed route may have a stake in the Southgate Project. Identifying and engaging them is important to the success of the Project.
- *Establish channels for two-way communication throughout the life of the Project*. Mountain Valley realizes that effective communication must be two-way. In addition to sharing information, the Project's outreach effort is designed to create a continuing dialogue with stakeholders, from the start of the pre-filing process through construction, restoration, and operation. It is also designed to provide stakeholders with a central point of contact to maintain ease of communication and ensure consistency of messaging.

Examples of FERC Key Stages and other information to be communicated:

- Pre-filing Request
- Open Houses
- Draft Resource Reports and Alternatives
- Monthly Status Reports
- FERC issues Notice of Intent
- Draft Resource Reports
- FERC Scoping Meetings
- Responses to Scoping Comments
- File Application
- Data Requests & Responses
- Supplemental information
- Commission Order
- Construction
- In-service

- *Ask for public input at critical stages of planning*. Mountain Valley believes that the Southgate Project is a partnership not only with the commercial partners, but with all stakeholders. With that idea in mind, the Southgate Project team has sought input and ideas from stakeholders during the planning and pre-filing process. This has helped to identify and address areas of concern. The Project held three open houses at locations convenient to affected stakeholders along the proposed Southgate Project route. These open house events initiated the open-dialogue process with our community members. The Southgate Project open houses and other activities outlined herein, have been designed to serve as opportunities for the public to learn about the Project and for the Southgate Project team to listen to concerns of affected stakeholders.
- *Keep stakeholders informed throughout the process*. Early and timely communication with all stakeholders is essential to the Southgate Project's success. The Project is committed to proactively communicating, through the use of website updates and other methods, during all phases of the

Project. Many outreach plans are designed to communicate effectively during early stages of implementation – especially during the approval stage – but then reduce communication during construction. While communication about the Southgate Project will certainly be heaviest early in the process, the Project team plans to proactively communicate, via website updates and other methods, during all phases of the Project, even after all approvals have been received.

- *Engage local resources*. To gain insight into public perceptions along the route and to improve the credibility of the Project, the Southgate Project team has retained community involvement specialists, who are very familiar with and knowledgeable about the local area, to supplement the efforts of the Project team. These specialists will arrange community meetings and other necessary meetings between the Project and stakeholders. Additionally, they will serve as the "eyes and ears" of the Project, helping to identify growing areas of concern, potential issues, and misinformation.

5.0 STAKEHOLDER IDENTIFICATION

Mountain Valley will focus its efforts on reaching the following audiences:

- Landowners
- Local elected officials
  - Mayors, city councils, boards of supervisors
  - County commissioners
  - County and municipal planning organizations
  - Zoning boards, etc.
- State elected officials
  - State senators (local area staff)
  - State congressmen (local area staff)
- Federal elected officials
  - U.S. Senators (local area staff)
  - U.S. Congressmen (local area staff)
- Federal, state, and local regulatory agencies
- Native American Tribes
- Economic development agencies/chambers of commerce
- Owners of mineral rights, such as coal companies
- Local law enforcement agencies
- Local emergency services (fire departments, ambulatory)
- Local media outlets

- Environmental non-governmental organizations
- Community at large

The status of contacts made to-date with federal and state agencies, local elected officials and municipal planning agencies can be found in the Southgate Project's pre-filing monthly reports to the FERC.

5.1 AGENCIES

In April 2018, the Project team made phone calls to all permitting agencies that require consultation of the projects plan to use the FERC pre-filing process and invited them to participate in the pre-filing process. Additionally, the Southgate Project team sent written correspondence to many of the aforementioned agencies requiring consultation that included a formalized invitation to participate in the FERC pre-filing process, a basic project overview, and a point of contact for the project.

The Southgate Project team remains committed to working with federal and state agencies. In the spirit of two-way engagement, the Project team is responding, and will continue to respond, to requests for information from these agencies in a timely manner. During the initial contacts, a specific line of communication was established between the agency personnel and Project staff. This line of communication will be utilized as confirmation to better understand agency requests and reaffirm agency receipts of requested information.

5.2 OTHER STAKEHOLDERS

The Southgate Project contacted stakeholders, including any affected landowners (as that term is defined by 18 CFR Section 157.6(d) (2)). In areas where notifying a larger group may be necessary, the Project will expand the mailing list to include landowners that may fall outside the requirements stated in 18 CFR Section 157.6(d)(2). Many of these stakeholders will have already been contacted, but it is the Project's goal to provide all stakeholders – including those with whom we have been in contact – the same information at the same time. The letter will describe the Project and provide updated information and inform stakeholders of the pre- filing process timeline and invite them to open houses.

5.3 STAKEHOLDER OUTREACH ACTIVITIES

Mountain Valley will employ the following methods to ensure successful communication and outreach, including:

Stakeholder Identification and Issues Management & Database Tracking System: After identifying stakeholders, the Southgate Project has developed and maintained an issues management system to track contact with these stakeholders in a manner that helps identify address and resolve emerging issues and concerns.

Information Materials: The Southgate Project has developed messages and materials to inform stakeholders about the Project and to address potential questions and areas of concern. These materials include, for example:

- A project overview fact sheet
- Frequently Asked Questions (FAQ)
- "Standard presentation" information posters, etc. for use at open houses and other meetings

- Internal project guidance concerning key messages about the Southgate Project to ensure consistency in communication
- Media advisories to announce public meetings and other Project updates
- Project newsletter to be physically mailed directly to affected landowners and other stakeholders 3-4 times per year and made available online via the Project website
- Project website that will include all the above, as well as maps of the proposed pipeline route

Media Relations: Keeping the media appropriately informed helps minimize the potential for misunderstanding and allows the Project to inform all stakeholders while reducing inaccurate information. Messages and materials about the Southgate Project will continue to be refined throughout the development effort to contain updated information and to address stakeholder concerns that may arise. In addition, materials contain the following information:

- Purpose and Need of the Project
- Information on Mountain Valley
- Information on environmental and other benefits of natural gas
- Discussion of today's energy market and the need for expanded natural gas infrastructure
    - FERC background information – The role of the FERC and other regulatory agencies in the process, and an overview of the pre-filing and filing processes
    - Information on construction, including the types and sizes of equipment used
    - Information on environmental activities conducted throughout the project, including pre-construction environmental surveys, measures during construction to minimize impact on environmental resources including agricultural resources, restoration, and post-construction monitoring
    - Safety information – A discussion of pre- and post-construction safety, and an overview of the safety record of the interstate natural gas pipeline industry and of the Project's affiliates
    - A Project time line – An intended time frame for completing key phases of the Southgate Project.

Training: A significant component of the outreach and communication team's effort is focused on training the Project team. The goal of the training effort is to familiarize all personnel who participate in the Project – both home office and field staff, including sub-contractors – of the Southgate Project outreach and public participation plan and to provide specific modules of training – including those developed by INGAA/IRWA for those personnel and contractors who interface with the public. Southgate Project staff receiving training includes all Project personnel and all contractors involved in field engineering, siting and survey, permitting and environmental impact mitigation, land acquisition, operations, property-owner relations, and government affairs. The Southgate Project's guiding principle is to train each individual shortly after retention for the Project or before the individual engages in his or her designated role.

Website: Because of its accessibility and the ability to be constantly updated, online communications will play a vital role in stakeholder dialogue. In addition to serving as a repository for up-to- date materials and information, the MVP Southgate Project website will feature mechanisms for stakeholders to ask questions and provide input about the Project.

Direct Contact Outreach: Mountain Valley will utilize direct contact, either in-person, by phone, or correspondence (e-mail and letter) with stakeholders throughout the Project, as appropriate. The Southgate Project will notify landowners affected by the Project as required by FERC's regulations. For example, direct contact by Project right-of-way representatives is a necessity in communicating with affected landowners. Direct contact with agencies has already been initiated by Project environmental staff and will continue.

Open Houses: In June 2018, Mountain Valley conducted three community open houses at locations in the project area. The Southgate Project's community open houses were in addition to the FERC scoping meetings. A formal presentation was not given during these open houses. However, attendees had direct, one-on-one access to members of the Project team who listened to stakeholder ideas and concerns and answered questions about the Project. The Project used an "information station" open house format with topic-specific stations covering possible concerns and potential solutions. The stations included rights-of-way, environmental, construction, engineering, etc., as well as a station dedicated specifically for FERC personnel. Each station contained information pertinent to that area of project responsibility, presented both in larger visual aids and/or in handout form and manned by Project team members knowledgeable of the subject presented. This allowed attendees arriving at different times to circulate among the stations and gather information in a more personal and relaxed fashion. Land agents were present at the open houses to review the proposed route and to answer any specific landowner concerns.

The Southgate Project utilized GIS software as a means of highlighting the proximity of the Southgate Project route to individual landowners' properties, businesses, farms, neighbors, etc. Stakeholders were notified and invited directly via invitations sent by U.S. mail and indirectly through news media reports, advertising and the MVP Southgate Project website about the open house schedule.

Locations of the open houses were determined and selected based on their proximity to the Southgate Project route and meeting room capacity, with intent to be as convenient as possible to the majority of landowners along the route. A list of dates and locations are provided in the table below:

Project Open House Meetings – MVP Southgate Project	
Date	**Location**
June 28, 2018	Olde Dominion Agriculture Complex Chatham, VA
June 26, 2018	Reidsville Event Center Reidsville, NC
June 25, 2018	The Palladium Event Center Burlington, NC

Scoping Meetings: The FERC conducted scoping meetings in the Southgate Project area. The Project participated in those scoping meetings, as well as in meetings with Federal, State, and local resource agencies.

FERC Scoping Meetings – MVP Southgate Project	
Date	**Location**
August 23, 2018	Vailtree Event and Conference Center Haw River, NC
August 21, 2018	Olde Dominion Agriculture Complex Chatham, VA
August 20, 2018	Reidsville Event Center Reidsville, NC

Project Contact Information: The Southgate Project maintains and monitors a toll-free phone number, e-mail address, and postal mailing address that enable stakeholders to obtain additional Project information and provide input. This information is included on printed materials and the Project website.

In summary, the Southgate Project understands that Stakeholder Outreach does not stop at submittal of the application or possible receipt of a certificate of Public Convenience and Necessity but is an ongoing commitment to keeping the public at-large, affected landowners, the market, and other interested parties informed of the Project status. The Project will seek to continue the relationships and dialogue built during these crucial early stages of public interaction.

5.4 COMMUNICATIONS MILESTONES

- April 2018 to present – Initial communications with agencies and stakeholders
- April 2018 – MVP Southgate Project website live and online
- April 2018 – Landowner welcome packet to introduce the Southgate Project
- May 15, 2018 – FERC accepts the Southgate Project into Pre-filing Process
- May – June 2018 – Additional informational letter to stakeholders; open house invitations; print media outreach
- June 2018 – Community open houses
- August 2018 – MVP Southgate Project first newsletter
- August 2018 – Public scoping meetings hosted by FERC
- November 2018 – File Certificate Application

5.5 COMMUNICATION VEHICLES

- Briefing materials for elected officials
- Website: www.mvpsouthgate.com
- Toll-free hotline: 833-MV-SOUTH
- Email: mail@mvpsouthgate.com

- Community open houses
- Site visits
- Maps for stakeholders to view (hard copy and electronic versions)
- High-level maps for general distribution
- Regular mailings to engage stakeholders without internet access and locations set up to review voluminous Project info
- Newspaper advertorials as needed
- Media interviews, including TV, radio, newspapers, to produce ongoing public stories and articles regarding updates on the MVP Southgate Project

5.6 FERC LANDOWNER ASSISTANCE

The FERC landowner helpline via telephone is toll-free at 1-877-337-2237 and via email address is LandownerHelp@FERC.gov

5.7 MVP SOUTHGATE PROJECT LANDOWNER RESOLUTION PROCESS

In the early stages of the Project's planning and development, the Southgate Project established a protocol to address landowner concerns and answer questions. The protocol utilizes Southgate Project's toll-free phone line (833-MV-SOUTH) and/or email submission to mail@mvpsouthgate.com and this same protocol will be utilized during the construction phase as well. These communication portals were created as a means for landowners, as well as community members, to contact Project representatives with questions, concerns, and issues. The Southgate Project also keeps a formal record of all calls and emails received in order to effectively track inquiries and resolutions. The three-step process is as follows:

Step 1: Gather Information

- Southgate Project representative will request all necessary information to complete the information section of the Inquiry/Issues Tracking Log, including the individual's name, address, parcel number, phone number, and Project reference. Additionally, any details offered regarding the purpose of the call will be entered on the Tracking Log.

Step 2: Define the Inquiry/Issue

- Southgate Project representative will work with the individual to help understand and address their concerns. If the representative can resolve the issue, they will record this on the Tracking Log. Otherwise, the individual will be advised that their concerns have been documented and that they can generally expect a return call within three business days from an MVP Southgate Project representative. The questions/concerns/issues as documented on the Tracking Log will then be directed to the appropriate right-of-way agent.

Step 3: Resolution

- If the issues are resolved during Step 2, the Southgate Project representative will complete the process by documenting how a resolution was reached for the Tracking Log. If a resolution is not

reached during Step 2, the Tracking Log is forwarded to the appropriate right-of-way agent who will return the call and also update the Tracking Log with the resolution. The delegation of the issue should generally follow this progression until resolution is reached. If a right-of-way agent receives a direct phone call relating to environmental, construction, or non- right-of-way issues from a landowner during pre-construction, construction, or post-construction activities, the agent will request all necessary information (as outlined in Step 1) and will initiate submission of the information on the Inquiry/Issues Tracking Log. The agent will then proceed to Steps 2 and 3 until a resolution is reached. After working with the Southgate Project representative and appropriate right-of-way agent, if the landowner is still not completely satisfied with the resolution, the individual should contact the Commission's Landowner Helpline at (877) 337-2237, or by email, LandownerHelp@FERC.gov.

5.8 MVP SOUTHGATE PROJECT FORMAL APPLICATION – PUBLIC LOCATIONS FOR VIEWING

When the formal application from Southgate Project is filed with the FERC, it will be sent to a public location in each county in Virginia and North Carolina. The list below identifies the locations in each county where the public can review a hard copy and/or a digital copy (depending on the preference of the library or county building).

County	Name	Address
Pittsylvania	Pittsylvania County Public Library	24 Military Drive, Chatham, VA 24531
Rockingham	Reidsville Public Library	204 W Morehead Street, Reidsville, NC 27320
Rockingham	Eden Public Library	598 S. Pierce Street, Eden, NC 27188
Alamance	May Memorial Library	342 S. Spring Street, Burlington, NC 27215

April 11, 2018

Dear Stakeholder,

As a valued stakeholder and community member, we would like to introduce the MVP Southgate project, a proposed natural gas pipeline designed to transport clean-burning, affordable natural gas from the Marcellus and Utica shale gas regions to growing demand markets in central North Carolina. MVP Southgate will be developed, constructed, and owned by Mountain Valley Pipeline, LLC (Mountain Valley) and regulated by the Federal Energy Regulatory Commission (FERC). PSNC Energy, a local distribution company, will utilize MVP Southgate as a diversified and reliable source of natural gas to serve its customers. Pending regulatory approvals, an in-service date is targeted for the fourth quarter of 2020.

As proposed, MVP Southgate will receive gas from the end of the Mountain Valley Pipeline mainline in Pittsylvania County, Virginia and extend approximately 70 miles south to new delivery points in Rockingham and Alamance Counties, North Carolina. The MVP Southgate route is being designed to avoid sensitive or protected areas; limit surface disturbance; minimize the overall environmental footprint; and utilize as many existing gas and electric transmission corridors as possible. The MVP Southgate project team will work diligently with stakeholders, including landowners, community members, local officials, as well as state and federal agencies to identify the best possible route for the proposed pipeline.

Civil, cultural, and environmental surveys will play a vital role in the route planning process as they help the project team to better understand the unique features of the region. During the coming days and weeks, land agents will be requesting survey permission from property owners for several routing options within what is known as a “study corridor.” Having an extended area for analysis and evaluation will allow the MVP Southgate project team to thoroughly evaluate options and determine an optimum route.

Your property has been identified as part of the study corridor and a land agent representing MVP Southgate will contact you to discuss permission for accessing your property in order to conduct these important surveys. Property owners often have critical pieces of historical or environmental information that can help our experts to identify a deliberate and thoughtful route; therefore, we want to thank you for your assistance during these early stages of planning and development.

Mountain Valley is dedicated to the safe, responsible, and environmentally conscious construction of the proposed MVP Southgate pipeline – and we want our community members to understand the natural gas transportation process and know that we are committed to the safety of our communities. Please contact us with questions or comments via email at mail@mvpsouthgate.com; or by phone at **833-MV-SOUTH**; and visit our website at www.mvpsouthgate.com.

Sincerely,

Josie Schultz
External Communications Manager
on behalf of Mountain Valley Pipeline, LLC

Attachments:
MVP Southgate Project Overview
Proposed MVP Southgate Map
Natural Gas Pipeline Safety

Project Overview

As proposed, the MVP Southgate project is a natural gas pipeline system that spans approximately 70 miles from southern Virginia into central North Carolina – and as an interstate pipeline will be regulated by the Federal Energy Regulatory Commission (FERC). MVP Southgate will be developed, constructed, and owned by Mountain Valley Pipeline, LLC (Mountain Valley).

With a vast supply of natural gas from Marcellus and Utica shale production, the Mountain Valley Pipeline mainline will transport natural gas to markets in the Mid- and South-Atlantic regions of the United States. The MVP Southgate project, as proposed, will receive gas from the Mountain Valley Pipeline mainline in Pittsylvania County, Virginia and extend approximately 70 miles south to new delivery points in Rockingham and Alamance Counties, North Carolina. MVP Southgate would provide low-cost supply access to natural gas produced in the Marcellus and Utica shale regions – for service delivery to PSNC Energy customers, as well as existing and new end-user markets in southern Virginia and central North Carolina.

The pipeline will be regulated under the federal Natural Gas Act, which requires a Certificate of Public Convenience and Necessity from the FERC before construction can commence. As currently proposed, the pipeline will be 16 to 20 inches in diameter and will require approximately 50 feet of permanent easement, with up to 100 feet of temporary easement during construction. In addition, as currently designed, the project would require one compressor station that is anticipated to be located at the beginning of the project in Pittsylvania County, Virginia, on land owned by Mountain Valley.

The Planning and Development Process

Several commercial and engineering aspects must be completed before construction can begin on MVP Southgate. Commercial aspects include securing and confirming capacity commitments, and while the project has a capacity commitment from PSNC Energy, a wholly owned subsidiary of SCANA Corporation, as an anchor shipper, an Open Season is being held to understand additional market interest. The Open Season will provide all market participants, including natural gas producers, marketers, industrial users, and local distribution companies, an opportunity to access capacity on the pipeline. Additional market interest received during the Open Season may change the current project scope

The engineering and environmental considerations include surveying and evaluating preliminary routing to help determine a final route with the least overall impact to landowners, historic and cultural resources, and the environment. An important step in the process is obtaining permission to access landowner property to conduct engineering and environmental surveys. At this stage, we are only seeking permission to access property – and the actual act of surveying will not begin until we receive permission. We may obtain landowner permissions for parcels that are not in the final route; however, a comprehensive evaluation is necessary to determine the route.

To-date, we are seeking landowner permissions in the following counties:

- **Virginia**: Pittsylvania
- **North Carolina**: Alamance and Rockingham

Once a preliminary route is determined, the environmental review process with the FERC will begin. This is referred to as the Pre-Filing Review, which provides for early identification and resolution of environmental issues and allows for direct interaction between FERC staff, community members, and other stakeholders. Once the Pre-Filing Review begins, a series of community open houses will be held along the proposed route corridor.

After the Pre-Filing Review is complete, Mountain Valley will file an application with the FERC for a Certificate of Public Convenience and Necessity. Construction cannot commence until the FERC issues this certificate, which will include the FERC's environmental analysis of the project.

Designing the Route

The proposed MVP Southgate route is being designed to avoid sensitive or protected areas when feasible; limit surface disturbance; and minimize the overall environmental footprint, as well as utilize as many existing gas and electric transmission corridors as possible. The MVP Southgate project team will work diligently with stakeholders, including landowners, community members, local officials, and state and federal agencies to identify the best possible route for the proposed pipeline. The currently proposed route avoids all federal and state parks and wildlife preserves.

Health, Safety, and Environment:

As the lead federal agency, the FERC will oversee the federal permitting process for MVP Southgate and will also coordinate with other federal, state, and local agencies during the environmental review process to identify and address potential environmental concerns.

- U.S. Department of Transportation statistics confirm that natural gas transmission pipelines are the safest form of energy transportation
- Construction and operation of natural gas transmission lines follow strict federal and state guidelines that minimize environmental disturbance
- Safety is a core value and number one priority for Mountain Valley
- Mountain Valley has a steadfast commitment to environmental protection and will conduct its business operation in a sustainable and environmentally responsible manner at all times

Community Benefits:

- Local communities can receive revenue from taxes paid on the pipeline and compressor station
- States can receive revenue from sales and use taxes paid during the construction of the project
- Potential employment opportunities for local residents during the construction phase of the project
- Increased activity and revenue for restaurants, hotels/motels, and retailers
- Natural gas supply diversity for PSNC Energy customers and other consumers in the region

Natural Gas Pipeline Safety

The safety of our communities, our employees, our contractors, and our pipeline will always remain a top priority. We will strive to ensure that the construction and operation of our natural gas infrastructure systems meet or exceed all federal and state safety regulations.

Fast Facts:

- The natural gas pipeline network has the best safety record of any energy delivery system according to the National Transportation Safety Board and the U.S. Department of Transportation (U.S. DOT).
- Federal and state regulations govern the design, construction, operations, and maintenance of natural gas pipelines.

Are natural gas pipelines safe?

Pipelines are the safest way to transport natural gas over long distances. Natural gas pipelines are built according to rigorous safety standards and have an outstanding safety record. According to the U.S. Energy Information Administration, the U.S. natural gas pipeline network consists of more than 300,000 miles of interstate and intrastate transmission pipelines.

What measures will Mountain Valley Pipeline, LLC take in constructing the proposed pipeline?

Mountain Valley Pipeline, LLC (Mountain Valley) will meet or exceed all U.S. DOT safety requirements during construction. Safety will be engineered into all facets of pipeline design, construction, and operation. The project will utilize trained and experienced inspectors who will carefully monitor pipeline construction to ensure compliance with safety standards and construction specifications. High-quality steel pipe will be used in the construction of Mountain Valley Pipeline, including adding protective coatings to the pipe during manufacturing. All pipe will be carefully inspected before it is installed to ensure it meets quality standards. After installation all pipeline field welds will be tested and inspected.

Before being placed into operation, the line would be pressure tested to certify integrity. Once in service, the pipeline would be patrolled, monitored, inspected, and maintained by the pipeline operator.

Considerations to ensure pipeline safety:

- No construction of buildings or other structures would be permitted on the permanent right-of-way.
- No planting of trees or other deep-rooting plants that may obstruct the permanent right-of-way would be permitted.
- No excavation or impounding water within the permanent right-of-way would be permitted without permission from the company.

How would Mountain Valley protect the pipeline and maintain its safe operation?

Safety is our priority in everything we do. Mountain Valley would ensure safe operation by maintaining the right-of-way to provide ready access and operate the pipeline in accordance with U.S. DOT and Federal Energy Regulatory Commission regulations. Regular inspections will occur to ensure pipeline integrity. The pipeline will be monitored 24-hours-a-day, 365-days-a-year using sophisticated computerized systems and around-the-clock personnel.

Tract #: VA-PI-002.003.CS1,VA-PI-002.002.CS1

Dear [redacted],

The MVP Southgate project is a proposed natural gas infrastructure system designed to transport clean-burning, affordable natural gas from the Marcellus and Utica regions to growing demand markets in central North Carolina. MVP Southgate will be developed, constructed, and owned by Mountain Valley Pipeline, LLC (Mountain Valley) – and as an interstate pipeline will regulated by the Federal Energy Regulatory Commission (FERC). PSNC Energy, a local distribution company, will utilize MVP Southgate as a diversified and reliable source of natural gas to serve its customers.

As proposed, MVP Southgate will receive gas from the end of the Mountain Valley Pipeline mainline in Pittsylvania County, Virginia and extend approximately 72 miles south to new delivery points in Rockingham and Alamance Counties, North Carolina. Other facilities associated with the project will include two compressor stations that will be located along the pipeline route, as well as measurement, regulation, and other ancillary facilities required for safe operation of the pipeline. During the past several weeks, we have been contacting landowners along the proposed route and requesting property access to conduct survey work.

As an important stakeholder and community member, we want to keep you informed of the proposed schedule, as well as provide ways for you to stay engaged throughout the various stages of the MVP Southgate project. On May 15, 2018, the FERC approved our use of the pre-filing process and assigned the following Docket Number: **PF18-4**. We have enclosed a FERC brochure titled, *An Interstate Natural Gas Facility on My Land? What Do I Need to Know?* This brochure will help guide landowners through the FERC process and explain how they can become involved in the project.

As part of our outreach efforts, we will host community open houses to introduce and discuss the proposed MVP Southgate project. While there will not be a formal speech or presentation during these open houses, you will have direct, one-on-one access to people who will listen to your ideas and answer your questions about the project. This is your opportunity to meet with members of the MVP Southgate project team, as well as talk with FERC representatives. You are invited and welcome to attend any of the following community open houses:

Monday, June 25, 2018
5:30 – 7:30 PM
The Palladium
1272 Plaza Drive
Burlington, NC 27215

Tuesday June 26, 2018
5:30 – 7:30 PM
The Reidsville Event Center
223 S. Scales Street
Reidsville, NC 27230

Thursday, June 28, 2018
5:30 – 7:30 PM
Olde Dominion Agricultural Complex
19783 U.S. Hwy 29 South
Chatham, VA 24531

In the fourth quarter of 2018, Mountain Valley plans to file the application for the Certificate of Public Convenience and Necessity with the FERC and other federal and state agencies. This aspect of the FERC process can take up to 12 months or longer and construction cannot begin until the FERC issues the certificate, which will include a comprehensive environmental analysis of the project. Based on this timeline, and upon receipt of the required regulatory approvals, which includes approvals by relevant federal and state agencies, we anticipate the MVP Southgate project to be in-service during the fourth quarter of 2020.

We are excited about this project and we encourage community members and stakeholders to attend the open houses to learn more about the benefits of bringing a reliable supply of natural gas to the region. Mountain Valley is dedicated to the safe, responsible, and environmentally conscious construction of the proposed MVP Southgate pipeline – and we want our community members to understand the natural gas transportation process and know that we are committed to the safety of our communities. Please contact us with questions or comments via email at mail@mvpsouthgate.com; or by phone at 833-MV-SOUTH; and visit our website at www.mvpsouthgate.com.

Sincerely,

Josie Schultz
External Communications Manager
on behalf of Mountain Valley Pipeline, LLC

MVP SOUTHGATE

IN THE PIPELINE

MVP SOUTHGATE NEWSLETTER
Volume 1 :: August 2018

MVP SOUTHGATE

Our project newsletter to stakeholders

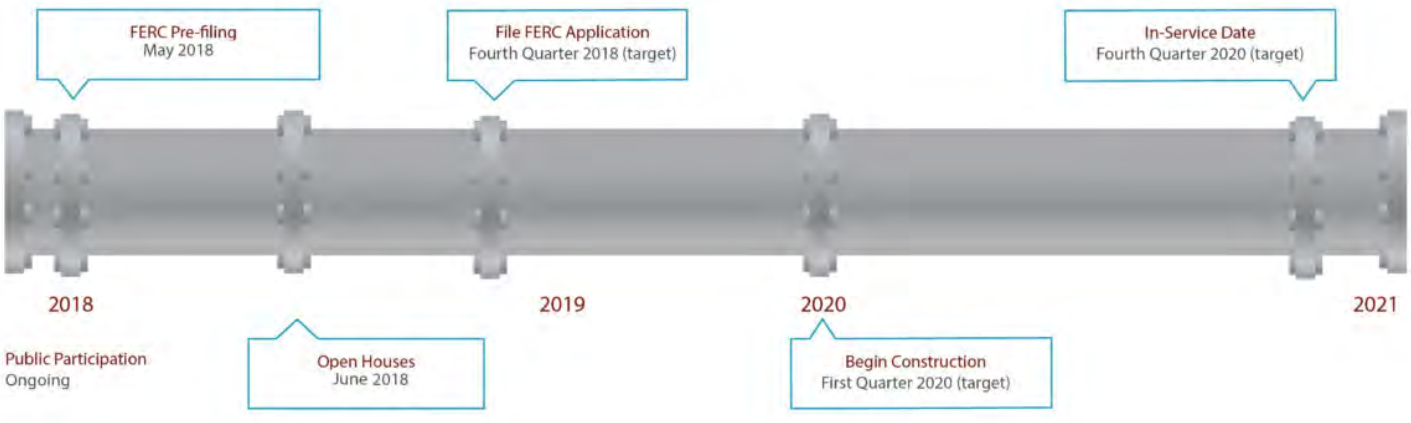
We are pleased to introduce the inaugural newsletter for the MVP Southgate. In an effort to maintain communication with stakeholders throughout the process/ project, we plan to issue this newsletter approximately 3-4 times per year. The newsletter will provide an update on where we are in the regulatory process, what stakeholders should expect in terms of next steps, and other relevant information on our project and the natural gas industry.

Tell me about the FERC pre-filing . . .

On May 3, 2018, Mountain Valley Pipeline, LLC (Mountain Valley) submitted its pre-filing request to the Federal Energy Regulatory Commission (FERC) to construct, own, and operate new interstate natural gas pipeline facilities and transport natural gas in interstate commerce. FERC issued docket number PF18-4-000 for the MVP Southgate project.

The pre-filing request letter provided a description of the proposed MVP Southgate project, including maps of the proposed pipeline route, lists of permitting agencies, an overview of the public participation plan, and a proposed schedule of major project milestones. The FERC formally accepted the MVP Southgate project into its pre-filing process on May 15, 2018.

The intent of the pre-filing process is to conduct significant outreach to seek stakeholder input; conduct field surveys to identify cultural resources, wetlands, and endangered species; to address potential constructability issues; and to begin the permit application submission process with other relevant regulatory agencies. All of this work is aimed at resolving issues and submitting a more complete formal application with the FERC, which we intend to do by the end of the year.



Keeping an open dialogue with our landowners and communities

Prior to being accepted by the FERC into the pre-filing process, we have been hard at work talking with local officials, community members, and landowners throughout the three counties in which the proposed route and alternative routes traverse. Our outreach team has been conducting public presentations and meeting with elected officials, tribes, non-governmental groups and other stakeholders since shortly after the project was announced in April. In addition, we appreciate the communities joining us at one or more of our three open houses that we held in June. Our team members welcomed the opportunity to engage with you and to listen to the issues and concerns you have related to the project.

We are currently working to address those issues in our formal filings with the FERC. One of our most recent documents to the FERC included several "alternative" routes that we were able to identify, in part, thanks to the feedback we received during our community open houses. While these alternative routes do not formally change the currently proposed route, they do provide options for further evaluation as we continue to design a route that is environmentally responsible, avoids sensitive areas, protects cultural resources, and minimizes the overall project footprint. These alternative route maps can be found on the MVP Southgate website.

Our team of land agents continues to work with landowners along the proposed route, as well as the alternative routes, to obtain permission for survey access on their properties. To date, we have received permission from 78 percent of landowners. In June, we began surveying properties along the study corridor. Surveying activity continues on parcels within the corridor. These surveys are vital to providing details necessary to finalize a proposed route that results in the least impacts possible to landowners and the environment.

Tell me about 'scoping meetings'

The next step in the regulatory process is for the FERC to hold an official scoping period and associated meetings. Scoping meetings are hosted by the FERC and are designed to help their staff identify relevant issues for major projects. These meetings also offer another opportunity for landowners and the public to provide detailed comments regarding the project. Scoping is the process of defining and refining the 'scope' of an environmental impact statement (EIS) and any alternatives needing investigation.

The FERC scoping meetings are open to the general public and are structured for people to make statements to the FERC staff about the project. In addition, the FERC staff describes the environmental review process, provides relevant information, and answers procedural questions.

The information gathered at scoping meetings helps us prepare environmental mitigation measures for the environmental resource reports required in the Certificate Application. In return, this information provides the FERC staff with the necessary resources to publish a more complete environmental document for public review.

For more information on our project

Access recent project filings on the FERC website at
https://elibrary.ferc.gov/idmws/docket_search.asp and use the docket number PF18-4

Thursday, August 23, 2018
5 – 8 PM
Vailtree Event and Conference Center
1567 Bakatsias Lane
Haw River, NC 27258

A NOTE FROM THE MVP SOUTHGATE PROJECT TEAM

We want to thank the hundreds of people who attended our open houses this summer to learn more about the MVP Southgate proposal, for asking good questions and for providing us with valuable feedback. We also want to invite you to the upcoming scoping meetings, where staff members from the Federal Energy Regulatory Commission will discuss the regulatory process and answer your questions.

These meetings are part of an extensive process designed to keep the public informed about the need and purpose of the proposed MVP Southgate project, and the rigorous review by state and federal agencies that must take place before the project can be approved for construction.

The MVP Southgate is currently proposed as a 24-inch diameter, 72-mile long interstate natural gas transmission pipeline, and it would be owned by Mountain Valley Pipeline, LLC. Mountain Valley is a joint venture of partner companies that have extensive experience in building and maintaining underground pipeline systems.

As proposed, MVP Southgate would start in Pittsylvania County, Virginia, near the endpoint of the Mountain Valley Pipeline, the 42-inch pipeline originating in northern West Virginia and scheduled for completion in early 2019. MVP Southgate would continue south through Pittsylvania County, crossing the state line and connecting with the existing East Tennessee Natural Gas transmission pipeline and PSNC Energy's system in Rockingham County, before ultimately connecting with PSNC Energy's system at an existing facility southeast of Graham in Alamance County.

We are eager to build this project in order to meet the region's growing demand for natural gas. In fact, we wouldn't be proposing this major infrastructure project if it wasn't needed. Highly-respected energy research organizations and the federal government, among other agencies, organizations and businesses, have recognized demand for natural gas will continue to grow, particularly in this region.

PSNC Energy has signed a long-term agreement for capacity on the MVP Southgate project to meet demand in the Triangle area. For PSNC and its customers, MVP Southgate offers the best-cost option for meeting demand for natural gas and enhancing the reliability of the region's existing natural gas infrastructure systems. Pipelines also are recognized as by far the safest means for transporting fuel, and MVP Southgate would incorporate sophisticated technologies, including remote-monitoring 24 hours per day, to ensure the safe operation of the line.

We have worked diligently to design a route that minimizes impact on landowners and natural resources. As a result, about half of the currently proposed route is co-located along existing pipeline and powerline rights-of-way.

For those areas where we have not been able to co-locate along existing rights-of-way, we continue to conduct research to develop the best route possible. We appreciate the many landowners who've expressed interest in working with us to identify such a route; in fact, as of early August, 78 percent of landowners along the proposed path of the pipeline had granted permission for us to conduct important survey work that helps us to inform route development and adjustments.

We continue to plan for a formal application to the FERC later this year, and we hope to receive a Certificate of Public Convenience and Necessity in time for construction to begin in early 2020. This would allow for the project to be completed and begin serving customers during winter in late 2020.

On a long-term basis, MVP Southgate will offer significant economic benefits associated with the increased access to natural gas, the preferred fuel source for manufacturers and other commercial and industrial businesses. It also offers potential savings to residential customers; heating a home with natural gas is about half the cost of using propane.

In the near-term, construction of the project also would offer a boost to local and state economies. FTI Consulting, a highly-regarded economic consulting firm, has estimated construction would generate an estimated 670 jobs in Virginia and 1,260 in North Carolina in 2020. The operation of the pipe would also generate significant new property tax revenue to counties along the route, which could be used to fund public services such as education and public safety.

We look forward to seeing you at the upcoming scoping meetings, continuing conversations about the project, and addressing any concerns you may have.

Mountain Valley is committed to contributing to the success of communities along the proposed MVP Southgate project's route, and we are excited about the potential benefits that this new infrastructure line will bring.

MVP SOUTHGATE

The MVP Southgate project is a natural gas pipeline that spans approximately 72 miles from southern Virginia to central North Carolina – and as an interstate pipeline will be regulated by the Federal Energy Regulatory Commission (FERC). MVP Southgate will be developed, constructed, and owned by Mountain Valley Pipeline, LLC (Mountain Valley).

Mountain Valley is a joint venture of EQT Midstream Partners, LP; NextEra US Gas Assets, LLC; Con Edison Transmission, Inc.; WGL Midstream; and RGC Midstream, LLC. From planning and development, to construction and in-service operation – Mountain Valley is dedicated to the safety of its communities, employees, and contractors, and to the preservation and protection of the environment.

IN THE PIPELINE

MVP SOUTHGATE NEWSLETTER
Volume 2 :: December 2018

MVP SOUTHGATE

Our project newsletter to stakeholders

We are pleased to provide you with the second newsletter for the MVP Southgate project. As part of our effort to maintain communication with stakeholders, we plan to issue this newsletter approximately 3-4 times per year. The newsletter will provide an update on where we are in the regulatory process, what stakeholders should expect in terms of next steps, and other relevant information on our project and the natural gas industry.

MVP Southgate's formal filing with the FERC

On November 6, 2018, the MVP Southgate project team filed an official application with the Federal Energy Regulatory Commission (FERC) for a Certificate of Public Convenience and Necessity. Through the certificate application filing, the FERC is being asked to certify the public convenience and necessity of the MVP Southgate project. The commission, together with cooperating agencies, will conduct a detailed review and evaluation of a broad number of subjects, including public safety; water resources; air quality; wildlife, soils, and vegetation; protected species; cultural and historic resources; sound levels; alternatives; and economic benefits.

The certificate application is a collection of information gathered before and during the FERC pre-filing process. This comprehensive set of documentation includes extensive research from environmental, geological, and economic studies conducted by the MVP Southgate project team and outside experts, as well as intelligence gathered during discussions with landowners along the route, local elected officials and others.

As part of the application, the MVP Southgate project team filed updated Resource Reports and a proposed route map that incorporated input from agencies, landowners and other stakeholders, as well as information from surveys and engineering analysis, gathered during the pre-filing process. These documents are available at mvpsouthgate.com.

With the application filed, what's next?

Now that the MVP Southgate team has filed its formal application, the project must undergo a lengthy and extensive regulatory review process before construction can begin. Meanwhile, TRC Engineers Inc. will continue to perform survey activities in order to inform the project's design and permitting. The FERC will review the project's submitted application and will prepare a Draft Environmental Impact Statement (DEIS), which we anticipate being issued in the spring of 2019. After the DEIS is issued, the FERC will hold public comment meetings on the statement, after which they will assess the comments and begin drafting a Final Environmental Impact Statement (FEIS). The current project schedule is targeting fall of 2019 for issuance of the FEIS. After additional review of the FEIS, the FERC makes a decision whether the MVP Southgate project can proceed with construction by issuing an order and granting certification. The project is targeted for construction to begin in the first quarter of 2020, with a completion date targeted for the fourth quarter of 2020.

Tell me more about recent changes to the project...

The MVP Southgate project's formal application removed one compressor station that had previously been planned for Rockingham County, North Carolina, and modified the diameter of the pipe. As currently proposed, the pipeline will require one compressor station on land owned by Mountain Valley Pipeline, LLC, near the project's starting point in Pittsylvania County, Virginia. The project will include 24-inch diameter steel pipe for approximately the first 31 miles into Rockingham County, and 16-inch diameter steel pipe for approximately the remaining 42 miles to the project's termination point in Alamance County.

The MVP Southgate project team considered a wide range of alternatives and variations to the proposed route, and made 191 route adjustments in response to feedback collected during the pre-filing process. The proposed route identified in the application encompasses these various revisions, which include the protection of streams, wetlands, and cultural resources, as well as the avoidance of, or minimization of impacts to, several sensitive areas. This includes the reduction in the temporary right-of-way width from 100 feet to 75 feet at wetland and waterbody crossings, and a proposal to cross Cascade Creek, Wolf Island Creek, and Deep Creek via conventional bore based on recommendations from the U.S. Fish and Wildlife Service.

Our commitment to safe, responsible construction and operation

Pipelines are recognized by the U.S. Department of Transportation as the safest means to move natural gas. In fact, few may realize that more than 20,000 miles of natural gas pipeline currently operate in Virginia, and more than 30,000 miles of natural gas pipeline currently operate in North Carolina. These pipelines pass through rural, suburban and urban areas in these states.

The MVP Southgate project will connect with existing pipeline systems in Rockingham and Alamance counties in North Carolina. The project team takes its environmental and public safety responsibilities very seriously and is dedicated to meeting or exceeding state and federal requirements. During construction at many smaller waterbodies along the route, we anticipate using the same type of crossing method commonly used in construction of sewer and drinking water lines.

At other, larger waterbodies, including the Dan River, we anticipate using horizontal directional drilling, a labor- and time-intensive process that involves drilling beneath the riverbed, thereby avoiding any direct impact to the waterbody. This involves the use of lubricating mud and additives that meet the same standards and specifications of additives used to drill drinking water wells.

Safety tips for winter travel

Safety is a top priority for the MVP Southgate team, and as winter sets in, we want to help keep our communities safe as they prepare for seasonal travel. Road trips during the holidays and routine daily commutes can become hazardous when the temperatures turn colder and the snow begins to fly. Checking the forecast before heading out on the road can be vital to ensuring safe travels; make sure to observe current conditions and anticipate quick changes in the weather.

Safety check your car before leaving

Always perform a quick safety check on your car before leaving your driveway.

- Examine tire pressure, test the brakes, and make sure the heater is working properly.
- If snow has fallen, make sure to brush the snow off your car and defrost your windows before driving to ensure maximum visibility.

A project designed to meet public need for clean, affordable natural gas

The MVP Southgate project's primary objective is to serve customers of PSNC Energy, a local distribution company in North Carolina. The company, which recently opted not to have an affiliate ownership stake in the project, is the anchor shipper on the proposed pipeline. The project is designed to strengthen the reliability of natural gas service in central North Carolina. Additionally, other markets along the project area will have the ability to access the MVP Southgate project, which in turn could attract manufacturing opportunities to the area. Having a safe, reliable source of natural gas is important to secure industry growth and stimulate job creation and spending throughout the region.

"Over the past decade, PSNC Energy has added more than 100,000 new natural gas customers," said Rusty Harris, president and chief operating officer of PSNC Energy. "We are committed to ensuring the highest levels of service to the homes and businesses that rely on natural gas for heating, cooking and other uses, and the MVP Southgate project offers the most efficient and cost-effective way to enhance reliability and provide the diversity of supply needed to meet our customers' needs."

WHAT OTHERS ARE SAYING...

During the past six months, there has been a lot of talk about the MVP Southgate project in Virginia and North Carolina. Many landowners, community members, and elected officials have expressed both concerns and support for the pipeline through personal meetings, phone calls, emails, and letters to the editor in various publications. In the natural gas industry, the negative stories are often the ones we hear the most, while the positive stories fall by the wayside.

The proposed pipeline will bring economic benefits to Virginia and North Carolina, and to communities located along the route. Here are some comments from supporters of the project that you may not have heard:

"The NC Chamber supports the MVP Southgate project because it will improve access to affordable natural gas and help strengthen North Carolina's reputation as a leading place in the world to do business. Many employers rely on natural gas to fuel their operations and the construction of the MVP Southgate project will bolster efforts to attract and retain businesses in North Carolina." **– Gary Salamido,** *chief operating officer and acting president of the NC Chamber*

"The proposed MVP Southgate pipeline would increase the region's supply of affordable, reliable and domestic natural gas and provide the fuel needed to meet North Carolinians' current and future energy demands." **– Mark Pope,** *president of the North Carolina Economic Development Association*

"Time and again we hear from manufacturers and other large companies that the availability of natural gas is a critical component in the site selection process. The Southern Virginia Mega Site at Berry Hill is the commonwealth's biggest business park, and the MVP Southgate project's proximity to that site offers tremendous long-term economic development opportunities. The Virginia Chamber fully supports the project and the potential benefits its construction and operation could bring." **– Barry DuVal,** *president of the Virginia Chamber of Commerce*

"The MVP Southgate project is important to the region and to the commonwealth. The efforts undertaken by the project team reflect a commitment to build the proposed pipeline in a safe and respectful manner, and Virginia FREE supports it." **– Chris Saxman,** *executive director of Virginia FREE*

MVP SOUTHGATE NEWSLETTER
Volume 3 :: April 2019

MVP SOUTHGATE

Our project newsletter to stakeholders

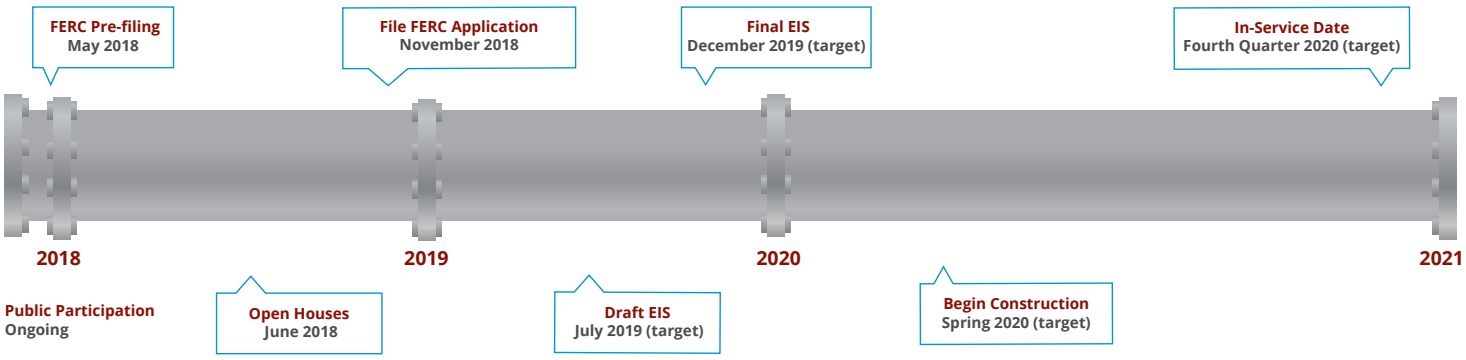
We are pleased to provide you with the third newsletter for the MVP Southgate project. As part of our effort to maintain communication with stakeholders, we plan to issue this newsletter approximately 3-4 times per year. The newsletter will provide an update on where we are in the regulatory process, what stakeholders should expect in terms of next steps, and other relevant information on our project and the natural gas industry.

MVP Southgate receives Notice of Schedule

On March 15, 2019, the Federal Energy Regulatory Commission (FERC) issued a Notice of Schedule (NOS) for the MVP Southgate project. This announcement represents a key milestone in the formal application process, as the NOS lays out the FERC's environmental review process for the remainder of the project. The dates identified in the NOS follow a targeted timeline, and as with any large-scale project, these dates are subject to change. In the event dates are modified, all pertinent agencies and stakeholders will receive project development updates.

What's next?

The FERC and the cooperating agencies are in the process of reviewing MVP Southgate's November 2018 certificate application and supplemental materials subsequently submitted. After the review is complete, the FERC will issue a Draft Environmental Impact Statement (DEIS), which is scheduled for issuance in July 2019. A public comment period will then open, and a series of public meetings will be held in communities along the proposed route. The FERC will designate the specific number of meetings, as well as the dates and locations. Once the meetings are completed and the comments are addressed, the FERC is scheduled to issue a Final Environmental Impact Statement (FEIS) in December 2019. After the FEIS is issued, the FERC will issue a decision on whether to authorize the MVP Southgate project. If the FERC approves the project, the MVP Southgate project team anticipates starting construction in the spring of 2020 and continues to target a fourth quarter 2020 in-service date.



Survey activity along the proposed route

The MVP Southgate team has conducted a multitude of surveys during the past year and appreciates the many landowners who have worked collaboratively with team members. This important work has been completed on approximately 90 percent of the proposed 73-mile route and is continuing in select areas in order to determine a route with the least overall impact to landowners, cultural and historic resources, and the environment. Civil, cultural, and environmental surveys have played a vital role in the planning process, as they help the team learn more about the region and its unique features in an effort to safely and responsibly develop the route. Results from these surveys have provided numerous route variations that have been, or may be, considered during the regulatory process.

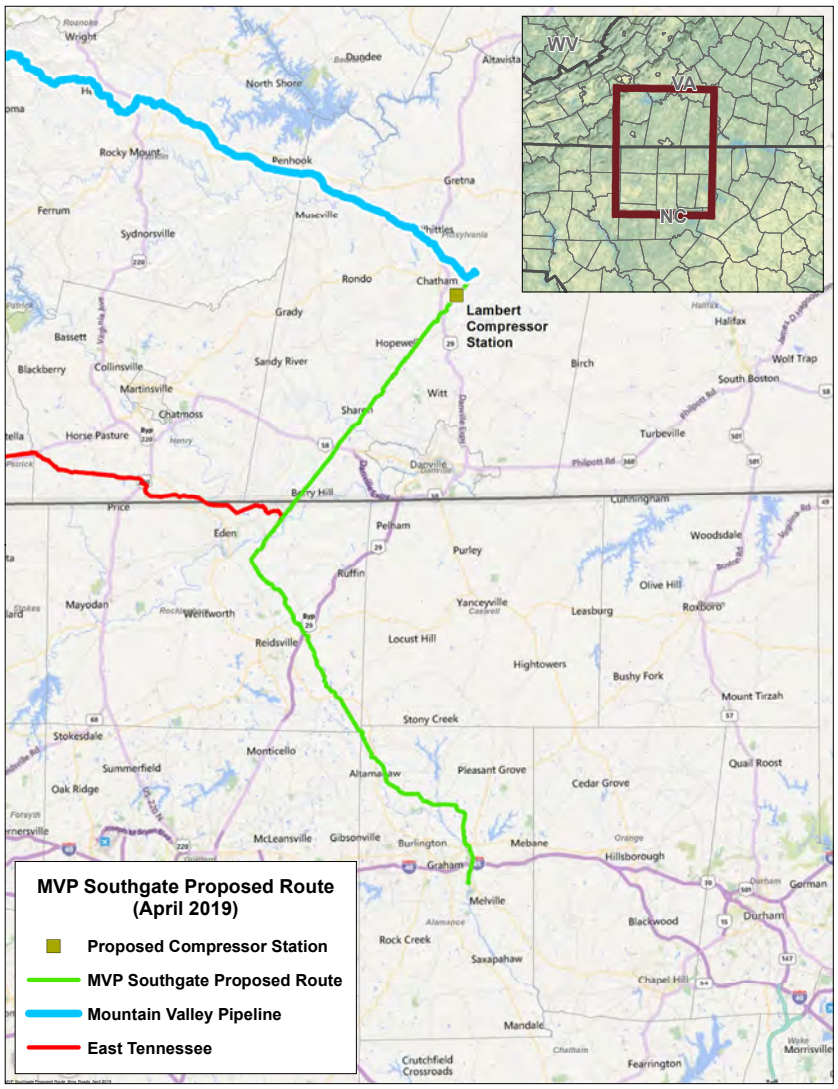
Civil surveys provide valuable information on the terrain of the proposed pipeline, allowing the team to determine where to avoid residential areas, decrease the amount of steep sidehill construction, and how to best traverse roads and railroad crossings. During civil surveys, field crews walk the proposed route, and place visible markers along the centerline of the route that help guide other survey crews to effectively conduct their work.

Cultural surveys are conducted to help identify and protect cultural and historic features along the proposed pipeline route. In order to conduct these surveys, trained experts travel the route and document historic buildings and search for signs of potential archeological resources. If indicators are present, archeologists perform a small discovery excavation to determine the validity of the resources. If and when resources are verified, extensive documentation of items is performed and possible route alternatives are considered to avoid areas of cultural significance.

Environmental surveys are also an integral element of the routing process and include many levels of study that provide invaluable information on the region – and most specifically along the proposed route. Waterbody and wetland surveys are being conducted to determine areas where the pipeline should take special precautions to preserve water resources. If and when resources are located, extensive documentation is performed and route alternatives are considered to avoid waterbody and wetland areas when feasible.

Compressor station for MVP Southgate

A compressor station is a natural gas facility located along a pipeline route that compresses gas in the pipeline to increase pressure, allowing it to flow through the line toward its intended destination. Friction and elevation changes induce pressure drop on natural gas traveling in a pipeline; therefore, a compressor station is typically placed every 40 to 100 miles along a pipeline route.



Based on the current capacity of 375 million cubic feet per day, the MVP Southgate project team has identified the need for one compressor station near the start of the proposed route to transport natural gas to its delivery points in Rockingham and Alamance counties in North Carolina.

The natural gas compressor will be driven by turbine engines that will be powered by natural gas. They will utilize a fraction of the gas coming through the station from the pipeline as fuel and will compress the remainder for transport and delivery.

The Lambert Compressor Station will be sited in Pittsylvania County, Virginia, at milepost (MP) 0.0 on land owned by Mountain Valley. It will pull gas from the connection with the Mountain Valley Pipeline for delivery to the North Carolina delivery points. This station will contain two gas-driven turbines, which combined will provide 28,915 nominal horsepower. The station is expected to include a compressor building, electrical control building, office, and air compressor building. A chain linked security fence will surround the perimeter of the station site upon completion of construction.

The MVP Southgate compressor station will be monitored 24/7 by an offsite system and will have remote devices with the ability to observe, control, and shut down operations in the event of an emergency. Emissions from the construction and operation of each compressor station will comply with all applicable air quality regulations as permitted by regulatory authorities. Equipment, controls, and safe operating practices will be utilized to minimize emissions.

MVP SOUTHGATE NEWSLETTER
Volume 4 :: August 2019

MVP SOUTHGATE

Our project newsletter to stakeholders

We are pleased to provide you with the fourth newsletter for the MVP Southgate project as part of our effort to maintain communication with stakeholders throughout the regulatory process.

MVP Southgate receives Draft Environmental Impact Statement

On Friday, July 26, 2019, the Federal Energy Regulatory Commission (FERC) issued the Draft Environmental Impact Statement (DEIS) for the MVP Southgate project. This DEIS was issued after more than 15 months of project planning and development. It reflects the evaluation of data from civil, environmental and cultural surveys conducted along 90 percent of the proposed route, as well as feedback from landowners, state and federal agencies, local officials, tribes and non-governmental organizations.

Through the DEIS, the FERC evaluates the potential environmental impacts associated with construction and operation of the proposed pipeline. While some environmental impacts are anticipated, the FERC concluded that those impacts would be limited and that, through implementation of the MVP Southgate team's proposed plans and additional conditions offered by the FERC, these impacts could be reduced to less than significant levels.

In order to meet growing public demand, MVP Southgate was designed to provide the region with an additional supply of natural gas, and the team has worked closely with its many stakeholders to develop a route that minimizes potential impacts. Since the project was announced in April 2018, the MVP Southgate team has made more than 1,000 adjustments to its route. The majority of these changes have been based on landowner requests, engineering considerations or an effort to avoid sensitive resources.

The MVP Southgate team will continue to work with landowners and other stakeholders to refine the proposed route as necessary and will respond to the FERC with the information requested in the DEIS. The MVP Southgate team also will evaluate and respond to public comments on the DEIS. Comments can be submitted to the FERC through September 16, 2019.

Key takeaways from FERC's Draft Environmental Impact Statement:

- "Based on our findings we conclude that the proposed Project is the preferred alternative that can meet the Project's stated purpose." (Page 3-48)
- "Based on our review of the potential impacts and mitigation measures, including our recommendations, we conclude that constructing and operating the Project would not significantly impact wildlife, terrestrial habitats, migratory birds, or fisheries and aquatic resources." (Page ES-6)
- "We conclude that Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety." (Page ES-8)

Read the full DEIS at www.mvpsouthgate.com/news-info/

The next steps

FERC staff will host public meetings to collect comments on the DEIS. Individual verbal comments will be taken on a one-on-one basis with a court reporter. While there will not be a formal presentation during these meetings, the public will have direct access to Commission staff to answer questions about the DEIS and the environmental review process. MVP Southgate representatives will also be present at each meeting to answer questions about the project.

Numbers will be provided to attendees in the order of their arrival, and distribution of the numbers will be discontinued at 7 p.m. in order to ensure all comments are received by the session closing time. Comments provided to the court reporter will be recorded, transcribed and submitted under the project's FERC Docket No. CP19-14, and will be considered by FERC in preparation of the Final Environmental Impact Statement (FEIS). The FERC has scheduled the FEIS for release in December 2019.

Schedule of upcoming DEIS public comment meetings

Rockingham County, NC
August 19, 2019
5 PM to 8 PM

Rockingham Community College
215 Wrenn Memorial Road
Wentworth, NC 27375

Pittsylvania County, VA
August 20, 2019
5 PM to 8 PM

Olde Dominion
Agricultural Complex
19783 U.S. Hwy 29 South
Chatham, VA 24531

Alamance County, NC
August 22, 2019
5 PM to 8 PM

Vailtree Event &
Conference Center
1567 Bakatsias Lane
Haw River, NC 27258

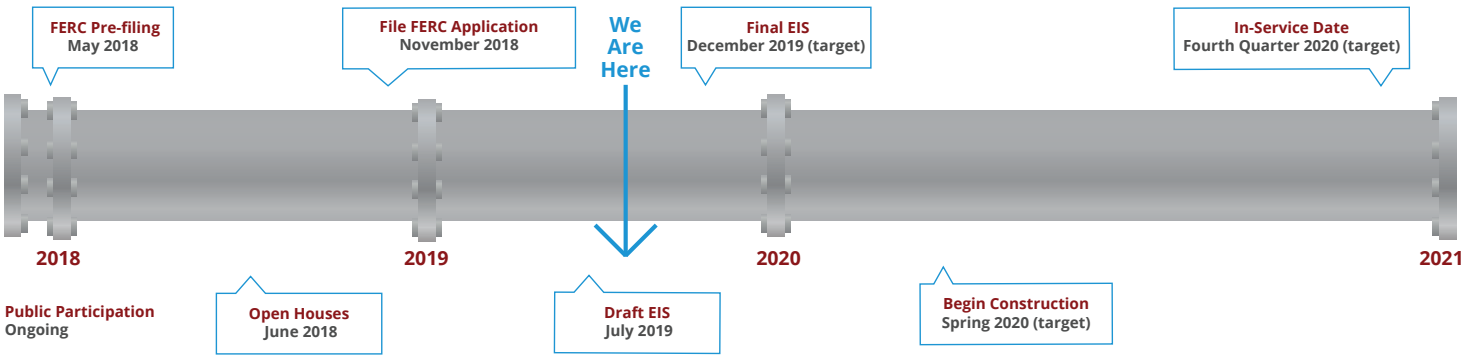
Additional efforts noted in the DEIS

- More than 50 percent of the proposed MVP Southgate project route is co-located along existing rights of way.
- The temporary easement needed for construction of the project would be reduced in wetland areas to 75 feet.
- Upon completion of construction, the MVP Southgate team will re-establish vegetation on the right of way and restore the ground surface to original contours as closely as practicable.

Other ways to comment

Comments citing the project docket number, CP19-14, may also be submitted until September 16, 2019, through:

- U.S. Mail: Secretary, Federal Energy Regulatory Commission, 888 First Street NE, Room 1A, Washington, D.C. 20426
- eFiling: www.ferc.gov



Our focus: Safety and preserving culture, environment

Safety is the No. 1 priority for the MVP Southgate project team. That's why we've committed to meeting or exceeding industry standards and best practices for construction and operation of this proposed interstate natural gas transmission line.

This project includes 24/7 remote monitoring and steel pipe at least .375-inch thick and buried under a marked right-of-way at least three feet below ground level. Cathodic protection beds and a fusion-bonded epoxy, like the one used to protect the interior of public drinking water pipes, will be used to protect this steel pipe against corrosion. Federal, state and project inspectors will be assigned throughout the right-of-way to monitor activity and compliance during construction.

For more than a year, our team has been working with experts in the field to identify environmentally and culturally sensitive areas along the project's proposed 74 mile route. We are dedicated to building this project in the most responsible manner, and teams of archaeologists, biologists and engineers have worked diligently to avoid those sensitive areas, mitigate any impacts and develop the best possible route in order to provide the additional supply of natural gas that North Carolinians need.

An archaeological technician sifts through excavated soil at a cultural survey and archaeological testing site along the proposed MVP Southgate project. Members of the North Carolina Office of State Archaeology, the North Carolina Commission of Indian Affairs and the U.S. Army Corps of Engineers visited the site to witness the surveying activities.

Engaging with the community

The MVP Southgate project team believes in making positive contributions to the community and being a good corporate citizen. We are proud to be members of the Danville-Pittsylvania Chamber of Commerce in Virginia, and the Reidsville, Eden and Alamance County chambers of commerce in North Carolina. The project team also proudly supports other education- and business-oriented activities and organizations, including the 2019 NC Envirothon and the Rockingham County Education Foundation.

Team members are focused on engaging with business leaders, residents, government officials, non-governmental groups and other stakeholders to increase economic opportunity and maintain the region's high quality of life.

We intend to continue working with local and state public safety agencies and emergency responders to discuss the safe and responsible construction and operation of the proposed pipeline.

Rockingham County Education Foundation's 10th annual fundraiser benefit was supported through ticket sales, donations and sponsorships, with proceeds directly supporting programs to increase educational opportunities for county residents.

MVP SOUTHGATE NEWSLETTER
Volume 5 :: December 2019

MVP SOUTHGATE

Our project newsletter to stakeholders

We are pleased to provide you with the fifth newsletter for the MVP Southgate project as part of our effort to maintain communication with stakeholders throughout the regulatory process.

Latest Regulatory News

In October and November 2019, the MVP Southgate team provided the Federal Energy Regulatory Commission (FERC) with multiple filings, including supplemental materials and additional data requested by the commission's Office of Energy Projects. These requests and filings are part of the normal regulatory process for a project of this nature. The office's requests were issued to clarify data and gather additional information on plans and procedures identified in the project's certificate application filed in November 2018. The requests also focused on information addressing topics such as pipeline construction, routing, cultural resources, environmental procedures, technical analyses, and other issues raised by various state and federal agencies regarding the project.

The MVP Southgate team also filed responses to public comments submitted during the FERC's comment period on the Draft Environmental Impact Statement for the proposed project. The Draft Environmental Impact Statement concluded that the MVP Southgate project could be built and operated safely and with limited adverse environmental impacts. The MVP Southgate project team's filings are available on the FERC website, ferc.gov, under Docket No. CP19-14, and at mvpsouthgate.com/news-info.

About MVP Southgate

Mountain Valley Pipeline, LLC, announced this proposed 74-mile interstate natural gas transmission pipeline in 2018. It is designed to meet customer demand for low-cost natural gas supply access in southern Virginia and central North Carolina. Dominion Energy North Carolina (DENC), formerly PSNC Energy, is a local natural gas distribution company that signed a long-term agreement to purchase natural gas from MVP Southgate. The North Carolina Utilities Commission has recognized MVP Southgate as the best option for meeting DENC customers' growing demand for natural gas.

Fast facts

- A majority of the route is collocated along existing natural gas and electric transmission line corridors
- Survey work has been completed on 95 percent of the route
- A majority of the project right-of-way has been acquired
- Construction is targeted to start in 2020

In North Carolina

The North Carolina Department of Environmental Quality (NC DEQ) is reviewing our application for a Water Quality Certification for proposed crossings of waterbodies along the project route in North Carolina. This authority is delegated to the state under the federal Clean Water Act. The MVP Southgate team has worked collaboratively with state regulators and is pleased to report that the proposed project would result in:

- No permanent impact to streams in North Carolina
- No permanent loss of wetlands in North Carolina
- No crossing of the Haw River

Unlike roads or other typical development projects, the MVP Southgate project won't result in large swaths of impervious land or an altered grade. The project's permanent footprint is a 50-foot wide green-field right-of-way. The pipeline will be buried at least three feet underground, with the surface re-graded to pre-construction conditions and revegetated with native plant species.

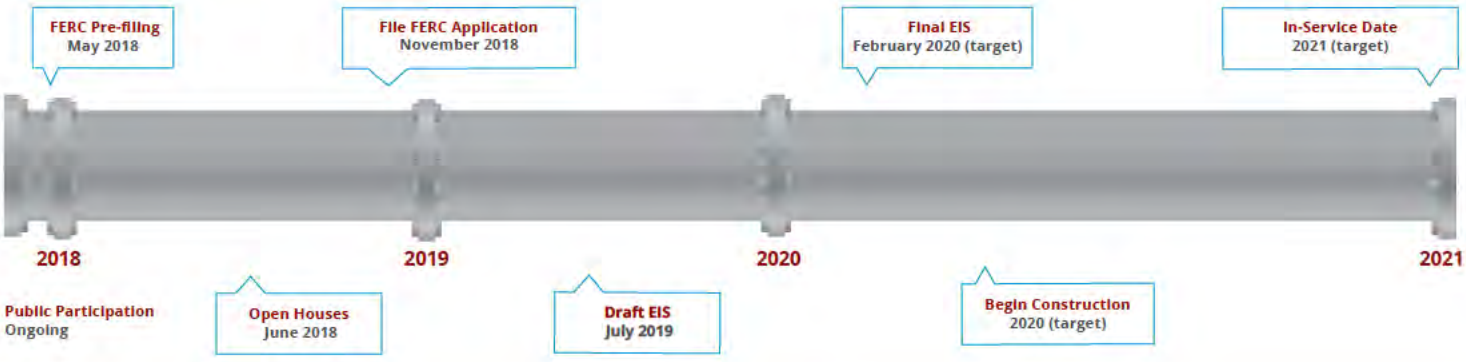
No herbicides will be used within 100 feet of wetlands or waterbodies unless permitted to do so by an appropriate public agency; elsewhere, locally certified personnel would apply a biodegradable herbicide to help maintain the right-of-way. At Stoney Creek and the Dan River, we have proposed to use horizontal directional drilling (HDD) to ensure protection of those waterbodies and avoid any direct impacts. Any additives used to facilitate these HDD crossings and other borings would meet the same standards as those that are applied for wells to provide drinking water.

In Virginia

The MVP Southgate team has applied with the Virginia Department of Environmental Quality for an air quality permit for its proposed Lambert Compressor Station.

This two-turbine compressor station would be built on land owned by Mountain Valley Pipeline, LLC, and adjacent to an older existing compressor station serving Transco. Emission-controls incorporated into the design of MVP Southgate's proposed compressor station ensure this facility's safe and efficient operation, and its status as a very minor source of emissions. The project team continues to discuss the proposed station and provide additional data as requested so that the agency is able to complete a thorough review of the application in 2020.

Project Schedule



Natural gas pipelines: More common than you think

With 2.5 million miles of natural gas pipelines operating in the U.S., it's easy to forget how prevalent, safe and important pipelines are in our communities.

In North Carolina, there are more than 35,000 miles of natural gas pipelines, including underground pipes that cross the Haw River, the Dan River and other streams, rivers and lakes. Natural gas and hazardous liquids pipelines have safely crossed under the Jordan Lake, which provides drinking water to residents in Wake County and other localities; through the city of Greensboro; and through Durham and Wake counties. The town of Haw River's Red Slide Park is on top of a natural gas transmission pipeline.

In Virginia, there are more than 22,000 miles of natural gas pipelines. They operate in densely populated areas such as the city of Norfolk and in Fairfax County, in northern Virginia, and in suburban and rural areas across the commonwealth. The Spring Hollow Reservoir, a drinking water source for the Roanoke area, was built on top of a natural gas transmission pipeline decades ago. Camp Roanoke, a popular recreational area for paddling and canoeing, coexists with that same natural gas pipeline, which provides a reliable supply of fuel for home heating, cooking and commercial operations in Southwest Virginia.

A disc golf course at Red Slide Park in the town of Haw River, North Carolina, is on top of an existing natural gas transmission pipeline right of way.

Elsewhere across the country, the same scenario exists. A natural gas transmission pipeline runs along the property of Atlanta's SunTrust Park, home of the Braves, and near the Battery Atlanta, a vibrant commercial and residential area. New York's Central Park has a natural gas transmission line running through it. The Chicago suburbs boast natural gas transmission pipelines crisscrossing residential and commercial districts, meeting demand for an affordable, clean-burning fuel that is critical to helping families and businesses get through winter and go about their daily lives.

An existing natural gas transmission pipeline right-of-way passes by the Graham Paddle Access at the Haw River along Highway 54 in Alamance County, North Carolina.

These systems are recognized as the safest and most efficient means for providing consumers with natural gas. They also eliminate the need for transport by road or rail, amplifying the clean-air benefits that this fuel source provides.

"Natural gas provides for nearly 25% of our country's total energy consumption, and petroleum provides for nearly 40%," according to the U.S. Pipeline & Hazardous Materials Safety Administration. "This requires the transportation of huge volumes of hazardous liquids and gas, and the most feasible, most reliable and safest way to do so is through pipelines."

The MVP Southgate project is designed to provide Dominion Energy North Carolina, a local natural gas distribution company, with the supply of affordable, domestic natural gas needed to meet existing and future customer demand.

IN THE PIPELINE

MVP SOUTHGATE NEWSLETTER
Volume 6 :: March 2020

MVP SOUTHGATE

Our project newsletter to stakeholders

We are pleased to provide you with the sixth newsletter for the MVP Southgate project as part of our effort to maintain communication with stakeholders throughout the regulatory process.

About MVP Southgate

Mountain Valley announced this proposed 75-mile interstate natural gas transmission pipeline in 2018. It is designed to meet customer demand for low-cost natural gas supply access in southern Virginia and central North Carolina. Dominion Energy North Carolina (DENC), formerly PSNC Energy, is a local natural gas distribution company that signed a long-term agreement to purchase natural gas from MVP Southgate. The North Carolina Utilities Commission has recognized MVP Southgate as the best option for meeting DENC customers' demand for natural gas.

MVP Southgate receives Final Environmental Impact Statement

On Friday, Feb. 14, 2020, the Federal Energy Regulatory Commission (FERC) issued the Final Environmental Impact Statement (FEIS) for the MVP Southgate project.

The FEIS concludes that the MVP Southgate project can be built and operated safely and successfully. While construction and operation of the MVP Southgate would result in some adverse environmental impacts, the majority of these impacts would be temporary and reduced to less-than-significant levels. As part of the FERC review, specific mitigation measures were developed in order to appropriately and reasonably reduce the environmental impacts resulting from construction and operation of the pipeline. These mitigation measures are being recommended as conditions to any authorization issued by the Commission.

The MVP Southgate team appreciates the strong support that this important infrastructure project has received in North Carolina and Virginia. We remain committed to continuing to work collaboratively and cooperatively with landowners, federal and state agencies, local governments, tribes, community groups and other non-governmental organizations in the coming months, and we look forward to receiving all necessary permits and authorizations in order to build and operate this important infrastructure line.

Key takeaways from FERC's Final Environmental Impact Statement

"We conclude that Mountain Valley's compliance with applicable design, construction and maintenance standards, and DOT safety regulations would be protective of public safety."
(Page ES-9)

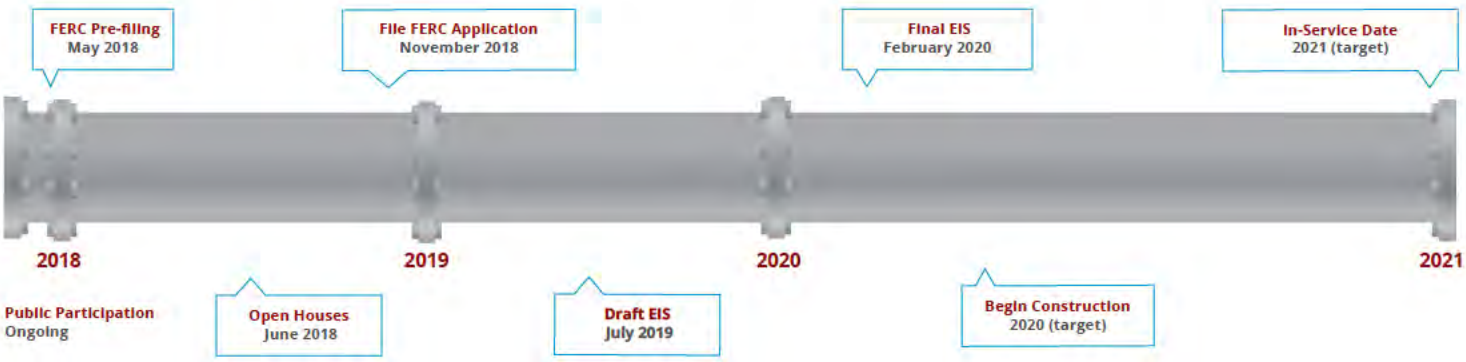
"[N]o other alternative would meet the purpose of the Project, be technically and economically feasible, and provide a significant environmental advantage."
(Page ES-10)

"Though temporary impacts would result from the Project, with implementation of BMPs and mitigation proposed by Mountain Valley, as well as our recommendations, we conclude the Project would not significantly affect water resources."
(Page 4-51)

Read the full FEIS at www.mvpsouthgate.com/news-info/

What's next

The MVP Southgate team anticipates receiving all necessary permits and authorizations in order to begin construction this year. The MVP Southgate project is targeted to enter service in 2021, providing the additional supply of natural gas needed to meet public demand and generating additional annual tax revenue to localities along the proposed route.



More key points from the FEIS

"Our review of available studies indicates that the Project is not likely to have a significant adverse impact on property values." (Page ES-7)

[W]e conclude that the Project would not result in high and adverse impacts on vulnerable populations and would not have a disproportionately high and adverse impact on the remaining environmental justice populations within the study area.
(Page 4-153)

Due to the distance between the Project and the Jordan Lake impoundment and the proposed surface water protection measures, no impacts would be expected to Jordan Lake's water quality or function.
(Page 4-43)

The proposed MVP Southgate project will use a horizontal directional drill to cross below the bed of the Dan River in order to avoid potential impacts on the waterbody.

"Mountain Valley proposes to cross the Dan River via HDD and no in-stream disturbance is anticipated." (Page 4-39)

"For the Southgate Project, Mountain Valley proposes to use Virginia and North Carolina standards for erosion and sediment control, which mandate that control measures be designed to handle storm events that are reasonably expected to occur during the period of construction. Mountain Valley has also agreed to implement supplemental control measures, which exceed the minimum standards required by these states." (Page 1-12)

Frequently Asked Questions about the MVP Southgate

Underground pipeline systems are the safest and most efficient way to move natural gas. Many people may not realize that more than 30,000 miles of natural gas pipeline currently operate in North Carolina, or that more than 20,000 miles of natural gas pipeline operate in Virginia today. That makes it easy for misinformation to spread. Here are some of the most common

questions circulating about this proposed project, along with the facts.

Question: Is the MVP Southgate project being built to export gas overseas?
Fact: The MVP Southgate project is far from the coast and even farther from the nearest LNG export facility. Furthermore, MVP Southgate has not filed for the federal Section 3 authorization needed to be able to export natural gas. The MVP Southgate project team has no plans to file for this authorization.

Question: Is there a local need for this project?
Fact: Yes. The MVP Southgate project is being built to provide low-cost supply access to natural gas produced in the Marcellus and Utica shale regions for service delivery to Dominion Energy North Carolina (formerly PSNC Energy) customers, as well as existing and new end-user markets in southern Virginia and central North Carolina. DENC is a local distribution company and is the anchor shipper on the MVP Southgate project. It has demonstrated to the North Carolina Utilities Commission that the MVP Southgate project offers the best-cost option for providing natural gas to its customers.

Question: Why are some people saying that studies show this project isn't needed?
Fact: Opposition-funded studies have provided flawed conclusions based on incomplete data. The North Carolina Utilities Commission regulates public utilities in North Carolina, including local gas distribution companies. In 2018, Dominion Energy North Carolina (formerly known as PSNC Energy) demonstrated to the NCUC that MVP Southgate offers the best-cost option for providing the natural gas that its customers demand. The company's application included public and nonpublic, confidential data, which allowed for a full and thorough analysis. The NCUC approved the application.

Question: Will drilling under the Dan River and other waterbodies include the use of toxic drilling mud?
Fact: The project team will use water-based drilling mud, typically consisting of inert clay like bentonite and water. Contractors will be limited to use of additives that are NSF/ANSI Standard 60 compliant. This is the same accreditation used to certify additives for drilling water wells. This attests that any additives meet the high standards intrinsic to water well fluids and ensures no harm to local drinking water supplies.

Question: Is the epoxy coating used on the pipeline toxic?
Fact: Fusion-bonded epoxy coatings have been used in various applications since the 1960s. This includes being used to line the interior of pipes in public drinking water systems as a measure to inhibit corrosion of the steel pipes. Fusion-bonded epoxy coatings have been studied extensively, and we are unaware of any evidence supporting claims of risk to human health or the environment.

Question: Is construction of a natural gas pipeline uniquely dangerous?
Fact: The construction sequence for a natural gas pipeline closely follows the sequence for any other type of pipeline, whether it is designed to carry wastewater, drinking water or hazardous materials. The sequence involves tree-felling, clearing, grading, trenching, stringing and welding pipe, lowering pipe into the trench, backfilling and restoration.
In areas where blasting is required, crews use small, controlled charges that are applied after a rigorous and scientific analysis. This is a highly technical process performed by experienced professionals in order to avoid impacts to groundwater. At waterbody crossings, any dams used to facilitate construction are released in a very slow, deliberative and controlled fashion to minimize turbidity. These are common practices used routinely in construction of various types of pipelines.

The MVP Southgate team is committed to safely and responsibly building and operating this important project. The proposed route and more details about the project can be found at www.mvpsouthgate.com.

IN THE PIPELINE

MVP SOUTHGATE NEWSLETTER
Volume 7 :: July 2020

MVP SOUTHGATE

Our project newsletter to stakeholders

We are pleased to provide you with the seventh newsletter for the MVP Southgate project as part of our effort to maintain communication with stakeholders throughout the regulatory process.

MVP Southgate receives FERC certificate

The Federal Energy Regulatory Commission (FERC) approved a Certificate of Public Convenience and Necessity for the MVP Southgate project on Thursday, June 18, 2020, marking a key milestone in the project's regulatory review.

The certificate, which recognizes the clear public need for the proposed project, follows more than two years of planning, development, and review. The proposed 75-mile underground pipeline will tie into the Mountain Valley Pipeline near Chatham, Virginia, and transport natural gas to delivery points in Rockingham and Alamance counties in North Carolina. Dominion Energy North Carolina (DENC), formerly PSNC Energy, is the local distribution company serving much of central North Carolina and is the anchor shipper on the MVP Southgate project.

The MVP Southgate team has worked diligently with landowners, community members, local officials, and state and federal agencies to identify the best possible route for the proposed pipeline. Approximately half of the route is collocated along existing utility corridors.

A Final Environmental Impact Statement (FEIS), issued in February 2020, concluded the project would result in limited adverse impacts and acknowledged the hundreds of route adjustments made to accommodate landowner requests, engineering considerations and avoid sensitive resources. The FEIS also noted the project is the preferred option for meeting the intended purpose of providing new natural gas supply access to central North Carolina and southern Virginia.

Construction of this important infrastructure project is expected to create approximately 1,700 jobs and generate more than $10 million in state and local tax revenues in North Carolina and Virginia.

After entering service, the MVP Southgate project is expected to generate more than $4.5 million in new annual ad valorem tax revenues to local communities along its route and provide the region with the additional supply needed to meet residential and business demand for affordable, clean-burning natural gas.

FERC's Order

To read the FERC's full order granting a Certificate of Public Convenience and Necessity for MVP Southgate, visit www.mvpsouthgate.com/news-info

Excerpts from the FERC's Order

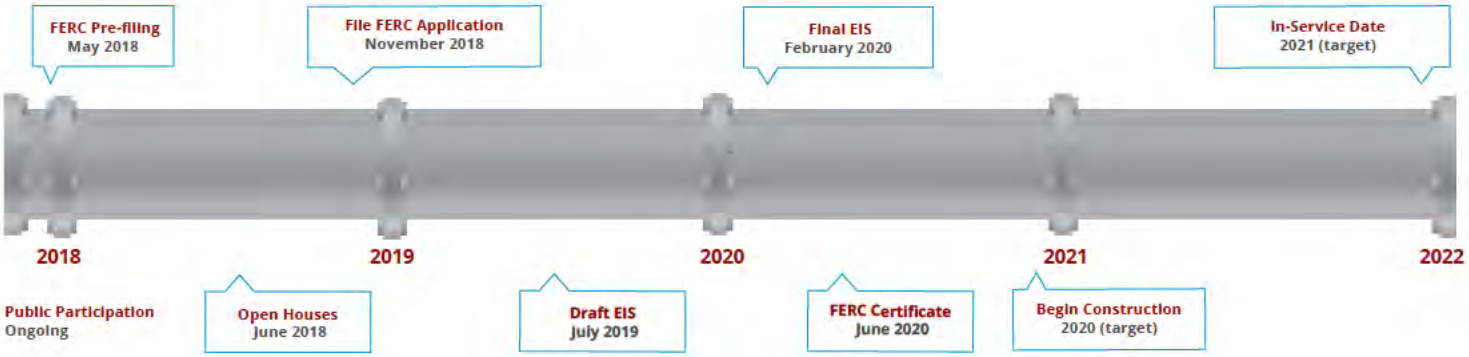
In the 130-page order, the FERC detailed the rationale for concluding that construction and operation of the MVP Southgate project is needed to meet public demand for natural gas. Here are some key excerpts:

"We find that Mountain Valley has sufficiently demonstrated that there is market demand for its project." (Page 19)

"Commission staff identified numerous reasonable alternatives to the project, which were evaluated in the EIS. Staff concluded that none of the alternatives analyzed would meet the project's purpose and need, be technically feasible, and offer a significant environmental advantage." (Page 38)

"The Commission encourages cooperation between interstate pipelines and local authorities. However, this does not mean that state and local agencies, through application of state or local laws, may prohibit or unreasonably delay the construction or operation of facilities approved by this Commission." (Page 67)

Project Schedule



Next steps

The MVP Southgate project team continues to work with state and federal agencies to satisfy permitting requirements necessary for construction to begin. The project team also continues to acquire right-of-way for the pipeline. To date, Mountain Valley has purchased easements across the majority of the proposed route.

In North Carolina, the project team has worked collaboratively with the state Department of Environmental Quality for more than a year as part of the application process for a state water-quality certification permit, and continues to work toward satisfying the requirements for this permit. The project team has committed to a series of best-management practices that raise the bar for linear infrastructure construction in North Carolina and protect waterbodies, riparian buffers and wetlands along the route.

In Virginia, the project team is working with the state Department of Environmental Quality to satisfy air permit requirements related to the project's proposed compressor station in Pittsylvania County. The station would incorporate state-of-the-art technology to ensure it is a minor source of emissions, and is proposed to be built on land already owned by Mountain Valley.

Response to COVID-19

Community groups, companies and charitable organizations are working together to provide relief to families and small businesses struggling to get by because of the COVID-19 pandemic. Mountain Valley and the companies leading the Southgate joint venture are committed to being good partners and supporting these community efforts.

In Pittsylvania County, Virginia, the Rotary Club of Chatham and the Boys & Girls Clubs of the Danville Area are spearheading relief services. The Rotary Club teamed with Pittsylvania County Public Schools to fund meal deliveries to families of students in need, while the Boys & Girls Clubs staffed and maintained food supplies at drive-through pick-up areas.

In North Carolina, the Reidsville Chamber of Commerce and Reidsville Downtown Corporation launched a "Buy One, Give One Community Relief Program." The Chamber sold gift cards to local businesses and raised $15,000 in matching funds – provided by the Reidsville Area Foundation and MVP Southgate – to support local charitable organizations, including the Salvation Army of Rockingham County.

The Salvation Army of Rockingham County operates food pantries in Reidsville and Eden, and provides clothing, rent/utility relief and food to those in need.

In Alamance County, officials designated the United Way of Alamance County as the Emergency Operations Center Feeding Coordinator. The organization coordinated and distributed more than $150,000 in donated funds to Alamance County nonprofits, churches and other charitable organizations for relief services that helped more than 10,000 people per month. They also just completed a Spirit of Alamance Food Drive that raised over 3,200 shelf-stable items for local food pantries.

Protect Yourself And Others

The COVID-19 pandemic is affecting all facets of life, and it is important for everyone to take steps to limit the risk of infection. More details about these general safety recommendations from the U.S. Centers for Disease Control and Prevention can be found at https://www.cdc.gov/coronavirus/2019-nCoV/index.html

Wash your hands often

- Wash your hands often with soap and water for at least 20 seconds especially after you have been in a public place, or after blowing your nose, coughing, or sneezing.
- If soap and water are not readily available, use a hand sanitizer that contains at least 60% alcohol.
- Avoid touching your eyes, nose, and mouth with unwashed hands.

Avoid close contact

- Avoid close contact with people who are sick, even inside your home.
- Maintain at least 6 feet from other people.

Cover your mouth and nose with a cloth face cover when around others

- Everyone should wear a cloth face cover when they have to go out in public.
- Cloth face coverings should not be placed on young children under age 2, anyone who has trouble breathing, or is unconscious, incapacitated or otherwise unable to remove the mask without assistance.

Cover coughs and sneezes

- Always cover your mouth and nose with a tissue when you cough or sneeze or use the inside of your elbow and do not spit.
- Throw used tissues in the trash.
- Immediately wash your hands.

Clean and disinfect

- Clean AND disinfect frequently touched surfaces daily.

Monitor your health

- Be alert for symptoms. Watch for fever, cough, shortness of breath, or other symptoms of COVID-19.

September xxx, 2020

Dear resident:

MVP Southgate is contacting you to let you know about a project proposed in your community. The MVP Southgate Project is a 75-mile natural gas pipeline running from Chatham, Virginia to Alamance County, North Carolina. Part of the project includes the construction of the Lambert Compressor Station, which is a new compressor station to be located within approximately 1.5 miles of your home, near the intersection of Transco Road and Halifax Road (see attached map).

Compressor stations are needed to push the natural gas from one location to another. A similar but much larger compressor station, Transco Station 165, has been located in your immediate area for several decades, so you may have some familiarity with this type of facility. The purpose of this letter is to reach out to people living within this area to let you know some facts about the proposed project and see if you have any questions at this time.

The attached fact sheet will give you additional information regarding the compressor station proposal. MVP Southgate is required to get an air permit from the Virginia Department of Environmental Quality (VDEQ) and approval for the compressor station from the Virginia Air Pollution Control Board. The Air Board and staff from VDEQ will conduct a public meeting, provide notices of meetings and hearings and opportunities for public comment, and will provide more information related to this project in the coming months.

Another part of the approval process is evaluating whether *environmental justice* issues are present near the site. Environmental justice means the fair treatment and meaningful involvement of all people in proximity to a proposed project. Our project team invited an independent consultant, Professor Alexa Sutton Lawrence, who is a Community Relations Advisor at Land & Heritage Consulting to assist with the environmental justice analysis. Dr. Lawrence is an environmental justice advocate with experience in this area and will help the MVP Southgate Project and community members assess potential environmental justice issues in the surrounding communities. Her goal is to conduct a Community Impact Assessment with the intent of identifying any potential opportunities, concerns, or benefits to communities located near the proposed project.

Any information provided by community members to Dr. Lawrence for the Community Impact Assessment will remain strictly confidential at an individual level; however, the accumulated findings of this assessment will be made publicly available to MVP Southgate, the permitting agencies and the community overall.

If you would like to share your thoughts about the project for this Community Impact Assessment, please reach out directly to Dr. Lawrence to schedule a 30-minute interview before September 30, 2020. She can be reached at **336-933-1946** or by email at alexa@landandheritageconsulting.com.

You can also request additional information about the project or provide comments by calling us at 833-687-6884 (833-MV-SOUTH), by email at mail@mvpsouthgate.com, or by mail using the self-stamped envelope enclosed with this letter.

We have provided options in the enclosed comments form to help you and our team engage in communications related to this project. Please use the enclosed form and select the option that best applies to your interest and return it in the enclosed self-stamped envelope.

Please note that an independent consultant will be handling the responses, so if you select Option 2, your information will be only provided to Dr. Lawrence. If you select options 1 or 3, your information and comments will be provided to the MVP Southgate team.

We look forward to your questions and comments.

Sincerely,

MVP Southgate Team

Comments Form

Please select the option below that best applies to your interest and return this form in the enclosed self-stamped envelope.

My name is _____ and I can be reached at _____.

☐ 1. I would like to be contacted by MVP Southgate team to discuss general questions related to the MVP compressor station project.

☐ 2. I would like to be contacted by Professor Lawrence's team to participate in the Community Impact Assessment.
Please send this response back before September 30, 2020 for this option

☐ 3. I am including written comments about the project.

Please note that an independent consultant will be handling the responses, so if you select Option 2, your information will be only provided to Dr. Lawrence. If you select options 1 or 3, your information and comments will be provided to the MVP Southgate team.

Please Provide Any Additional Comments about the Lambert Compressor Station Project:

MVP SOUTHGATE

Project Overview

The MVP Southgate project is a proposed interstate natural gas pipeline system that will tie into the Mountain Valley Pipeline near Chatham, Virginia, and transport supplies of Marcellus and Utica natural gas to delivery points in Rockingham and Alamance counties in North Carolina for distribution to residential and commercial customers.

The project requires one compressor station, with a proposed location near its start, and on land owned by the project near Chatham, Virginia. The MVP Southgate compressor station will be monitored 24/7 by an offsite system and will have remote devices with the ability to observe, control, and shut down operations in the event of an emergency. Emissions from the construction and operation of the compressor station will comply with all applicable air quality regulations as permitted by regulatory authorities. Equipment, controls, and safe operating practices will be utilized to minimize emissions.

The pipeline will be 24 inches in diameter through Pittsylvania County, Virginia, for the first 31 miles, and 16 inches in diameter for the remaining 44 miles. The pipeline project will require approximately 50 feet of permanent easement, with up to an additional 50 feet of temporary easement during construction (for a total of up to 100 feet during construction).

As an interstate pipeline project, MVP Southgate is governed by the federal Natural Gas Act and regulated by the Federal Energy Regulatory Commission (FERC). Mountain Valley Pipeline, LLC, will construct and own the proposed MVP Southgate project. EQM Midstream Partners will operate the pipeline and own the largest interest in the project.

Project Schedule

MVP Southgate filed a revised air permit application with the Virginia Department of Environmental Quality in July 2020 for the Lambert Compressor Station. The agency will hold a public hearing on the application that will be noticed in advance, and is anticipated to issue a decision whether to grant the permit in the first quarter of 2021.

Compressor Stations

What is a compressor station?

A compressor station is a natural gas facility located along a pipeline route that compresses gas in the line to increase pressure, allowing it to flow through the line toward its intended destination. Friction and elevation changes induce pressure drop on the natural gas traveling in a pipeline and must be periodically compressed to ensure consistent pressure and efficient delivery.

Where will MVP Southgate's compressor station be located?

MVP Southgate's Lambert Compressor Station will be built on land owned by the project and near an existing compressor station at Transco Village, more than two miles east of the Chatham town limit.

How much land will be affected?

Construction of the compressor station will affect 18.6 acres of land owned by Mountain Valley. The facility will require 3.8 acres for operations, and it is expected to include a compressor building, electrical control building, office, and air compressor building. A chain linked security fence will surround the perimeter of the station site upon completion of construction.

How big will this facility be?

The compressor station is considerably smaller than the existing Transco compressor station in the area, about a third of the capacity and less than 10% of total ton per year emissions of all air regulated pollutants. As proposed, it will include two gas-driven turbines, providing approximately 27,756 nominal hp of compression. This level of power is equivalent to about a quarter of one jet engine. The station also will incorporate equipment, controls and other features, including catalytic converter technology, to reduce air emissions to levels classified by federal and state regulators as minor.

Will this facility be busy or noisy?

This facility will be monitored remotely 24 hours a day, 7 days per week, and one or two employees will likely report to the site daily. A small number of workers may periodically visit the facility to perform maintenance. At the nearest noise-sensitive area, which is slightly more than a half mile away, the sound of the facility's operation will be minor and comparable to the sound of a refrigerator humming.

MVP Southgate Project
Resource Report 4 – Cultural Resources

Resource Report 4 - Filing Requirements	
Information	**Location in Resource Report**
Minimum Filing Requirements	
1. Initial cultural resources consultation and documentation, and documentation of consultation with Native Americans. (§ 380.12(f)(1)(I) & (2)) See § 380.14 for specific procedures.	Section 4.3.3, Appendix 4-A
2. Overview/Survey Report(s). (§ 380.12(f)(1)(ii) & (2) • See § 380.14 for specific procedures. • For the offshore area this will usually require completion of geophysical and other underwater surveys before filing.	Appendices 4-D, 4-E, 4-F, and 4-G
Additional Information Often Missing and Resulting in Data Requests	
3. Identify the project APE in terms of direct or indirect effects to known cultural resources.	Section 4.4
4. Provide a project map with mileposts clearly showing boundaries of all survey areas (right-of-way, extra work areas, access roads, etc.). Ensure that you mark mileposts, clearly specify survey corridor widths, and clearly indicate where you have not completed surveys.	Appendix 4-B
5. Provide documentation of consultation with applicable State Historic Preservation Offices (SHPO), Tribal Historic Preservation Offices (THPO), and land-managing agencies regarding the need for and required extent of cultural resource surveys.	Section 4.3, Appendix 4-A
6. Provide a narrative summary of overview results, cultural resource surveys completed, identified cultural resources and any cultural resource issues.	Section 4.5
7. Provide a project specific Ethnographic Analysis (can be part of Overview/Survey Report).	Part of Overview/Survey Reports (Appendices 4-D and 4-E)
8. Identify by mileposts any areas requiring survey for which the landowner denied access.	Section 4.5, Appendix 4-B
9. Provide written comments on the Overview and Survey Reports from the applicable SHPOs, THPOs, and land-managing agencies, if available.	Not Available
10. Provide a Summary Table of completion status of cultural resource surveys, and applicable SHPO or THPO and land-managing agency comments on the reports.	Section 4.5
11. Provide a Summary Table of identified cultural resources, and applicable SHPO or THPO and land-managing agency comments on the eligibility recommendations for those resources.	Section 4.5
12. Provide a brief summary of the status of contact with federally recognized Indian tribes, including copies of all related correspondence and records of verbal communications.	Section 4.3.3, Appendix 4-A
13. Provide a brief summary of comments received from stakeholders regarding cultural resources.	Section 4.3.4
14. Provide a schedule for completing any outstanding cultural resource studies.	Section 4.5.3
15. Provide an Unanticipated Discoveries Plan for the project area, referencing appropriate state statues.	Section 4.6, Appendix 4-C

RESOURCE REPORT 4
CULTURAL RESOURCES

4.1 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission ("FERC" or "Commission") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Southgate Project" or "Project"). The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina. See Resource Report 1 (General Project Description) for additional Project information.

4.1.1 Environmental Resource Report Organization

Resource Report 4 is prepared and organized according to the FERC *Guidance Manual for Environmental Report Preparation* (February 2017). This report comprises six major sections and a separate section containing references. Following this introduction (Section 4.1), Section 4.2 discusses the scope and authority of the review process, while Section 4.3 discusses coordination with State and Federal agencies, Native American groups, and other interested parties. The direct and indirect area of potential effects ("APE") for the Project are defined in Section 4.4, and Section 4.5 presents the methods and results of the cultural resources investigations to date. Section 4.6 discusses the Project's Unanticipated Discoveries Plan, and Section 4.7 contains the References.

4.2 SCOPE AND AUTHORITY

The Southgate Project is being reviewed under Section 106 of the National Historic Preservation Act ("NHPA") of 1966, as amended and under the National Environmental Policy Act of 1969 ("NEPA"). Prior to authorizing an undertaking (e.g., the issuance of a FERC Certificate), Section 106 requires federal agencies, including the FERC, to take into account the effect of that undertaking on cultural resources listed or eligible for listing in the National Register of Historic Places ("NRHP") and afford the Advisory Council on Historic Preservation ("ACHP") an opportunity to comment on the undertaking. The Section 106 compliance process is coordinated at the state level by the State Historic Preservation Officer ("SHPO"), represented in Virginia by the Virginia Department of Historic Resources ("VDHR") and in North Carolina by the North Carolina Historic Preservation Office ("NC HPO"). The FERC, as the lead federal agency, must consult with the VDHR, NC HPO, and federally-recognized Native American groups regarding the potential effects of the Project on historic properties. The Project, as a non-federal party, is assisting the FERC to fulfill its obligations under Section 106 and the ACHP's implementing regulations at 36 Code of Federal Regulations ("CFR") 800.

The primary goals of cultural resources investigations conducted as part of the Section 106 review are to:

- Locate, document, and evaluate buildings, structures, objects, landscapes, and archaeological sites that are listed, or eligible for listing, in the NRHP;
- Assess potential effects of the Project on those resources; and
- Provide recommendations for subsequent treatment, if necessary, to assist with compliance with Section 106.

In addition to complying with Section 106 and its implementing regulations (36 CFR Part 800, *Protection of Historic Properties*), the cultural resources investigations are being conducted for the Project in accordance with 18 CFR Part 380, the FERC's *Regulations Implementing the National Environmental Policy Act* (including Sections 380.3 – Environmental Information to be Supplied by an Applicant and 380.14 – Compliance with the National Historic Preservation Act); the FERC's Office of Energy Projects' *Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects* (FERC, 2017a) and *Guidance Manual for Environmental Report Preparation* (FERC, 2017b); and the Secretary of the Interior's *Standards and Guidelines for Archeology and Historic Preservation* (48 Federal Register 44716-42, Sept. 29, 1983). The work also conforms to the relevant SHPO guidelines, including the VDHR's *Guidelines for Conducting Historic Resources Survey in Virginia* (VDHR, 2017) and the NC HPO's *Archaeological Investigation Standards and Guidelines* (NC HPO, 2017) and *Report Standards for Historic Structure Survey Reports/Determinations of Eligibility/Section 106-110 Compliance Reports in North Carolina* (NC HPO, 2016).

4.3 AGENCY AND NATIVE AMERICAN COORDINATION

The Southgate Project is assisting the FERC in meeting its Section 106 obligations by conducting Section 106 coordination with various state and local agencies and Native American groups located in or having interests regarding cultural resources in Virginia and North Carolina. Section 4.3 details the correspondence the Project has conducted to date with each of these entities. Correspondence related to the cultural resources surveys for the Project referenced below is included in Appendix 4-A, and additional correspondence will be forwarded to the Commission upon receipt.

4.3.1 Virginia Department of Historic Resources

The Southgate Project submitted a Project information package to the VDHR for review and comment on April 27, 2018. On May 17, 2018, Project staff met with VDHR staff to discuss the Project. Topics covered the Project facilities and routing, the nature of the direct and indirect area of potential effects ("APEs"), the types of cultural resources expected to be encountered (potentially including archaeological sites, aboveground resources, historic districts, and cultural landscapes), proposed methods for identification and evaluation of resources, and proposed coordination with Native American groups.

On June 4, 2018, the Southgate Project provided the VDHR with a Geographic Information System ("GIS") shapefile of the Project facilities as well as detailed protocols for the identification and assessment of historic architectural resources, including the nature of the Project indirect effects APE. On July 2, 2018, the Project provided the VDHR with detailed protocols for the identification and assessment of archaeological resources and for archaeological deep testing (should it prove necessary), including the nature of the Project direct effects APE. On August 3, 2018, the Project contacted the VDHR to invite VDHR staff for site visits and to inform the VDHR that Draft Resource Report 4 and the Project-specific Unanticipated Discoveries Plan would be filed with FERC and submitted to the VDHR for comment later in August. Draft Resource Report 4 and the Plan for Unanticipated Discoveries of Historic Properties and Human Remains were submitted to the VDHR for comment on August 13, 2018 (digitally) and on August 16, 2018 (hard copy). On September 14, 2018, the VDHR responded via letter that Draft Resource Report 4 satisfactorily describes the work to date and that the Plan for Unanticipated Discoveries of Historic Properties and Human Remains was satisfactory.

4.3.2 North Carolina Historic Preservation Office

The Southgate Project submitted a Project information package to the NC HPO for review and comment on April 27, 2018. On May 10, 2018, the Project staff met with NC HPO staff to discuss the Project. Topics covered the Project facilities and routing, the nature of the direct and indirect effects APEs, the types of cultural resources expected to be encountered (potentially including archaeological sites, aboveground resources, historic districts, and cultural landscapes), proposed methods for identification and evaluation of resources, and proposed coordination with Native American groups. On May 21, 2018, the NC HPO responded to the information provided and provided additional guidance regarding Project review procedures. In addition, on May 17 and May 22, 2018, the NC HPO provided information on historical associations and other potentially interested groups within the Project area.

On June 4, 2018, the Southgate Project provided the NC HPO with a GIS shapefile of the Project as well as detailed protocols for the identification and assessment of archaeological and historic architectural resources. On July 6, 2018, the NC HPO approved the protocols and requested additional information concerning the protection of potential graves that might be encountered during Project investigations. The revised protocols were provided on August 13, 2018. On July 24 and 27, 2018, the Project and the NC HPO exchanged emails concerning planning for upcoming NC HPO staff visits to the Project. On August 3, 2018, the Project contacted the NC HPO to alert the NC HPO that Resource Report 4 and the Project Unanticipated Discoveries Plan would be filed with FERC and submitted to the NC HPO for comment later in August, and to continue planning the site visits. On August 21, 2018, four members of the NC HPO staff visited the Southgate Project. Draft Resource Report 4 and the Plan for Unanticipated Discoveries of Historic Properties and Human Remains were submitted to the NC HPO for comment on August 13, 2018, along with the revised protocols for the identification of archaeological resources. On September 6, 2018, the NC HPO responded via letter approving the revised protocols and the Plan for Unanticipated Discoveries of Historic Properties and Human Remains.

4.3.3 Native American Coordination

The Southgate Project, on behalf of the FERC, contacted (via email, phone calls, and meetings) federally-recognized Native American groups to provide them the opportunity to identify concerns related to the Project. Information on those tribes and contacts, and responses received to date, is provided in Table 4.3-1 (see Tables Section) and in Appendix 4-A. As of October 15, 2018, three tribes, the Catawba Indian Nation, the Chickahominy Tribe, and the Upper Mattaponi Tribe have requested further coordination on the Project under the Section 106 review process. In addition, on August 3, 2018, the Monacan Indian Nation contacted the FERC and requested consulting party status on the Project, and on September 10, 2018, the Cheyenne River Sioux and Rosebud Sioux tribes contacted the FERC and requested consulting party status on the Project. Three tribes, the Delaware Tribe of Indians, the Eastern Band of Cherokee Indians, and the Muscogee (Creek) Nation have responded that the Project is outside their areas of interest.

Notice that Draft Resource Report 4 and the Plan for Unanticipated Discoveries of Historic Properties and Human Remains were available for review was provided to the federally recognized tribes on August 31, 2018. On September 28, 2018, the Catawba Indian Nation responded via letter that it has no immediate concerns regarding the Project but wish to be notified if Native American artifacts and/or human remains are located during the ground disturbance phase of the Project.

In addition to contacting the federally-recognized Native American groups, the Southgate Project is contacting the North Carolina Commission on Indian Affairs, which represents both federally and non-federally recognized Native American tribes residing in North Carolina, to provide it an opportunity to identify concerns related to the Project. The Project also is contacting the individual non-federally recognized tribes in North Carolina and Virginia to provide those groups the opportunity to identify concerns related to the Project. Information on those contacts, and responses received to date, are provided in Table 4.3-2 (see Tables Section). In addition, on August 2, 2018, the Sappony Tribe (a non-federally recognized tribe in North Carolina) contacted the FERC and requested consulting party status on the Project, and on October 15, 2018, the Occaneechi Band of the Saponi Nation (a non-federally recognized tribe in North Carolina) contacted the FERC and requested consulting party status on the Project.

4.3.4 Coordination with Other State and Local Agencies and with Individuals

As of October 15, 2018, the Southgate Project has provided information on the Project to one Certified Local Government ("CLG") and one historical association in Virginia (Table 4.3-3, see Tables Section). The Pittsylvania Historical Society has responded expressing an interest in the Project, and coordination with that group is ongoing.

The Southgate Project has provided information on the Project to two CLGs and eight historical or genealogical associations or museums in North Carolina, one of which also has interests in Virginia (Table 4.3-4, see Tables Section). As of October 15, 2018, the Alamance County Historical Properties Commission, the Graham Historical Museum, and the Rockingham County Historical Society have responded expressing an interest in the Project, and coordination with those groups is ongoing.

The FERC is using the NEPA scoping and public comment process as its public participation process under Section 106, and several individuals and one organization (Preservation Virginia) have provided comments relating to cultural resources. Information relating to potential cultural resources identified by those parties is provided in Table 4.3-5 (see Tables Section).

4.4 AREA OF POTENTIAL EFFECTS

The APE is the "geographic area or areas within which an undertaking may directly or indirectly cause changes in the character of or use of historic properties, if any such properties exist" (36 CFR 800.16(d)). The APE is defined based on the *potential* for effect, which may differ for aboveground cultural resources (historic structures and landscapes) and subsurface resources (archaeological sites).

4.4.1 Direct Effects APE

The Project APE for direct effects was determined to include all areas where ground-disturbing activities may take place. The APE for direct effects includes a 300- or 400-foot-wide study corridor that subsumes areas of ground disturbance for the pipeline trench, as well as associated temporary workspaces (temporary construction right-of-way and additional temporary workspace). The APE for direct effects is 300 feet wide where the corridor is not collocated with other utility corridors, and 400 feet wide where it is collocated. Within this corridor, a 100-foot-wide right-of-way would include construction areas and additional temporary workspaces. The 100-foot right-of-way will consist of 50 feet of permanent easement centered over the pipeline and 50 feet of temporary workspace. The direct effects APE also includes Project-related facilities outside of the corridor, such as access roads, cathodic protection ground beds,

compressor and meter stations, and contractor yards. The direct effects APE also includes areas of the pipeline that will be installed using the horizontal directional drill method.

4.4.2 Indirect Effects APE

The indirect effects APE is the area within which any resources (including individual resources, potential historic districts, or cultural landscapes) might be within view of proposed vegetation clearing or aboveground construction, or otherwise potentially affected by Project activities. The indirect effects APE will minimally consist of a 450-foot-wide corridor centered on the pipeline centerline, 250-foot-wide corridors centered on access road centerlines, and an area extending 0.5-mile from the compressor station and meter station sites. The indirect effects APE generally will be terminated 0.5 mile from the pipeline corridor or other Project activity, or where vegetation and/or topography obstructs lines of sight. Figure 4.5-1 (Appendix 4-B) depicts a 0.5-mile radius from all identified Project activities, which generally constitutes the maximum extent of the indirect effects APE.

4.5 CULTURAL RESOURCES INVESTIGATIONS

Cultural resources include archaeological sites, historic standing structures, objects, districts, traditional cultural properties, and other properties that illuminate important aspects of prehistory or history or have important and long-standing cultural associations with established communities or social groups. Significant archaeological and architectural properties are generally identified using the eligibility criteria for listing in the NRHP, in consultation with the SHPOs of the respective states through which a project traverses, and/or Tribal Historic Preservation Officers ("THPOs") of Native American groups residing in or with historical ties to the area.

The cultural resources investigations for the Southgate Project are being conducted in accordance with FERC and SHPO guidelines. The individuals responsible for conducting the surveys meet or exceed all requirements set forth by the Secretary of Interior at 36 CFR Part 61.

4.5.1 Overview Results

The initial phase of the investigation involved background research to gather information about previous cultural resources investigations and known archaeological sites and aboveground resources within one-mile of the Project direct effects APE and to determine which Native American groups and other organizations might have interest in the Project. The following methodology was used to complete the overview:

- Identification of any known archaeological sites and previously recorded aboveground cultural resources through background research and state site file searches. Data pertaining to the known resources, including their locational, functional, and temporal characteristics, were reviewed where applicable;
- Review of recent cultural resources studies performed in the counties where the Project is located;
- Review of primary and secondary historic information (such as maps or county histories) to identify areas where previous structures and landscapes were potentially located;
- Research concerning the Native American groups formerly and presently residing in the Project area;

- Conversations with VDHR and NC HPO staff concerning Native American groups with interests in the Project area; and
- Contacts with Native American groups and others to request information regarding the area.

As part of this work, the Project conducted research at the VDHR and NC HPO offices and in various other repositories.

Archaeological Sites

The VDHR archaeological site files are part of the state database system known as the Virginia Cultural Resources Information System ("V-CRIS"). The Southgate Project conducted a site file search of the VDHR files in April 2018 and updated that search on September 26, 2018. V-CRIS contains records for 79 archaeological sites that have been previously recorded within 0.5-mile of the Project including 24 precontact sites, 19 precontact and postcontact sites, and 36 postcontact sites. Information on those resources is provided in Table 4.5-1 (see Tables Section). Of those 79 sites, two have been determined eligible for the NRHP by the VDHR, three are considered potentially eligible for the NRHP, 42 have not been evaluated for NRHP eligibility, and 32 have been determined not eligible for the NRHP by the VDHR.

The NC HPO archaeological site files are maintained by the North Carolina Office of State Archaeology ("OSA"). The Southgate Project conducted a site file search of the OSA files in April 2018 and updated that search on September 26, 2018. The OSA files contain records for 63 archaeological sites that have been previously recorded within 0.5-mile of the Project, including 46 precontact sites, 12 precontact and postcontact sites, and five postcontact sites. Information on those sites is provided in Table 4.5-2 (see Tables Section). Of those 63 sites, two are listed in the NRHP, 33 are unassessed for NRHP eligibility, and 28 have been determined not eligible for the NRHP by NC HPO.

Aboveground Cultural Resources

A search of V-CRIS revealed 79 postcontact aboveground cultural resources recorded within 0.5-mile of the Project in Virginia. Information on those resources is provided in Table 4.5-3 (see Tables Section). Those 79 resources include four that are listed in the NRHP, five that have been determined eligible for the NRHP by the VDHR (including three that have been determined eligible for Environmental Review purposes only), 21 that have been determined not eligible for the NRHP by the VDHR, and 48 that the VDHR has not evaluated for NRHP eligibility. An additional resource bears the notation "Primary resource is no longer extant" but has apparently not been evaluated for NRHP eligibility by the VDHR.

A search of NC HPO records revealed 94 postcontact aboveground cultural resources recorded within 0.5-mile of the Project in North Carolina. Information on those resources is provided in Table 4.5-4 (see Tables Section). Of those 94 resources, at least 21 have been demolished since being recorded (including one that had been listed on the NRHP). The 73 remaining previously recorded aboveground resources in North Carolina include five resources listed on the NRHP, five resources that have been placed on the NC HPO study list (indicating that they may be NRHP eligible but require additional evaluation), and 63 that have been surveyed only and have not been assessed for NRHP eligibility.

4.5.2 Archaeological Field Survey

The Southgate Project is conducting systematic Phase I archaeological field surveys of the Project corridor and other facilities, following the state guidelines and protocols developed for the Project. The survey

procedures include a pedestrian walkover of all portions of the APE, systematic surface examination of all suitable areas, and systematic subsurface testing of areas lacking sufficient surface visibility or that have potential for subsurface resources. The archaeological surveys began on May 10, 2018 and are ongoing. This Resource Report 4 contains information on all survey activities conducted through September 20, 2018, and the results of those surveys are provided in Appendices 4-D and 4-E. Additional reports will be filed as access is obtained and surveys and site evaluations are completed.

In Virginia, crews excavate 40-centimeter-diameter shovel tests at maximum intervals of 15 meters within the survey areas; additional close-interval shovel tests are excavated to delineate potential archaeological sites and finds. Shovel tests are excavated in arbitrary 10-centimeter levels to sterile subsoils (with the exception of disturbed plow zone soils, which are excavated as a single level), unless natural obstructions (e.g., rocks, bedrock, or roots) prevent further excavation. Excavated soil is hand screened through 0.25-inch wire mesh hardware cloth. Cultural materials remaining in the mesh are bagged and tagged by level within each shovel test pit, and the counts and types of recovered cultural material are noted on field forms. Soil profiles are recorded for each shovel test on standardized forms. All shovel tests are filled following excavation to restore the ground surface to its original contour. Digital photographs are taken of the general Project area and recorded on standardized logs. Sub-meter Global Positioning System ("GPS") data are collected from each shovel test excavated within the study area. Visible surface features (e.g., foundations) encountered during the survey are recorded through description and photographs, and locational data are collected with the GPS and drawn on Project maps.

In North Carolina, crews excavate 30- to 40-centimeter-diameter shovel tests at intervals of 30 meters within the survey areas; additional close-interval shovel tests are excavated to delineate potential archaeological sites and finds. Tests are excavated in arbitrary 10-centimeter levels to sterile subsoils (with the exception of disturbed plow zone soils, which are excavated as a single level), unless natural obstructions (e.g., rocks, bedrock, or roots) prevent further excavation. Excavated soil is hand screened through 0.25-inch wire mesh hardware cloth. Cultural materials remaining in the mesh are bagged and tagged by level within each shovel test, and the counts and types of recovered cultural material are noted on field forms. Soil profiles are recorded for each shovel test on standardized forms. All shovel tests are filled following excavation to restore the ground surface to its original contour. Digital photographs are taken of the general Project area and recorded on standardized logs. Sub-meter GPS data are collected from each shovel test excavated within the study area. Visible surface features (e.g., foundations) encountered during the survey are recorded through description and photographs, and locational data are collected with the GPS and drawn on Project maps.

Tables 4.5-5 and 4.5-6 (see Tables Section) describe the completion status for the cultural resources surveys along the pipeline route and of aboveground facility sites as of September 20, 2018. This information is also provided graphically in Figure 4.5-1 (Appendix 4-B), which depicts both the direct effects APE and the maximum potential extent of the indirect effects APE. As of September 20, 2018, archaeological surveys have been completed for approximately 61.89 miles (84.7 percent) of the pipeline route, including 25.5 miles (97.7 percent) of the route in Virginia and 36.39 miles (77.4 percent) of the route in North Carolina. In addition, surveys have been completed for 18.1 miles (81.6 percent) of access roads in Virginia and 21.2 miles (78.8 percent) of access roads in North Carolina.

Virginia Archaeological Survey Results

The archaeological surveys in Virginia conducted to date have resulted in the identification of 42 archaeological resources: 31 precontact archaeological sites or isolated finds, six postcontact archaeological sites or isolated finds, and five precontact and postcontact archaeological sites or isolated finds (Table 4.5-7, see Tables Section). These include 23 precontact archaeological sites or isolated finds, five postcontact archaeological sites or isolated finds, and four precontact and postcontact archaeological sites or isolated finds located along the pipeline route; one precontact site located along the pipeline; two precontact sites and one precontact and postcontact site located within the Lambert Compressor Station; one postcontact site situated at a Contractor Yard, and five precontact sites or isolated finds located along access roads. (Cemeteries are considered aboveground resources in Virginia and are not included in these totals.)

Based on the survey data, 31 of the 42 archaeological sites or finds in Virginia appear to have limited research potential within the direct effects APE or otherwise fail to meet the NRHP criteria. Per VDHR guidelines, those sites will be recommended as not eligible for listing in the NRHP under Criteria A–D (if their boundaries have been totally defined within the direct effects APE) or recommended NRHP unassessed (if their boundaries have not been defined), and no further archaeological evaluation will be recommended for the Project (see Table 4.5-7, Tables Section).

The Southgate Project recommends 11 sites in Virginia as NRHP unassessed and requiring additional survey (one site) or avoidance or additional evaluation (10 sites) based on their characteristics within the direct effects APE (Appendix 4-D). Of those 11 sites, three will be avoided, and additional survey or evaluation will be conducted for the remaining eight sites (Table 4.5-7). Results of the additional survey or evaluation will be submitted to the VDHR and tribes, and any necessary avoidance plans will be submitted to the FERC, the VDHR and the tribes for review and approval.

North Carolina Archaeological Survey Results

The archaeological surveys in North Carolina conducted to date have resulted in the identification of 61 archaeological resources: 40 precontact archaeological sites or isolated finds, seven precontact and postcontact sites or isolated finds, and 14 postcontact sites or isolated finds (including cemeteries; which are considered archaeological sites in North Carolina) (Table 4.5-8, see Tables Section). These include 37 precontact archaeological sites or isolated finds, seven precontact and postcontact sites or isolated finds, and 13 postcontact archaeological sites or isolated finds along the pipeline route; and three precontact sites or isolated finds and one postcontact site along access roads.

Based on the survey data, 49 of the 61 archaeological sites or finds in North Carolina appear to have limited research potential and otherwise fail to meet the NRHP criteria based on the deposits present within the direct effects APE. Per NC HPO guidelines, those sites will be recommended as not eligible for listing in the NRHP under Criteria A–D, and no further archaeological evaluation will be recommended for the Project. These 49 sites include five postcontact cemeteries that will be recommended as not eligible for the NRHP, but that will be avoided by the Project. (One of those, 31RK234, is considered potentially eligible for the NRHP as architectural resource RK1531).

The Southgate Project recommends 12 sites in North Carolina as NRHP unassessed. Of these sites, four will be avoided, and evaluation will be conducted for the remaining eight sites (Table 4.5-8). Results of

the will be submitted to the NC HPO and tribes, and any necessary avoidance plans will be submitted to the FERC, the NC HPO and the tribes for review and approval.

4.5.3 Aboveground Cultural Resources Survey

Following completion of background research, the Southgate Project is conducting systematic surveys of historic architectural properties and other aboveground resources within the Project direct and indirect effects APEs. The fieldwork involves the identification of all aboveground properties within the APE that appear to be at least 50 years old or are included in previous inventories, including potential cultural landscapes and historic districts. Prior to fieldwork, the architectural historians use aerial photographs, topographic maps, and other sources to identify, map, and compile a database of potential aboveground resources within the APEs. Aerial base maps and property parcel maps are then used during the fieldwork to identify the study corridor. The architectural historians visit accessible parcels from public rights-of-way, associated properties, and known or potential historic districts for which any portion of the property intersects with the study corridor. Each property included in the survey is assigned a survey number and plotted on a base map. Data regarding the current condition and significant characteristics of identified properties are recorded, and the information on the inventory forms for previously surveyed properties is verified. Photographs of each surveyed property and its views toward the Project are taken with a high-resolution digital camera. If any potential historic districts are identified, the surveyors will record information about the area's character; photograph streetscapes, views, and individual properties; and identify the boundaries of the potential district.

Based on the condition, integrity, materials, approximate age, design, and setting of the identified resources, a preliminary assessment is formed regarding the potential NRHP eligibility of each property. An assessment of the potential effects of the Project then is conducted for properties that are listed or evaluated as potentially eligible for listing in the NRHP. The assessment takes into account the location of the property in relation to the pipeline, the nature of the potential effects, and the characteristics of the property's significance.

Virginia Aboveground Cultural Resources Survey Results

In Virginia, intensive aboveground survey fieldwork by Southgate Project architectural historians is ongoing. As of September 20, 2018, the Project has identified 74 aboveground resources within the Project study areas in Virginia; an additional 23 previously identified aboveground resources remain to be revisited or redocumented by the Project (Appendix 4-F). Table 4.5-9 (see Tables Section) lists the aboveground resources identified in Virginia for the Project to date. No historic districts or historic cultural landscapes have been identified to date in Virginia. Per VDHR guidelines, historic cemeteries lacking associated archaeological components are classified as aboveground resources in Virginia.

Two of the 74 aboveground resources identified in Virginia are currently listed on or will be recommended eligible for the NRHP, and four of the resources are considered potentially eligible for the NRHP. The NRHP eligibility of one resource is considered undetermined, and the Project recommends the remaining 67 above ground resources in Virginia as not eligible for the NRHP. The Project will complete the survey and assessment of NRHP eligibility of the remaining aboveground resources within the APE and will assess potential Project effects on any resources that are NRHP listed or are determined NRHP eligible. If any of

those resources are to be affected by the Project, the Project then will evaluate measures to avoid, minimize, and/or mitigate those effects.

North Carolina Aboveground Cultural Resources Survey Results

In North Carolina, intensive aboveground survey fieldwork by Southgate Project architectural historians is ongoing. As of September 20, 2018, the Project has identified 267 aboveground resources within the Project study areas in North Carolina (Appendix 4-G). Table 4.5-10 (see Tables Section) lists the aboveground resources identified in North Carolina for the Project to date. No historic districts or historic cultural landscapes have been identified to date in North Carolina. Per NC HPO guidelines, historic cemeteries are generally classified as archaeological sites in North Carolina (although one cemetery that was previously recorded as an aboveground resource is listed here).

Two of the 267 aboveground resources identified in North Carolina are currently listed on the NRHP, while the eligibility status of an additional 16 aboveground resources is presently considered undetermined. The Project will complete the assessment of NRHP eligibility for those resources and will assess potential Project effects to any resources that are NRHP listed or are determined NRHP eligible. If any of those resources are to be affected by the Project, the Project then will evaluate measures to avoid, minimize, and/or mitigate those effects. The Project recommends the remaining 249 aboveground resources in North Carolina as not eligible for the NRHP.

4.5.4 Aboveground Cultural Resource Impacts and Avoidance Measures

To the greatest extent practicable, the Project will not result in direct effects to NRHP-eligible or -listed aboveground resources as a result of Project construction and operation. The only areas where Project-related impacts may occur is in areas with shallow depth to bedrock where blasting may be required. Where consolidated rock is encountered during construction, the Project's preferred procedure will be to fracture and excavate the bedrock using standard construction equipment. The Project's blasting technique would typically involve small charges strong enough to crack rock in the pipeline centerline. As currently planned, the impact of such blasting is expected to be limited to within 50 feet of the right-of-way. The Project's contractor will prepare a detailed Blasting Plan for each distinct blasting area, which will comply with all permit requirements. Structures within 150 feet, historic or not, will be evaluated for pre- and post-blasting condition. Further details regarding the Project's Blasting Plan and mitigation efforts are included in Resource Report 6.

4.5.5 Summary

As of September 20, 2018, archaeological survey has been completed for approximately 61.89 miles (84.7 percent) of the Southgate Project pipeline route including 25.5 miles (97.7 percent) of the route in Virginia and 36.39 miles (77.4 percent) of the route in North Carolina. In addition, surveys have been completed for 18.1 miles (81.6 percent) of access roads in Virginia and 21.2 miles (78.8 percent) of access roads in North Carolina.

The archaeological surveys completed to date have resulted in the identification of 103 archaeological resources: 42 in Virginia and 61 in North Carolina. Eighty of these sites are recommended not eligible for listing in the NRHP or otherwise do not require further investigations, including five postcontact cemeteries in North Carolina that will be avoided by the Project. The remaining 23 sites (11 in Virginia and 12 in

North Carolina) would require additional investigation to assess NRHP eligibility. The Project plans to avoid eight of those sites and conduct additional survey or evaluation of 15 of those sites.

The aboveground resources field surveys completed to date have resulted in the identification of 341 aboveground resources: 74 in Virginia and 267 in North Carolina. No historic districts or historic cultural landscapes have been identified. Of the 341 aboveground resources, four are listed on or will be recommended eligible for the NRHP, while the eligibility status of an additional 21 above ground resources is presently considered undetermined. The Project recommends the remaining 316 aboveground resources in North Carolina as not eligible for the NRHP.

The results of those surveys are provided in Appendices 4-D through 4-F and have been submitted to the VDHR, NC HPO, and those Native American groups expressing interest in the Southgate Project. The results of additional surveys and site evaluations will be submitted as addenda reports as they are available. Due to the sensitive nature of some of the material within the reports, those reports will be labeled "**CUI//PRIV – DO NOT RELEASE**" in accordance with FERC procedures and 36 CFR Part 800.11(c)(1).

The Southgate Project's goal is to build and operate the Project without adverse effects to NRHP-listed and -eligible cultural resources. If any NRHP-listed or -eligible resources cannot be avoided and will be adversely affected by the Project, the Project will develop and implement appropriate treatment plans in consultation with the FERC, the VDHR or NC HPO, interested Native American groups, and other interested parties as appropriate.

4.6 PLAN FOR UNANTICIPATED DISCOVERIES OF HISTORIC PROPERTIES AND HUMAN REMAINS

The Southgate Project has developed a *Plan for Unanticipated Discoveries of Historic Properties and Human Remains, Virginia and North Carolina* (Appendix 4-C). The plan (or information on its availability) was provided to the VDHR, NC HPO, and Native American groups for review and comment in August 2018. As of October 15, 2018, the VDHR, NC HPO, and Catawba Indian Nation have approved of the plan.

LIST OF TABLES

Table 4.3-1

Federally-Recognized Native American Groups Contacted for the MVP Southgate Project (current as of October 15, 2018)

Tribe Name	Date(s) Contacted (includes meetings)	Date(s) Response Received (includes meetings)
Catawba Indian Nation	5/31/2018, 6/1/2018, 6/28/2018, 7/11/2018, 8/31/2018/ 9/5/2018/ 9/28/2018	5/31/2018, 7/12/2018, 9/28/2018
Cherokee Nation of Oklahoma	8/31/2018	No response received to date
Cheyenne River Sioux Tribe	6/6/2018, 7/11/2018, 8/31/2018	No response received to date
Chickahominy Tribe	5/31/2018, 6/1/2018, 6/12/2018, 6/14/2018, 6/25/2018, 6/29/2018, 7/11/2018, 8/31/2018, 9/6/2018	5/31/2018, 6/14/2018, 9/6/2018
Chickahominy Tribe Eastern Division	5/31/2018, 6/1/2018, 6/12/2018, 6/14/2018, 8/21/2018, 8/31/2018, 9/6/2018	5/31/2018, 6/14/2018, 9/6/2018
Delaware Nation	6/6/2018, 7/11/2018, 8/31/2018	No response received to date
Delaware Tribe of Indians	6/6/2018, 7/11/2018	6/7/2018
Eastern Band of Cherokee Indians	5/31/2018, 6/1/2018, 6/11/2018, 6/29/2018, 7/11/2018, 8/31/2018	5/31/2018, 10/15/2018
Eastern Shawnee Tribe of Oklahoma	6/6/2018, 7/11/2018, 8/31/2018	No response received to date
Monacan Indian Nation*	5/31/2018, 6/1/2018, 6/12/2018, 6/27/2018, 7/11/2018, 8/9/2018, 8/15/2018, 8/31/2018, 10/9/2018	5/31/2018, 6/12/2018, 8/7/2018, 10/9/2018
Muscogee (Creek) Nation	6/6/2018, 7/11/2018, 8/31/2018	6/8/2018
Nansemond Tribe	5/31/2018, 6/1/2018, 6/11/2018, 6/26/2018, 7/11/2018, 8/31/2018, 9/6/2018	5/31/2018, 6/11/2018, 9/6/2018
Pamunkey Tribe	5/31/2018, 8/31/2018	No response received to date
Rappahannock Tribe	5/31/2018, 6/5/2018, 7/11/2018, 8/31/2018, 9/6/2018	9/6/2018
Rosebud Sioux Tribe of Indians	6/6/2018, 6/7/2018, 7/11/2018, 8/31/2018	No response received to date
Tuscarora Nation	6/6/2018, 7/11/2018, 8/31/2018	No response received to date
Upper Mattaponi Tribe	5/30/2018, 6/12/2018, 6/25/2018, 7/11/2018, 8/31/2018, 9/6/2018	9/6/2018

Table 4.3-2

Non-federally Recognized Native American Groups Contacted for the MVP Southgate Project (current as of October 15, 2018)

Tribe Name	Date(s) Contacted (includes meetings)	Date(s) Response Received (includes meetings)
Cheroenhaka (Nottoway) Tribe	8/3/2018, 8/31/2018	No response received to date
Mattaponi Tribe	8/3/2018, 8/31/2018	No response received to date
Nottoway of Virginia	8/3/2018, 8/31/2018	No response received to date
Patawomeck Tribe	8/3/2018, 8/31/2018	No response received to date
North Carolina Commission on Indian Affairs	7/12/2018, 7/25/2018, 7/31/2018, 8/22/2018, 8/31/2018, 9/7/2018	7/31/2018, 8/27/2018, 9/7/2018
Cohare Tribe	8/3/2018, 8/31/2018	No response received to date
Haliwa-Saponi Indian Tribe	8/3/2018, 8/31/2018	No response received to date
Lumbee Tribe	8/3/2018, 8/31/2018	No response received to date
Meherrin Indian Tribe	8/3/2018, 8/31/2018	No response received to date
Occaneechi Band of the Saponi Nation*	8/3/2018, 8/6/2018, 8/14/2018, 8/20/2018, 8/31/2018, 10/2/2018, 10/4/2018	8/17/2018, 8/24/2018, 10/5/2018
Sappony Tribe*	8/3/2018, 8/9/2018, 8/15/2018, 8/31/2018, 10/9/2018	8/7/2018, 10/9/2018
Waccamaw Siouan Tribe	8/3/2018, 8/31/2018	No response received to date

* See also Sappony Tribe and Occaneechi Band of the Saponi Nation communications with the FERC referenced in text.

Table 4.3-3

Other Virginia State and Local Agency Cultural Resources Coordination for the MVP Southgate Project (current as of October 15, 2018)

Organization	Date(s) Contacted	Date(s) Response Received
City of Danville (CLG)	7/6/2018	No response received to date
Pittsylvania Historical Society	7/6/2018, 7/24/2018, 8/17/2018	7/21/2018

Table 4.3-4

Other North Carolina State and Local Agency Cultural Resources Coordination for the MVP Southgate Project (current as of October 15, 2018)

Organization	Date(s) Contacted	Date(s) Response Received
Town of Eden (CLG)	7/6/2018	No response received to date
Alamance County Historical Properties Commission (CLG)	7/6/2018, 7/31/2018, 8/3/2018	7/30/2018, 7/31/2018, 8/3/2018
Rockingham County Historical Society	9/5/2018, 10/3/2018	10/2/2018, 10/4/2018
Alamance County Historical Museum	7/6/2018	No response received to date
Graham Historical Museum	7/6/2018, 7/23/2018	7/21/2018
Haw River Historical Society Museum	8/7/2018	No response received to date
Mebane Historical Society and Museum	7/6/2018	No response received to date
Textile Heritage Museum	7/6/2018	No response received to date
Virginia-North Carolina Piedmont Genealogical Society	8/19/2018	No response received to date
Afro-American Historical and Genealogical Society of North Carolina, Piedmont Triad Chapter	8/21/2018	No response received to date

Table 4.3-5

Potential Cultural Resources Reported in Public Comments

Resource Number	Resource Name	Distance from CL/Facility	Applicant's NRHP Recommendation	Applicant's Effects Recommendation
071-0036	Little Cherrystone Manor	Property is crossed by CL	NRHP Listed	Assess effects and mitigate as necessary
071-0002	Bachelors Hall Plantation	8100 feet from TA-PI-052	VDHR determined eligible	No effect; resource is outside indirect effects APE
071-0020	Oak Ridge Plantation	8000 feet from TA-PI-054	NRHP listed	No effect; resource is outside indirect effects APE
071-0026; 44PY0040	Oak Hill Plantation	2780 feet from TA-PI-063	NRHP listed but demolished	No effect; resource is outside indirect effects APE
071-0035	Windsor Plantation	2000 feet from CL	NRHP listed	No effect; resource is outside indirect effects APE
071-0006	Berry Hill Plantation	1070 feet from workspace	NRHP listed	No effect; resource is outside indirect effects APE
AM0003	Glencoe Mill Village	1500 feet from CL	NRHP Listed Historic District	No effect; resource is outside indirect effects APE
NCAMt242/ NCAM243	Arches Grove United Church of Christ	2420 feet from CL	Not Eligible	No effect; resource is outside indirect effects APE
None	Moore property – 1810 farmhouse	~1400 feet from CL	Unassessed; property has not been accessed for above ground resources survey	Unknown but likely no effect due to distance and vegetative screening
None	Moore property - family cemetery	Unknown	Unassessed/	No Effect; property is not within direct effects APE
None	Moore property – Native American sites	Unknown	Unassessed/	No Effect; property is not within direct effects APE
31AM431	Archaeological Site 31AM431	700 feet from PA-AL-174	Unassessed	No Effect; property is not within direct effects APE
None	Burlington-Hillsborough Stage Coach Trail	800+ feet from CL	Unassessed	No Effect; property is not within direct effects APE
None	William Fonville Family House	900 feet from CL	Unassessed; property has not been accessed for above ground resources survey	No recommendation possible at present
AM0555	Aldridge building – Anderson House	11,500 feet from TAR-AL-79A	Unassessed (on NC HPO study list)	No effect; resource is outside indirect effects APE
AM0196	Aldridge building – Jacob Holt House	10,000 feet from TAR-AL-79A	Unassessed (on NC HPO study list)	No effect; resource is outside indirect effects APE
None known	Aldridge cemetery #1	Unknown; at least 9,000 feet from TAR-AL-79A	Unassessed	No effect; resource is outside direct effects APE
None known	Aldridge cemetery #2	Unknown; at least 9,000 feet from TAR-AL-79A	Unassessed	No effect; resource is outside direct effects APE
AM0464	Kerr Scott Farm	1500 feet from CL	NRHP Listed	No effect; resource is outside indirect effects APE

Table 4.5-1

Previously Recorded Archaeological Resources within 0.5-mile of Project Components in Virginia (updated September 26, 2018)

Resource Number/ Name	Resource Type	Distance (feet)	Recorder/ Organization	Date	Recorder Evaluation	SHPO Evaluation
44PY0115	Postcontact farmstead	180	Lyle Browning/ Browning & Assoc.	11/5/2003	None Provided	Not Evaluated
44PY0215	Precontact lithic scatter	2100	Lyle Browning/ Browning & Assoc.	7/20/2001	None Provided	Not Evaluated
44PY0219	Precontact campsite; Postcontact farmstead	1800	URS	9/1/2001	None Provided	Not Eligible
44PY0220	Postcontact farmstead	1800	Matt Jorgensen/ URS	9/12/2001	None Provided	Not Eligible
44PY0242	Postcontact farmstead	590	Lyle Browning/ Browning & Assoc.	11/5/2003	None Provided	Not Evaluated
44PY0243	Postcontact farmstead	780	Lyle Browning/ Browning & Assoc.	11/5/2003	None Provided	Not Evaluated

Correspondence Summary Sheet

Client: Mountain Valley Pipeline, LLC	**By:** Paul Webb
Project Name: MVP Southgate Project	**Talked With:** Roger Kirchen
Project Number:	
Date: August 10, 2018	**Of:** VDHR
Subject: RR4, Site Visit	**Telephone:**
	Email:
Supplemental Information Attached? NO	
Indicate Documentation Type: Telephone	

I called Roger Kirchen of VDHR to inform him that RR 4 was coming, and ask if the VDHR was interested in a site visit.

Roger asked if RR4 was coming to them directly, and I said that it was.

He said he didn't see any need for site visits at this time.

Roger –

Per our conversation on Friday, MVP Southgate filed Resource Report 4 (cultural resources) with the FERC this morning. I am attaching a .pdf of the complete PUBLIC version of RR4 as filed (which includes Appendix 4-C, the Unanticipated Discoveries Plan) for your review. Also attached is Figure 4.5-1, which was filed as PRIVILEGED.

There is also a PRIVILEGED version of the SHPO correspondence, which I'll send via a FTP link due to its size.

We look forward to your review of these materials, including the Unanticipated Discoveries Plan. Also, please let me know if you have any difficulties with any of the files, need hard copies, or have any questions or concerns about the project.

Thanks,

Paul Webb
Cultural Resources Program Leader

Re: MVP Southgate Project – Resource Report 4, Cultural Resources
Pittsylvania County, VA
DHR File No. 2018-3545; FERC Docket No. PF18-4-000

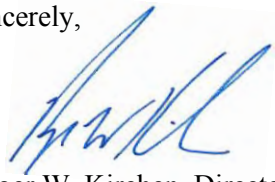
Dear Mr. Miller:

We have received for review the document referenced above. Our comments are provided as assistance to FERC in satisfying its responsibility pursuant to Section 106 of the National Historic Preservation Act.

We find that the report accurately documents consultation to date. Further, we accept the *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* presented in Appendix 4-C of the report.

Thank you for the opportunity to review this document. Should you have any questions regarding these comments, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,



Roger W. Kirchen, Director
Review and Compliance Division

Subject: possible MVP Southgate - VDHR meeting

Roger (cc Alex) –

I hope all's well with you.

We wanted to see if you and other DHR staff would be interested in and available for a brief meeting on Monday, October 15th? Goal would be a brief discussion of work completed, results to date, and next steps, as well as an initial discussion of possible treatment options for a couple of likely eligible sites.

Please let me know if this would be of interest to you; if you're interested but that time doesn't work we'll see what we can work out.

Thanks,

Paul Webb

Renee –

Per my earlier email, MVP Southgate filed Resource Report 4 (cultural resources) with the FERC this morning. I am attaching a .pdf of the complete PUBLIC version of RR4 as filed (which includes Appendix 4-C, the Unanticipated Discoveries Plan) for your review. Also attached is Figure 4.5-1, which was filed as PRIVILEGED.

There is also a PRIVILEGED version of the SHPO correspondence, which I'll send via a FTP link due to its size.

We look forward to your review of these materials, including the Unanticipated Discoveries Plan. Also, please let me know if you have any difficulties with any of the files, need hard copies, or have any questions or concerns about the project.

Thanks,

Paul Webb
Cultural Resources Program Leader

Pittsburgh, PA 15222

Updated – August 13, 2018

INTRODUCTION

These proposed procedures have been developed to guide archaeological survey, site testing, and deep testing investigations conducted by TRC Environmental Corporation (TRC) for the MVP Southgate Project (Project) in North Carolina. The methods presented follow those outlined in the North Carolina Office of State Archaeology's (OSA) *Archaeological Investigations Standards and Guidelines* (December 2017) and also take into account the nature of the Project.

PHASE I SURVEY

As discussed in a May 10, 2018 meeting between MVP Southgate representatives and the North Carolina Historic Preservation Office (HPO) staff, specified in Federal Energy Regulatory Commission (FERC 2017) procedures, and acknowledged in a May 21, 2018 letter from the HPO (Renee Gledhill-Earley, letter of May 21, 2018), MVP Southgate is conducting a comprehensive archaeological survey of areas to be potentially affected by the development of the Project, including the proposed pipeline corridor and related appurtenances (compressor and meter station sites, additional workspaces, construction yards, access roads, etc.).

Survey Areas

The archaeological survey areas (which represent the direct effects Area of Potential Effects (APE) for the Project) will typically consist of a 300-foot wide corridor centered along the proposed pipeline route (which will likely only utilize a 100-foot wide construction corridor) and 50-foot wide corridors centered along proposed access roads, as well as the limits of proposed compressor station sites, workspaces and other facilities. All survey areas will be located in the field using GIS data and aerial photographs, and labeled according to a sequential survey segment number or according to the proposed facility name. No survey or other archaeological investigations will be conducted in any area without approved landowner access or otherwise in accordance with state law, and any landowner restrictions will be noted and followed. The field survey teams will be provided with current data regarding previously recorded cultural resources in the vicinity of the survey area as well as the potential for previously undiscovered cultural resources based on landform characteristics, historical maps, and other data sources.

Survey Techniques

The archaeological survey will begin with a visual inspection of the ground surface and the systematic collection of surface artifacts. (If it is evident that shovel testing will be required and there are no other complicating factors, survey will begin with shovel testing and no walkover will be conducted.) If some portion of the original land surface has been completely destroyed by modern activities (such as grading or industrial development), then no further survey will be conducted in that area beyond developing written and photographic documentation of the destruction and a map indicating the location and extent of the destroyed area.

The archaeological survey will include surface examination of all areas with good ground surface visibility, including cultivated fields as well as areas of ground exposure related to animal burrows, tree falls, dirt roads, or firebreaks. If there is greater than 50% visibility, there is 0–15% slope, and there is no possibility of an accretional/depositional environment (i.e., alluvial or colluvial soil deposition), the surface survey will consist of systematic surface examination at no greater than 10-meter (m) (33 feet) intervals. Surface examination of landforms located on greater than 15% slope will be conducted at 30-m (98.4 feet) intervals.

Where at least some portion of the original land surface remains intact, the landform exhibits 0–15% slope, and sufficient surface visibility is lacking, systematic subsurface testing (shovel testing) will be conducted.

Shovel tests will be round and measure no less than 30 centimeters (cm) in diameter, and will generally be excavated at 30-m (98.4 feet) intervals along 30-m interval transects within the 300-foot study corridor or otherwise at 30-m intervals along access roads within survey areas; shovel tests may also be excavated at closer intervals (down to 5-m intervals) as needed to investigate particular landforms (especially narrow ridgetops and higher landforms near streams and creeks, etc.). Shovel tests will be excavated to 100 cm below surface (cmbs), to hydric soils, or at least 20 cm into the sterile B horizon in upland environments with no potential for alluvial or colluvial deposition.

Three shovel test transects will generally be required to complete the survey. In areas where the survey area includes 300 feet of greenfield (i.e., previously undeveloped) corridor, transects will be placed along the centerline and 100 feet to either side. In areas where the survey area is co-located with an existing utility corridor and includes 150 feet of new right-of-way and 150 feet of existing corridor, shovel test transects will be excavated along the centerline and 100 feet from the centerline within the new right-of-way.

All soil excavated from shovel test pits will be screened through ¼-inch mesh hardware cloth over tarps to facilitate backfilling; if the soil type (for example, heavy clay) prohibits screening, this will be noted in the field and discussed in the report. Sufficient shovel test locations will be recorded via GPS to allow documentation of the location of all transects and shovel tests. Data on each shovel test will be recorded on shovel tests forms using standard USDA terminology (for horizon and texture) and Munsell color terms, and representative soil profiles will be photographed and drawn to scale. All tests will be backfilled promptly.

All artifacts recovered from shovel tests or surface inspection will be collected and bagged in the field according to provenience and natural stratigraphy. Provenience information will be recorded on each bag and on field forms. At a minimum, the following information will be recorded:

- Project Name;
- Survey Segment;
- Field Site Number;
- Transect Number;
- Shovel Test or Surface Transect Number;
- Stratum and Depth (cm below surface);
- Description/Count of Artifacts Collected;
- Date; and
- Excavator's Name or Initials.

If apparent cultural features are encountered within a shovel test, notes will be taken concerning feature type, depth, appearance, etc. No attempt will be made to enlarge the shovel test to recover additional artifacts, but the location will be noted and will be considered as a possible test unit location during site testing.

If shovel tests in alluvial settings do not reach channel gravels (lag deposits), that fact will be noted and the area will be designated as a potential deep testing area (see proposed methods below). If other alternate methods of site detection, including, but not necessarily limited to, metal detecting, remote sensing, plowing and surface collecting, or mechanized stripping are considered necessary, MVP Southgate will consult with OSA staff prior to implementing those approaches. In general, however, such techniques will be reserved for site testing.

Site Delineation

All locations at which pre-modern artifacts (i.e., those over 50 years old) are recovered or cultural features (i.e., foundations, possible pit features, etc.) are identified will be considered archaeological sites regardless of artifact density, as will cemeteries with interments prior to 1968, railroad grades or bridge abutments, and similar features. Ephemeral road traces (i.e., farm or logging roads) or rock piles presumably resulting from historic period field clearing will be noted, but not recorded as archaeological sites.

All site delineation will be conducted on a coordinate system, with N500 E500 assigned to a positive shovel test or surface collection block located near the center of the site (and on the centerline if possible).

Minimally (in the event of a single positive shovel test), at least four additional subsurface tests will be excavated at 15-m intervals in the cardinal directions from the original productive test (tests at 30-m intervals will have been completed as part of the survey). If no other cultural materials are recovered and no other indications of an archaeological site are noted, no additional shovel tests will be excavated. If additional artifacts (or surface features indicative of an archaeological site) are identified, delineation of sites will continue until two negative shovel tests have been excavated or the limits of the direct effects APE are reached. For larger sites, full interior delineation will be conducted at 15-m intervals within the survey area.

Surface sites will be investigated and delineated by collecting artifacts along additional, close-interval transects (generally spaced 5-m apart). In order to assess the nature of subsurface deposits at surface sites, sites in areas with surface visibility of 50% or greater will also be investigated with shovel tests at a density of no less than four per acre, which is roughly comparable to excavating shovel tests at 30-m intervals on transects spaced 30 m apart. At a minimum, one shovel test will be excavated at the location of all surface sites.

Summary data on each resource will be recorded by the Crew Lead on the Project Site Summary Form, and additional notes will be taken as necessary. All shovel test locations will be recorded on a sketch map, and all delineation shovel test locations (positive and negative) will be recorded via GPS. Once site delineation is completed, the site boundaries will be recorded as specified above. Digital color photographs will be taken of the site locations and associated cultural features, as outlined above.

PHASE II TESTING

Research Objectives

In some instances, more intensive Phase II site evaluation/testing may be needed to further evaluate the National Register of Historic Places (NRHP) eligibility of archaeological sites. The purpose of the work will be to evaluate the site's significance in terms of the NRHP *Eligibility Criteria*, as outlined in 36 CFR 60.4 (USDOI 1991). The *Eligibility Criteria* state:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:
>
> A. That are associated with events that have made a significant contribution to the broad pattern of our history; or
>
> B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic value, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield information important to history or prehistory.

Archaeological sites that are deemed eligible for the NRHP are generally recommended under Criterion D. In order to assess each site's potential under Criterion D, TRC will evaluate the site's integrity as well as its potential for providing new or substantial additional data concerning locally, regionally, or nationally relevant research topics. The work will also consider potential site eligibility under Criteria A, B, and/or C, however, and the final eligibility recommendation will address all four criteria.

The proposed testing strategies will take into account the nature of each site, including the archaeological components present, the nature and depth of deposits, and the type of ground cover. The work will seek to provide documentation of site structure (i.e., the spatial relationships among objects and the sediment matrix) and the recovery of archaeological data (artifacts, floral and faunal remains, contextual information, etc.) that will provide a basis for interpretations of site chronology, integrity, and function. Recovering such data will require documentation of the depth and horizontal extent of deposits, the identification of discrete deposits such as middens, pits, or other features, and the identification and documentation of functionally and chronologically related materials, such as the artifacts that manifest an activity area.

Specific research questions will be developed for each testing project and will vary according to the site age and type. The following questions will be addressed for each component being evaluated, and additional component-specific questions will also be developed as appropriate.

- Does the site appear to represent a single occupation or multiple occupations?
- If multiple occupations are present, what is the apparent horizontal and vertical integrity of the deposits associated with each occupation? How do the current spatial distributions of the artifacts from each occupation present relate to their likely depositional contexts? Is there evidence of appreciable post-depositional disturbances that would restrict research potential, either through bioturbation or due to plowing, logging, etc.?
- What is the apparent chronology of each occupation? Can the site potentially provide absolute chronometric data that can provide more refined intervals for the various occupations and contribute to the refinement of culture-historical chronological sequences?
- Is it possible to separate (horizontally and/or vertically) the artifact signatures of the various occupations (if present)? If individual occupation areas can be distinguished, what types of activities do they appear to represent?
- Does the site contain (or is it likely to contain) discrete pit features or other contexts that can be associated with individual components? Does the site appear to have the potential to produce subsistence data?
- Is there any evidence of postholes, foundations, or other architectural remains, or any indications that any of the site components are associated with multi-seasonal or long-term occupations?
- How did the activities represented by each occupation articulate into the broader settlement and subsistence patterns during the time period(s) represented?
- How representative are the remains and artifact assemblages from each occupation when compared to other sites with similar temporal components?

- For historic sites, is additional written or oral history documentation available that will assist in site interpretation?

- Given these factors, what is the potential that this site can provide additional substantive data that would contribute to our understanding of local, regional, or national prehistory or history.

Supplemental Background Research

TRC is conducting general background research on the archaeology of Rockingham and Alamance counties and the northern North Carolina Piedmont, including gathering archaeological reports and site forms relating to previous investigations and sites along the pipeline corridor. As part of the site evaluations, however, TRC will conduct additional research regarding sites and components similar to those being evaluated. As part of this review, the researchers will consider the methods used to identify sites and define site boundaries, data on artifact types and distributions, and previous recommendations and determinations concerning site integrity and significance. In the event that a site has been previously recorded, TRC will attempt to examine the material previously recorded from the site. In addition, for historic period sites, TRC will conduct additional documentary research, including review of census records, deeds, etc., to gain an understanding of the history of the site and its inhabitants.

Field Methods

Site Mapping and Documentation. The arbitrary coordinate system established during site delineation will be used to record all new shovel tests and larger excavation units. The datum location and grid will be shown on all maps, and the grid coordinates will be included as part of the identification of specific units and their artifact contents. In addition, once the temporary site datum has been relocated and the grid reestablished, the locations of all Phase I shovel tests will be re-established. If individual Phase I shovel tests cannot be recognized, their approximate locations will be identified with a GPS unit with sub-meter accuracy and the locations flagged.

A detailed site map will be prepared based on the Phase I map and will show the locations of the datum, prominent cultural and natural features, all relocated Phase I shovel tests, and all Phase II shovel test and test unit locations. Positive and negative shovel test locations will be differentiated, as will Phase I versus Phase II shovel tests. Any historic cultural features and other landscape features (such as logging roads, streams, etc.) also will be mapped. The final version of this map will be professionally drawn and will include an appropriate legend, a scale, and a north arrow.

All field activities will be documented in a field notebook maintained by the Field Director in which he/she will record daily observations and impressions concerning the progress and results of the work, as well as other relevant data. Standard forms will also be used to document specific aspects of the work, including Shovel Test Forms, Unit Level Forms, Unit Summary Forms, Feature Forms, Bag Lists, and Photo Logs, among others.

A variety of overview photographs will be taken, including general site photographs, photographs of significant cultural and natural features, photographs of various testing activities in progress, and photographs of excavation units and cultural features.

Remote Sensing. Remote sensing (including metal detecting and other techniques) may be employed if appropriate, especially to search for metal artifacts and/or subsurface features on potential early historic period or military sites.

Systematic Shovel Testing. Site testing will generally begin with completion of delineation efforts (if necessary) within the portion of the site situated within the environmental survey corridor (or within 15 m

of the narrower construction corridor if that has been defined). A limited number of additional tests may be placed at 5- to 10-m intervals around high-density tests to gather additional data, define the spatial dimensions of artifact concentrations, and determine the spatial relationships of inferred occupations or components at the site.

Shovel testing methods will follow those outlined above. Data on shovel test provenience and field artifact counts by artifact class and raw material will be entered into an Excel spreadsheet to assist in guiding subsequent investigations. Field assessment of artifacts will permit preliminary assessments of activity areas and component.

Test Unit Excavation. A limited number of larger, hand-excavated test units will then be excavated to gather additional artifact samples and stratigraphic information, and/or to investigate apparent features.

Test units will measure at least 1 × 1 m and will be excavated at least two sterile 10-cm levels deeper than the maximum depth of artifacts recovered in adjacent shovel tests to ensure that the lower deposits are sterile (except in the case of historic sites where excavations may stop at the base of the plowzone or occupation level once the stratigraphy is well understood). All units will be excavated in natural levels and will be subdivided into arbitrary levels so that no excavation layer is thicker than 10 cm, with the exception of the plowzone, which will generally be excavated as a single level. All excavated soil (except for feature contents, see below) will be screened through ¼-inch mesh for uniform artifact recovery, and soil and flotation samples will be taken as appropriate.

The number of units to be excavated will vary according to site size and the number of components or artifact concentrations present. In general, however, TRC anticipates excavation of from four to 16 1 × 1 m units to investigate a typical site.

Each excavated level will be documented on a Level Form, and the base of each level will be cleaned and examined for indications of archaeological features or other disturbance before excavation proceeds. Plan views will be drawn when warranted, and at least one wall profile of each unit will be drawn to scale as well as photographed. All soil horizons and strata will be described in standard scientific terms, including USDA terminology for soil horizons and soil texture, and Munsell color terminology. A catalog of field lot numbers will be maintained to keep track of the number of bags recovered and the date of recovery of artifacts, soil samples, radiocarbon samples, etc. from each test unit. A Unit Summary Form will also be completed for each unit excavated, and all units will be backfilled.

Digital color photographs will be taken to record significant data and information. All photographs will contain a scale, direction indicator (north arrow), and information (written on a menu board with plastic letters and numbers) identifying the site, date, and subject. The north arrow and information boards will be clearly readable in the photographs, but placed so as to not obscure the subject. Photo logs will be maintained for all photographs taken and will include the digital file number, direction of view, subject matter, and date.

Mechanized Stripping. Depending on the site type, vegetation cover, landowner permission, and safety concerns, limited mechanized stripping may be conducted to search for pit features and structural remains. Any stripping will utilize a Gradall or trackhoe equipped with a smooth-bladed bucket to remove the plowzone and search for cultural features at the top of the B horizon. At least one archaeologist will monitor all stripping, clean (shovel shave) the stripped surface as necessary, and identify potential features and postholes. All potential features and postholes will be marked with color-coded pin flags and mapped with a total station or a real-time kinematic (RTK) GPS unit, with appropriate information collected in the data collector. After appropriate investigation, all stripped areas will be returned to as close to their original contours as possible.

Cultural Feature Identification and Excavation. Special attention will be paid to the identification of potential cultural features, including prepared facilities (hearths, pits, wells, etc.), the remains of a discrete and/or narrow range of activities (such as a broken ceramic vessel or lithic debris from tool manufacture), or of a broader range of activities associated with a narrow time interval (such as a sheet midden or refuse-filled pit).

All possible cultural features encountered during unit excavation or stripping will be numbered consecutively, drawn and photographed in plan view, and investigated individually. Slightly different techniques will be used to excavated and record features depending on their size and class (or apparent association with structure patterns). Initially, each feature will be carefully defined by troweling or shovel shaving and mapped using a total station; more detailed individual plan maps will also be drawn of all substantial pits or other features. Photographs will be taken of the feature in plan. Each non-post feature (except those that appear potentially to be human graves) will be cross-sectioned along its long axis. The initial half will be excavated by natural strata (fill zones) if these can easily be recognized, or removed in a single unit if not. The feature will then be mapped and photographed in cross-section, and the remainder of the fill will be excavated by zone. If at any time a feature is determined to be non-cultural in origin (e.g., rodent burrow, tree root), excavation will be terminated. Rock cluster features (such as hearths) will be treated in similar fashion.

All information generated from feature excavation will be recorded on a feature form. Standard soil descriptions will be completed for each fill zone, and data will be recorded concerning form, evidence of burning, etc. Flotation samples (minimal 10 liters in volume) will be taken from each fill zone or feature, depending on its type and significance. The remaining feature fill will be screened through either 1/4-inch mesh or 1/16-inch mesh (window screen), depending on its provenience and logistical concerns. The finer 1/16-inch mesh will be used to maximize recovery of small faunal elements and such diagnostic artifacts as glass beads when appropriate.

Larger flotation samples (up to one half of the feature) will be taken from selected contexts that are known or believed to be rich in archaeobotanical remains. For rock clusters, a representative sample of soil will be retained from within the area of the rocks and immediately below the rocks. Radiocarbon samples will also be taken as appropriate.

Apparent postholes (stains less than 25 cm in diameter that do not appear to be smudge pits or other specialized pit types) that are not part of recognizable structure patterns will be cross-sectioned, and information recorded on diameter, cross-section form, fill type, depth, and associated artifacts. The fill from these posts will be screened through 1/4-inch or 1/16-inch mesh. Potential posts will be categorized as cultural, possibly cultural, or non-cultural based on their shape and other factors.

All posts making up possible structure patterns or palisade lines will be completely described and excavated, and the fill screened or taken for flotation samples as appropriate. Special care will be taken to recover charred wood samples from these posts for species identification or radiocarbon dating when possible. Structure-specific maps will be hand drawn and tied to the total station data. Photographs will also be taken of each individual structure and of representative sections of any palisade lines.

If large numbers of cultural features or postholes are identified and it is clear that the site is eligible for the NRHP, excavations will be limited to that necessary to confirm the integrity of the deposits, assess artifact density, and identify the potential for the preservation of subsistence remains. If the excavations encounter unusual soils or potential depositional environments, we will consult with a geomorphologist regarding the appropriate interpretation of site stratigraphy.

DEEP TESTING

Research Objectives

In some instances, more intensive mechanized deep testing may be needed to search for sites in deep alluvial deposits or to further evaluate the NRHP eligibility of archaeological sites. The nature and scale of deep testing at any specific location will be determined based on site and soil characteristics as well landowner concerns. Should major changes to these methods be needed, TRC will consult with OSA staff prior to their implementation.

Field Methods

Documentation. The location of all deep testing excavations will be recorded via GPS and according to the site grid, if appropriate. All deep testing will be conducted by a Project archaeologist skilled in the interpretation of soil stratigraphy and under the supervision of a geomorphologist. The location, depth, and stratigraphy of each excavated trench or probe will be recorded and documented through digital photography.

Mechanized Trenching. The deep testing will generally consist of the excavation of one or more trenches using a backhoe or trackhoe (preferably equipped with a smooth-bladed bucket), and may be supplemented by hand or mechanical coring or augering. Trenches will measure at least 30 inches in width and will be stepped or shored according to OSHA (2015) standards and TRC safety procedures.

Trenches will generally be placed in a single transect oriented along the proposed project centerline, although supplemental trenches may be placed elsewhere within the workspace as appropriate. Trenches will likely be discontinuous, with individual trench segments placed as necessary to assist in interpreting landform development. No trenches will be placed in wetlands or within 20 feet of a river or stream.

At least one wall of each trench will be cleaned as necessary to record and interpret stratigraphy. Soil profiles will be drawn and photographed, and soil samples will be taken for grain size analysis, AMS dating, and other analyses as appropriate. Should archaeological deposits or potential buried soil horizons be identified, a 50 × 50 cm soil column may be excavated and screened to evaluate potential artifact content. If appropriate, additional soil columns or shovel tests may also be excavated in the floor of the trench. Any cultural features identified will be isolated as feasible and excavated according to the procedures outlined above.

At the conclusion of the excavations, all trenches will be backfilled and the ground surface restored to grade as much as possible.

LABORATORY METHODS

Laboratory Analyses

In most cases, all recovered artifacts will be removed from the field for analysis in the laboratory using standard procedures (see below). If requested by the landowner, however, analyses may be conducted in the field and the artifacts replaced in the individual shovel test or on the surface, as appropriate. Any such in-field analyses will include counts of artifacts by type and provenience along with detailed descriptions and photographs of temporally diagnostic artifacts, but may lack the level of detail that could be obtained in a laboratory setting.

Artifact process and analyses will begin concurrent with the fieldwork and continue until completed. Details of all analytical techniques employed will be provided in the technical report, and a detailed

catalog/inventory of all artifacts by provenience will be provided as an appendix to the report and in electronic format.

Artifact Check-In and Washing. All artifact and sample bags will be inventoried at the end of each day of fieldwork, and all provenience data will be checked against field records at that time. All artifacts and samples will then be boxed according to the type of processing necessary and transferred to the laboratory for washing and analysis. All artifacts will then be washed, stabilized as necessary, and sorted by rough category to facilitate subsequent analysis.

Artifact Analyses. All artifacts will be systematically identified, classified, and analyzed using regionally- and temporally-relevant classification schemes that are appropriate to each particular artifact class.

The Native American ceramic assemblage (if present) will first be sorted into size categories. Sherds smaller than two cm will be counted, weighed, and examined for the presence of pipe fragments or unusual attributes, but will not be subjected to further analysis, unless such analysis is deemed crucial to defining chronologically sensitive attributes from certain discrete features or select unit level contexts. All sherds larger than 2 cm will be subjected to detailed analysis. Each sherd will be characterized according to surface treatment (e.g., net impressed, plain, etc.), adjunct decoration, and location of the extant fragment(s) in the original vessel (e.g., rim, neck, body, etc.). Where relevant, the rim profile configuration, type of rim, and type and location of any decorative elements will be recorded. The temper type and size of the aplastic (inclusion) content will be documented for each ceramic according to raw material type. The type of interior surface treatment will be recorded. The surface decoration and aplastic content from the preliminary analysis will be compared to published type descriptions and regional type collections, and type names will be applied as appropriate.

Lithic artifacts will first be sorted into a number of general categories, including chipped stone tools, chipped stone debitage, groundstone, and fire cracked rock. Chipped stone tools will then be described by general type (e.g., projectile point, biface, unifacial scraper, etc.). When possible, projectile points will be assigned type names based on those developed by previous regional researchers. Relevant measurements (including length, shoulder width, thickness, stem length, neck width, and base width for stemmed points) will be obtained for diagnostic and unbroken specimens, the raw material will be recorded (see below), and the artifact will be weighed. Other chipped stone tools and cores will be described using standard terminology (e.g., Stage II biface fragment, multifacial core, etc.).

Chipped stone debitage will be sorted by size and classified according to reduction stage. All chipped stone artifacts will then be classified by raw material category, which will be defined according to material type and such factors as color, texture, presence of inclusions, etc. as appropriate. Operational definitions for raw material types and other variables will be included in the report, along with primary references for all temporally diagnostic artifact types.

All soapstone (chlorite schist or steatite) and other ground stone artifacts will be individually described. Soapstone artifacts will be described according to form and apparent function, such as vessel fragment, perforated boiling slab, pipe, waste fragment, etc. Fire cracked rock (FCR) and apparent unmodified rock fragments from all contexts will be counted, weighed, and then discarded. This process may take place in the field for non-feature materials; materials from features will be washed and examined in the laboratory before being discarded. Representative samples of FCR from feature contexts may be retained for possible future analyses.

Historic artifacts will be initially divided into principal categories based on composition (i.e., ceramic, glass, metal, etc.) and function, using standardized and well-defined sorting criteria, and then classified according to published artifact descriptions. In addition, date ranges will be assigned to historic artifacts where

possible based on period of manufacture and/or commonly attributable period of usage. Most modern artifacts encountered will be noted, but not generally collected.

Specialized Analyses. If intact pre-modern cultural features or intact cultural strata are discovered, soil samples will be collected for various specialized analyses, including flotation processing and archaeobotanical analysis and radiocarbon/AMS analysis. Flotation samples will be processed using a Flote-Tech soil flotation system, and light and heavy fractions will be bagged separately and selected samples will be analyzed.

Archaeobotanical analysis will be conducted on botanical materials recovered from pre-modern features, identifying specimens to the most specific taxa possible to provide information regarding the use of plants by the site's occupants. Selected recovered faunal remains will be analyzed according to standard analytical techniques, concentrating on identifying the economic use(s) of the specimens by the site's inhabitants.

AMS or conventional radiocarbon samples from features or other selected contexts may be submitted for dating. All samples will be identified by the archaeobotanist prior to dating. Whenever possible, an attempt will be made to conduct AMS dating of identifiable botanical remains (i.e., individual nutshell fragments, maize cupules, etc.) rather than multiple wood charcoal fragments.

Curation. It is anticipated that most of the recovered artifacts will be returned to landowners at the conclusion of the project. If requested by OSA staff, however, MVP Southgate will attempt to procure selected collections for curation in the Office of State Archaeology Research Collection (OSARC) or elsewhere.

REPORTING

Draft and Final Reports. The complete descriptive, analytical, and interpretative results of the background research, fieldwork, and laboratory and data analyses, as well as an assessment of potential project effects on the site, will be provided in the form of a comprehensive draft final report. The report will be fully illustrated with appropriate maps and photographs, and will be professionally edited.

TRC will respond to all agency review comments in a timely manner, and the required printed and electronic copies of the Final Report will be provided.

All site eligibility recommendations will reference all four NRHP criteria, and will be only made for the portion of the site that was investigated for the Project. If any site is recommended eligible for the NRHP, the researchers will also provide an assessment of potential adverse effects to the site as well as recommendations concerning site avoidance or treatment options (including a preliminary research design addressing the information that could potentially be provided by data recovery excavations).

DISCOVERIES OF GRAVES OR HUMAN REMAINS

It is possible that human graves, potential graves, or human remains will be identified during any stage of the archaeological investigations.

If marked graves are identified, Project archaeologists will record the approximate cemetery boundary using GPS, and will record data concerning the number and age of the interments. No shovel tests or other excavations will be conducted within 25 feet of the apparent cemetery boundary without the approval of the North Carolina State Archaeologist. All cemeteries containing graves older than 50 years will be recorded as archaeological sites per OSA procedures.

In the event that potential graves (generally, oval to rectangular pit features containing mottled subsoil and organic fill) are identified during excavations, fieldwork will be halted within 25 feet of the location. Information regarding their number, location, and likely cultural affiliation will be provided to the State Archaeologist and the FERC Archaeologist assigned to the Project, and subsequent tribal notifications will be conducted at their direction. MVP Southgate anticipates that potential grave pits will be drawn, photographed, and re-covered with soil without any additional investigation. These locations will be recorded via GPS and an appropriate avoidance plan will be developed in association with the State Archaeologist. Although care will be taken to keep any specific potential grave locations confidential, if appropriate the potential grave location and a suitable buffer area will be marked in the field and shown on project mapping to ensure its protection.

If human remains or potential funerary objects are exposed during the work, the remains and/or funerary objects will be re-covered and work within 25 feet will stop immediately. TRC will immediately notify the North Carolina State Archaeologist and the FERC archaeologist. The State Archaeologist will then conduct additional notifications and consultation as needed in accordance with North Carolina General Statute 70-3, *The Unmarked Human Burial and Skeletal Remains Protection Act*, and additional tribal notifications and consultations will also be conducted following FERC procedures.

Throughout the fieldwork, analysis, and reporting, TRC will ensure that the treatment of any human remains and associated funerary objects discovered within the project area complies with all applicable state and federal laws and the Advisory Council on Historic Preservation's (2007) *Policy Statement Regarding Treatment of Burial Sites, Human Remains and Funerary Objects*.

MVP Southgate Project
Meeting Minutes

Meeting Date:	August 21, 2018
Meeting Location:	MVP Southgate Corridor
Meeting Leader:	Alex Miller, NextEra, Environmental Specialist
Minutes Prepared By:	Paul Webb, TRC Cultural Resources Lead
Participants:	Lindsay Ferrante, HPO/Office of State Archaeology (OSA) Katie Harville, HPO Rosie Blewitt-Golsch, HPO/OSA Kim Urban, HPO/OSA Tracy Millis, TRC, Cultural Resources Field Coordinator

Meeting Purpose:

Provide NC HPO staff with an opportunity to view MVP Southgate archaeological fieldwork. Participants visited ongoing deep testing/Phase II work at site 31RK222 in the Dan River vicinity and an historic cemetery (31RK234).

Discussion Points:

- HPO staff appreciated opportunity to visit fieldwork. MVP Southgate will keep HPO informed and arrange additional visits depending on site findings and any HPO concerns.
- HPO would like minimal 25 foot buffer at historic cemeteries; additional buffers may be appropriate depending on certainty regarding boundaries.
- HPO staff will likely report on visit at upcoming NC Commission on Indian Affairs meeting (Sept 7).

Subject: MVP Southgate Project, Construct Interstate Pipeline, Rockingham and Alamance Counties, ER 18-1041

Dear Mr. Webb:

Thank you for your letter of August 13, 2018, transmitting the draft resource report. We have reviewed the materials submitted and offer the following comments.

The archaeological survey is ongoing and has already resulted in the identification of 58 sites. Eleven of these sites are recommended unassessed for the National Register of Historic Places (NRHP) and 47 sites are recommended not eligible for the NRHP. We look forward to reviewing the report on the results of this survey work when it is submitted with the Certificate application. Five cemeteries have been identified in the project area. We note the inclusion of an amended work plan for Project Archaeological Survey, Testing, and Deep Testing Investigations in North Carolina that answers our previous question regarding how cemeteries will be marked in the field and on route plans to ensure they are avoided during construction. The Unanticipated Discovery Protocol, both for cultural resources that involve human remains or funerary objects and those that do not, are adequate for the protection of unexpected discoveries that may occur during construction. We look forward to continued work with TRC on this project.

The above comments are made pursuant to Section 106 of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Regulations for Compliance with Section 106 codified at 36 CFR Part 800.

Thank you for your cooperation and consideration. If you have questions concerning the above comment, contact Renee Gledhill-Earley, environmental review coordinator, at 919-807-6579 or environmental.review@ncdcr.gov. Remember to use the above assigned tracking number for any correspondence or questions concerning this undertaking. Failure to do so may cause delays in our response. We appreciate your time and consideration.

Sincerely,

Renee Gledhill-Earley

for Ramona M. Bartos

Rosie –

We're gotten an enquiry about 31AM431, which was apparently recorded on a landowner property recently. We'll be coming back over to do more research asap, but in the meantime is there any way you could provide a copy of the form? Any info welcomed, thanks...

Hi Paul,

I've attached your table with the permanent site numbers added. I've also attached the amateur site form for 31AM431. The landowner filled out a site form. She reported finding artifacts over the years on her property.

Best,
Rosie

RE: MVP Southgate Project, Virginia and North Carolina.

Dear Dr. Haire:

As requested, we are pleased to provide you with hard and digital copies of the prefiling draft of MVP Southgate Project Resource Report 4, which was filed with the FERC on August 13, 2018. Please note that this version of Resource Report 4 includes some pages marked CUI//PRIV that contain sensitive cultural resource information and were omitted from the publically filed document.

We look forward to your review of this material, including the Project Unanticipated Discoveries Plan. Please don't hesitate to contact me at (713) 374-1599 or via email at alex.miller@nee.com, or Paul Webb of TRC at (919) 530-8446 x222 or via email at pwebb@trcsolutions.com, with any questions or concerns that you or your staff might have.

Sincerely,

Alex V. Miller
Environmental Specialist
MVP Southgate

Re. THPO #	TCNS #	Project Description
2018-1055-2		Prefiling draft of MVP Southgate Project Resource Report 4

Dear Mr. Miller,

The Catawba have no immediate concerns with regard to traditional cultural properties, sacred sites or Native American archaeological sites within the boundaries of the proposed project areas. **However, the Catawba are to be notified if Native American artifacts and / or human remains are located during the ground disturbance phase of this project.**

If you have questions please contact Caitlin Rogers at 803-328-2427 ext. 226, or e-mail caitlinh@ccppcrafts.com.

Sincerely,

Caitlin Rogers for

Wenonah G. Haire
Tribal Historic Preservation Officer

CAUTION - EXTERNAL EMAIL

Dear Agnes,
Thank you for contacting the Eastern Band of Cherokee Indians, Tribal Historic Preservation Office (EBCI THPO) to engage in communications early in the process of planning for the Southgate project extension for the MVP. After following the link to your website to find the location of the projects, I can confirm that the counties: Pittsylvania, VA; Rockingham, NC; and Alamance, NC are outside of the designated Traditional Territory for the EBCI THPO. As such we will differ to the appropriate SHPOs and Native groups that have an interest in the project. If no other Tribal entities elect to participate in consultation, please let us know and we may choose to rejoin the consultation process as the project moves forward. If the project locations are modified or are discovered to be in additional counties please contact our office to potentially reinitiate consultation. Of primary concern to the EBCI THPO is that the remains of Native people are not disturbed. Thank you again for the opportunity to participate in this process.
Have you already contacted the Cherokee Nation and United Keetoowah Band of Cherokee Indians? While the extent of the boundary that the EBCI THPO is very similar to the extent of those Nations, there are some minor differences since the perimeters are generally delineated by modern county political boundaries.

Thank you,
Stephen

Subject: MVP Southgate Update

Russ, Miranda and Stephen,

MVP Southgate is requesting your review and comment on our draft resource reports, as they pertain to the Eastern Band of Cherokee's area of interest, within the next couple weeks. This will allow us to address concerns prior to filing our application to the Federal Energy Regulatory Commission (FERC) in early November. For public convenience, the resource reports were placed on our company webpage: http://www.mvpsouthgate.com/news-info/. They can also be found in the FERC eLibrary on the MVP Southgate docket PF18-4-000.

Please feel free to reach out to me at agnes.ramsey@nee.com or 561-691-2820, or you can contact my colleague, Alex Miller at alex.miller@nee.com or 713-374-1599, with any questions or concerns you have while performing your review.

Thank you in advance for your time,

Agnes S. Ramsey

Hi Paul,

Is there a shapefile, feature class, or gis service layer of the Proposed Route? The online map does not include parcels which would help considerably to know which sites will be impacted.
Katherine can be reached at 336-570-4052 or I can be reached 336-570-4102.

Very Respectfully,

Dear Ms. Liles –

Thanks very much for your response; we very appreciate your interest in the MVP Southgate Project.

The best available mapping is on the project website - http://www.mvpsouthgate.com/; if you go to the maps page - http://www.mvpsouthgate.com/maps/ - there is a scalable map of the route; you can zoom in and out and also change the background to an aerial photograph.

Hopefully this be useful as you look at the project in relation to historic properties. If you'd like more information or to discuss your concerns, please pass along a phone number and Alex Miller or I will give you a call.

Thanks,

Paul Webb

Good Morning,

Alamance County is in receipt of your letter of July 6th containing initial information to request input on the proposed pipeline's potential for historic impacts within the planning area. Alamance County does contain significant cultural resources and we would like to ensure that we participate in the siting process to ensure their protection.

The attached map is very generic and it would be difficult to use for planning purposes. Could you send us a GIS layer for Alamance County with your project planning area? This would help us better match data which would provide for more meaningful input.

Thank you,
Kathy Liles
Interim Planning Director

August 7, 2018

Mr. Buddy Boggs
Haw River Historical Association Museum
PO Box 103
Haw River, NC 27258

RE: MVP Southgate Project, Alamance County, North Carolina

Dear Mr. Boggs:

The purpose of this letter is to provide initial information to the Haw River Historical Association Museum regarding the proposed MVP Southgate Project (Project) and to request input regarding the Project from your organization under the provisions of the National Historic Preservation Act (NHPA, 54 U.S.C. 300101 et seq.) and its implementing regulations (36 CFR Part 800 [Protection of Historic Properties]).

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission pursuant to Section 7(c) of the Natural Gas Act to construct and operate the Project. The Project will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina (Attachment 1). Mountain Valley proposes to construct approximately 72 miles of 24-inch-diameter natural gas pipeline to provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States.

On May 3, 2018, Mountain Valley filed a request with the Federal Energy Regulatory Commission ("FERC") to use the National Environmental Policy Act pre-filing process ("Pre-filing Process") for the MVP Southgate Project and the FERC issued a Pre-Filing docket number (PF18-4-000) to place information related to the Project into the public record. On May 15, 2018, the FERC granted Mountain Valley's Pre-Filing request. The Pre-filing Process provides all stakeholders (including federal, state and local agencies, landowners, and local citizens) the opportunity for early cooperation and involvement in evaluating the project prior to filing a formal application with the FERC. Following the Pre-filing Process, Mountain Valley will file a formal application for review and approval from the FERC, and numerous other agencies. The permit proceedings, which will be conducted by these agencies, will provide additional opportunity for public input and involvement. The FERC application is currently targeted to be filed in November 2018. All other federal agency applications are planned to be filed in a similar time frame.

In North Carolina, the proposed Project facilities include approximately 26 and 20 miles of 24-inch-diameter natural gas pipeline in Rockingham and Alamance County, respectively. Aboveground facilities in Rockingham County include the Russell Compressor Station in Rockingham County, a pig launcher, two mainline valves, and two meter stations. In Alamance County, the aboveground facilities include a pig receiver, three mainline valves, and one meter station.

The Project cultural resource investigations in North Carolina will be conducted in accordance with federal and state regulations, including the FERC Office of Energy Projects' Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects (2017) and Guidance Manual for Environmental Report Preparation (2017), (36 CFR Part 800, Protection of Historic Properties), the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (36 CFR Part 61), and the North Carolina State Historic Preservation Office's Archaeological Investigations Standards and Guidelines (2017), Architectural Survey Manual (2008), and Report Standards for

Historic Structure Survey Reports/Determinations of Eligibility/Section 106/110 Compliance Reports in North Carolina.

Via this letter, we would like to solicit any information that your organization may have regarding cultural resources that could potentially be affected by the project or regarding any other concerns that you might have. Please feel free to contact me at (713) 374-1599 or via email at alex.miller@nee.com. Paul Webb of TRC will be coordinating the cultural resource compliance activities for the Project, and can be reached at (919) 530-8446 x222 or via email at pwebb@trcsolutions.com.

Thank you for your time and consideration. We look forward to receiving any input that you might have.

Sincerely,

Alex V. Miller

Ms. Jordan Rossi
Executive Director
Rockingham County Historical Society
1086 NC Highway 65
Reidsville, NC 27320

RE: MVP Southgate Project, Rockingham County, North Carolina

Dear Ms. Rossi:

The purpose of this letter is to provide initial information to the Rockingham County Historical Society regarding the proposed MVP Southgate Project (Project) and to request input regarding the Project from your organization under the provisions of the National Historic Preservation Act (NHPA, 54 U.S.C. 300101 et seq.) and its implementing regulations (36 CFR Part 800 [Protection of Historic Properties]).

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission pursuant to Section 7(c) of the Natural Gas Act to construct and operate the Project. The Project will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina (Attachment 1). Mountain Valley proposes to construct approximately 72 miles of 24-inch-diameter natural gas pipeline to provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States.

On May 3, 2018, Mountain Valley filed a request with the Federal Energy Regulatory Commission ("FERC") to use the National Environmental Policy Act pre-filing process ("Pre-filing Process") for the MVP Southgate Project and the FERC issued a Pre-Filing docket number (PF18-4-000) to place information related to the Project into the public record. On May 15, 2018, the FERC granted Mountain Valley's Pre-Filing request. The Pre-filing Process provides all stakeholders (including federal, state and local agencies, landowners, and local citizens) the opportunity for early cooperation and involvement in evaluating the project prior to filing a formal application with the FERC. Following the Pre-filing Process, Mountain Valley will file a formal application for review and approval from the FERC, and numerous other agencies. The permit proceedings, which will be conducted by these agencies, will provide additional opportunity for public input and involvement. The FERC application is currently targeted to be filed in November 2018. All other federal agency applications are planned to be filed in a similar time frame.

In North Carolina, the proposed Project facilities include approximately 26 and 20 miles of 24-inch-diameter natural gas pipeline in Rockingham and Alamance County, respectively. Aboveground facilities in Rockingham County include the Russell Compressor Station in Rockingham County, a pig launcher, two mainline valves, and two meter stations. In Alamance County, the aboveground facilities include a pig receiver, three mainline valves, and one meter station.

The Project cultural resource investigations in North Carolina will be conducted in accordance with federal and state regulations, including the FERC Office of Energy Projects' Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects (2017) and Guidance Manual for Environmental Report Preparation (2017), (36 CFR Part 800, Protection of Historic Properties), the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (36 CFR Part 61), and the North Carolina State Historic Preservation Office's Archaeological Investigations Standards and Guidelines (2017), Architectural Survey Manual (2008), and Report Standards for

Historic Structure Survey Reports/Determinations of Eligibility/Section 106/110 Compliance Reports in North Carolina.

Via this letter, we would like to solicit any information that your organization may have regarding cultural resources that could potentially be affected by the project or regarding any other concerns that you might have. Please feel free to contact me at (713) 374-1599 or via email at alex.miller@nee.com. Subject: FW: MVP southgate project location map

Dear Ms. Plaster –

I hope all is well with you; I just wanted to check and see if you had the information that you needed for the Society's review.

Also, if you are interested we can try to arrange to have someone from the project attend to provide an overview and answer any questions, just let me know.

Thanks,

Paul Webb

Dear Ms. Plaster –

I enjoyed speaking with you this morning, and appreciate the Historical Society's interest in the MVP Southgate Project.

As we discussed, the best available mapping is on the project website - http://www.mvpsouthgate.com/; if you go to the maps page - http://www.mvpsouthgate.com/maps/ - there is a scalable map of the route; you can zoom in and out and also change the background to an aerial photograph.

I hope this is useful and look forward to hearing the Society's input; if you have any problems with the map or any questions feel free to contact me via phone or email.

Thanks,

Paul Webb

As President of the Pittsylvania Historical Society, I respond to your July, 2018 certified mail (to former President Larry Aaron – now a nursing home resident) to request a more definitive map (with appropriate designations and/or descriptions) of the 26 miles depicted by a blue line for Pittsylvania County, Virginia, in the "Project Overview Map." Our organization's next meeting will be the third Monday in August. We wish to consider input about the proposed route, as requested. However, more precise information is required to determine designated sites before addressing impact and proximity to historic properties. I contacted Pittsylvania County administration to learn it has no additional map information from you to share. Therefore, know our appreciation for your consideration of this notice requesting assistance for a prompt reply.

Ms. Diane Barbour
Virginia-North Carolina Piedmont Genealogical Society
P.O. Box 1103
Danville, VA 24543-1103

RE: MVP Southgate Project, Pittsylvania County, Virginia

Dear Ms. Barbour:

The purpose of this letter is to provide initial information to the Virginia-North Carolina Piedmont Genealogical Society regarding the proposed MVP Southgate Project (Project) and to request input regarding the Project from your organization under the provisions of the National Historic Preservation Act (NHPA, 54 U.S.C. 300101 et seq.) and its implementing regulations (36 CFR Part 800 [Protection of Historic Properties]).

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission pursuant to Section 7(c) of the Natural Gas Act to construct and operate the Project. The Project will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina (Attachment 1). Mountain Valley proposes to construct approximately 72 miles of 24-inch-diameter natural gas pipeline to provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States.

On May 3, 2018, Mountain Valley filed a request with the Federal Energy Regulatory Commission ("FERC") to use the National Environmental Policy Act pre-filing process ("Pre-filing Process") for the MVP Southgate Project and the FERC issued a Pre-Filing docket number (PF18-4-000) to place information related to the Project into the public record. On May 15, 2018, the FERC granted Mountain Valley's Pre-Filing request. The Pre-filing Process provides all stakeholders (including federal, state and local agencies, landowners, and local citizens) the opportunity for early cooperation and involvement in evaluating the project prior to filing a formal application with the FERC. Following the Pre-filing Process, Mountain Valley will file a formal application for review and approval from the FERC, and numerous other agencies. The permit proceedings, which will be conducted by these agencies, will provide additional opportunity for public input and involvement. The FERC application is currently targeted to be filed in November 2018. All other federal agency applications are planned to be filed in a similar time frame.

In Virginia, the proposed Project facilities in Pittsylvania County include approximately 26 miles of 24-inch-diameter natural gas pipeline, the Lambert Compressor Station, a pig launcher and receiver, three mainline valves, and one meter station. The Project cultural resource investigations in Virginia will be conducted in accordance with federal and state regulations, including the FERC Office of Energy Projects' Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects (2017) and Guidance Manual for Environmental Report Preparation (2017), (36 CFR Part 800, Protection of Historic Properties), the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (36 CFR Part 61), and the VDHR's Guidelines for Conducting Historic Resources Survey in Virginia (2017).

Via this letter, we would like to solicit any information that your organization may have regarding cultural resources that could potentially be affected by the project or regarding any other concerns that you might have. Please feel free to contact me at (713) 374-1599 or via email at alex.miller@nee.com.

Paul Webb of TRC will be coordinating the cultural resource compliance activities for the Project, and can be reached at (919) 530-8446 x222 or via email at pwebb@trcsolutions.com.

Afro-American Historical and Genealogical Society of North Carolina, Inc.
P.O. Box 36254
Greensboro, NC 27416

RE: MVP Southgate Project, Rockingham and Alamance Counties, North Carolina

Dear Sir or Madam:

The purpose of this letter is to provide initial information to the North Carolina Piedmont Triad Chapter of the Afro-American Historical and Genealogical Society of North Carolina regarding the proposed MVP Southgate Project (Project) and to request input regarding the Project from your organization, under the provisions of the National Historic Preservation Act (NHPA, 54 U.S.C. 300101 et seq.) and its implementing regulations (36 CFR Part 800 [Protection of Historic Properties]).

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission pursuant to Section 7(c) of the Natural Gas Act to construct and operate the Project. The Project will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina (Attachment 1). Mountain Valley proposes to construct approximately 72 miles of 24-inch-diameter natural gas pipeline to provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States.

On May 3, 2018, Mountain Valley filed a request with the Federal Energy Regulatory Commission ("FERC") to use the National Environmental Policy Act pre-filing process ("Pre-filing Process") for the MVP Southgate Project and the FERC issued a Pre-Filing docket number (PF18-4-000) to place information related to the Project into the public record. On May 15, 2018, the FERC granted Mountain Valley's Pre-Filing request. The Pre-filing Process provides all stakeholders (including federal, state and local agencies, landowners, and local citizens) the opportunity for early cooperation and involvement in evaluating the project prior to filing a formal application with the FERC. Following the Pre-filing Process, Mountain Valley will file a formal application for review and approval from the FERC, and numerous other agencies. The permit proceedings, which will be conducted by these agencies, will provide additional opportunity for public input and involvement. The FERC application is currently targeted to be filed in November 2018. All other federal agency applications are planned to be filed in a similar time frame.

In North Carolina, the proposed Project facilities include approximately 26 and 20 miles of 24-inch-diameter natural gas pipeline in Rockingham and Alamance County, respectively. Aboveground facilities in Rockingham County include the Russell Compressor Station in Rockingham County, a pig launcher, two mainline valves, and two meter stations. In Alamance County, the aboveground facilities include a pig receiver, three mainline valves, and one meter station.

The Project cultural resource investigations in North Carolina will be conducted in accordance with federal and state regulations, including the FERC Office of Energy Projects' Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects (2017) and Guidance Manual for Environmental Report Preparation (2017), (36 CFR Part 800, Protection of Historic Properties), the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (36 CFR Part 61), and the North Carolina State Historic Preservation Office's Archaeological Investigations Standards and Guidelines (2017), Architectural Survey Manual (2008), and Report Standards for Historic Structure Survey Reports/Determinations of Eligibility/Section 106/110 Compliance Reports in North Carolina.

Via this letter, we would like to solicit any information that your organization may have regarding cultural resources that could potentially be affected by the project or regarding any other concerns that you might have. Please feel free to contact me at (713) 374-1599 or via email at alex.miller@nee.com. Dear Ms. Rossi –

Alex Miller passed along your request for more detailed mapping of the MPV Southgate route for use by the Museum and Archives of Rockingham County/Rockingham Historical Society in examining the potential route and its relationship to historic sites and other cultural resources.

I'm attaching a .kmz of the centerline that can be viewed in Google Earth in the hopes that it will be helpful; if you have any questions or comments, or need anything, please don't hesitate to let one of us know.

Thanks,

Paul Webb

MVP Southgate Project

FERC Docket No. CP19-XX-000

November 2018

TABLE OF CONTENTS

1.0 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission ("FERC" or "Commission") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Southgate Project" or "Project"). The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina.

Mountain Valley recognizes that, despite the extensive archaeological field investigations that are conducted prior to Project construction, it is possible that potentially significant cultural resources could be discovered during construction, especially during excavation activities. The Southgate Project recognizes its role to protect and preserve cultural resources that may be found during construction in accordance with federal and state regulations. Cultural resources in this context are defined as archaeological sites, objects, and features and include human remains and associated or unassociated funerary objects.

This *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* ("Plan") was developed on behalf of the Southgate Project and in consultation with the Virginia Department of Historic Resources ("VDHR") and the North Carolina Historic Preservation Office ("NC HPO"), which represent the State Historic Preservation Officers ("SHPOs") in Virginia and North Carolina, respectively. This Plan summarizes the approach the Project will follow to address the discovery of archaeological finds or human remains during construction activities within the Project's Area of Potential Effects ("APE").

2.0 GUIDELINES, REGULATIONS, AND LEGISLATION FOR UNANTICIPATED DISCOVERIES OF CULTURAL RESOURCES AND HUMAN REMAINS

The stipulations of the Plan as set forth below are in accordance with the current guidelines detailed in the following federal and state guidelines, regulations, and legislation:

2.1 Federal

- Section 106 of the *National Historic Preservation Act ("NHPA"),* as amended (54 United States Code ("USC") 306101 et seq.)
- Secretary of the Interior's *Standards for Archeology and Historic Preservation* (48 FR 44716-42)
- Advisory Council for Historic Preservation's ("ACHP's"): *Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects* (ACHP February 23, 2007)
- Federal Energy Regulatory Commission's ("FERC") Office of Pipeline Regulations *Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects* (FERC 2017);

2.2 Virginia

- VDHR's *Guidelines for Conducting Historic Resources Survey in Virginia* (2017)
- Virginia Antiquities Act, (§ 10.1-2305 Code of Virginia), "Permit required for the archaeological excavation of human remains;"

2.3 North Carolina

- North Carolina Office of State Archaeology's ("OSA's") *Archaeological Investigations Standards and Guidelines* (OSA December 2017)

- North Carolina General Statute 70-3, *The Unmarked Human Burial and Skeletal Remains Protection Act.*

3.0 CONSULTATION WITH SHPOS AND NATIVE AMERICAN TRIBES

The Southgate Project initiated consultation with VDHR and NC HPO on April 27, 2018. The Project is also contacting federally-recognized Native American Tribes to solicit their concerns and input regarding potential Project effects to historic properties, tribal resources, and human remains. Contact information for the VDHR, NC HPO, and the tribes is included in Section 5.0 of this Plan. In the event that cultural resources and/or human remains are encountered during construction, the Project will notify the VDHR or NC HPO (as applicable), those tribes that have asked to be consulted in the event of a discovery ("Interested Tribes"), any other consulting parties for the Project (potentially including non-federally recognized tribes or other organizations), and/or law enforcement, as outlined below.

4.0 UNANTICIPATED DISCOVERY PROTOCOL

4.1 Cultural Resources Training

The Southgate Project requires that its employees and contractors have a basic understanding of the nature of cultural resources, and all Project inspectors and construction contractor personnel will be given basic training in cultural resource site recognition prior to beginning work on the Project.

The cultural resource training will review the Project's commitments regarding cultural resources compliance and provide examples of the types of archaeological resources that may be encountered during construction. In addition, the training program will emphasize the exact procedures to be followed, as outlined in this Plan, regarding actions to be taken and notifications required in the event of a significant site discovery or a discovery of human remains during construction.

The training will ensure that Southgate Project personnel and construction contractors understand the extent of the archaeological survey program that has been performed for the Project and are fully aware of the distinction between sites that have been located and "cleared" under the cultural resource program (i.e., sites that have determined to be non-significant after different levels of investigation or have already undergone data recovery excavations) and new discoveries that may be made during the construction process.

4.2 Notification and Assessment Procedures (Not Involving Human Remains or Funerary Objects)

The following steps will to be followed in the event an unanticipated discovery (not involving human remains or funerary objects) is made during Southgate Project construction:

1 The Contractor will immediately notify the Lead Environmental Inspector ("EI") (or Chief Inspector, if the Lead EI is not immediately available) of an unanticipated discovery.

2 The Lead EI or Chief Inspector will direct a *Stop Task Order* to the Contractor's Site Foreman to ensure that the activity within 100 feet of the unanticipated discovery ceases and will instruct the Contractor to flag or fence off the discovery location and take any necessary measures to ensure site security. Any unanticipated discovery made on a weekend or overnight hours will be protected with security fencing until all appropriate parties are notified of the discovery. The

Contractor will not restart work in the area of the find until the Chief Inspector has agreed in writing that work can resume.

3 The Lead EI will inform the Project Archaeologist ("PA") of the discovery. If the PA determines that the location is not an archaeological site, or determines that the find is a previously known and cleared archaeological resource and that the find would not alter the current understanding of the resource, the PA will report that documentation to the Lead EI. The Lead EI will document that determination and notify the Chief Inspector to resume work.

4 If the PA determines that the find is not a previously known and cleared resource, or potentially represents information that would alter the current understanding of a previously known and cleared archaeological resource, she/he will notify the Project. Within 24 hours of notification, the PA will conduct a preliminary field assessment of the discovery to determine if it is potentially a significant archaeological site.

5 If based on that inspection the PA determines that the discovery is an isolated find or otherwise not a potentially significant archaeological site, the PA will report that determination to the EI. The Lead EI will document that determination and notify the Chief Inspector to resume work.

6 If the PA determines that the find is a newly identified archaeological site, or represents information that would alter the current understanding of a previously known and cleared archaeological resource, the PA will inform the Southgate Project, the Lead EI, and the Chief Inspector of that determination.

   a. Within 24 hours of that determination, the Project will notify the FERC, the relevant SHPO, and the Interested Tribes of the determination. Work within the flagged or fenced off discovery location will not resume until authorized by the FERC.

   b. Following consultation with the relevant SHPO, the FERC, and Interested Tribes, the PA will evaluate the discovery and assess its horizontal and vertical extent, cultural association(s), and integrity.

   c. The PA will inform the Project, the Lead EI, the Chief Inspector, the FERC, the relevant SHPO, and the Interested Tribes of the findings and recommendations. If the FERC, in consultation with the SHPO and Interested Tribes, determines that the find is not eligible for the NRHP, the Chief Inspector will grant clearance for construction to resume. If the FERC determines that the find is eligible for the NRHP, the Project will authorize the PA or their designee to develop an archaeological treatment plan that will be submitted to the FERC, the relevant SHPO, and Interested Tribes (if appropriate) for review and comment.

   d. Upon authorization by the FERC, the Project will implement the treatment plan.

   e. At the conclusion of archaeological fieldwork, a meeting or site visit may be held with the FERC, the Project, the relevant SHPO, and the Interested Tribes to review the results of the work accomplished.

f. Upon receiving written acceptance of the results of the implemented treatment from the FERC, the Lead EI and Chief Inspector will grant clearance to the construction team to resume work.

4.3 Notification and Treatment Procedures (Human Remains or Funerary Objects)

The Southgate Project will treat any human remains encountered during the Project in a manner guided by the ACHP's *Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects* (2007) and by the relevant state laws and guidelines. In particular, human remains must be treated with the utmost dignity and respect at all times. Human remains and/or associated artifacts (including grave markers, coffin hardware, or funerary objects) will be left in place and not disturbed, and no unnecessary photographs will be taken. No skeletal remains or materials associated with the remains will be collected or removed until appropriate consultation has taken place and a plan of action has been developed. All personnel involved with the discovery will maintain confidentiality concerning the remains, and any press contacts will be referred to appropriate Project or agency personnel.

The following measures will be taken in the event an unanticipated discovery of potential or confirmed human remains or funerary objects is made during Project construction.

1 The Contractor will immediately notify the Lead EI (or Chief Inspector, if the Lead EI is not immediately available) of the discovery.

2 The Lead EI or Chief Inspector will direct a *Stop Task Order* to the Contractor's Site Foreman to ensure that work within 100 feet of the discovery ceases. The Lead EI or Chief Inspector will instruct the Contractor to flag or fence off the discovery location and take any necessary measures to ensure site security. Work will not resume in the area of the find until the Chief Inspector grants clearance to recommence work (see below).

3 All human remains and/or funerary items will be left in place and treated with dignity and respect. All efforts will be made to exclude the general public from viewing any gravesites and/or funerary objects.

4 The Lead EI will contact the Project and the PA on the day of the discovery, and the PA will examine the discovery within 24 hours of notification. If the PA determines that the finds are human remains or funerary items, the PA will immediately notify the Project.

   For finds in Virginia, the Project will immediately notify the FERC, the landowner, and the VDHR of the find, as well as the Virginia State Police.

   For finds in North Carolina, the Project will immediately notify the FERC, the landowner, the County Medical Examiner, and the North Carolina State Archaeologist, who shall conduct further notifications per North Carolina General Statute 70-3, *The Unmarked Human Burial and Skeletal Remains Protection Act.*

5 If, upon inspection by the appropriate legal authorities, the remains are determined to be a criminal matter and not archaeological, the Project will await clearance by the appropriate legal authorities before resuming construction.

6 If the find is determined not to be a criminal matter, the Southgate Project will comprehensively evaluate the potential to avoid and/or minimize the Project's effects to the human remains.

a. If human remains are determined to be Native American, the remains will be left in place and protected from further disturbance with security fencing and if necessary, a security guard until a site-specific work plan for their avoidance or, if necessary, their removal can be generated. Note that avoidance is the preferred choice of the SHPOs and Tribes. The Project will contact FERC, the appropriate SHPO, and the Interested Tribes to develop a plan of action.

b. If human remains are determined to be non-Native American, the remains will be left in place and protected from further disturbance with security fencing and if necessary, a security guard until a site-specific work plan for their avoidance or removal can be generated. Please note that avoidance is the preferred choice of the SHPOs. Consultation with the SHPO and other appropriate parties, in accordance with Virginia or North Carolina state law, will be required to determine a treatment plan.

c. In Virginia, if human skeletal remains must be removed, the Project will obtain a Permit for *Archaeological Removal of Human Burials* from the VDHR and consultation will be conducted with Interested Tribes, and lineal descendants, as appropriate. In North Carolina, any removal of human remains would be done in accordance with *The Unmarked Human Burial and Skeletal Remains Protection Act* and other relevant state statutes, and through consultation with the NC HPO, Interested Tribes, and lineal descendants, as appropriate.

d. The Project will be responsible for all costs associated with the discovery, evaluation and agency consultation, excavation, investigation and study, disinterment, repatriation, re-interment, reporting, and curation of any human remains and associated funerary items encountered during Project construction.

e. Project construction may resume within the flagged or fenced off discovery location only after successful implementation of the treatment plan and after the Project receives written approval by the FERC, the relevant SHPO, and the Interested Tribes.

Re: (1) *Phase I Archaeological Survey for the MVP Southgate Pipeline Project, Pittsylvania County, Virginia* (November 2018)
(2) *Historic Architectural Survey for the MVP Southgate Pipeline Project, Pittsylvania County, Virginia* (November 2018)
DHR File No. 2018-3545; FERC Docket No. PF18-4-000

Dear Mr. Webb:

The Virginia Department of Historic Resources (DHR) has received for review the reports referenced above prepared by TRC Environmental Corporation (TRC) for MVP Southgate, LLC (MVP). We have reviewed the documents and supporting documentation and provide the following comments as assistance to MVP and the Federal Energy Regulatory Commission (FERC) in meeting their responsibilities under Section 106 of the National Historic Preservation Act.

Archaeological Survey

The draft report addresses the archaeological potential of 25.5 miles of pipeline, .05 miles of lateral, 21.6 miles of access roads, one (1) compressor station, two (2) MLV sites, and one (1) contractor yard. The remaining length of pipeline and other ancillary facilities will be considered in future reports. The survey documented 23 archaeological sites and 19 isolated finds. No further work is recommended for the isolated finds except for VA-FS-30. Isolated Find VA-FS-30 should be investigated with shovel tests when access to the property is granted. An additional 13 previously recorded sites are mapped within the project area but were not relocated as part of this study and no further consideration of these resources is warranted.

Of the 23 sites identified, TRC recommends, and DHR concurs, that the following 11 sites are *not eligible* for listing in the National Register of Historic Places (NRHP): **44PY0261**, **44PY0442**, **44PY0446**, **44PY0448**, **44PY0450**, **44PY0453**, **44PY0456**, **44PY0457**, **44PY0458**, **44PY0459**, and **44PY0460**. Further, TRC recommends, and DHR concurs, that the following sites warrant no additional consideration in regards to this project, but should be managed as *unevaluated* for NRHP eligibility: **44PY0358** and **44PY0452**.
DHR recommends the following sites a *potentially eligible* for NRHP listing: **44PY0270**, **44PY0281**, **44PY0375**, **44PY0445**, **44PY0447**, **44PY0449**, **44PY0451**, **44PY0454**, and **44PY0455**. Finally, DHR concurs that **44PY0271** warrants further investigation for this project, but is currently unevaluated. The nine

(9) potentially eligible sites should be avoided or subject to Phase II evaluation. We agree that impacts to site 44PY0447 will be avoided through the alternative presented in the report.

Historic Architectural Survey

The draft report records and evaluates for NRHP listing 74 architectural properties which are fifty years old or older located within the project's Area of Potential Effects (APE). Of these 74 properties, 17 were previously identified while 57 are newly recorded. It should be noted that TRC acknowledges that there remain an additional 19 previously documented architectural properties within the APE that are not considered in this report; however, these resources require additional survey and documentation. They will be addressed in a future report.

Among the 74 recorded architectural resources, the consultant identified one (1), Little Cherrystone Manor/Wooding House (DHR ID #071-0036), as being listed in the NRHP. TRC also recommends five (5) properties, Giles Log House (DHR ID #071-5222), Farmstead, Batterman Lane (DHR ID #071-5571), House, Batterman Road (DHR ID #071-5572), Farmstead, Woodlawn Academy Road (DHR ID #071-5578), and Farmhouse, Woodlawn Academy Road (DHR ID #071-5580), as potentially eligible for listing in the NRHP and one building, Farm, Route 868 (DHR ID #071-5217), as "Undetermined" due to the consultant's limited access to the resource. The consultant recommends the remaining 67 architectural resources not NRHP eligible.

DHR concurs with TRC that **071-0036** should retain its NRHP-*listed* status. We further agree with the consultant that **071-5222** is *potentially eligible* for NRHP listing under Criterion C for its architectural merit; and **071-5580** is *potentially eligible* for NRHP listing under Criterion A for settlement and Criterion C for architecture. DHR disagrees with the recommendations for **071-5571**, **071-5572** and **071-5578** and recommend these resources as *not eligible* for NHRP listing. It is our opinion that these buildings are stylistically unremarkable and have undergone modern alterations including window replacement and the addition of vinyl siding. DHR recommends treating **071-5217** as *potentially eligible* for NRHP listing for Section 106 purposes until the property can be properly surveyed and evaluated.

The DHR concurs with TRC's recommendation that the following architectural properties are *not eligible* for listing in the NRHP: **071-5033**, **071-5208 through 071-5211 (inclusive)**, **071-5218**, **071-5221**, **071-5224**, **071-5225**, **071-5226**, **071-5525**, **071-5526**, **071-5566 through 071-5570 (inclusive)**, **071-5573 through 071-5577 (inclusive)**, **071-5579**, **071-5581 through 071-5597 (inclusive)**, **071-5599 through 071-5619 (inclusive)**, **071-5621**, **071-5622**, and **071-5623**.

DHR disagrees that 071-5212 is no longer eligible for the NRHP due to its outbuildings being removed. The farmhouse was previously determined to be eligible under Criterion C, architecture. Although it is unfortunate that the farmstead's agricultural outbuildings are no longer extant, this does not diminish the architectural merit of the main house. We believe **071-5212** should still be considered NRHP *eligible*. We also believe the late-19th century railroad (DHR ID #**071-5598**) should either be subjected to a *Phase II (Intensive) Level Survey or be considered eligible* for listing in the NRHP for Section 106 purposes under Criterion A, transportation. Finally, DHR recommends that Wallor Cemetery (DHR ID #**071-5227**) and Cemetery, off Hopewell Road (DHR ID #**071-5620**) should either be *treated as NRHP eligible or evaluated under a Phase II (Intensive) Level Survey*. Both these cemeteries contain unusual headstone designs which are, to our knowledge, unknown elsewhere in Virginia.

Thank you for the opportunity to review these documents. If you have any questions regarding these comments, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Re: *Historic Architectural Survey for the MVP Southgate Pipeline Project, Pittsylvania County, Virginia* (revised July 2019)
DHR File No. 2018-3545; FERC Docket No. PF18-4-000

Dear Mr. Webb:

The Virginia Department of Historic Resources (DHR) has received for review the report referenced above prepared by TRC Environmental Corporation (TRC) for MVP Southgate, LLC (MVP). This revised report was prepared in response to DHR's February 13, 2019 comments. It is our opinion that the revised report addresses our previous comments. We look forward to receiving your assessment of effects for those properties determined or treated as eligible for listing in the National Register of Historic Places.

Thank you for your continued consideration of historic properties in the planning of this project. If you have any questions regarding these comments or our review of this project, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,

Roger W. Kirchen, Director
Review and Compliance Division\

Re: *Addendum 1, Historic Archaeological Survey for the MVP Southgate Pipeline Project, Pittsylvania County, Virginia* (September 2019)
DHR File No. 2018-3545; FERC Docket No. PF18-4-000

Dear Mr. Webb:

The Virginia Department of Historic Resources (DHR) has received for review the report referenced above prepared by TRC Environmental Corporation (TRC) for MVP Southgate, LLC (MVP). It is our opinion that this report meets DHR's *Survey Guidelines* and other applicable standards. Our comments are provided as assistance to MVP and the Federal Energy Regulatory Commission in meeting their collective responsibility under Section 106 of the National Historic Preservation Act.

This study represents the archaeological survey of 37 pipeline corridor segments (6.25 linear miles), three (3) contractor yards, seven (7) ATWS, and 27 access roads. The survey identified six (6) sites and four (4) isolated finds within the study area. The isolated finds are, by definition, not eligible for listing in the National Register of Historic Places (NRHP) and no further consideration of these resources is warranted. We concur that site **44PY0477** is *potentially eligible* for NRHP listing and should be avoided or subject to Phase II evaluation. Further, we concur that sites **44PY0473**, **44PY0474**, **44PY0475**, and **44PY0478** are *not eligible* for NRHP listing. Finally, we concur that site **44FY0476** remains *unevaluated*, but does not contain significant deposits within the project and warrants no further work in support of this project.

If you have any questions regarding these comments or our review of this project, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,

Roger W. Kirchen, Director
Review and Compliance Division

Re: *Addendum Report, Historic Architectural Survey for the MVP Southgate Pipeline Project, Pittsylvania County, Virginia* (September 2019)
DHR File No. 2018-3545; FERC Docket No. PF18-4-000

Dear Mr. Webb:

The Virginia Department of Historic Resources (DHR) has received for review the report referenced above prepared by TRC Environmental Corporation (TRC) for MVP Southgate, LLC (MVP). It is our opinion that this report meets DHR's *Survey Guidelines* and other applicable standards. Our comments are provided as assistance to MVP and the Federal Energy Regulatory Commission in meeting their collective responsibility under Section 106 of the National Historic Preservation Act.

This supplemental architectural survey identified 23 previously recorded and 33 newly recorded resources within the study area. DHR concurs with TRC that Mountain View (**071-0025**) should remain *listed* in the National Register of Historic Places (NRHP). We also agree that Belle Grove (**071-0004**), Farmstead and Cemetery (**071-5720**), Railroad Corridor Segment (**071-5727**), and Farmstead (**071-5732**) are *potentially eligible* for NRHP listing. It should be noted that the report's Management Summary (Page i) states that these four (4) properties are eligible for NRHP listing under Criterion C for their architectural merit. The accompanying V-CRIS forms and report narratives on the four potentially NRHP eligible properties have different recommendations. The narrative for Belle Grove (071-0004) states it is eligible under Criterion A for its significance in early Pittsylvania County settlement, Criterion B for its association with William P. Tunstall, and Criterion C as an excellent example of Federal style architecture. Additionally, a 2014 survey update by DHR staff member Michael Pulice also ascribed Criterion D to its significance. The report narrative and V-CRIS form recommends Farmstead and Cemetery (071-5720) potentially eligible under Criterion A "for its significance in the area of agriculture". Similarly, Railroad Corridor Segment (071-5727) is recommended in the narrative and V-CRIS form as potentially eligible under Criterion A for transportation. Only Farmstead (071-5732) is recommended by TRC as eligible solely under Criterion C. It is our opinion that the Management Summary reference to Criterion C being the only reason these properties

are eligible is in error. We concur with the recommendations for NRHP eligibility found in the report's individual property narratives and V-CRIS forms.

TRC also recommend the discontiguous cemetery associated with Little Cherrystone Manor/Wooding House (**071-0036**), a property listed in the NRHP, to be *contributing* to the larger property. The cemetery (44PY0274) is located approximately 2,900 feet northeast of the Little Cherrystone Manor/Wooding House property, which is outside the project APE. The DHR agrees that the cemetery should be considered contributing to the NRHP-listed resource.

One resource (**071-5544**) was inaccessible and remains *unevaluated*. DHR concurs with the consultant that the remaining 49 surveyed properties listed below are *not eligible* for listing in the NRHP:

071-5195	071-5305	071-5711	071-5722	071-5735
071-5196	071-5313	071-5712	071-5723	071-5736
071-5197	071-5333	071-5713	071-5724	071-5737
071-5198	071-5499	071-5714	071-5725	071-5738
071-5199	071-5524	071-5715	071-5726	071-5739
071-5219	071-5530	071-5716	071-5728	071-5740
071-5220	071-5545	071-5717	071-5730	071-5741
071-5228	071-5546	071-5718	071-5731	071-5742
071-5245	071-5621	071-5719	071-5733	071-5743
071-5246	071-5710	071-5721	071-5734	

It does not appear that TRC completed a V-CRIS form for Belle Grove (071-0004). DHR requests TRC revise the existing 2014 V-CRIS form completed by Mr. Pulice and provide us with a hardcopy of the document.

Thank you for the opportunity to review this work. If you have any questions regarding these comments or our review of this project, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,

Roger W. Kirchen, Director
Review and Compliance Division

Appendix M

MVP Southgate Project

Plan for Unanticipated Discoveries of Historic Properties and Human Remains

Appendix 4-C

Plan for Unanticipated Discoveries of Historic Properties and Human Remains

MVP Southgate Project

FERC Docket No. CP19-14-000

November 2018; Updated May 2019

TABLE OF CONTENTS

1.0 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission ("FERC" or "Commission") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Southgate Project" or "Project"). The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham, Alamance, Guilford, and Caswell counties, North Carolina.

Mountain Valley recognizes that, despite the extensive archaeological field investigations that are conducted prior to Project construction, it is possible that potentially significant cultural resources could be discovered during construction, especially during excavation activities. The Southgate Project recognizes its role to protect and preserve cultural resources that may be found during construction in accordance with federal and state regulations. Cultural resources in this context are defined as archaeological sites, objects, and features and include human remains and associated or unassociated funerary objects.

This *Plan for Unanticipated Discoveries of Historic Properties and Human Remains* ("Plan") was developed on behalf of the Southgate Project and in consultation with the Virginia Department of Historic Resources ("VDHR") and the North Carolina Historic Preservation Office ("NC HPO"), which represent the State Historic Preservation Officers ("SHPOs") in Virginia and North Carolina, respectively. This Plan summarizes the approach the Project will follow to address the discovery of archaeological finds or human remains during construction activities within the Project's Area of Potential Effects ("APE").

2.0 GUIDELINES, REGULATIONS, AND LEGISLATION FOR UNANTICIPATED DISCOVERIES OF CULTURAL RESOURCES AND HUMAN REMAINS

The stipulations of the Plan as set forth below are in accordance with the current guidelines detailed in the following federal and state guidelines, regulations, and legislation:

2.1 Federal

- Section 106 of the *National Historic Preservation Act ("NHPA"),* as amended (54 United States Code ("USC") 306101 et seq.)
- Secretary of the Interior's *Standards for Archeology and Historic Preservation* (48 FR 44716-42)
- Advisory Council for Historic Preservation's ("ACHP's"): *Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects* (ACHP February 23, 2007)
- Federal Energy Regulatory Commission's ("FERC") Office of Pipeline Regulations *Guidelines for Reporting on Cultural Resources Investigations for Natural Gas Projects* (FERC 2017);

2.2 Virginia

- VDHR's *Guidelines for Conducting Historic Resources Survey in Virginia* (2017)
- Virginia Antiquities Act, (§ 10.1-2305 Code of Virginia), "Permit required for the archaeological excavation of human remains;"

2.3 North Carolina

- North Carolina Office of State Archaeology's ("OSA's") *Archaeological Investigations Standards and Guidelines* (OSA December 2017)

- North Carolina General Statute 70-3, *The Unmarked Human Burial and Skeletal Remains Protection Act.*

3.0 CONSULTATION WITH SHPOS AND NATIVE AMERICAN TRIBES

The Southgate Project initiated consultation with VDHR and NC HPO on April 27, 2018. The Project is also contacting federally-recognized Native American Tribes to solicit their concerns and input regarding potential Project effects to historic properties, tribal resources, and human remains. Contact information for the VDHR, NC HPO, and the tribes is included in Section 5.0 of this Plan. In the event that cultural resources and/or human remains are encountered during construction, the Project will notify the VDHR or NC HPO (as applicable), those tribes that have asked to be consulted in the event of a discovery ("Interested Tribes"), any other consulting parties for the Project (potentially including non-federally recognized tribes or other organizations), and/or law enforcement, as outlined below.

4.0 UNANTICIPATED DISCOVERY PROTOCOL

4.1 Cultural Resources Training

The Southgate Project requires that its employees and contractors have a basic understanding of the nature of cultural resources, and all Project inspectors and construction contractor personnel will be given basic training in cultural resource site recognition prior to beginning work on the Project.

The cultural resource training will review the Project's commitments regarding cultural resources compliance and provide examples of the types of cultural resources that may be encountered during construction. In addition, the training program will emphasize the exact procedures to be followed, as outlined in this Plan, regarding actions to be taken and notifications required in the event of a significant site discovery or a discovery of human remains or funerary objects during construction.

The training will ensure that Southgate Project personnel and construction contractors understand the extent of the archaeological survey program that has been performed for the Project and are fully aware of the distinction between sites that have been located and "cleared" under the cultural resource program (i.e., sites that have been determined to be non-significant after different levels of investigation or have already undergone data recovery excavations) and new discoveries that may be made during the construction process.

4.2 Notification and Assessment Procedures (Not Involving Human Remains or Funerary Objects)

The following steps will be followed in the event an unanticipated discovery of artifacts or other indications of a cultural resource (not involving human remains or funerary objects) is made during Southgate Project construction:

1 The Contractor or relevant party will immediately notify the Lead Environmental Inspector ("EI") (or Chief Inspector, if the Lead EI is not immediately available) of an unanticipated discovery.

2 The Lead EI or Chief Inspector will direct a *Stop Task Order* to the Contractor's Site Foreman to ensure that the activity within 100 feet of the unanticipated discovery ceases and will instruct the Contractor to flag or fence off the discovery location and buffer and take any necessary measures to ensure site security. Any unanticipated discovery made on a weekend or overnight

hours will be protected with security fencing until all appropriate parties are notified of the discovery. The Contractor will not restart work in the area of the find until the Chief Inspector has agreed in writing that work can resume.

3 The Lead EI will inform the Project Archaeologist ("PA") of the discovery. If the PA determines that the location is not an archaeological site, or determines that the find is a previously known and cleared archaeological resource and that the find would not alter the current understanding of the resource, the PA will report that documentation to the Lead EI. The Lead EI will document that determination and notify the Chief Inspector to resume work.

4 If the PA determines that the find is not a previously known and cleared resource, or potentially represents information that would alter the current understanding of a previously known and cleared archaeological resource, she/he will notify the Project. If the find is not determined insignificant by the PA within 24 hours of notification, the PA will conduct a preliminary field assessment of the discovery to determine if it is potentially a significant archaeological site.

5 If based on that inspection or further review the PA determines that the discovery is an isolated find or otherwise not a potentially significant archaeological site (e.g., lacks the type of archaeological features, intact contacts, or patterned artifact distributions that could provide substantive information concerning prehistory or history), the PA will document that determination and report the determination to the Lead EI. The Lead EI will then notify the Chief Inspector to resume work.

6 If the PA determines that the find is a newly identified and potentially significant archaeological site, or represents information that would alter the current understanding of a previously known and cleared archaeological resource, the PA will inform the Southgate Project, the Lead EI, and the Chief Inspector of that determination.

   a. Within 24 hours of that determination, the Project will notify the FERC, the relevant SHPO, and the Interested Tribes of the determination.

   b. Following notification of the FERC, the relevant SHPO, and the Interested Tribes, the PA will evaluate the discovery and assess its horizontal and vertical extent, cultural association(s), and integrity. If the find appears to be significant, the PA will also evaluate potential strategies (i.e., the installation of protective fencing or matting) that would allow the passage of construction equipment through the discovery area pending treatment of the resource. Apart from the potential installation of matting or other protective measures, further ground disturbing activities within the flagged or fenced off discovery location will not resume until authorized by the FERC.

   c. The PA will inform the Project, the Lead EI, the Chief Inspector, the FERC, the relevant SHPO, and the Interested Tribes of the findings and recommendations regarding site significance and, if necessary, the implementation of protective measures. If the FERC, in consultation with the SHPO and Interested Tribes, determines that the find is not eligible for the NRHP, the Chief Inspector will grant clearance for construction to resume. If the FERC determines that the find is eligible for the NRHP, the PA or their designee will develop an archaeological treatment plan

that will be submitted to the FERC, the relevant SHPO, and Interested Tribes (if appropriate) for review and comment.

d. Upon authorization by the FERC, the Project will implement the treatment plan.

e. At the conclusion of archaeological fieldwork, a meeting or site visit may be held with the FERC, the Project, the relevant SHPO, and the Interested Tribes to review the results of the work accomplished.

f. Upon receiving written acceptance of the results of the implemented treatment from the FERC, the Lead EI and Chief Inspector will grant clearance to the construction team to resume ground-disturbing activities within the discovery area.

4.3 Notification and Treatment Procedures (Human Remains or Funerary Objects)

The Southgate Project will treat any human remains encountered during the Project in a manner guided by the ACHP's *Policy Statement Regarding Treatment of Burial Sites, Human Remains, and Funerary Objects* (2007) and by the relevant state laws and guidelines. In particular, human remains must be treated with the utmost dignity and respect at all times. Human remains and/or associated artifacts (including grave markers, coffin hardware, or funerary objects) will be left in place and not disturbed, and no unnecessary photographs will be taken. No skeletal remains or materials associated with the remains will be collected or removed until appropriate consultation has taken place and a plan of action has been developed. All personnel involved with the discovery will maintain confidentiality concerning the remains, and any press contacts will be referred to appropriate Project or agency personnel.

The following measures will be taken in the event an unanticipated discovery of potential or confirmed human remains or funerary objects is made during Project construction.

1 The Contractor will immediately notify the Lead EI (or Chief Inspector, if the Lead EI is not immediately available) of the discovery.

2 The Lead EI or Chief Inspector will direct a *Stop Task Order* to the Contractor's Site Foreman to ensure that work within 100 feet of the discovery ceases. The Lead EI or Chief Inspector will instruct the Contractor to flag or fence off the discovery location and buffer and take any necessary measures to ensure site security. Work will not resume in the area of the find until the Chief Inspector grants clearance to recommence work (see below).

3 All human remains and/or funerary items will be left in place and treated with dignity and respect, and protected from the elements. All efforts will be made to prevent the general public from viewing any gravesites and/or funerary objects.

4 The Lead EI will contact the Project and the PA on the day of the discovery, and the PA will examine the discovery within 24 hours of notification. If the PA determines that the finds are human remains or funerary items, the PA will immediately notify the Project.

For finds in Virginia, the Project will immediately notify the FERC, the landowner, and the VDHR of the find, as well as the Virginia State Police.

For finds in North Carolina, the Project will immediately notify the FERC, the landowner, the County Medical Examiner, and the North Carolina State Archaeologist, who shall conduct

further notifications per North Carolina General Statute 70-3, *The Unmarked Human Burial and Skeletal Remains Protection Act.*

5 If, upon inspection by the appropriate legal authorities, the remains are determined to be a criminal matter and not archaeological, the Project will await clearance by the appropriate legal authorities before resuming construction.

6 If the find is determined not to be a criminal matter, the Southgate Project will comprehensively evaluate the potential to avoid and/or minimize the Project's effects to the human remains.

a. If human remains are determined to be Native American, the remains will be left in place and protected from further disturbance with security fencing and if necessary, a security guard until a site-specific work plan for their avoidance or, if necessary, their removal can be generated. Note that avoidance is the preferred choice of the SHPOs and Tribes. The Project will assist the FERC, the appropriate SHPO, and the Interested Tribes in their consultation to develop a plan of action.

b. If human remains are determined to be non-Native American, the remains will be left in place and protected from further disturbance with security fencing and if necessary, a security guard until a site-specific work plan for their avoidance or removal can be generated. Please note that avoidance is the preferred choice of the SHPOs. Consultation with the SHPO and other appropriate parties, in accordance with Virginia or North Carolina state law, will be required to determine a treatment plan.

c. In Virginia, if human skeletal remains must be removed, the Project will obtain a Permit for *Archaeological Removal of Human Burials* from the VDHR and consultation will be conducted with Interested Tribes, and lineal descendants, as appropriate. In North Carolina, any removal of human remains would be done in accordance with *The Unmarked Human Burial and Skeletal Remains Protection Act* and other relevant state statutes, and through consultation with the NC HPO, Interested Tribes, and lineal descendants, as appropriate.

d. The Project will be responsible for all costs associated with the discovery, evaluation and agency consultation, excavation, investigation and study, disinterment, repatriation, re-interment, reporting, and curation of any human remains and associated funerary items encountered during Project construction.

e. Project construction may resume within the flagged or fenced off discovery location only after successful implementation of the treatment plan and after the Project receives written approval by the FERC, the relevant SHPO, and the Interested Tribes.

PROGRAMMATIC AGREEMENT
AMONG
THE FEDERAL ENERGY REGULATORY COMMISSION, THE VIRGINIA STATE HISTORIC PRESERVATION OFFICE, AND THE NORTH CAROLINA STATE HISTORIC PRESERVATION OFFICE, REGARDING THE SOUTHGATE PROJECT

FERC Docket Number CP19-14-000

WHEREAS, the Federal Energy Regulatory Commission (FERC) may issue an authorization to Mountain Valley Pipeline LLC (Mountain Valley) under Section 7 of the Natural Gas Act (NGA, Title 15 United States Code [U.S.C.] § 717) to construct and operate the Southgate Project (Undertaking), in Virginia and North Carolina, in FERC Docket No. CP19-14-000; and

WHEREAS, the Undertaking would consist of about 75 miles of new 24-inch- and 16-inch-diameter natural gas transmission pipeline in Pittsylvania County, Virginia and Rockingham and Alamance Counties, North Carolina, one new compressor station in Pittsylvania County, Virginia, four interconnections with existing systems, and ancillary facilities including pig launchers and receivers, mainline block valves, and cathodic protection; and

WHEREAS, FERC is the lead federal agency for compliance with the National Environmental Policy Act (NEPA, 42 U.S.C. § 4371) and the National Historic Preservation Act (NHPA, 54 U.S.C. § 306108) under Section 15 of the NGA, and in accordance with the May 2002 Interagency Agreement;[1] and

WHEREAS, under authority delegated to FERC's Director of the Office of Energy Projects, FERC staff is tasked with implementing the environmental conditions appended to any forthcoming Order that authorizes the Undertaking, which ensures that FERC's responsibilities under Section 106 of the NHPA are fulfilled; and

WHEREAS, the status of compliance with Section 106 of the NHPA for the Undertaking was summarized in section 4.10 of the final Environmental Impact Statement (EIS) issued by FERC on February 14, 2020. FERC staff defined the Undertaking's area of

[1] *Interagency Agreement on Early Coordination of Required Environmental and Historic Preservation Reviews Conducted in Conjunction with the Issuance of Authorizations to Construct and Operate Interstate Natural Gas Pipelines Certificated by the Federal Energy Regulatory Commission* (May 2002) signed by the FERC, Advisory Council on Historic Preservation, Council on Environmental Quality, U.S. Environmental Protection Agency, U.S. Department of Agriculture, U.S. Department of the Army, U.S. Department of Commerce, U.S. Department of Energy, U.S. Department of Interior, and U.S. Department of Transportation.

potential effect (APE) in section 4.10.2.1 of the EIS. There would be about 27 miles of pipeline route in Virginia and about 48 miles in North Carolina. Along the pipeline route the direct APE is a corridor about 200 feet on each side of the centerline, and 50 feet from yards, and along proposed access roads. Construction of the Undertaking would impact a total of about 564 acres in Virginia and 903 acres in North Carolina; and

WHEREAS, at the end of December 2019, Mountain Valley had conducted cultural resources[2] inventories of about 70.5 miles of pipeline route (94 percent), 30.3 acres at aboveground facilities including the Lambert Compressor Station and interconnects (100 percent), 119.2 acres at yards (68 percent), 1.1 acres at cathodic protection beds (66 percent), and 29.9 miles of access roads (93 percent). During those inventories, Mountain Valley identified 30 archaeological sites and 78 historic architectural structures in the direct APE in Virginia, and 51 archaeological sites and 163 historic architectural structures in the direct APE in North Carolina (see tables 4.10-8, 4.10-9, 4.10-10, and 4.10-11 of the EIS); and

WHEREAS, about 4.6 miles of pipeline route (0.2 mile in Virginia and 4.4 miles in North Carolina), 0.6 acre at cathodic protect beds, 55.6 acres at yards, and 2.4 miles along access roads remain to be surveyed in the future. Mountain Valley shall complete future identification and evaluation investigations, and treatment at any newly found historic properties[3] that cannot be avoided, in accordance with the stipulations of this Programmatic Agreement (PA), prior to FERC allowing construction of any facilities; and

WHEREAS, FERC is using this PA to clarify the framework that will be followed to identify historic properties, and resolve adverse effects for those properties that would be adversely affected by the Undertaking, in accordance with Title 36 Code of Federal Regulations (CFR) Part 800.6(c), the regulations for implementing Section 106 of the NHPA; and

WHEREAS, Mountain Valley has indicated that all National Register of Historic Places (NRHP) listed or eligible or potentially eligible sites identified in the direct APE would be avoided, except five sites in Virginia (44PY270, 44PY477, 44PY479, 71-5598, and

[2] Cultural resources are locations of human activity, occupation, or use. According to FERC's Office of Energy Projects "Guidelines for Reporting on Cultural Resources Investigations for National Gas Projects," "cultural resources include any prehistoric or historic archaeological site, district, object, cultural feature, building or structure, cultural landscape, or traditional cultural property." Although "cultural resources" are not defined in 36 CFR 800, it is a term-of-art in the field of historic preservation and archaeological research. Some Indian tribes believe that cultural resources could include natural resources, such as plants and animals of traditional importance to tribes, and topographic features and viewsheds that may be sacred.

[3] Historic properties include any prehistoric or historic district, site, building, structure, or object, and properties of traditional religious or cultural importance to Indian tribes, listed on or eligible for listing on the National Register of Historic Places, as defined in Part 800.16(l).

71-5727), and four sites in North Carolina (AM452, 31RK97, 31RK259, and RK1770). Except for affected historic property Site 31RK259, addressed below, Mountain Valley shall either conduct additional investigations at those sites and other unevaluated sites, in accordance with Stipulation II of this PA, or submit avoidance plans for those sites, in accordance with Stipulation III; and

WHEREAS, FERC staff has determined that the Undertaking will have adverse effects on historic properties, and has consulted with the Virginia State Historic Preservation Office (VASHPO) and the North Carolina State Historic Preservation Office (NCSHPO).[4] The respective SHPOs have reviewed survey and testing reports, and avoidance and treatment plans submitted by Mountain Valley, and provided FERC with their assessments of NRHP eligibility for individual sites. In accordance with Part 800.6(c)(1)(ii), the VASHPO and NCSHPO are required as signatories to execute this PA; and

WHEREAS, FERC staff and NCSHPO agree that Site 31RK259, in Rockingham County, North Carolina, is eligible for nomination to the NRHP, cannot be avoided, and would be adversely affected by the Undertaking. Mountain Valley produced a Treatment Plan for Site 31RK259, that was reviewed by FERC staff and NCSHPO. This PA stipulates that prior to construction, Mountain Valley must implement the measures outlined in the Treatment Plan to resolve adverse effects at Site 31RK259; and

WHEREAS, the U.S. Army Corps of Engineers (COE), Norfolk and Wilmington Districts, are responsible for issuing permits under Section 404 of the Clean Water Act (CWA, 33 U.S.C. § 1251 et seq.) and Sections 10 and 14 of the Rivers and Harbors Act (RHA, 33 U.S.C. § 407 and § 408) for the undertaking. The COE is a cooperating agency in the production of the EIS (in accordance with 40 CFR Part 1501.6, regulations for implementing NEPA), has responsibilities under the NHPA, and was consulted by FERC regarding the effects of this Undertaking on historic properties. However, the COE is not a land-managing agency for the Undertaking. Therefore, per Part 800.6(c)(3), the COE is invited to be concurring party to this PA; and

WHEREAS, FERC consulted with 33 Indian tribes[5] (listed on table 4.10.2 of the EIS) about this Undertaking.[6] Indian tribes that expressed an interest in the Undertaking

[4] The VASHPO is represented by the Department of Historic Resources (VADHR); while the NCSHPO is housed within the Department of Natural and Cultural Resources (NCDNCR) which also includes the North Carolina Office of State Archaeology (NCOSA). Consultations and communications between the respective SHPOs and FERC and Mountain Valley are documented in section 4.10.1.1 of the EIS for this Project.

[5] Indian tribes are defined in Part 800.16(m) as: "an Indian tribe, band, nation, or other organized group or community, including a Native village, Regional Corporation, or Village Corporation, as those terms are defined in Section 3 of the Alaska Native Claims Settlement Act (43 U.S.C. 1602), which is recognized as eligible for the special programs and services provided by the United States to Indians because of their special status as Indians."

[6] Consultations between FERC and Indian tribes are documented in section 4.10.1.2 of the EIS.

(including the Monacan Indian Nation, Nansemond Indian Tribe, and Upper Mattaponi Tribe) were provided copies of cultural resources investigations reports for review. The Monacan Indian Nation, Nansemond Indian Tribe, and Upper Mattaponi Tribe are considered to be consulting parties,[7] and are invited to be concurring parties to this PA, in accordance with Part 800.6(c)(3); and

WHEREAS, the North Carolina state-recognized Sappony Tribe and Occaneechi Band of the Saponi Nation have made comments on the record about the Undertaking and communicated with FERC staff and Mountain Valley, are considered to be consulting parties in accordance with Part 800.2(c)(6), and are invited to be concurring parties to this PA; and

WHEREAS, Mountain Valley would be responsible for constructing and operating the Undertaking and implementing certain stipulations under this PA. Mountain Valley may prepare information, analyses, and recommendations for this Undertaking, in accordance with Part 800.2(a)(3), including conducting additional cultural resources investigations (such as surveys and testing), and implementing treatment plans at affected historic properties. Therefore, per Part 800.6(c)(3), Mountain Valley is invited to be a concurring party to this PA; and

WHEREAS, FERC notified the affected counties and local governments listed on table 4.10-4 of the EIS about the Undertaking, and no counties or local governments requested to be consulting parties; and

WHEREAS, FERC notified local historical organizations listed on table 4.10-5 of the EIS about the Undertaking, and no organizations or individuals requested to be consulting parties. However, Mountain Valley provided copies of cultural resources reports and maps of the pipeline route to organizations and individuals who requested such data, as indicated in table 4.10-7 of the EIS; and

WHEREAS, FERC notified the public about the Undertaking through its Notice of Intent issued August 9, 2018, and Notice of Application issued November 19, 2018. Public scoping sessions were held by FERC in August 2018. The public also had the opportunity to comment on the Undertaking's potential impacts on historic properties in response to the draft EIS issued July 2019, and public sessions to take comments on the draft EIS were held by FERC in August 2019. In accordance with Part 800.2(d), FERC considered the views of the public, and addressed comments on the draft EIS in the final EIS; and

[7] Consulting parties are defined in Part 800.2(c).

WHEREAS, in accordance with Part 800.6(a)(1), in a letter dated November 14, 2019 FERC invited the Advisory Council on Historic Preservation (ACHP) to participate in the development of this PA, and the ACHP, in a letter to FERC staff dated December 10, 2019, has chosen not to participate in the consultation process pursuant to Part 800.6(a)(1)(iii); and

NOW, THEREFORE, FERC, VASHPO, and NCSHPO agree that the Undertaking shall be implemented in accordance with the following stipulations in order to take into account the effect of the Undertaking on historic properties.

STIPULATIONS

FERC shall ensure that the following measures are carried out:

I. STANDARDS

A. All archaeological fieldwork and treatment measures shall be conducted by cultural resources professionals who meet, at a minimum, the Secretary of the Interior's "Draft Historic Preservation Professional Qualification Standards" (*Federal Register* [FR] 20 June 1997, Vol. 62, No. 119; 36 CFR 61, section 112(a)(1)).

B. All archaeological fieldwork and treatment measures, and reports and plans generated for this Undertaking shall be consistent with applicable cultural resources state guidelines,[8] the U.S. Secretary of the Interior's "Standards and Guidelines" (48 FR 44716-42, 29 September 1983), the U.S. Department of the Interior National Park Service (NPS) *Bulletin* series, the ACHP's publication "Treatment of Archaeological Properties," and FERC Office of Energy Project's "Guidelines for Reporting on Cultural Resources Investigations for Pipeline Projects" (July 2017 version).

C. While FERC staff shall coordinate overall activities under this PA, Mountain Valley and its cultural resources consultants shall conduct fieldwork, and prepare information, analyses, and recommendations, in accordance with Part 800(2)(a)(3), and shall distribute all reports and plans to FERC staff, appropriate SHPO, COE, applicable consulting Indian tribes, and other consulting parties, and conduct other tasks associated with this PA, as necessary. Mountain Valley shall be responsible for covering all costs related to activities stipulated in this PA,

[8] Such as, in Virginia, VADHR's "Guidelines for Conducting Historic Resources Survey in Virginia" (Revised September 2017), and in North Carolina, NCOSA's "Archaeological Investigation Standards and Guidelines" (December 2017) and NCDNCR's "Report Standards for Historic Structure Survey Reports" (30 September 2019).

including fieldwork, analyses, curation, report production, public outreach, and dissemination of information.

D. The signatories and concurring parties to this PA acknowledge that public disclosure of the location of cultural sites may expose resources to harm. Therefore, the signatories and concurring parties agree to treat site locational information in a confidential manner as privileged or sensitive data, use their best efforts to not publicly disclose such data, and protect cultural resources, consistent with Section 304 of the NHPA and Part 800.6(a)(5), and other applicable federal and state laws and regulations.

E. For those portions of the Undertaking where the provisions of this PA have been met, and that would function to achieve the Undertaking's objectives of transporting natural gas to interstate markets, FERC staff may provide Mountain Valley with a notice to proceed with construction. Construction shall not proceed on portions of the Undertaking until after the applicable provisions of this PA, including survey and evaluation studies, and the implementation of measures outlined in treatment plans to resolve adverse effects at affected historic properties, have been carried out for those portions.

II. IDENTIFICATION AND EVALUATIONS

A. Future phased identification and evaluation efforts will be conducted for the Undertaking, in accordance with Part 800.4(b)(2), because access to some areas may be restricted until after FERC has issued a Certificate of Public Convenience and Necessity, or at portions of the Undertaking where cultural resources investigations have not yet been completed. The reporting of additional survey and evaluation investigations shall be in accordance with Stipulation VII of this PA.

B. Mountain Valley and its cultural resources consultants are responsible for conducting future inventories for all areas in the APE that have not been previously surveyed (including along the pipeline route, staging areas and additional temporary extra workspaces, yards, new or improved access roads, and new workspace variances or route realignments). All changes to the construction rights-of-way/ancillary areas not authorized in the FERC Order, including areas needed for emergency actions, would require the review and approval of FERC staff.

C. All archaeological sites and historic architectural structures, and traditional cultural properties, found/revisited during surveys for this Undertaking need to be fully reported on. Appropriate state site forms shall be submitted by Mountain

Valley and its cultural resources contractors to the appropriate SHPO for any newly recorded or revisited sites, with copies filed with FERC. Mountain Valley and its contractors should also submit to the appropriate SHPO Geographic Information System (GIS) shape files of the facilities, areas actually surveyed, and site locations; however, GIS data does not have to be filed with FERC.

D. Following directions from FERC staff, Mountain Valley may conduct future archaeological testing or other investigations to assess the NRHP eligibility of previously unevaluated sites. Mountain Valley and/or its cultural resources contractors shall evaluate all recorded sites in terms of NRHP criteria (36 CFR 60.4) and assess effects on individual resources consistent with Part 800.5.

E. Unless they can be avoided, in accordance with Stipulation III below, Mountain Valley shall conduct additional investigations to evaluate NRHP eligibility and assess potential effects at previously recorded sites 44PY270, 44PY477, 44PY479, 71-5598, and 71-5727 in Virginia, and sites AM452, 31RK97 and RK1770 in North Carolina. The results of those investigations shall be provided by Mountain Valley in reports filed with FERC, and also submitted to the appropriate SHPO, COE, appropriate consulting Indian tribes, and other consulting parties, in accordance with Stipulation VII below.

F. FERC staff will make recommendations on NRHP eligibility and effects, based on data filed by Mountain Valley, after consultations with the appropriate SHPO. For those resources where FERC staff and the appropriate SHPO agree that NRHP criteria are not met, no further consideration will be required. If FERC staff and the appropriate SHPO are unable to agree on a determination, FERC will follow the regulations at Part 800.4(c)(2). Those properties that are determined eligible for the NRHP and would be adversely affected by the Undertaking will be treated in accordance with Stipulation IV below.

III. AVOIDANCE

A. Whenever feasible, avoidance of historic properties shall be the preferred option. Mountain Valley will identify the means by which these properties would be avoided and request concurrence from the appropriate SHPO and FERC staff. Avoidance measures can include, but are not limited to, route re-alignments, use of a horizontal directional drill or bore, narrowing the width of the right-of-way, re-configuration of or not using a temporary workspace, re-designing or not using a specific yard or access road, and exclusionary fencing.

B. As of the date of the preparation of this PA, Mountain Valley has indicated that it intends to avoid 35 sites (archaeological sites 44PY281, 44PY358, 44PY447,

44PY449, 44PY452, 44PY454, and 44PY477/71-5732 in Virginia, and archaeological sites 31RK44, 31RK222, 31RK228, 31RK230, 31RK234, 31RK237, 31RK239, 31RK261, and 31AM441, and 31AM443/AM1603 in North Carolina; and historic architectural sites 71-4, 7-25, 71-36/44PY274/44PY275, 71-5212, 71-5222, 71-5225/44PY284, 71-5226/44PY272, 71-5227, 71-5525, 71-5593, 71-5595, 71-5596, 71-5620, 71-5622, 71-5623, 71-5731, and 71-5735 in Virginia and site AM867 in North Carolina). Mountain Valley shall document in a filing with FERC that it submitted avoidance plans for all these sites to the appropriate SHPO, and file with FERC the SHPOs' comments on those plans.

C. For sites identified during future investigations that would be avoided, Mountain Valley shall produce site-specific avoidance plans for the review of FERC staff and the appropriate SHPO. The documentation of avoidance of historic properties during construction shall be reported in the comprehensive Treatment Report required under Stipulation VII below.

IV. TREATMENT OF ADVERSELY AFFECTED HISTORIC PROPERTIES

A. Prior to construction, Mountain Valley shall implement the measures outlined in the Treatment Plan to resolve adverse effects on Site 31RK259 in Rockingham County, North Carolina. Mountain Valley shall document the completion of treatment fieldwork at Site 31RK259 through a Management Summary letter report and comprehensive final Treatment Report, in accordance with Stipulation VII of this PA.

B. For historic properties identified during future investigations that cannot be avoided, Mountain Valley shall develop site-specific treatment plans to mitigate any adverse effects as per Part 800.6(b), including any visual effects for those properties where the viewshed is part of the historic significance. Mountain Valley shall submit the treatment plans to FERC staff, appropriate SHPO, COE, applicable consulting Indian tribes, and other consulting parties, for review and comment, in accordance with Stipulation VII.

C. Mountain Valley may not begin implementing the measures of any treatment plans or construct any facilities without the explicit written permission of FERC.

V. POST-PA DISCOVERIES

If human remains, funerary objects, sacred objects, and objects of cultural patrimony[9] are discovered during archaeological investigations, or if cultural resources or human remains are discovered during construction, or if unanticipated effects on historic properties are found, Mountain Valley shall implement the measures outlined in its accepted Unanticipated Discovery Plan (UDP).[10] A copy of the UDP is attached as an appendix to this PA.

VI. CURATION

A. All materials and records resulting from archaeological investigations related to this Undertaking shall be curated in a manner consistent with 36 CFR 79, particularly the standards at Parts 79.9 and 79.10. The comprehensive final Treatment Report (required under Stipulation VII below) shall include an artifact catalog of all cultural materials collected during all post-PA archaeological investigations, giving their provenience, place of curation or disposition, and photographs or drawings of culturally diagnostic or unique items.

B. Mountain Valley shall encourage landowners to donate artifacts recovered on private lands to appropriate museums or curation facilities agreed to by the signatories. In Virginia collected artifacts can be donated to the Virginia Department of Historic Resources State Collection Management Facility, while artifacts recovered in North Carolina should be donated to the North Carolina Office of State Archaeology Research Center. In addition, Mountain Valley will provide to landowners contact information for consulting Indian tribes so that landowners would have the opportunity to donate collected materials to tribes if they so choose; with the approval of the signatories. Mountain Valley shall document in its comprehensive final Treatment Report the donation of all archaeological materials (except human remains, funerary objects, sacred objects, and objects of cultural patrimony), or the return of artifacts to landowners who do not donate them. No human remains, funerary objects, sacred objects, and objects of cultural patrimony collected shall be curated, publicly displayed, or sold.

[9] As defined in the Native American Graves Protection and Repatriation Act (NAGPRA, 25 U.S.C. 3001-3013, 43 CFR Part 10).

[10] Mountain Valley filed its UDP as Appendix 4-C of Resource Report 4 in its November 6, 2018 application to FERC. The UDP was originally reviewed and approved by the VASHPO and NCSHPO on September 6 and 14, 2018, respectively; and a revised version filed by Mountain Valley with FERC on May 22, 2019 was approved by the VASHPO and NCSHPO on October 8 and August 19, 2019, respectively. FERC staff agrees with the SHPOs that the UDP is acceptable.

Human remains, funerary objects, sacred objects, and objects of cultural patrimony shall be treated in accordance with the UDP; and repatriated to appropriate consulting Indian tribes or reburied after analysis, as determined by consultations among the signatories to this PA.

VII. REPORTING REQUIREMENTS AND REVIEWS

A. All reports and plans produced by Mountain Valley and/or its cultural resources contractors, in regards to the measures stipulated in this PA, shall be filed with FERC, with separate copies simultaneously also provided by Mountain Valley to the appropriate SHPO, COE, applicable consulting Indian tribes, and other consulting parties. Mountain Valley shall provide FERC staff, the appropriate SHPO, COE, applicable consulting Indian tribes, and other consulting parties with one (1) hard-copy of each report, and an electronic copy (.pdf file). Electronic copies of reports can be provided by emails. All materials filed with FERC containing **location, character, and ownership** information about archaeological resources must have the cover and any relevant pages therein clearly labeled in bold lettering: "**CUI//PRIV- DO NOT RELEASE**."

B. The time period for review and comments on all draft reports and plans shall begin with the receipt of the hard-copy version. Any consulting party can provide comments on any draft report or plan resulting from this PA to FERC staff and Mountain Valley. FERC staff shall take the comments of consulting parties into consideration prior to making any determinations, and providing its comments on draft reports/plans to Mountain Valley. The standard review period for comments shall be thirty (30) calendar days after receipt of reports/plans, unless the signatories agree to another schedule. If timely comments are not received during the review period, FERC can assume that the non-responding parties have no comments, and may proceed based on consideration of comments received from other responsive parties within the review period.

C. For all cultural resources documents (e.g., inventory reports, testing reports, avoidance plans, and treatment plans, etc.) submitted by Mountain Valley to the consulting parties prior to April 2020, where comments on reports/plans were not previously filed with FERC, the consulting parties shall provide FERC staff with comments on each individual document within thirty (30) calendar days after execution of this PA. Lack of comments by the conclusion of this review period shall be deemed by FERC staff as concurrence by the non-responsive parties with the recommendations in those documents.

D. Mountain Valley shall file draft reports documenting additional post-PA inventories. Additional inventory reports shall make recommendations on NRHP eligibility (including justifications about how sites could qualify according to the criteria at 36 CFR 60.4), potential effects, and future work. Within thirty (30) calendar days after receiving comments on drafts from FERC staff, Mountain Valley shall file final inventory reports that address all comments on draft reports.

E. If FERC staff and appropriate SHPO agree that additional post-PA investigations are necessary at any site to assess its NRHP eligibility, Mountain Valley shall file draft site-specific testing or research plans. Within thirty (30) calendar days after receiving FERC staff comments on drafts, Mountain Valley shall file final testing/research plans that address all comments on draft plans.

F. Mountain Valley shall conduct the post-PA evaluative investigations, in accordance with the approved site-specific testing/research plan, after receiving written notice to proceed from FERC. Mountain Valley shall file draft reports documenting the results of archaeological testing or other evaluative studies, including raw data from the studies, and recommendations of NRHP eligibility and potential effects. The VASHPO and NCSHPO, in their respective reviews of post-PA evaluation reports, shall specify if they consider a property eligible for the NRHP, and apply the criteria of adverse effect, pursuant to Part 800.5(a). Within thirty (30) calendar days after receiving comments on drafts from FERC staff, Mountain Valley shall file final testing/evaluation reports that addresses all comments on draft reports.

G. For any sites that can be avoided, Mountain Valley shall file site-specific avoidance plans. Within thirty (30) calendar days after receiving comments on drafts from FERC staff, Mountain Valley shall file with final avoidance plans that address all comments on draft plans.

H. For any sites that FERC staff determines eligible or listed on the NRHP (with concurrence from appropriate SHPO), and cannot be avoided, Mountain Valley shall file draft site-specific treatments plans that would mitigate adverse effects. Within thirty (30) calendar days after receiving comments on drafts from FERC staff, Mountain Valley shall file final treatment plans that addresses all comments on draft plans.

I. Within thirty (30) calendar days after the completion of the treatment fieldwork at an individual affected historic property, a Management Summary letter report briefly describing results, and documenting that all the measures outlined in the site-specific treatment plan were implemented, shall be filed by Mountain Valley.

J. Starting with the execution of this PA until its termination, Mountain Valley shall yearly file a Cultural Resources Annual Report (by the end of February for the previous calendar year). The Annual Report shall summarize all cultural resources fieldwork and reports and plans submitted within the previous year, the current status of investigations and reviews, and a schedule for upcoming work, plans, and reports.

K. A draft comprehensive Treatment Report detailing the results of the treatment program shall be filed by Mountain Valley no later than one (1) year after the completion of treatment fieldwork, unless the signatories agree to a different date. Within six (6) months after receiving comments on the draft from FERC staff, Mountain Valley shall file a final comprehensive Treatment Report that addresses all comments on the draft.

VIII. PUBLIC OUTREACH AND EDUCATION

A. Mountain Valley shall develop a program for cultural resources public outreach and education for the Undertaking. The Public Outreach and Education Program Plan can disseminate information to the general public through a variety of media, including but not limited to brochures, books, articles, lectures, exhibits, school-based activities, participation in data recovery excavations, videos, and interactive web sites, and other means.

B. Within sixty (60) calendar days after FERC issues any forthcoming Order authorizing the Undertaking, Mountain Valley shall file a draft Public Outreach and Education Program Plan. Within thirty (30) calendar days after receiving comments on the draft plan from FERC staff, Mountain Valley shall a revised final Public Outreach and Education Program Plan that addresses all comments on the draft. Mountain Valley shall implement the measures outlined in the plan upon receiving written notice from FERC.

IX. OTHER TERMS AND CONDITIONS

A. This PA may be signed by the parties on photocopy, facsimile, e-mail, pdf, or counterpart signature pages. FERC shall distribute copies of all signed pages to all parties to this PA once the PA is executed. FERC shall provide the ACHP with a copy of the executed PA including all signed signature pages, and a copy of the executed PA shall also be filed in FERC's public record docket for these proceedings.

B. This PA is limited in scope to the Southgate Project, in FERC Docket Nos. CP19-14-000. If FERC decides not to authorize this Undertaking, this PA is null and void on the date of FERC's decision.

C. The signatories to this PA shall review its terms and conditions, and the status of activities conducted under the PA, within three (3) years after its execution. At that time, the signatories shall consult and agree that progress is satisfactory, or a signatory may suggest an amendment, in accordance with Stipulation XII, or raise an objection which shall be resolved according to Stipulation XI.

X. DURATION

This PA shall remain in effect until all stipulations and requirements for fieldwork, treatment, analyses, reporting, curation, public outreach, and dissemination of information have been meet. However, this PA will expire if its terms are not carried out within six (6) years from the date of its execution. Prior to such time, FERC staff may consult with the other signatories to reconsider the terms of the PA and amend it in accordance with Stipulation XII.

XI. DISPUTE RESOLUTION

Should any signatory object at any time to any actions stipulated in this PA, or the manner in which its terms are implemented, FERC staff shall consult with such party to resolve the objection. If FERC determines that such objection cannot be resolved, FERC will:

A. Forward all documentation relevant to the dispute, including FERC's proposed resolution, to the ACHP. The ACHP shall provide FERC with its advice on the resolution of the objection within thirty (30) days of receiving adequate documentation. Prior to reaching a final decision on the dispute, FERC staff shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the ACHP, signatories and concurring parties, and

provide them with a copy of this written response. FERC will then proceed according to its final decision.

B. If the ACHP does not provide its advice regarding the dispute within the thirty (30) day time period, FERC may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, FERC staff shall prepare a written response that takes into account any timely comments regarding the dispute from the signatories and concurring parties, and provide them and the ACHP with a copy of such written response.

C. If at any time during implementation of the measures stipulated in the PA, an objection pertaining to an action under the PA should be raised by a member of the public, FERC staff shall take the objection into account, communicate with the objector regarding potential resolutions, and notify the parties to the PA about the objection and recommendations for resolutions.

D. FERC's responsibility to carry out all other actions subject to the terms of this PA that are not the subject of the dispute remain unchanged.

XII. AMENDMENTS

This PA may be amended when such an amendment is agreed to in writing by all signatories. The amendment will be effective on the date a copy signed by all of the signatories is filed with the ACHP.

XIII. TERMINATION

A. If any signatory determines that the terms of the PA will not or cannot be carried out, that party shall immediately consult with the other signatories to attempt to develop an amendment per Stipulation XII. If within thirty (30) days (or another time period agreed to by all signatories) an amendment cannot be reached, any signatory may terminate the PA upon written notification to the other signatories.

B. Once the PA is terminated, and prior to work continuing on the Undertaking, FERC must either (1) execute an agreement pursuant to Part 800.6 or (2) request, take into account, and respond to the comments of the ACHP under Part 800.7. FERC shall notify the signatories as to the course of action it will pursue.

XIV. EXECUTION

A. This PA is considered executed when signed by FERC and the VASHPO and NCSHPO, in accordance with Part 800.6(b)(1)(iv). The effective date of execution of this PA is the date of the last signature affixed by a signatory.

B. Execution of this PA by FERC and the VASHPO and NCSHPO, and implementation of its terms and stipulations, is evidence that FERC has taken into account the effects of this Undertaking on historic properties and afforded the ACHP an opportunity to comment.

MVP Southgate Project

Resource Report 9 – Air and Noise Quality

(November 2018)

Mountain Valley PIPELINE LLC

MVP Southgate Project

Docket No. CP19-XX-000

Resource Report 9 – Air and Noise Quality

November 2018

MVP Southgate Project
Resource Report 9 – Air and Noise Quality

Resource Report 9 – Filing Requirements	
Information	**Location in Resource Report**
Minimum Filing Requirements	
1. Describe existing air quality in the vicinity of the project. (§ 380.12(k)(1)) • Identify criteria pollutants that may be emitted above EPA-identified significance levels.	Section 9.2.1
2. Quantify the existing noise levels (day-night sound level (Ldn) and other applicable noise parameters) at noise sensitive areas and at other areas covered by relevant state and local noise ordinances. (§ 380.12(k)(2)) • If new compressor station sites are proposed, measure or estimate the existing ambient sound environment based on current land uses and activities. • For existing compressor stations (operated at full load), include the results of a sound level survey at the site property line and nearby noise-sensitive areas. • Include a plot plan that identifies the locations and duration of noise measurements. • All surveys must identify the time of day, weather conditions, wind speed and direction, engine load, and other noise sources present during each measurement.	Section 9.3.3
3. Quantify existing and proposed emissions of compressor equipment, plus construction emissions, including nitrogen oxides (NOx) and carbon monoxide (CO), and the basis for these calculations. Summarize anticipated air quality impacts for the project. (§ 380.12(k)(3)) • Provide the emission rate of NOx from existing and proposed facilities, expressed in pounds per hour and tons per year for maximum operating conditions, include supporting calculations, emission factors, fuel consumption rate, and annual hours of operation.	Section 9.2.2, Appendix 9-A, Appendix 9-B, Appendix 9-C, Appendix 9-D
4. Describe the existing compressor units at each station where new, additional, or modified compressor units are proposed, including the manufacturer, model number, and horsepower of the compressor units. For proposed new, additional, or modified compressor units include the horsepower, type, and energy source. (§ 380.12(k)(4))	There are no existing compressor units
5. Identify any nearby noise-sensitive area by distance and direction from the proposed compressor unit building/enclosure. (§ 380.12(k)(4))	Section 9.3.3
6. Identify any applicable state or local noise regulations. (§ 380.12(k)(4)) • Specify how the facility will meet the regulations.	Section 9.3.2
7. Calculate the noise impact at noise-sensitive areas of the proposed compressor unit modifications or additions, specifying how the impact was calculated, including manufacturer's data and proposed noise control equipment. (§ 380.12(k)(4))	Section 9.3.5
Additional Information Often Missing and Resulting in Data Requests	
8. Include climate information as part of the air quality information provided for the project area.	Section 9.2.1.1
9. Identify potentially applicable federal and state air quality regulations.	Section 9.2.4
10. Provide construction emissions (criteria pollutants, hazardous air pollutants, greenhouse gases) for proposed pipelines and aboveground facilities.	Section 9.2.5, Appendix 9-A
11. Provide copies of state and federal applications for air permits.	Appendix 9-C

Resource Report 9 – Filing Requirements	
Information	**Location in Resource Report**
12. Provide operation and fugitive emissions (criteria pollutants, hazardous air pollutants, greenhouse gases) for pipelines and aboveground facilities.	Section 9.2.5.2, Appendix 9-B
13. Provide air quality modeling for entire compressor stations.	Appendix 9-D
14. Identify temporary and permanent emissions sources that may have cumulative air quality effects in addition to those resulting from the project.	Section 9.2.6, Table 9.2-9
Noise and Vibration (see further discussion below)	
15. Describe the existing noise environment and ambient noise surveys for compressor stations, liquefied natural gas facilities, meter and regulation facilities, and drilling locations.	Section 9.3.3
16. Identify any state or local noise regulations applicable to construction and operation of the project.	Section 9.3.2
17. Indicate whether construction activities would occur over 24-hour periods.	Section 9.3.4
18. Discuss construction noise impacts and quantify construction noise impacts from drilling, pile driving, dredging, etc.	Section 9.3.4.3
19. Quantify operation noise from aboveground facilities, including blowdowns.	Section 9.3.5
20. Describe the potential for the operation of the proposed facilities to result in an increase in perceptible vibration and how this would be prevented.	Section 9.3.5.4
21. Identify temporary and permanent noise sources that may have cumulative noise effects in addition to those resulting from the project.	Section 9.3.7

RESOURCE REPORT 9
AIR AND NOISE QUALITY

9.1 INTRODUCTION

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity from the Federal Energy Regulatory Commission ("FERC" or "Commission") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Southgate Project" or "Project"). The Southgate Project facilities will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina. See Resource Report 1 (General Project Description) for additional Project information.

9.1.1 Environmental Resource Report Organization

Resource Report 9 includes discussion of Air Quality and Noise in the Southgate Project area as well as potential Project-related impacts. Resource Report 9 is prepared and organized according to the FERC *Guidance Manual for Environmental Report Preparation* issued February 2017. Air quality resources and potential air impacts associated with the Southgate Project are discussed in Section 9.2. A summary of the regional climate and existing air quality is provided in Section 9.2.1, and a discussion of Project-related emissions is located in Section 9.2.2. An overview of the air permitting requirements are discussed in Section 9.2.3, a discussion of applicable regulatory requirements in Section 9.2.4, an analysis of General Conformity in Section 9.2.5, and a summary of air quality mitigation measures in Section 9.2.6. Noise quality resources and potential impacts from the Southgate Project are discussed in Section 9.3. Section 9.3.1 provides background information on noise, Section 9.3.2 provides a description of the applicable regulatory requirements applicable to noise, Section 9.3.3 identifies the existing in-air acoustic conditions and presents noise modeling results, Section 9.3.4 discusses construction noise, Section 9.3.5 discusses Project operation noise, Section 9.3.6 discusses post-construction sound survey, and Section 9.3.7 discusses cumulative effects.

9.2 AIR QUALITY

Potential short-term and temporary air quality impacts may result from construction activities necessary to install the pipeline, metering and regulating sites, and compressor station. Long-term air impacts may result from the operation of the turbines and other equipment. From a regulatory standpoint, the emissions and associated air quality impacts are addressed in two separate ways:

1) Construction Permitting – Construction (and operation) permitting addresses the emissions and associated impacts from the operational equipment and sources at the Southgate Project facilities. Depending on the major/minor status of the Project and the location of the Project, Prevention of Significant Deterioration ("PSD"), Nonattainment NSR ("NNSR"), and/or associated state permitting programs ensure that the proposed installation of new air emissions sources (i.e., operational equipment) meet required emission levels, install appropriate control technologies, and meet other regulatory requirements, where appropriate. The regulatory applicability of permitting programs to the Project is discussed in Section 9.2.4. The Project performed air quality modeling of the emissions of all criteria pollutants resulting from the Project. This modeling assessment demonstrates that all National Ambient Air Quality Standards ("NAAQS") standards are met during operation of the Project. The modeling approach and results are

assessed in detail in Appendix 9-D (Modeling Report) and are not discussed further as part of the regulatory requirements and compliance demonstrations of Sections 9.2.4 through 9.2.6.

2) General Conformity – General Conformity addresses the sources of emissions not covered by permitting actions (e.g., construction activities or an increase in traffic to the sites) and ensures that they comply with the applicable State Implementation Plan(s). Generally, these include the short-term/temporary emissions from construction activities and new emissions increases from non-permitted emission sources such as mobile sources. General Conformity, discussed in Section 9.2.5, is only applicable in maintenance/non-attainment areas. All counties that are impacted by the Southgate Project are in attainment for all criteria pollutants (USEPA, 2018). As such, General Conformity does not apply. However, the Southgate Project has included the construction emissions per the FERC's *Guidance Manual for Environmental Report Preparation* issued February 2017.

9.2.1 Existing Air Quality

9.2.1.1 Climate

The climate in the Southgate Project area is primarily continental in character but is subject to modification by the Atlantic Ocean; the proper classification for the climate is "modified continental." The mid- latitude site location and proximity to the Atlantic Ocean exposes the region to a variety of meteorological conditions and events. Varying weather conditions can occur in the Project area including tropical storms and hurricanes, thunderstorms, and droughts. The mid-latitude location exposes the area to large annual ranges in temperatures. Cold outbreaks originating from the northern latitudes contrast significantly with the heat and humidity that is often transported from the Gulf of Mexico. The primary interaction point between these mid-latitude regions results in weather characterized by frequent, sometimes powerful, change. At times, mesoscale influences alter this meteorological variety.

Southcentral Virginia and northern North Carolina have a varied climate. The eastern half of each state, including the eastern shores, lie within the Humid Subtropical climate zone. This region experiences hot, humid summers and mild to cool winters, with evenly dispersed precipitation. The western half of the states are within the transition zone between the Humid Subtropical and Humid Continental zones, with more mild summertime temperatures and colder winters that experience frequent subfreezing low temperatures and moderate snowfall (Britannica, 2018).

In the Southgate Project area, summers are warm and humid and winters are cold, but not severe. Thunderstorms can occur at any time but are most frequent during the late spring and summer. The storms are most often accompanied by downpours and gusty winds but are not usually severe. Tornadoes, which infrequently occur, have resulted in significant damage. Severe hailstorms have occurred in the spring. Tropical storms can bring heavy rain, high winds and flooding in the late summer and fall.

The National Climatic Data Center's ("NCDC") 1981-2010 Climate Normals (NCDC, 2012) were evaluated from meteorological stations located in Chatham, Pittsylvania County, Virginia, and in Reidsville, Rockingham County, North Carolina. Temperatures near the Project facilities are generally highest in July and lowest in January. Maximum temperatures of 90 degrees Fahrenheit (°F) or higher occur about 20-28 days per year on average, while minimum temperatures of 0°F or lower occur less than one day per year on average. The mean annual precipitation is about 45 to 46 inches, with monthly average precipitation ranging from a low of about 3.0 inches in February to a maximum of about 4.8

inches in July. Precipitation of 0.01 inch or greater occurs on about 115 days per year on average. Precipitation of 1.0 inch or greater occurs on average about 12 days per year. The average annual snowfall for the region is approximately 4 to 9 inches. The average annual wind speed for Chatham, VA is 7.4 miles per hour, with a prevailing wind direction from the west-southwest. The average annual wind speed for Reidsville, NC is 7.1 miles per hour, with a prevailing wind direction from the southwest.

Table 9.2-1 provides a summary of the climate parameters associated with the Southgate Project compressor station.

Table 9.2-1

Climate Parameters at the Compressor Station Location

Compressor Station	Monitoring Station	ID	Approximate Distance and Direction from Existing Monitoring Station to Compressor Station	Average Daily Minimum Temperature – January (°F)	Average Daily Maximum Temperature – July (°F)	Annual Precipitation (inches)
Lambert	Chatham, VA	USC00441614	6 km west	22.8	86.3	45.2

km = kilometer

9.2.1.2 National Ambient Air Quality Standards

NAAQS have been established for each of the following criteria air pollutants: particulate matter with an aerodynamic diameter of 10 microns or less ("PM_{10}"), particulate matter with an aerodynamic diameter of 2.5 microns or less ("$PM_{2.5}$"), sulfur dioxide ("SO_2"), ozone ("O_3"), nitrogen dioxide ("NO_2"), carbon monoxide ("CO"), and lead ("Pb"). Standards are designated as primary or secondary. Primary standards are set at a level designed to protect public health. Secondary standards are set to protect welfare values such as vegetation, visibility, and property values. NAAQS values are listed in the Code of Federal Regulations ("CFR") at 40 CFR Part 50. The current NAAQS for these criteria pollutants are summarized in Table 9.2-2. Footnotes to Table 9.2-2 explain how compliance with each NAAQS is assessed.

Note that both states have adopted State Ambient Air Quality Standards that are equivalent to the NAAQS.

Table 9.2-2

National Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Period	Standards	
		Primary	Secondary
SO_2	1-hour [l,m]	75 ppb 196 µg/m³	--
	3-hour [b]	--	0.5 ppm 1300 µg/m³
	Annual [a,m]	0.03 ppm 80 µg/m³	--
	24-hour [b,m]	0.14 ppm 365 µg/m³	--
PM_{10}	24-hour [d]	150 µg/m³	150 µg/m³
$PM_{2.5}$ (2012 Standard)	Annual [e,]	12.0 µg/m³	15.0 µg/m³
$PM_{2.5}$ (2006 Standard)	24-hour [f]	35 µg/m³	35 µg/m³
NO_2	Annual [a]	0.053 ppm (53 ppb) 100 µg/m³	0.053 ppm (53 ppb) 100 µg/m³
	1-hour [c]	100 ppb 188 ug/m³	--
CO	8-hour [b]	9 ppm 10,000 µg/m³	--
	1-hour [b]	35 ppm 40,000 µg/m³	--
O_3 (2008 Standard)	8-hour [g,h]	0.075 ppm	0.075 ppm
O_3 (2015 Standard)	8-Hour[i]	0.070 ppm	0.070 ppm
O_3	1-hour [j,k]	0.12 ppm	0.12 ppm
Pb	Rolling 3-month [a]	0.15 µg/m³	0.15 µg/m³

Table 9.2-2

National Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Period	Standards	
		Primary	Secondary

Notes:
a/ Not to be exceeded.
b/ Not to be exceeded more than once per year.
c/ Compliance based on 3-year average of the 98th percentile of the daily maximum 1-hour average at each monitor within an area.
d/ Not to be exceeded more than once per year on average over 3 years.
e/ Compliance based on 3-year average of weighted annual mean $PM_{2.5}$ concentrations at community-oriented monitors.
f/ Compliance based on 3-year average of 98th percentile of 24-hour concentrations at each population-oriented monitor within an area.
g/ Compliance based on 3-year average of fourth-highest daily maximum 8-hour average ozone concentrations measured at each monitor within an area.
h/ The 2008 8-hour ozone standard will remain in effect until one year after an area is designated for the 2015 8-hour ozone standard, which corresponds with January 16, 2019 based upon attainment designations for the 2015 ozone standard issued on January 16, 2018.
i/ Permit applications that have not met U.S. Environmental Protection Agency's ("USEPA's") grandfathering criteria would have to demonstrate that the proposed project does not cause or contribute to a violation of any revised ozone standards that are in effect when the permit is issued, including the 2015 revised standards.
j/ Maximum 1-hour daily average not to be exceeded more than one day per calendar year on average.
k/ The 1-hour ozone standard has been revoked in all areas in which Project activities will occur.
l/ Compliance based on 3-year average of 99th percentile of the daily maximum 1-hour average at each monitor within an area.
m/ The 24-hour and annual average primary standards for SO_2 have been revoked.

ppm = parts per million by volume.
ppb = parts per billion by volume.
$\mu g/m^3$ = micrograms per cubic meter.

9.2.1.3 Section 107 Attainment Status Designations

The standard method for characterizing existing air quality in a given area is to identify the attainment status of the air quality control region ("AQCR") in which it is located. An AQCR, as defined in Section 107 of the Clean Air Act ("CAA"), is a federally-designated area in which NAAQS must be met. An implementation plan is developed for each AQCR describing how ambient air quality standards will be achieved and maintained.

The U.S. Environmental Protection Agency ("USEPA") designates the attainment status of an area on a pollutant-specific basis based on whether an area meets the NAAQS. Areas that meet the NAAQS are termed "attainment areas." Areas that do not meet the NAAQS are termed "nonattainment areas." Areas for which insufficient data are available to determine attainment status are termed "unclassified areas." Areas formerly designated as nonattainment areas that have subsequently reached attainment are termed "maintenance areas."

The attainment status designations appear at 40 CFR Part 81. The attainment status of a region, in conjunction with projected emission rates or emissions increases, determines the regulatory review

process for a new project. The Lambert Compressor Station and associated pipeline in Virginia is located in AQCR 143, the Central Virginia Intrastate AQCR. These facilities are in a region that is designated as attainment/unclassifiable for all criteria air pollutants (USEPA, 2018).

The pipeline in North Carolina is located in AQCR 150, the Northern Piedmont Intrastate AQCR. This region is designated as attainment/unclassifiable for all criteria air pollutants (USEPA, 2018).

9.2.1.4 Existing Ambient Background Levels

The Southgate Project is located in Pittsylvania County, Virginia and in Rockingham and Alamance counties, North Carolina. These counties contain ambient air quality monitors that collect data concerning existing levels of various air pollutants. Summary data from the USEPA AirData database were reviewed to characterize existing concentrations at the Project for comparison with NAAQS. Specifically, data from the closest ambient air quality monitoring stations were used to represent existing air quality at the Project. If no county data were available, data from a nearby county were used as a substitute (USEPA, 2017).

Ambient air quality monitoring data from the 3-year period 2015-2017 are summarized in Table 9.2-3 for monitoring stations nearest to the Southgate Project. Table 9.2-3 lists the maximum annual mean concentration and/or a near-maximum short-term concentration by station. Second-high short-term concentrations are listed for most pollutants, but Table 9.2-3 includes the fourth-highest 8-hour average concentration for ozone, the 98th percentile 1-hour average concentration for NO_2, the 98th percentile 24-hour average concentration for $PM_{2.5}$, and the 99th percentile 1-hour average concentration for SO_2, consistent with the structure of the NAAQS for those pollutants and averaging periods.

Table 9.2-3

Existing Ambient Background Levels in the Vicinity of the Lambert Compressor Station

Pollutant	Averaging Period	Monitoring Station	AQS Site ID	County	State	Approx. Distance from Facility (km)	Background Concentration	Primary NAAQS	Units a/
Ozone	8-hour	Reidsville	37-033-0001	Caswell	NC	59	0.064	0.070	ppm
CO	1-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	1.1	35	ppm
CO	8-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	0.7	9	ppm
NO_2	1-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	33.3	100	ppb
NO_2	Annual	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	5.7	53	ppb
PM_{10}	24-hour	Mendenhall School	37-081-0013	Guilford	NC	90	35	150	ug/m^3
$PM_{2.5}$	24-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	15.7	35	ug/m^3
$PM_{2.5}$	Annual	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	7.0	12	ug/m^3
SO_2	1-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	4.0	75	ppb
SO_2	24-hour	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	2.8	140	ppb
SO_2	Annual	East Vinton Elementary School	51-161-1004	Roanoke	VA	69	0.4	30	ppb

a/ ppm = parts per million by volume. ppb = parts per billion by volume. µg/m3 = micrograms per cubic meter.

9.2.1.5 Federal Class I Areas

Federal Class I areas are certain areas established by Congress, such as wilderness areas and national parks, that are afforded special protection under the Clean Air Act. Once designated as a Class I area, an area cannot be re-designated to another (lower) classification. Class I areas are allowed the smallest degree of air quality deterioration through New Source Review ("NSR") / PSD permitting, and special considerations must be made in the NSR permitting process when a Class I area is located close to a site. The Southgate Project is not anticipated to require major source PSD review and thus, Class I air quality modeling will not be required. Regardless, the Class I areas nearest to the location of the Lambert Compressor Station have been identified. The Class I areas are listed in Table 9.2-4.

Table 9.2-4
Federal Class I Areas Closest to the Lambert Compressor Station

Class I Area	Managing Agency	Direction from Lambert	Distance to Compressor Station	
			Kilometers	Miles
James River Face Wilderness Area, VA	U.S. Forest Service	North	81	50
Shenandoah National Park, VA	National Park Service	North	143	89

9.2.2 Project Emissions

9.2.2.1 Construction

Construction activities associated with the Southgate Project will result in temporary increases in emissions of some pollutants due to the use of non-stationary equipment powered by diesel fuel or gasoline engines; the temporary generation of fugitive dust due to disturbance of the ground surface, vegetation clearing, and other dust generating actions; and indirect emissions attributable to workers commuting to and from work sites during construction. Detailed construction emissions calculations along with the methodology and emissions factors used are provided in Appendix 9-A.

These sources are not considered stationary sources, and their impacts will generally be temporary and localized. Therefore, the emissions are not required to be evaluated as part of the PSD or NNSR major source determination analysis. Furthermore, the emissions from construction activities are not expected to cause or significantly contribute to an exceedance of the NAAQS.

Potential emissions from construction of the Southgate Project are presented in Section 9.2.5.

9.2.2.2 Operation (including maintenance and malfunctions)

The following sections list the equipment to be installed at the Lambert Compressor Station. Emission calculations have been performed and are presented in Appendix 9-B for these emission sources. The Southgate Project has included volatile organic compounds ("VOC") and greenhouse gas ("GHG") emissions from blowdown events at the compressor station using the following assumptions:

- While only 8 blowdown events are planned per year, due to system testing and maintenance activities, permitting will reflect 16 for the compressors in case additional blowdown events become necessary.

Lambert Compressor Station

The Lambert Compressor Station will involve the installation of:

- Two (2) turbines for the compression and transmission of natural gas;
- Five (5) microturbines to provide power;
- One (1) fuel gas heater;
- Two (2) produced fluids tanks and associated loadout; and
- Associated piping and components.

Operational emission estimates associated with fugitive gas releases from the pipeline, valves, meter stations, regulation facilities, and pig launcher/receivers along the pipeline are provided in Appendix 9-B. The calculations in Appendix 9-B are based on a methodology described in Interstate Natural Gas Association of America guidelines[1] and a representative natural gas sample, which is also included in Appendix 9-B.

9.2.2.3 Decommissioning

Decommissioning is not currently planned. Mountain Valley will obtain the necessary state and federal permits for decommissioning at the end of the useful Project life.

9.2.3 Air Permitting Requirements

The Virginia Code of State Rules ("CSR") require sources of air contamination to notify the state and receive a permit to construct, modify, relocate and operate the stationary source, unless otherwise exempt. The Southgate Project will submit the necessary construction permit applications and other relevant documentation prior to construction. A copy of the minor source air permit application for Lambert Station is included in Appendix 9-C [*Note: Appendix 9-C to be provided in a supplemental filing*].

9.2.4 Regulatory Review and Applicability

This section lists federal and state air quality regulations that may be applicable to the Southgate Project.

9.2.4.1 Prevention of Significant Deterioration Source Classification

Federal construction permitting programs regulate new and modified sources of attainment pollutants under PSD and new and modified sources of non-attainment pollutants under NNSR. PSD regulations apply when a new source is constructed in which emissions exceed PSD major source thresholds, an existing minor source undergoes a modification in which emission increases exceed PSD major source

[1] Greenhouse Gas Emission Estimation Guidelines for Natural Gas Transmission and Storage, Volume 1 - GHG Emission Estimation Methodologies and Procedures, Interstate Natural Gas Association of America, September 28, 2005

thresholds, or an existing major source undergoes a modification in which emission increases exceed PSD significant emission rates. The Lambert Compressor Station will be designed as a minor source with respect to PSD, as shown in Table 9.2-5. As such, PSD permitting is not triggered.

Table 9.2-5

Emissions from Compressor Station versus NSR Major Source Thresholds

Pollutant	Lambert Compressor Station Site-Wide PTE (TPY) a/	Major Source Threshold (TPY)	NSR Program	Subject to Major NSR?
NO_2	55.58	250	PSD	NO
PM_{10}	14.96	250	PSD	NO
$PM_{2.5}$	14.96	250	PSD	NO
CO	66.08	250	PSD	NO
SO_2	5.25	250	PSD	NO
VOC	9.07	250	PSD	NO

a/ PTE includes emissions from fugitive sources. PTE = potential to emit

NNSR regulations apply only in areas designated as non-attainment. The compressor station will be located in Pittsylvania County, Virginia, which is designated as attainment/unclassifiable areas for all criteria pollutants (USEPA, 2018) Therefore, NNSR regulations do not apply.

9.2.4.2 Title V Operating Permit Program

Title 40 of the Code of Federal Regulations, Chapter 70 (40 CFR 70) establishes the Federal Title V operating permit program ("Title V"). Virginia has incorporated the provisions of this federal program in its Title V operating permit program in Virginia 45 CSR 30. The major source thresholds with respect to the Virginia and North Carolina Title V operating permit program regulations are 10 tons per year ("tpy") of a single hazardous air pollutant ("HAP"), 25 tpy of any combination of HAP and 100 tpy of all other regulated pollutants, except GHG.[2]

The potential emissions of all regulated pollutants at the Lambert Compressor Station will be below the corresponding Title V thresholds. Therefore, the Lambert Compressor Station is not anticipated to be a major source for Title V purposes.

9.2.4.3 New Source Performance Standards

New Source Performance Standards ("NSPS"), located in 40 CFR 60, require new, modified, or reconstructed sources to control emissions to the level achievable by the best demonstrated technology as specified in the applicable provisions. Moreover, any source subject to an NSPS is also subject to the general provisions of NSPS Subpart A, except where expressly noted. The following is a summary of applicability and non-applicability determinations for NSPS regulations of relevance to the facilities.

[2] On June 23, 2014, the U.S Supreme Court decision in the case of *Utility Air Regulatory Group v. EPA* effectively changed the permitting procedures for GHGs under the PSD and Title V programs.

NSPS Subpart Dc – Steam Generating Units

Subpart Dc, Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units, applies to all steam generating units with a heat input greater than or equal to 10 million British thermal units per hour ("MMBtu/hr") and less than 100 MMBtu/hr. No units at the facilities meet the definition of a steam generating unit nor have a heat input greater than 10 MMBtu/hr; therefore, the requirements of this subpart will not apply.

NSPS Subpart GG – Stationary Gas Turbines

Subpart GG, Standards of Performance for Stationary Gas Turbines, applies to all gas turbines with a heat input at peak load greater than or equal to 10 MMBtu/hr based on the lower heating value of the fuel fired. This standard was promulgated in 1979. The applicability of Subpart KKKK, promulgated in 2006, is similar to that of Subpart GG and applies to stationary combustion turbines that commence construction after February 18, 2005. Turbines subject to Subpart KKKK are specifically exempt from the requirements of Subpart GG per 40 CFR § 60.4305(b). As such, this subpart does not apply to the proposed Solar turbines at the compressor station, which are subject to the requirements of Subpart KKKK as discussed in the below section. The proposed generators have a heat input less than 10 MMBtu/hr and are not subject to the requirements of Subpart GG.

NSPS Subparts K, Ka, and Kb – Storage Vessels for Petroleum Liquids/Volatile Organic Liquids

These subparts apply to storage tanks of certain sizes constructed, reconstructed, or modified during various time periods. Subpart K applies to storage tanks constructed, reconstructed, or modified prior to 1978, and Subpart Ka to those constructed, reconstructed, or modified prior to 1984. All storage tanks located at the compressor station will be constructed after these dates; therefore, the requirements of Subparts K and Ka do not apply. Subpart Kb applies to volatile organic liquid storage tanks constructed, reconstructed, or modified after July 23, 1984 with a capacity equal to or greater than 75 m^3 (approximately 19,813 gallons). All storage tanks at the compressor station will be new construction but will not have a capacity greater than 75 m^3. Therefore, Subpart Kb does not apply to the storage tanks at the compressor station.

NSPS Subpart JJJJ – Stationary Spark Ignition Internal Combustion Engines

Subpart JJJJ, Standards of Performance for Stationary Spark Ignition Internal Combustion Engines, applies to manufacturers, owners and operators of stationary spark engines. There will be no stationary spark engines installed at the compressor station. Therefore, this subpart is not applicable to the Southgate Project.

NSPS Subpart KKKK – Stationary Combustion Turbines

Subpart KKKK, Standards of Performance for Stationary Combustion Turbines, applies to stationary combustion units with a heat input at peak load equal to or greater than 10 MMBtu/hr, based on the higher heating value of the fuel, commencing construction after February 18, 2005. The generators at the compressor station will each have a heat input less than 10 MMBtu/hr. Therefore, they are not subject to this standard.

The proposed Solar turbines for the Lambert Compressor Station will be subject to the nitrogen oxide ("NO_X") emissions limitations in NSPS KKKK. Turbines with a rated capacity between 50 to 850 MMBtu/hr at peak load are limited to NO_X emissions of 25 ppm at 15 percent O_2 when firing natural gas. The Solar turbines that will be installed at the station are equipped with lean pre-mix combustion technology and are guaranteed by the manufacturer to emit a maximum of 15 ppm of NO_X at 15 percent O_2 under variable turbine load conditions when firing on natural gas. This vendor guarantee is below the NSPS KKKK standard.

The Southgate Project will perform annual performance tests in accordance with §60.4340(a) and§ 60.4400 to demonstrate compliance with the NO_X emission limitations, or as an alternative, will continuously monitor the appropriate parameters to determine whether each turbine is operating in low-NO_X mode in accordance with §60.4340(b)(2)(ii) and §60.4355(a). The Solar turbines will also comply with the SO_2 emission limits in NSPS KKKK. The Southgate Project will comply with the SO_2 requirements by the exclusive use of natural gas which contains total potential sulfur emissions less than 0.060-pound SO_2/MMBtu heat input in accordance with §60.4330(a)(2).

NSPS Subpart OOOO – Natural Gas Production, Transmission, and Storage

Subpart OOOO, Standards of Performance for Crude Oil and Natural Gas Production, Transmission, and Distribution, applies to facilities that commenced construction, reconstruction, or modification after August 23, 2011 and on or before September 18, 2015. This NSPS was published in the Federal Register on August 16, 2012 and was subsequently amended. The list of potentially affected facilities includes:

- Gas wellheads;
- Centrifugal compressors located between the wellhead and the point of custody transfer to the natural gas transmission and storage segment;
- Reciprocating compressors located between the wellhead and the point of custody transfer to the natural gas transmission and storage segment;
- Continuous bleed natural gas-driven pneumatic controllers with a bleed rate of greater than 6 standard cubic feet per hour located between the wellhead and the point of custody transfer to the natural gas transmission and storage segment (excluding natural gas processing plants);
- Continuous bleed natural gas-driven pneumatic controllers located at natural gas processing plants;
- Storage vessels in the production, processing, or transmission and storage segments; and
- Sweetening units located onshore that process natural gas produced from either onshore or offshore wells.

Since the compressor station will be constructed after September 18, 2015, this subpart does not apply to any sources at the facility.

NSPS Subpart OOOOa - Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution

40 CFR Part 60, Subpart OOOOa applies to sources that are constructed/modified/reconstructed after September 18, 2015 including centrifugal compressors, reciprocating compressors, pneumatic controllers, pneumatic pumps, storage vessels, equipment leaks and sweetening units within the crude oil and natural gas sector. In the natural gas transmission segment, Subpart OOOOa defines standards for each of these affected facilities, except for pneumatic pumps and sweetening units.

Centrifugal compressors with wet seals constructed after September 18, 2015 are subject to the control, recordkeeping, and reporting requirements of Subpart OOOOa. Mountain Valley will not be installing any centrifugal compressors with wet seals as part of the Southgate Project. Any new natural gas pneumatic controller installed will have a bleed rate less than or equal to six standard cubic feet per hour, as required by Subpart OOOOa.

The regulatory standards applicable to storage vessels are detailed in 40 CFR §60.5395a. The only tanks that fall under the Subpart's definition of a "storage vessel" are the produced fluid storage tanks; however, these tanks will have potential VOC emissions below 6 tpy each. As such, per §60.5365a(e), these tanks are not storage vessel affected facility under the rule.

Subpart OOOOa has added Leak Detection and Repair requirements for new or modified compressor stations in the transmission segment. For equipment leaks, Subpart OOOOa requires quarterly surveys using optical gas imaging ("OGI") technology and subsequent repair of any identified leaks. The Southgate Project will comply with all applicable leak detection provisions of Subpart OOOOa.

9.2.4.4 National Emission Standards for Hazardous Air Pollutants

Regulatory requirements for facilities subject to National Emission Standards for Hazardous Air Pollutants ("NESHAP") standards, otherwise known as Maximum Available Control Technology ("MACT") Standards for source categories, are contained in 40 CFR Part 63. 40 CFR Part 61 NESHAP standards are defined for specific pollutants while Part 63 NESHAPs are defined for source categories where allowable emission limits are established on the basis of a MACT determination for a particular major source. A major source of HAP is defined as having potential emissions in excess of 25 tpy for total HAP and/or potential emissions in excess of 10 tpy for any individual HAP. Area sources consist of smaller-size facilities that release lesser quantities of toxic pollutants into the air and are defined as sources that emit less than 10 tpy of a single air toxin or less than 25 tpy of a combination of air toxins. Part 63 NESHAPs apply to sources in specifically-regulated industrial source categories (CAA Section 112(d)) or on a case-by-case basis (Section 112(g)) for facilities not regulated as a specific industrial source type.

Potential HAP emissions from the compressor station will be below the major source thresholds (i.e., less than 10 tpy of individual HAP and 25 tpy of total HAP) and therefore, the facility will be an area source of HAP. The potential applicability of specific MACT standards to the compressor station is discussed below.

NESHAP Subpart HH – Natural Gas Production Facilities

This standard applies to sources at natural gas production facilities that are major or area sources of HAP emissions. The Lambert Compressor Station is a transmission facility; therefore, the facility will not be subject to Subpart HH.

NESHAP Subpart HHH – Natural Gas Transmission and Storage Facilities

This standard applies to sources at natural gas transmission and storage facilities that are major sources of HAP emissions located downstream of the point of custody transfer (after processing and/or treatment in the production sector), but upstream of the distribution sector. The Lambert Compressor Station is a transmission facility and an area (not major) source of HAP emissions. Therefore, the facility will not be subject to Subpart HHH.

NESHAP Subpart YYYY – Stationary Combustion Turbines.

Stationary combustion turbines located at facilities that are major sources of HAPs are potentially subject to Subpart YYYY, NESHAP for Stationary Combustion Turbines. Subpart YYYY establishes emissions and operating limitations for lean premix gas-fired, lean premix oil-fired, diffusion flame gas-fired and diffusion flame oil-fired stationary combustion turbines. The Lambert Compressor Station is an area (not major) source of HAP and therefore is not subject to the requirements of this subpart.

NESHAP Subpart ZZZZ – Stationary Reciprocating Internal Combustion Engines

Stationary reciprocating internal combustion engines at both area and major sources of HAP emissions are potentially subject to Subpart *ZZZZ – NESHAP for Stationary Reciprocating Internal Combustion Engines*. There are no proposed stationary reciprocating internal combustion engines at the compressor station. Therefore, the station is not subject to this subpart.

NESHAP Subpart DDDDD – Industrial, Commercial, and Institutional Boilers and Process Heaters (Major Source Boiler MACT)

This MACT standard applies to industrial, commercial, and institutional boilers of various sizes and fuel types at major sources of HAP. The facility is an area (not major) source of HAP; therefore, the requirements of this subpart will not apply.

NESHAP Subpart JJJJJJ – Industrial, Commercial, and Institutional Boilers (Area Source Boiler MACT)

This MACT standard applies to industrial, commercial, and institutional boilers of various sizes and fuel types. The rule does not apply to natural gas fired boilers and does not apply to process heaters at area sources. The fuel heaters are natural gas-fired and are specifically exempt from this subpart. Therefore, the requirements of this subpart will not apply.

9.2.4.5 Greenhouse Gas Reporting Rule

Per 40 CFR §98.2(a)(2), facilities that contain a source category listed in Table A-4 and emit 25,000 metric tons or more per year of carbon dioxide equivalent ("CO_2e") in combined emissions from stationary fuel combustion units, miscellaneous uses of carbonate, and all applicable source categories in Tables A-3 and A-4 are subject to reporting under the Greenhouse Gas Mandatory Reporting Rule

("MRR"). Table A-4 of 40 CFR 98 Subpart A includes Petroleum and Natural Gas Systems. Greenhouse gas emissions from the compressor station are over 25,000 metric tpy on a potential basis. The actual emissions will be calculated annually following support W applicability and calculation methodology and compared with the 25,000 metric tpy of CO_2 to address the applicability of the rule. The Southgate Project will meet all requirements of the MRR for the new compressor station, as applicable. No other subparts under the MRR are applicable to the compressor station.

9.2.4.6 Virginia Air Quality Regulations

The Lambert Compressor Station is subject to regulations contained in the Virginia CSR, which requires sources of air contamination to notify the state and receive a permit to construct, modify, relocate and operate the stationary source, unless otherwise exempt. The air quality regulations for the Commonwealth of Virginia are codified in Title 9 of the Virginia Administrative Code (9 VAC) Agency 5, State Air Pollution Control Board. The following sections present a discussion of potentially applicable Virginia air quality regulations.

9 VAC 5-20: General Provisions on Air Pollution Control

The General Provisions on Air Pollution Control contain provisions to secure and maintain all air quality levels in Virginia. Under 9 VAC 5-20-170, the air pollution control board may require an owner of a stationary source to submit a control program, in a form and manner satisfactory to the board, showing how compliance shall be achieved. For cases of equipment maintenance or malfunctions, 9 VAC 5-20-180 will require the facility record and notify the board of such instances.

9 VAC 5-30: Ambient Air Quality Standards

Ambient air quality standards are required to assure that ambient concentrations of air pollutants are consistent with established criteria and shall serve as the basis for effective and reasonable management of the air resources. Depending on the ambient air quality concentrations, air dispersion modeling may be required. State operating permits ("SOP") are covered in 9 VAC 5-80, which is discussed in more detail below.

9 VAC 5-50: New and Modified Sources

The owner or operator of a new or modified emission source must achieve compliance with all standards of performance prescribed under this chapter within 60 days of achieving maximum production rate, but no later than 180 days after initial startup. Upon the request of the board, the owner or operator may be requested to continuously monitor emissions and process parameters by procedures and methods acceptable to the board. Performance tests will include odor, toxic pollutants, dust, and visible emissions testing. Recordkeeping and reporting requirements include notification of startup, shutdown, malfunction, performance tests, monitoring device malfunctions or repairs, monitoring start and end times. Records must be kept for at least 5 years.

In addition, new or modified stationary sources under Article 6 may be required to demonstrate the use of Best Available Control Technology ("BACT") under 9 VAC 5-50-260. A copy of the air permit application for Lambert Station, which includes BACT applicability and assessment is included in Appendix 9-C.

9 VAC 5-50-80: Visible Emission Standards

Standards for visible emissions from affected facilities are included within 9 VAC 5-50-80. This standard prohibits affected facilities from operating equipment with visible emissions, which exhibit greater than 20 percent opacity, except for one six-minute period in any one hour with no more than 30 percent opacity. Emissions units at the Lambert Compressor Station will comply with the visible emissions standard using EPA Method 9, except during start-up, shutdown, and malfunction.

9 VAC 5-50-90: Fugitive Dust Emissions

The 9 VAC 5-50-90 rule states that during construction and operation of an affected facility, an owner or operator should take reasonable precautions to prevent particulate matter from becoming airborne from any materials or property to be handled, transported, stored, used, constructed, altered, or repaired. The Lambert Compressor Station will be constructed using the fugitive dust mitigation measures discussed in Section 9.2.6 to minimize fugitive dust emissions.

9 VAC 5-60: Hazardous Air Pollutant Sources

Standards and criteria on regulated HAPs are included within 9 VAC 5-60. Emissions testing and recordkeeping is also included in this chapter. A source is exempt from this chapter if the source emits less than the Federal standards for HAP emissions. Air dispersion modeling is required based on the site-specific emissions calculations.

9 VAC 5-80-50: Federal Operating Permits

A Federal operating permit is required for any major source or an area source subject to a standard, limitation, or other requirement under Sections 111-112 of the Clean Air Act, unless otherwise exempt. A copy of the air permit application for Lambert Station, which includes an applicability assessment for major source federal operating permits is included in Appendix 9-C.

9 VAC 5-80: State Operating Permits

Article 6 permitting must be completed before construction of a new source, per 9 VAC 5-80-1100. Virginia's SOPs are most often used by stationary sources to establish federally enforceable limits on potential emissions to avoid major NSR permitting (PSD and NNSR permits), Title V permitting, and/or major source MACT applicability. When a source chooses to use a SOP to limit their emissions below major source permitting thresholds, it is commonly referred to as a "synthetic minor" source. SOPs can also be used to combine multiple permits from a stationary source into one permit or to implement emissions trading requirements.

A copy of air permit application for Lambert Station, which includes an applicability assessment for SOP regulations is included in Appendix 9-C.

9 VAC 5-80-1100: Construction Permits

Article 6 permitting must be completed before construction of a new source. The required Form 7 application forms and attachments are included in the VADEQ air permit application provided in Appendix 9-C to satisfy this requirement for the construction of sources at the facility.

9 VAC 5-85: Permits for Stationary Sources of Pollutants Subject To Regulation

This chapter contains definitions and general provisions which are essentially identical to those discussed in chapter 5-20 above.

9 VAC 5-130: Open Burning

Open burning is permitted on site for the destruction of clean burning waste and debris waste resulting from the development or modification of roads and highways, pipelines, buildings, or from any other clearing operations. Open burning is prohibited from May 1 through September 30. The contractor(s) may utilize open burning as a means of disposing of land-clearing waste during construction of the Southgate Project. The Project's contractor(s) will comply with the provisions of 9 VAC 5-130 during construction.

9.2.4.7 Chemical Accident Prevention Provisions

EPA has established accidental release prevention and risk management plan requirements as part of 40 CFR Part 68 (Chemical Accident Prevention Provisions). Part 68 lists regulated substances along with thresholds for determining the applicability of the associated requirements. If a regulated substance is handled, stored, or processed in greater than threshold quantities at a stationary source, then a risk management plan must be prepared (40 CFR Sections 68.10(a) and 68.12(a)).

Except for constituents of natural gas, such as ethane and methane, the Southgate Project is not expected to produce, process, handle, or store any substance regulated under Part 68 in quantities exceeding applicability thresholds.

9.2.4.8 North Carolina Air Quality Regulations

15A NCAC 02D.1900: Open Burning

This rule outlines the requirements for permissible open burning during land clearing and right of way maintenance. Contractor(s) may utilize open burning as a means of disposing of land-clearing waste during construction of the Southgate Project. This rule regulates items such as the timing, location, meteorological conditions, and type of waste for burning. The Project's contractor(s) will comply will all provisions of 15A NCAC 02D.1900 during construction.

9.2.5 General Conformity

Under the Clean Air Act, a General Conformity analysis is required for any project that requires federal action. General Conformity applies to those emission generating activities resulting from the Project that are not already covered by permitting and located in an area that is designated as nonattainment or a maintenance area (40 CFR 93.153(b)).

The Lambert Compressor Station and pipeline in Virginia is located in AQCR 143, the Central Virginia Intrastate AQCR. These facilities are in a region that is designated as attainment/unclassifiable for all criteria air pollutants. The pipeline in North Carolina is located in AQCR 150, the Northern Piedmont Intrastate AQCR. This region is designated as attainment/unclassifiable for all criteria air pollutants. Therefore, a General Conformity analysis is not required for the Southgate Project.

Construction emissions are presented in Section 9.2.5.1 per FERC's *Guidance Manual for Environmental Report Preparation* issued February 2017. Operation emissions are presented in Section 9.2.5.2.

9.2.5.1 Construction Emissions

The use of equipment to construct the Southgate Project will result in temporary, short-term emissions of air pollutants that will be restricted to the construction period for the compressor station and pipeline and will terminate once construction has been completed. Construction for the Project is expected to take place in 2020. In addition, some right-of-way restoration will occur in 2021.

Construction activities can generally be categorized into the following activities:

- Construction Equipment Engines – Emissions associated with off-road construction equipment such as air compressors, backhoes, cranes, and other construction equipment;
- On-Road Vehicle Travel – Emissions from commuter buses, passenger vehicles, and diesel or gasoline trucks;
- Construction Vehicle Travel – Emissions associated with on-road vehicle travel by dump trucks, light/medium duty trucks, and water/fuel trucks;
- Earthmoving Fugitives – Emissions resulting from bulldozing, grading, and land disturbance; and
- Wind Erosion – Emissions resulting from soil piles.

Emissions from these source categories were calculated using emission factors and USEPA models from the following sources:

- WRAP Fugitive Dust Handbook, Countess Environmental, September 2006;
- USEPA NONROAD2008a Model; and
- USEPA MOVES2014a Vehicle Emission Modeling Software.

Note that fugitive dust emissions from on-road construction equipment and on-road commuter traffic are included in the emission calculations provided in Appendix 9-A. Additionally, note that for the types of sources of GHG emissions associated with Southgate Project construction, total carbon dioxide ("CO_2") is essentially the same as carbon dioxide equivalents (CO_2e) because the CO_2 component of CO_2e for these sources is much greater than 99 percent.

Compressor Station and Meter Station Emissions

Emissions from the compressor station and meter stations were estimated based on the type of construction activity occurring and the length of time that type of activity was expected to last at each station. The total emissions are based on the year the construction is expected to occur at each station and exhibited in Tables 9.2-6 through 9.2-7. Detailed construction emissions calculations along with the methodology and emissions factors used are provided in Appendix 9-A.

Pipeline Emissions

Emissions from the construction of the pipeline are calculated based on the length of pipeline being constructed in each county. Emissions were estimated based on the type of construction activity occurring and the length of time that type of activity was expected to last within each county of pipeline construction. The total emissions expected to occur for each construction year by county are exhibited in Tables 9.2-6 through 9.2-7. Detailed construction emissions calculations along with the methodology and emissions factors used are provided in Appendix 9-A.

9.2.5.2 Operations Emissions

Emissions from operating the equipment at the new Lambert Compressor Station are a result of combustion of natural gas in compressor turbines at the station. The main emission sources at the compressor station are the natural gas turbines and the generators. Emissions of all pollutants have been minimized through the selection of the most fuel-efficient turbines. Larger turbines, with greater horsepower ("hp") output, are more efficient. More efficient models use less fuel and produce fewer emissions for the same hp output. The new compressor station will utilize the largest, most efficient turbines that meet the pipeline operational requirements. The generators that will be installed as part of the Southgate Project have very low emissions compared to viable alternatives, such as reciprocating internal combustion engines. Table 9.2-8 presents the operational emissions potential to emit in tons per year.

For the natural gas turbines, the Southgate Project is planning to purchase and install Solar turbines at the compressor station which are equipped with SoLoNOx, Solar's emission reduction technology. SoLoNOx is a lean, pre-mixed technology that controls the air to fuel ratio and the temperature of the flame to reduce NOX emissions without significantly increasing CO. As noted in section 9.2.4.3, the manufacturer's guaranteed NOX emissions of 15 ppm are below the 25 ppm limit of NSPS Subpart KKKK. Further, the Project will further mitigate these emissions through the development and implementation of an Operation and Maintenance Plan that is consistent with the manufacturer's recommendations for good combustion practices. Proper operation and preventative maintenance activities will ensure that emissions from the turbines will be minimized and continue to meet or exceed the applicable emission standards.

9.2.6 Air Quality Mitigation Measures

Construction Emissions

The construction emissions associated with the Southgate Project are temporary in nature and are expected to have minimal impact on the air quality in the surrounding area. However, the Project will implement various mitigation measures to minimize construction emissions. These include:

- The Southgate Project will avoid unnecessary construction activities leading to increased emissions, where possible;

- The Southgate Project will utilize low sulfur diesel fuel with a maximum sulfur content of 15 ppm based upon the requirements of 40 CFR Part 80;
- The Southgate Project will, when practical, request that contractor(s) use newer model equipment that are equipped with the latest emission reduction technologies that are in compliance with EPA's mobile source emission standards;
- The Southgate Project will follow manufacturer's operating recommendations regarding good combustion practices to ensure that fuel efficiency is maximized, and engines are operated such that emissions are minimized;
- The Southgate Project will implement the fugitive dust control measures as described below; and
- The Southgate Project will avoid idling of the construction equipment to the extent possible.

The fugitive dust control measures will include the following specific steps to be taken during construction:

- Fugitive dust emissions from vegetation removal, clearing and grading, cutting and filling, topsoil removal, trenching, backfilling and stockpile storage will be controlled to a great extent by following the construction sequencing and disturbing limited areas at a time;
- Fugitive dust emissions generated by motorized equipment and miscellaneous vehicle traffic will be controlled by wet suppression as necessary;
- Fugitive dust emissions from paved roads will be controlled with a combination of water trucks, power washers, sweeping and/or vacuuming. If necessary, additional potential sources of water for dust control may include other municipal systems, groundwater supply wells, and/or approved surface waters;
- Track out of loose materials will be controlled using rock construction entrances on access roads that begin at a junction with paved roads; and
- When environmental conditions are dry, inspection of dust control measures will be conducted daily.

The Southgate Project performed a complete air dispersion modeling analysis, which is presented in Appendix 9-D, to ensure that the concentration levels from the emission sources at the compressor station will not exceed the NAAQS levels. Table 9.2-9 presents the list of the major existing and reasonably foreseeable future projects that may cumulatively or additively impact air quality along with an approximate distance from the nearest Project facility. Operation of the existing and reasonably foreseeable major air emissions sources listed in Table 9.2-9 will have air emissions associated with them; however, the other sources of air emissions from operation of these recent or planned projects are or will be controlled in accordance with state and federal air pollution laws and regulations. Additionally, Transcontinental Gas Pipe Line Company, LLC ("Transco") will need to obtain FERC authorization for the natural gas transmission projects associated with modifications at Transco Stations 165 and 166 prior to construction and operation; the review of those projects will include a detailed air quality assessment for construction and operation.

Table 9.2-9 Major Air Quality Facilities Within 20-miles of the Lambert Compressor Station		
County / State	**Facility**	**Approximate Distance to The Lambert Station (miles)**
Pittsylvania, VA	Transco - Station 165	<1
Pittsylvania, VA	Transco - Station 166	<1
Pittsylvania, VA	Arkema Inc.	5
Pittsylvania, VA	Owens-Brockway Glass Container Inc.	16
Pittsylvania, VA	Intertape Polymer Corporation	16
Pittsylvania, VA	Elkay Wood Product Company	17
Pittsylvania, VA	Dominion - Pittsylvania Power Station	19

The existing and proposed offsite major air emissions sources are or will be operated in compliance with all applicable state and federal air regulations; including, stack testing, recordkeeping, reporting, and monitoring requirements to establish compliance with federally enforceable emissions standards. Because operation of the Southgate Project, along with the other existing and proposed major Title V projects/facilities, will be regulated by the VADEQ and NCDEQ through the air permitting process, the cumulative effect of operation of the Project with other projects is not expected to result in adverse air quality impacts.

Climate Change and Greenhouse Gases

Construction activities will result in temporary increases in GHG emissions due to the use of non-stationary equipment powered by diesel fuel or gasoline engines and indirect emissions attributable to workers commuting to and from work sites during construction. These sources are not considered stationary sources, and their impacts will generally be temporary and localized. The Southgate Project will, to the extent practical, employ good management practices, as described above, to limit these emissions.

With respect to operational emissions, USEPA has not published formal white papers for different industries to discuss available GHG control technologies. In permitting guidance, USEPA agrees that energy efficiency improvements will satisfy the control requirements for GHGs in most cases. As such, operational GHG emissions would be expected to be limited to the use of energy efficient design and the minimization of GHG releases through standard work practices for the natural gas industry. The use of the combustion turbines represents one element of the Southgate Project's energy efficient design.

Fugitive GHG (and to a lesser extent, VOC) leaks will be minimized by adhering to good operating and maintenance practices and meeting the requirements of the federal NSPS OOOOa regulation. Mountain Valley designed the Southgate Project to reduce GHG emissions where technically and economically feasible. In addition, the Project reviewed USEPA's voluntary Natural Gas Star program for potential emission reduction measures, and Table 9.2-10 summarizes the feasibility of various measures for the Project. Total, site-wide VOC and GHG emissions from fugitive and blowdown sources are estimated to be low and well below major source permitting thresholds. Therefore, any additional emission reduction will not be cost effective due to the minimal emission reductions achieved.

Natural gas that will flow on the Southgate Project will be received at either the Mountain Valley Pipeline interconnection near Chatham, Virginia or from East Tennessee at the LN 3600 Interconnect near Eden, North Carolina. Accordingly, any GHGs attributable to this natural gas that could subsequently be attributed to a downstream use will either: (1) already have been considered as part of the Commission's upstream pipeline approval; or (2) is not an incremental increase in natural gas being transported but rather represents a different utilization of the upstream pipeline capacity. Therefore, it would be double counting if these GHG emissions were to be considered as part of the Southgate Project, and such downstream GHG emissions should not be attributed to the Project. Using good management practices and energy efficient design, the Project employed measures to minimize GHG emissions and any resulting impact on climate change.

Table 9.2-10

Summary of Natural Gas Star Program

Energy Star Project[3]	Feasibility Assessment
Replace Gas Starters with Air or Nitrogen	Feasible – Gas starters may be replaced with air.
Reduce Natural Gas Venting with Fewer Compressor Engine Startups and Improved Engine Ignition	Feasible – Turbines are intended to operate at all times other than preventative maintenance shutdowns. The Project's preventative maintenance program will reduce starts related to unanticipated shutdown/repairs.
Reducing Methane Emissions from Compressor Rod Packing Systems	Not feasible – This reduction strategy is applicable to older compressors with potentially worn packing. Compressors are equipped with newly installed packing by design. The Project will follow the manufacturer's recommended procedures for proper maintenance and inspection of compressor rod packing systems and comply with NSPS OOOOa.
Test and Repair Pressure Safety Valves	Feasible - Completed by the Project on periodic basis.
Eliminate Unnecessary Equipment and/or Systems	The Project will only be installing what is required for this application.
Install Automated Air/Fuel Ratio Controls	Feasible – Turbines will be equipped with state-of-the art AFR (air-to- fuel-ratio) controllers/SoLoNOx technology.
Install Electric Motor Starters	The turbines are intended to operate at all times therefore the number of starts is minimized and the potential methane reductions would be small. Nonetheless, current design includes electric motor starts.
Reducing Emissions When Taking Compressors Off-Line	Feasible - Blowdown gas may be injected into the fuel gas recovery system. However, the proposed facility is a gathering facility that is expected to operate at or near 100% capacity year-round. Shutdown events are expected to be very infrequent, and the current design of the station does not allow for recycling of turbine blowdowns.
Replace Compressor Cylinder Unloaders	Not Applicable.

[3] https://www.epa.gov/natural-gas-star-program/recommended-technologies-reduce-methane-emissions

Table 9.2-10 Summary of Natural Gas Star Program	
Energy Star Project[3]	**Feasibility Assessment**
Install Electric Compressors	Not Feasible - Electric compressors are cost prohibitive even if electric supply is available. As stated in the NG Star fact sheet "The capital costs and the electricity costs, however, are higher for an electric motor compared to those for a gas driven engine. The savings from maintenance costs relative to the cost of energy will not be justified unless the engine is at the end of its economic life."
Wet Seal Degassing Recovery System for Centrifugal Compressors	Turbine centrifugal compressors will be dry seal.

9.3 Noise

This section provides an overview of the noise generating equipment for the Project, the noise study approach for each compressor station, meter stations, locations of horizontal directional drill ("HDD") and railroad conventional bores, a description of noise associated with construction activities, and a discussion of typical noise mitigation methods for the type of equipment associated with each component of the Project. Environmental noise will be generated during construction and operation of the compressor station and meter stations associated with the Project. There will also be noise associated with the construction of the meter stations and the pipeline.

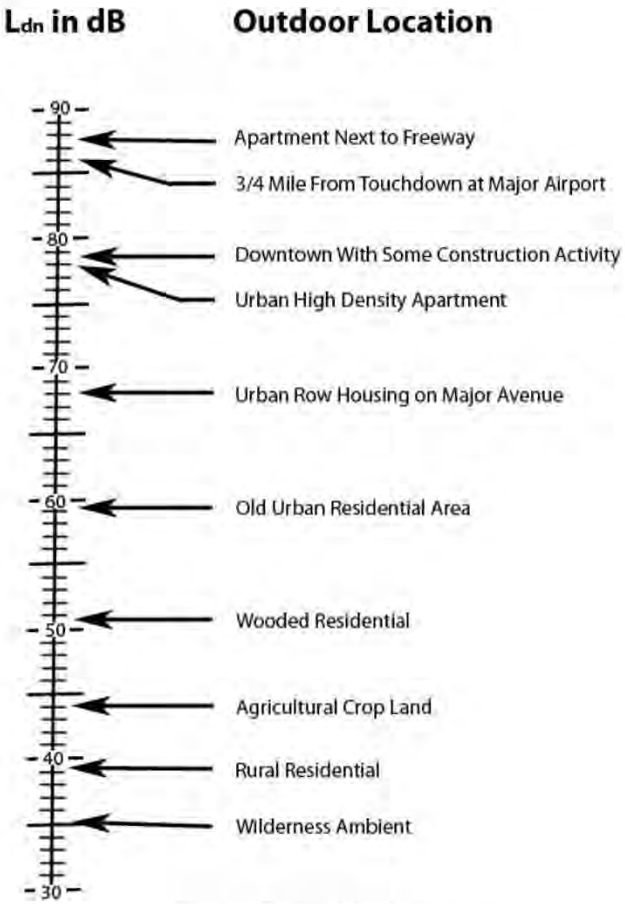
9.3.1 Background Information on Sound and Noise

A sound source is defined by a sound power level ("L_W"), which is the rate at which acoustical energy is radiated outward and is expressed in units of watts. A sound pressure level ("L_P") is a measure of fluctuation at a given receiver location and can be obtained through the use of a microphone or calculated from information associated with the source sound power level and surrounding environment. Sound power cannot be measured directly but can be calculated from measurements of sound intensity or sound pressure at a given distance from the source.

The perception of sound as "noise" is influenced by several technical factors such as intensity, sound quality, tonality, duration, and existing background levels. Sound levels are presented on a logarithmic scale to account for the large range of acoustic pressures that the human ear is exposed to and are expressed in units of decibels ("dB"). Broadband sound includes sound energy summed across the frequency spectrum. In addition to broadband sound pressure levels, analysis of the various frequency components of the sound spectrum is used to determine tonal characteristics. The unit of frequency is Hertz ("Hz") which is a measure of the cycles per second of the sound pressure waves. Typically, the frequency analysis examines 11 octave (or 33 1/3 octave) bands ranging from 16 Hz (low) to 16,000 Hz (high). One-third (1/3) octave bands have one third the width of full octave bands, which gives a higher resolution and a more detailed description of the frequency content of the sound. Since the human ear does not perceive every frequency with equal loudness, spectrally varying sounds are often adjusted with a weighting filter.

The A-weighted filter is applied to compensate for the frequency response of the human auditory system and sound exposure in acoustic assessments and is designated in A-weighted decibels ("dBA"). Environmental noise is commonly described in terms of equivalent sound level ("L_{eq}"). The L_{eq} value,

conventionally expressed in dBA, is the energy-averaged, A-weighted sound level for the complete time period represented as a steady, continuous sound level. Another common noise descriptor used when assessing environmental noise is the day-night sound level ("L_{dn}"), which is calculated by averaging the 24-hour hourly L_{eq} levels at a given location and adding 10 dB to noise emitted during the nighttime period (10:00 p.m. to 7:00 a.m.) to account for the increased sensitivity of people to hear noises that occur at night. The L_{max} is the maximum instantaneous sound level as measured during a specified time period. It can also be used to quantify the time-varying maximum instantaneous sound pressure level (as generated by equipment or an activity) or a manufacturer maximum source emission level. Estimates of common noise sources and outdoor acoustic environments, and the comparison of relative loudness are presented in Figure 9.3-1a.



(Adapted from USEPA, 1974)

Figure 9.3-1a. Environmental Sound Pressure Levels (L_{dn})

9.3.2 Applicable Noise Regulations

The Southgate Project pipeline is located in Virginia and North Carolina and crosses portions of three counties. The Project reviewed federal, state, county, and local noise regulations to identify regulations that may be applicable to construction and operation. A regulatory search found no state noise standards

applicable to the Project; however, there are several federal requirements and county noise regulations that are potentially applicable to the Project as described in Sections 9.3.2.1 and 9.3.2.2, respectively.

9.3.2.1 FERC Requirements

The FERC noise regulations, set forth in 18 CFR §380.12(k)(2), require an applicant to identify existing noise sensitive areas ("NSAs") within one mile of Project facilities (e.g., residences, schools, churches) and quantitatively describe existing sound levels at NSAs and at other areas covered by relevant state and local noise ordinances. The following stipulations are given:

- If new compressor station sites are proposed, measure or estimate the existing ambient sound environment based on current land uses and activities;
- For existing compressor stations (operated at full load), include the results of a sound level survey at the site property line and nearby NSAs;
- Include a plot plan that identifies the locations and duration of noise measurements; and
- All surveys must identify the time of day, weather conditions, wind speed and direction, engine load and other noise sources present during each measurement.

In addition, the FERC requirement for noise quality, in the absence of any applicable state or local noise regulation, is that the post-construction noise attributable to any new compressor station and associated pipeline facilities must not exceed an L_{dn} of 55 dBA at any pre-existing NSA such as schools, hospitals, or residences. This criterion limits the sound level contribution from the Project at any pre-existing NSA to 55 dBA (L_{dn}). An L_{dn} of 55 dBA is equivalent to a continuous noise level of 48.6 dBA L_{eq} for facilities that operate at a constant level of noise.

Regarding HDD construction sites, conditions set forth by the FERC typically require that the sound attributable to drilling operations should not exceed 55 dBA (L_{dn}) at any NSA during HDD operations. If this sound criterion/guideline is expected to exceed this level at any nearby NSA, it is generally necessary to describe noise mitigation measures/options which would be implemented during the drilling activity to reduce the noise impact of the drilling operations and achieve the sound criterion/guideline.

As per FERC's *Guidance Manual for Environmental Report Preparation* issued February 2017, "Construction activity that would or may occur during nighttime hours should be performed with the goal that the activity contribute noise levels below 55 dBA L_{dn} and 48.6 dBA L_{eq}, or no more than 10 dBA over background if ambient noise levels are above 55 dBA L_{dn}." at all surrounding NSAs. NSAs are typically residences, schools, churches, or hospitals.

In addition to the 55 dBA L_{dn} and 48.6 dBA L_{eq} nighttime sound level targets, for this Project, the nighttime construction noise has been compared to the existing nighttime ambient sound levels, to calculate the short-term increase in sound levels expected due to the construction activities.

9.3.2.2 County Limits

The three counties that the Project crosses have noise ordinances that may be applicable to the Project. Table 9.3-1 provides a summary of the noise limits identified within the ordinances. The Pittsylvania

County ordinance is the only one that provides quantitative limits. Both Rockingham County and Alamance County have ordinances that are primarily nuisance-based and provide no numerical limits.

The Pittsylvania County limits apply at the property boundary of the noise source or at any point within any other affected property, rather than at the NSA structure, so they cannot be directly compared to the FERC sound level requirements. The Pittsylvania County ordinance has an exemption for construction provided it takes place between 7:00 a.m. and 10:00 p.m. The Lambert Compressor Station is located in Pittsylvania County, Virginia. The sound levels from the station have been evaluated against both the FERC and the county sound level requirements.

Table 9.3-1

Noise Level Limits for Counties with Noise Ordinances Crossed by the MVP Southgate Project

County, State	Daytime (7 AM – 10 PM)	Nighttime (10 PM – 7 AM)
Pittsylvania, Virginia	Residential: 57 L_{eq} dBA Industrial: 77 L_{eq} dBA	Residential: 52 L_{eq} dBA Industrial: 77 L_{eq} dBA
Rockingham, North Carolina	Not Applicable (Nuisance based)	
Alamance, North Carolina	Not Applicable (Nuisance based)	

9.3.3 Existing Sound Environment

The existing sound environment surrounding each compressor station, meter station, HDD work area or railroad crossing was quantified during a baseline environmental sound level survey in the vicinity of each site. Sound levels were measured at accessible locations near the NSAs at each site. Observations of the primary existing environmental sound sources were documented.

Type 1 sound level instrumentation was used with field calibration conducted before and after each measurement. Windscreens were installed on all microphones. All instrumentation has current laboratory certification. Weather conditions during each survey were recorded, and the measurements were taken during weather periods appropriate for environmental sound level surveys.

Insect activity was the dominant source of ambient noise at most of the measurement locations. Because insect activity varies seasonally, insect noise may not be present during substantial portions of the year. Ambient data are therefore presented both as measured with the insect noise present, and with the insect noise filtered out by omitting sound energy in the whole octave bands above 1000 Hz in accordance with American National Standard method (ANSI/ASA, 2014). For the purposes of evaluating operational sound level impact, the insect-filtered data is used as the primary point of comparison to be conservative. However, if construction is going to be taking place in the spring or summer when insects will be present, it may be more appropriate to compare construction sound levels to the unfiltered ambient data.

9.3.3.1 Lambert Compressor Station

The Lambert Compressor Station site is located in Pittsylvania County, Virginia approximately 3.0 miles east of Chatham, Virginia. The area surrounding the station is mostly rural consisting of a mix of forest and open land, though there are several residences and Highway 57 within a one-mile radius of the station site. There is an existing Transco compressor station located just northeast of the site. The four closest

NSAs were identified, all residences. Figure 9.3-1 (Appendix 9-E) shows the NSAs in proximity of the Lambert Compressor Station and sound level measurement locations.

Table 9.3-2 shows the weather conditions at the start of the environmental sound level survey.

Table 9.3-2

Weather Conditions during the Lambert Compressor Station Sound Level Survey

Dates	July 18 – July 19, 2018
Temperature Range	81-86° F
Relative Humidity Range	48-64%
Wind Speed	1-4 mph
Wind From	S, W, SSW
Precipitation	none

Table 9.3-3 shows the measured daytime and nighttime sound levels (L_{eq}, dBA) as well as the equivalent day-night sound levels (L_{dn}, dBA). The measured sound level results at NSA 3 was higher than other locations due to traffic on Highway 57. Measurement locations are shown on Figure 9.3-1 (Appendix 9-E).

Table 9.3-3

a/ Insect noise was removed by omitting sound energy in the whole octave bands above 1000 Hz in accordance with American National Standard method (ANSI/ASA, 2014)

9.3.3.2 Meter Stations

There are currently four-meter (interconnect) stations planned as part of the Project.

Lambert Interconnect

The Lambert Interconnect will be located on the same site as the Lambert Compressor Station. The noise analysis for this interconnect has been included in the Lambert Compressor Station analysis. The NSAs for this site are therefore the same as for the Lambert Compressor Station. See Figure 9.3-1 (Appendix 9-E) for the meter station, compressor station, NSAs, and measurement locations for this site.

LN 3600 Interconnect

The LN 3600 Interconnect site is located in Rockingham County, North Carolina approximately 4 miles northeast of Meadow Summit, North Carolina. The closest NSA to the site is a residence. See Figure 9.3-2 (Appendix 9-E) for the NSA and measurement locations for this site. See Figure 9.3-2 (Appendix 9-E) for the meter station, compressor station, NSAs, and measurement locations for this site.

T-15 Dan River Interconnect

The T-15 Dan River Interconnect site is located in Rockingham County, North Carolina approximately 5.0 miles east of Eden, North Carolina. The closest NSA to the site is a residence. See Figure 9.3-3 (Appendix 9-E) for the NSA and measurement locations for this site.

T-21 Haw River Interconnect

The T-21 Haw River Interconnect is located in Alamance County, North Carolina approximately 2.0 miles southeast of Graham, North Carolina. The closest NSA to the site is a residence. See Figure 9.3-4 (Appendix 9-E) for the NSA and measurement locations for this site.

Ambient sound levels were measured for 24 hours from July 16 to July 17, 2018. Table 9.3-4 shows the weather conditions during the meter station sound level surveys.

Table 9.3-4

Weather Conditions during the Meter Station Sound Level Surveys

T-15 Dan River Interconnect	24:00	64.7	59.7	67.3	63.1	57.1	65.0
T-21 Haw River Interconnect	24:00	64.9	60.6	67.9	62.8	57.2	65.0

a/ Insect noise was removed by omitting sound energy in the whole octave bands above 1000 Hz in accordance with American National Standard method (ANSI/ASA, 2014)

9.3.3.3 Horizontal Directional Drilling and Railroad Crossing Sites

The HDD method will be used to cross the Dan River in Virginia and the Stony Creek Reservoir in North Carolina. In addition, there will be four railroad crossings that will be performed using the direct bore method and will likely require nighttime construction work. A noise evaluation has been performed for each HDD site and railroad crossing. An ambient noise survey at the potential HDD and railroad crossing sites was conducted to quantify the current ambient sound levels around each site and to document/identify existing NSAs. All NSAs are residences.

Table 9.3-6 shows the weather conditions during the HDD and railroad crossing sound level measurements.

Table 9.3-6

Weather Conditions during the HDD / Railroad Crossing Sound Level Surveys

Location	HDD: Stony Creek Reservoir	HDD: Dan River	Railroad Crossing 1	Railroad Crossing 2	Railroad Crossing 3	Railroad Crossing 4
Dates	July 18, 2018	July 16, 2018	July 16, 2018	July 16, 2018	July 17, 2018	July 18, 2018
Temperature	75° F	80° F	80° F	80° F	82° F	80° F
Relative Humidity	89%	70%	71%	74%	69%	53%
Wind Speed	0 mph	0 mph	1 mph	0 mph	0 mph	0 mph
Wind From	N/A	N/A	W	N/A	N/A	N/A
Precipitation	none	none	none	none	none	none

Figures 9.3-5 through 9.3-10 (Appendix 9-E) show the HDD and railroad crossing work areas along with the identified NSAs and sound level measurement locations. Table 9.3-7 shows the measured daytime and nighttime sound levels (L_{eq}, dBA) as well as the equivalent day-night sound levels (L_{dn}, dBA) near the HDD work areas and railroad crossings.

At all HDD and railroad crossing locations, short-duration nighttime measurements were taken near the closest NSA. Effort was made to exclude noise from passing vehicles from the measurements. Daytime levels were estimated by applying the average day-night sound level difference from a nearby 24-hour measurement location. The average day-night difference from the overnight measurement location closest to each HDD and railroad crossing location was applied to the short-duration data collected to estimate the nighttime level. The average day-night difference of 5 dB from the T-21 Haw River Interconnect measurement position was applied at the Stony Creek Reservoir HDD site and railroad crossing 4, and the average day-night difference of 5.5 dB from the T-15 Dan River Interconnect measurement location was applied to the other four locations.

Table 9.3-7

Existing Sound Level Measurement Results – HDD and Railroad Crossings

a/ Insect noise was removed by omitting sound energy in the whole octave bands above 1000 Hz in accordance with American National Standard method (ANSI/ASA, 2014)

9.3.4 Project Construction Noise

9.3.4.1 Pipeline Construction Noise and Mitigation

Potential impacts from pipeline construction could include short-term increases in sound. Construction of the pipeline will generate noise from heavy machinery and equipment as construction moves in phases along the right-of-way (see Resource Report 1 for description of pipeline construction). Sound from pipeline construction will generally be temporary, sporadic, and short-term in any one location along the pipeline route. Because of the temporary and generally daytime nature of pipeline construction activities, no special noise mitigation or noise monitoring program will be implemented during the construction phase, except in locations where blasting or HDDs are required. These special cases are discussed below.

9.3.4.2 Compressor Station and Meter Station Construction Noise and Mitigation

Potential impacts at compressor and meter station locations could include short-term increases in sound levels during construction. Only standard construction equipment will be used in the construction of the stations, with no dynamic compaction or pile driving expected. Most construction will occur during daytime working hours of 7:00 a.m. until 7:00 p.m. Emergencies or other non-typical circumstances may necessitate limited nighttime work. The highest sound levels during construction are expected during the early earthmoving phase. Equipment that may be operating during this phase would include bulldozers, front end loaders, dump trucks, generators, etc.

Based on the equipment usage predictions, a sound level calculation was performed for compressor station and meter station construction using the Federal Highway Administration's Roadway Construction Noise Model version 1.1 (FHWA, 2008) The following equipment was included in the construction evaluation:

Daytime Civil Work – total sound power level of 123.9 dBA Lw

- Three (3) Excavators, Komatsu 228 or similar
- Three (3) Bulldozers, Cat D6 or similar
- Three (3) Dump trucks, 26-ton, articulated
- One (1) Generator
- Three (3) Drilling rigs
- Two (2) Pile augers
- One (1) Roller, smooth drum, 25 ton, Bomag or similar

Nighttime Civil Work – total sound power level of 120.2 dBA L_w

- Two (2) Excavators, Komatsu 228 or similar
- Two (2) Bulldozers, Cat D6 or similar
- Two (2) Dump trucks, 26 ton, articulated
- Three (3) Light plants
- One (1) Roller, smooth drum, 25 ton, Bomag or similar

Table 9.3-8 shows a summary of the predicted short-term, daytime construction sound levels at the NSAs for the compressor station and meter stations. The worst-case NSAs are not necessarily the closest NSAs due to terrain shielding between the compressor stations and the NSAs.

As shown in Table 9.3-8, the predicted construction sound levels are all below 55 dBA L_{dn} at the Lambert Compressor Station NSAs, low enough that no special noise mitigation or noise monitoring program will be implemented during daytime only construction. Some of the construction sound level contributions exceed 55 dBA L_{dn} at NSAs close to the T-15 Dan River and T-21 Haw River Interconnects. However, ambient sound levels at those locations are well above 55 dBA L_{dn} and the temporary sound level increase expected during construction is less than 6 decibels during the day and 3.1 decibels for the 24-hour L_{dn}. At all other NSAs, the expected construction sound levels are lower than 55 dBA L_{dn}.

Table 9.3-8

Predicted Temporary Sound Levels Due to Construction, Single 12-Hour Daytime Shift

Compressor / Meter Station	NSA	Existing Ambient Sound Levels, dBA a/			Predicted Sound Level –Single Daytime Shift, dBA		Construction Plus Ambient, dBA		Temporary Increase in Sound Level, dBA	
		Day	Night	L_{dn}	Day	L_{dn}	Day	L_{dn}	Day	L_{dn}
Lambert Compressor Station / Interconnect	1	36.8	40.8	46.8	48.7	46.6	49.0	49.7	12.2	2.9
	2				46.5	44.4	46.9	48.8	10.2	2.0
	3	60.4	55.1	62.8	43.8	41.7	60.5	62.8	0.1	0.0
	4	38.6	38.4	44.8	42.7	40.7	44.1	46.3	5.5	1.4
LN 3600 Interconnect	3	47.2	42.1	49.7	51.2	49.1	52.7	52.4	5.4	2.7
T-15 Dan River Interconnect	1	63.1	57.1	65.0	64.7	62.7	67.0	67.0	3.9	2.0
T-21 Haw River Interconnect	1	62.8	57.2	65.0	67.1	65.1	68.5	68.1	5.6	3.1

a/ To be conservative, ambient levels have been processed to remove insect noise.

Work will primarily be conducted between 6:00 a.m. and 7:00 p.m. or sunset, whichever is later. Nighttime work will be conducted for specific situations related to safety, permit compliance, or construction activities that cannot be stopped until completion (e.g. HDD, conventional bores, dry waterbody crossings). Low noise generating activities (e.g. x-ray, inspections, hydrostatic test, drying, etc.) may also occur during limited nighttime hours.

Table 9.3-9 shows the predicted temporary nighttime sound level impact for 24-hour construction activities. As shown in this table, nighttime construction sound levels are above 48.6 dBA and 55 dBA L_{dn} at certain NSAs. As shown in Table 9.3-9, the predicted construction sound levels are all below 55 dBA L_{dn} at the Lambert Compressor Station NSAs, just above 55 dBA L_{dn} at the LN 3600 Interconnect NSA, and less than 10 dB above the ambient at the T-15 Dan River and T-21 Haw River Interconnects. With the exception of the LN 3600 Interconnect, the predicted levels are low enough that no special noise mitigation or noise monitoring program should be required for 24-hour construction. However, due to the uncertainty of the equipment that might be operating during night construction, the Project will develop a nighttime construction noise management plan if nighttime construction is required at the compressor station or meter stations. This noise management plan will outline the specific equipment that will be

operating at night, the location of the equipment, and will predict the sound levels from the expected nighttime equipment. The management plan will include specific noise mitigation, such as noise barriers, quieter equipment, or partial equipment enclosures to ensure that sound levels at the NSAs do not exceed 48.6 dBA at night or 55 dBA L_{dn} overall or 10 dB over the ambient for the T-15 Dan River and T-21 Haw River Interconnects with ambient levels that exceed 55 dBA L_{dn}.

Table 9.3-9

Predicted Temporary Sound Levels Due to Construction, 24-Hour Construction Activities

Compressor / Meter Station	NSA	Existing Ambient Sound Levels, dBA a/			Predicted Sound Level –Single Daytime Shift, dBA		Construction Plus Ambient, dBA		Temporary Increase in Sound Level, dBA

a/: To be conservative, ambient levels have been processed to remove insect noise.

9.3.4.3 Blasting

Blasting may be necessary for ditch excavation in locations where shallow bedrock is encountered. Most of the energy released during blasting goes towards rock breakage and movement, but a small portion passes outside the intended work zone in the form of ground or air vibrations. Air vibrations are pressure waves generated by the blast, referred to as "airblast" or "air overpressure". High frequency pressure waves (above about 20 Hz) may be heard as sound, while lower frequency pressure waves may be felt rather than heard, similar to a gust of wind. In general, surface detonations involving unconfined or poorly-confined blasts will cause audible noise; well-confined blasts, such as those used to excavate rock, generate lower frequency effects with airblast energy predominantly in the inaudible range. For this reason, and because noise from blasting is inherently short-term, there are often no audible noise limits for blasting projects. Blast emission criteria are specified on the basis of safe limits designed to minimize the risk of cosmetic damage such as surface cracks due to either vibration or airblast.

The Project has developed a Project Blasting Plan (see Resource Report 6 – Appendix 6-D). When the locations and extent of blasting is known, a noise and vibration assessment will be completed for residences and historical structures that could be affected by blasting. Noise and vibration due to blasting will be evaluated in accordance with the International Society of Explosives Engineers Blasters'

Handbook, which contains recommended ground vibration limits. If necessary, charge size per delay will be reduced to ensure these limits are not exceeded to prevent structural damage to nearby buildings.

9.3.4.4 Horizontal Directional Drilling and Railroad Crossing Construction Noise and Mitigation

The HDD method will be used to install the pipeline underneath the Dan River in Virginia and Stony Creek Reservoir in North Carolina. In addition, there will be four railroad crossings that will performed using the conventional bore method that will likely require nighttime construction work. A noise evaluation has been performed for each HDD site and railroad crossing.

Equipment Data

The HDD entry and exit sites will have several sound sources in operation during the temporary construction work. On the entry side, sound sources will include the drilling rig itself, mud pumps, generators, drilling mud mixers, shale shakers, light plants, and the driving engines associated with this equipment. Additional sound sources include mobile equipment such as cranes, front-end loaders, forklifts, and trucks. On the exit side, less equipment is required, typically including a backhoe or bulldozer, and possibly a generator and light plant. The actual equipment used, and the site layout and configuration, will depend on the drilling contractor(s) selected for the Project, the site conditions, and other factors. Typical sound power levels (L_w) for peak HDD construction operations based on measurements of previous HDD operations are shown in Table 9.3.10, below. These levels will be used in all HDD calculations in this study.

Table 9.3-10

Sound Power Levels of HDD and Railroad Crossing Equipment

Octave Band Center Frequency, Hz	Unweighted Sound Power Level at Octave Band Center Frequency									Total
	31.5	63	125	250	500	1000	2000	4000	8000	dBA
HDD Entry Site	118	115	112	114	112	109	108	106	98	115
HDD Exit Site	110	108	105	102	100	98	95	92	88	103
Railroad crossing: Auger Boring Machine	116	117	124	107	95	100	97	99	79	110
Railroad crossing: Backhoe	114	115	122	106	93	98	95	97	77	108
Railroad crossing: Light Plant	88	93	93	98	93	88	83	78	73	94

For the conventional bore crossings of the railroads, an auger boring machine will be used similar to the Barbco HD48RCBM. That manufacturer reports that the auger produces sound level of 87 dBA at 20 feet. A standard diesel-powered engine spectrum was applied to the reported sound levels, and six light plants and two backhoes were included (or similar engine-driven earthmovers) at each railroad crossings.

Sound level data for the ancillary equipment were derived from the Federal Highway Administration's Roadway Construction Noise Model (FHWA 2008)[4]. The sources were used as inputs in a three-dimensional computer noise model developed using CadnaA acoustical modeling software.

These values represent conservative estimates without assumption of any additional noise control treatments. These levels do assume that all original equipment manufacturer noise control treatments are correctly installed and that all operating equipment is well-maintained and in good operating condition. These levels also assume some slight typical shielding and screening effects from the tanks and trailers that are used in typical construction operations.

Operations Schedule

The current drilling operation plan is to perform HDD activities whenever dictated by schedule or operations, 24-hours per day if necessary. As such, all calculations are based on the maximum HDD activity sound power levels shown in Table 9.3-10 without any adjustment for reduced activities during nighttime hours.

For the railroad crossings, 24-hour construction activities will be required for two to three days at each crossing. The duration could extend up to 14 days if problems are encountered during construction. The pipeline construction beyond the railroad crossing locations will take place during daytime unless otherwise specified.

Calculations

A noise model was developed for each HDD work area and railroad crossing using CadnaA version 2018 build 161.4801. The models were used to calculate the expected temporary sound level contributions due to the HDD and railroad crossing equipment. The ISO 9613-2 standard was used to calculate the divergence, atmospheric absorption, foliage, and ground absorption for the path from the HDD entry or exit site to the closest NSA.

Since the drilling direction has not been decided, two models were constructed for each HDD location, with each side modeled as both entry and exit. The models were used to identify both the worst-case NSA (i.e., the NSA likely to experience the highest noise) for either drilling direction and how many NSAs will potentially be affected. If the calculations indicated that the sound level at the worst-case NSA would exceed the sound level target, the required noise mitigation has been evaluated to meet the targets. A summary of the calculation results for all of the NSAs and railroad crossings is included in Table 9.3-11 below.

Predicted Temporary Sound Level Impact

The predicted HDD and railroad crossing equipment sound level contribution for each NSA was calculated using the noise model. The calculated sound level contribution was then combined with the

[4] FHWA (2008) Roadway Construction Noise Model, Federal Highway Administration, US Department of Transportation. Version 1.1, December 8, 2008.

measured ambient sound levels to determine the potential short-term sound level impact of the HDD or railroad crossing activities.

Noise Mitigation for HDD and Railroad Sites

For those HDD or railroad crossing sites where the predicted HDD or boring activity sound levels at the NSAs are predicted to be greater than 55 dBA L_{dn}, noise mitigation for the equipment or compensation/relocation will likely be necessary in order to achieve the noise goals. For noise mitigation on HDD or conventional bore equipment, engine exhaust and barrier treatments are typically used to reduce the sound level contribution to less than 55 dBA L_{dn}. Typically, all engines on power units, gensets, etc. would be fitted with residential-grade exhaust mufflers, and temporary barriers may be installed between the HDD / conventional bore site and the nearest NSAs. Secondary noise control treatments may be required, depending on the actual equipment and site layout used.

As an alternative to these primary and/or secondary noise control treatments, the Project may consider offering the residents compensation or temporary relocation as a means of reducing the temporary construction noise impact. If all impacted residents choose to accept temporary relocation compensation, then temporary barriers or other treatments will not be necessary.

Table 9.3-11 provides a summary of the Noise Quality Analysis for the planned HDD and railroad crossing sites at the closest NSA to the entry and exit side of the planned HDD and assumes that a "standard" drilling rig is employed (i.e., no additional noise mitigation measures included).

Table 9.3-11

Predicted Temporary Sound Levels Due to HDD / Railroad Crossing

HDD and Railroad Crossing	Distance and Direction of the Closest NSA to Site Center	Existing Ambient	Calculated Sound Level		Existing Ambient L_{dn} Plus L_{dn} of Operations	Temporary Change in the Ambient Sound Level
		L_{dn} dBA	L_{eq} dBA	L_{dn} dBA	L_{dn} dBA	L_{dn} dBA
Dan River HDD	1400 feet N	39.7	46.5	52.9	53.1	13.4
Stony Creek Reservoir HDD	300 feet NW	42.8	54.2	60.6	60.7	17.9
Railroad Crossing 1	3550 feet E	58.9	38.7	45.1	59.0	0.2
Railroad Crossing 2	3000 feet S	41.1	31.9	38.3	42.9	1.8
Railroad Crossing 3	250 feet NW	45.5	63.1	69.5	69.5	24.1
Railroad Crossing 4	700 feet N	48.9	50.3	56.7	57.4	8.5

Railroad Crossings 1 and 2 are located in Pittsylvania County and therefore are subject to the county noise ordinance. Construction noise is exempt from the Pittsylvania County noise ordinance if it occurs

between 7:00 a.m. and 10:00 p.m. However, if nighttime construction is necessary, the sound due to construction is expected to be less than 52 dBA at the nearest resident's property line for both locations.

The acoustical assessment indicates that the noise of HDD operations at the entry site for the planned HDD crossing at the Stony Creek Reservoir could exceed 55 dBA L_{dn} at the closest NSAs. Noise from the direct bore work at Railroad Crossings 3 and 4 will likely also exceed 55 dBA L_{dn} at the closest NSAs.

HDD activities can occur over the course of several weeks, so compensation or relocation are typically not practical for HDD work areas. Railroad crossings typically take one to three days, so compensation or relocation of affected residents of the most impacted NSAs is a practical noise mitigation option.

Noise mitigation for the Stony Creek Reservoir HDD site will likely take the form of a noise barrier, erected between the HDD site and the closest NSAs. Calculations indicate that an approximately 12 decibel reduction in the HDD site sound level contributions are possible through the implementation of a series of 12-14 foot tall noise barriers located approximately 20 feet from the primary noise generating equipment at the HDD site. Similar reductions would be expected for the direct bore equipment at the railroad crossings. Table 9.3-12 shows the predicted sound levels with a noise barrier in place for the Stony Creek Reservoir HDD site and at Railroad Crossings 3 and 4.

Even with noise barriers in place, it is likely that the sound levels due to the direct bore at Railroad Crossing 3 will exceed 55 dBA L_{dn} due to the close proximity of the NSA to the work area. Due to the short-term nature of the railroad crossing work, temporary compensation or relocation of the effected residents is likely the most efficient method.

Table 9.3-12

Predicted Temporary Sound Levels Due to HDD / Railroad Crossings with Noise Mitigation

HDD Crossing (Entry or Exit Site)	Distance and Direction of the Closest NSA to Site Center	Existing Ambient	Calculated L_{dn} of the Operations	Existing Ambient L_{dn} Plus L_{dn} of Operations	Temporary Change in the Ambient Sound Level
		L_{dn} dBA	L_{dn} dBA	L_{dn} dBA	L_{dn} dBA
Stony Creek Reservoir HDD	300 feet NW	42.8	48.7	49.7	6.9
Railroad Crossing 3	250 feet NW	45.5	57.5	57.8	12.3
Railroad Crossing 4	700 feet N	48.9	44.7	50.3	1.4

9.3.5 Project Operation Noise

9.3.5.1 Compressor and Meter Station Operational Noise and Mitigation

The Project has developed noise models for the Lambert Compressor Station using the most current station designs and manufacturer specifications.

The following equipment items were considered significant sound sources in the model:

- Noise from the turbine exhaust, including the exhaust outlet and noise radiated from the exhaust ductwork, expansion joints, and silencer shell;
- Noise from the turbine intake air system, including the inlet opening and noise radiated from the silencer/ductwork shell and any duct joints;
- Turbine/Compressor casing noise that penetrates the building and building ventilation openings;
- Noise from the lube oil/auxiliary cooler and gas aftercooler; and
- Noise radiated by aboveground station piping.

Noise Model Methodology

The noise model for each compressor station was developed using CadnaA, version 2018 build 161.4801, a commercial noise modeling package developed by DataKustik GmbH. The software takes into account spreading losses, ground and atmospheric effects, shielding from barriers and buildings, reflections from surfaces and other sound propagation properties. The software is based on published engineering standards. The ISO 9613 standard was used for air absorption and other noise propagation calculations. To be conservative, no foliage was included in the noise model. The model presents a worst-case prediction without any influence of trees or vegetation.

Noise Model Inputs

Sound power and sound pressure level data for the equipment in the noise models were taken from manufacturer data (if available) or from measurements of similar equipment at other compressor stations or interconnects. An exhaust system consistent with the planned turbine installations and current vendor proposals for the Project was modeled assuming an exhaust height of 45.5 feet above grade. The Lambert Compressor Station was modeled with one 10,915 hp Titan 130 turbine and one 15,900 hp Mars 100 turbine.

Table 9.3-13 shows the sound pressure levels and sound power levels used to model the Project compressor station and interconnect equipment along with the source of the information.

a/ Manufacturer's quote provided by Mountain Valley.
b/ From Solar.
c/ From Moore Fan Datasheet
d/ Based on measurements of similar installed equipment.
e/ From Capstone
f/ As specified by Mountain Valley

Each compressor building will include wall exhaust fans and an acoustically baffled roof ridge vent. The sound levels due to intake ductwork, exhaust system ductwork, and suction and discharge piping were based on sound level measurements of similar equipment at existing compressor stations. The gas cooler sound power levels were taken from a manufacturer datasheet. The lube oil cooler sound power levels were supplied by Solar.

Noise Control Treatments

The noise models include certain noise control treatments as part of the compressor station design; however, there are many different combinations of noise control mitigation measures that would provide similar noise control. As the station design is finalized, noise mitigation treatments will also be finalized and will be modified as needed to ensure each station operates in compliance with FERC and local sound level requirements. Noise control treatments included in the noise model are shown in Table 9.3-14 and summarized below.

Table 9.3-14

Modeled Noise Control Treatments, Insertion Loss (IL) or Transmission Loss (TL)

Compressor Building Walls and Roof

The compressor buildings will include a minimum STC-40 wall and roof system. The compressor buildings will have no windows, skylights, or translucent panels. The building will be well sealed with no cracks or gaps, and all piping penetrations through the building walls will be flashed and caulked. The interior surfaces of the compressor building walls have been modeled as acoustically absorptive with an average Noise Reduction Coefficient of 0.8 or better.

Compressor Building Doors and Ventilation

The compressor buildings will have standard insulated overhead doors and industrial metal doors with good perimeter seals, all meeting defined acoustic transmission loss specifications. All building ventilation openings should include standard acoustical louvers or silencers to meet the Project requirements.

Turbine Exhaust Silencers and Breakout

The manufacturer warrants that the sound pressure level for the Mars 100 unit exhaust system at a distance of 200 feet from the exhaust will not exceed 45 dBA and the entire exhaust system for the Taurus 70 unit exhaust system will not exceed 45 dBA at a distance of 200 feet. The breakout noise generated by the exhaust system ductwork was included at this level.

Turbine Intake Silencers and Breakout

The sound pressure level of the intake system was warranted by the manufacturer to not exceed 73 dBA at 50 feet from the air inlet. This level includes the performance of the entire system, including any filter insertion losses and breakout noise.

Station Piping

Noise from centrifugal compressors can cause significant noise radiation from connected piping. To the extent practical, suction and discharge piping will be run underground. No acoustical lagging was included in the compressor station models, but aboveground main gas piping can be acoustically lagged as necessary.

Noise Modeling Results

The predicted sound levels from the acoustic modeling for the Lambert Compressor Station is shown in Figure 9.3-11, (Appendix 9-E) and the predicted sound levels due to meter station operations are shown in Figures 9.3-12 through 9.3-14 (Appendix 9-E). Predicted noise impacts on the nearest NSAs to each station are presented in Table 9.3-15. Site locations, layouts, and modeled equipment were determined from best available information and incorporated site-specific sound mitigation measures for these compressor and meter stations such as acoustical building enclosures, turbine intake and exhaust silencers.

Table 9.3-15

Predicted Sound Levels – Compressor and Meter Station

Compressor/ Meter Station	NSA	Distance from Compressor Station to NSA (feet)	Direction	Measured Existing Ambient (L_{dn} dBA)	Estimated Contribution of Station Equipment (L_{eq} dBA / L_{dn} dBA)		Combined, All Sources Including Ambient (L_{dn} dBA)	Increase Above Existing Condition (dB)
Lambert Compressor Station	1	3,480	WSW	46.8	41.6	48.0	50.5	3.7
	2	3,500	SW		35.2	41.6	47.9	1.1
	3	3,290	SE	62.8	34.3	40.7	62.8	0.0
	4	3,800	N	44.8	33.0	39.4	45.9	1.1
LN 3600 Interconnect	1	3,010	SE	49.7	41.6	48.0	50.5	3.7
T-15 Dan River Interconnect	1	750	S	65.0	40.4	46.8	65.1	0.1
T-21 Haw River Interconnect	1	550	N	65.0	35.4	41.8	65.0	0.0

As demonstrated by the noise model results, operation of the compressor and meter stations, with the noise mitigation included in the design, will contribute sound levels of less than 55 dBA L_{dn} at all NSAs. The predicted increase in the ambient sound levels ranges from 0.0 to 4.2 dB and is less than 10 decibels at all NSAs. The stations are predicted to operate in full compliance with FERC noise regulations.

Lambert Compressor Station is subject to the Pittsylvania County noise ordinance which limits sound levels at the station property line to 57 dBA during the day and 52 dBA at night for residential areas and to 77 dBA during both day and night for industrial areas. The parcels along the northeast property line are zoned industrial. The highest predicted sound level at the station property line is 65 dBA at the northeast property line adjacent to the Transco station. This is less than the 77 dBA limit for industrial areas. The highest predicted station sound level at a non-industrial property line is 51.9 dBA at the property line southeast of the station. This is just below than the nighttime limit of 52 dBA for agricultural property. The station is, therefore, predicted to comply with the Pittsylvania County noise ordinance.

9.3.5.2 Compressor Station Unit Venting Noise and Mitigation

Under certain circumstances, the pressure in the compressor casing and unit piping must be released in a controlled manner. These events are called unit venting and occur when a unit is shut down for an extended period. During venting, the high-pressure gas in the system is released in a controlled fashion through a silencer. Venting events may cause a temporary increase in sound level that usually lasts for approximately five minutes.

Compressor units will vent through silencers to limit the noise during venting. A compressor unit venting scenario was modeled for the Lambert station using a silencer designed to limit the maximum sound level due to venting to less than 85 dBA at 3 feet from each silencer.

Table 9.3-16 shows sound level predictions for the NSA at which the compressor station unit venting is predicted to be loudest. The worst-case NSA is not necessarily the closest NSA due to terrain shielding between the station and NSAs. The unit venting sound level is compared to the nighttime average level at the NSA to show the potential short-term sound level impact at the station. The predicted unit venting sound levels are low, with the highest predicted sound level of 36.5 dBA at NSA 1 of the Lambert Compressor Station.

Table 9.3-16

Lambert Compressor Station Unit Venting Sound Level Prediction

Worst Case NSA	Measured Existing Ambient, Night Average (L_{eq} dBA)	Estimated Contribution of Unit Venting (L_{eq} dBA)	Combined Venting and Ambient (L_{eq} dBA)	Short-term Sound Level Increase During Venting (dB)
1	44.5	36.5	45.1	0.6

9.3.5.3 Emergency Shutdown Noise and Mitigation

The compressor station has an emergency shutdown ("ESD") system that automatically halts operation of the station in the event of an irregularity. This results in full station venting during which the gas from all station piping is released in a controlled manner. These events are extremely rare and take place only in the event of an emergency or when the system is tested once every year. Residents will be notified in advance of the annual ESD system test.

The sound level due to an ESD event will be high enough to be audible within a one-mile radius and is intended to function as an alarm to notify nearby residents of a potential emergency.

9.3.5.4 Vibration

Large turbine exhausts, such as those present at the Lambert compressor station can be a source of low-frequency noise. Low-frequency noise can result in acoustically induced vibrations if the sound pressure level is above 65 dB in the 31.5 Hz octave band or above 75 dB in the 63 Hz octave band. The model predicts the station contribution will be 50 dB at 31.5 Hz and 50 dB at 63 Hz at the closest NSA to Lambert Compressor Station. Therefore, low-frequency noise induced vibration of structures should not be a concern.

9.3.6 Post Construction Sound Survey

As per FERC requirements, the Project will undertake post-construction sound level testing at the compressor station within 60 days of the station being placed into constant service. The testing will consist of sound level measurements at the closest NSAs with the station equipment in full-load operation. If full-load operation is not possible, then appropriate adjustments will be applied to the measured levels to estimate the sound levels under full-load conditions. The measured levels, along with the measurement methodology, measurement equipment used, station operating and weather conditions during the testing will be included in a report that will be submitted to the Commission. If the station sound level contributions are found to exceed the Commission's sound level limits, then the reports will

include the noise mitigation or equipment modifications that will be implemented to bring the station sound level contributions to below 55 dBA L_{dn}.

9.3.7 Cumulative Effect

Section 1.10 of Resource Report 1 discusses the reasonably foreseeable future actions that have been included in the cumulative impacts assessment for the Project, with the projects considered shown in Table 1.10-1. Generally, the cumulative impact assessment radius for noise is one mile. Of the projects listed in Table 1.10-1, only the Mountain Valley Pipeline and Stony Mill Road Construction are within one mile of the Southgate Project.

The Mountain Valley Pipeline Project is under construction and should be complete by the time that construction begins on the Southgate Project, so there is limited opportunity for cumulative construction noise impacts. In addition, there are no Mountain Valley Pipeline aboveground facilities (compressor stations or meter stations) within one mile of any of the Southgate Project aboveground facilities, so there are no cumulative operational noise impacts expected.

The Stony Mill Road construction project is a small road construction project at the intersection of Stony Mill Road and Tunstall High Road in Pittsylvania County, Virginia. There are no Southgate Project compressor stations, meter stations, HDDs, or railroad crossings within one mile of this project, so the only potential cumulative noise impact that could arise would be during pipeline construction. At the 0.5-mile distance from the pipeline corridor to the intersection, it is not expected that pipeline construction activities will be a significant noise source. No cumulative noise impacts are expected for the Stony Mill Road construction.

Fugitive Dust Emission Factors (Construction)

PM_{10}[2]	5.50E-02 ton/acre-month
$PM_{2.5}$[1,2]	5.50E-03 ton/acre-month

[1]WRAP Fugitive Dust Handbook, Countess Environmental, September 2006, Section 3.4.1.
[2]WRAP Fugitive Dust Handbook, Table 3-2, level 1, average conditions

Fugitive Dust Emission Factors (Wind Erosion)

PM_{10}[3]	7.92E-03 ton/acre-month
$PM_{2.5}$[3,4]	1.19E-03 ton/acre-month

[3]Wind erosion of exposed areas (seeded land, stripped or graded overburden) = 0.38 ton TSP/acre/yr (WRAP Fugitive Dust Handbook, Table 11-6)

[4]PM_{10}/TSP = 0.5, $PM_{2.5}$/PM_{10} = 0.15, (**WRAP Fugitive Dust Handbook**, Section 7-2)

[5]Water and other approved dust suppressants would be used at construction sites (50% minumum control applied per WRAP Fugitive Dust Handbook).

Notes

1. Data provided by Solar for 100%, 75%, and 50% load cases: net output power, fuel flow (MMBtu/hr, LHV), exhaust flow (lb/hr), exhaust temperature, NOx/CO/UHC concentrations and lb/hr.
2. Below zero and low load operation uses 0°F for operating parameters and uses concentrations from Solar PIL 167. Data for Particulate Matter based upon Solar PIL 171.
3. Greenhouse gases are calculated using emission factors from Part 98, Tables C-1 and C-2 and global warming potentials from Table A-1 (CO_2 = 1, CH_4 = 25, N_2O = 298).
4. VOC as 20% of UHC based on Solar PIL 168 for natural gas.

Notes

1. Data provided by Solar for 100%, 75%, and 50% load cases: net output power, fuel flow (MMBtu/hr, LHV), exhaust flow (lb/hr), exhaust temperature, NOx/CO/UHC concentrations and lb/hr.
2. Below zero and low load operation uses 0°F for operating parameters and uses concentrations from Solar PIL 167. Data for Particulate Matter based upon Solar PIL 171.
3. Greenhouse gases are calculated using emission factors from Part 98, Tables C-1 and C-2 and global warming potentials from Table A-1 (CO_2 = 1, CH_4 = 25, N_2O = 298).
4. VOC as 20% of UHC based on Solar PIL 168 for natural gas.

Note: Facility-wide blowdown events may occur for unplanned reasons (e.g. when an unsafe operating condition is detected). To prepare for such events, Mountain Valley Pipeline, LLC must perform ESD testing once every 5 years to ensure proper operation of the ESD system. A full station blowdown will only occur during emegency conditions. Emergency events are expected to be very infrequent and cannot be predicted. Accordingly, emergency station shutdown events are provided for informational purposes only.

1.0 INTRODUCTION

1.1 Project Overview

Mountain Valley Pipeline, LLC ("Mountain Valley") is seeking a Certificate of Public Convenience and Necessity ("Certificate") from the Federal Energy Regulatory Commission ("FERC") pursuant to Section 7(c) of the Natural Gas Act to construct and operate the MVP Southgate Project ("Project"). The Project will be located in Pittsylvania County, Virginia and Rockingham and Alamance counties, North Carolina. Mountain Valley proposes to construct approximately a 0.4-mile-long 24-inch-diameter pipeline (H-605) and 73 miles of 24- and 16-inch-diameter natural gas pipeline (H-650) to provide timely, cost-effective access to new natural gas supplies to meet the growing needs of natural gas users in the southeastern United States ("U.S."), including for the Project's anchor shipper, a local distribution company serving customers in North Carolina.

In addition to the proposed pipeline, Mountain Valley proposes to construct and operate a new compressor station (Lambert Compressor Station) near the beginning of the pipeline. As part of the Southgate Project and in order to boost pressures on Mountain Valley's transmission pipeline system, Mountain Valley is proposing to construct and operate one Solar Taurus 70 compressor turbine (11,792 hp) and one Solar Mars 100 compressor turbine (17,123 hp) at the Lambert Compressor Station. The Lambert Compressor Station (CS) will be a new natural gas transmission facility covered by Standard Industrial Classification (SIC) 4922. Ancillary project emission sources include five (5) Capstone microturbines rated at 200 kW each, one (1) 0.77 MMBtu/hr natural gas fired heater, and two (2) 10,000 gallon produced fluids tanks.

At the federal level, because the emission increases from the Lambert Compressor Station equipment are less than applicable major source thresholds, the Project will not trigger federal NSR requirements for any regulated air pollutant under either PSD or NNSR permitting programs. At the state level, the Project triggers air permitting through the VADEQ as a minor source of air emissions. If the agency considers that any project triggering minor NSR permitting could threaten attainment with the National Ambient Air Quality Standards (NAAQSs), VADEQ can require air dispersion modeling for the Project. A site wide modeling analysis for criteria pollutants has been performed to demonstrate that the Project will comply with the NAAQS. This report details the NAAQS and toxic air pollutant modeling assessments for the proposed Lambert Compressor Station.

2.0 PROJECT DESCRIPTION

2.1 Site Location and Surroundings

The proposed Lambert Compressor Station, as shown in Figure 2-1, is proposed to be located on an undeveloped parcel of land in a rural area near to Chatham, Virginia. The Lambert Compressor Station will be constructed at the beginning of the pipeline at milepost 0.0 in Pittsylvania County, Virginia on a parcel of land owned by Mountain Valley.

The approximate Universal Transverse Mercator (UTM) coordinates of the facility are: 647,900 meters east and 4,076,900 meters north in Zone 17 (North American Datum of 1983(NAD83)). A detailed plot plan of the proposed facility is shown in Figure 2-2.

2.2 Facility Conceptual Design

As a part of the Southgate Project, Mountain Valley is proposing to install the following equipment at the proposed Lambert Compressor Station:

- One Solar Taurus 70, 11,792 hp natural gas fired turbine-driven compressor unit;
- One Solar Mars 100, 17,123 hp natural gas fired turbine-driven compressor unit;
- Five (5) Capstone Microturbines each rated at 200 kW;
- One 0.77 MMBtu/hr heater; and
- Two 10,000 gallon produced fluids storage tanks.

Potential Project emissions include trivial station blowdowns consisting of two types of gas blowdown events that could occur at the Station: (1) a type of maintenance gas blowdown that could occur when a compressor is stopped and gas between the suction/discharge valves and compressors is vented to the atmosphere via a blowdown vent, and (2) an emergency full station shutdown (ESD) that would only occur infrequently at required U.S. Department of Transportation (DOT) test intervals or in an emergency situation.

The installation of the above equipment will include a number of piping components at the station which could result in additional fugitive emissions due to equipment leaks.

2.2.1 Compressor Turbines

The proposed Solar Taurus 70 and Mars 100 natural gas-fired turbines to be installed at the Lambert Compressor Station will be equipped with Solar's SoLoNOx dry low NOx

combustor technology for NOx control. Potential emissions for the Solar Turbines conservatively assume that the units will operate up to 8,760 hours per year and up to 100% rated output. The vendor provided emission rates for normal operating conditions are as follows (all emissions rates are in terms of parts per million dry volume (ppmvd) @ 15% O2):

- 15 ppmvd NOx;
- 25 ppmvd CO;
- 25 ppmvd unburned hydrocarbons (UHC); and
- 5 ppmvd VOC.

Depending upon demand, the turbines may operate at loads ranging from 50% to 100% of full capacity. Because of the different emission rates and exhaust characteristics that occur at different loads and ambient temperatures, a matrix of operating modes is presented. Emission parameters for three turbine loads (50%, 75%, and 100%) and six ambient temperatures (0°F, 20°F, 40°F, 60°F, 80 °F, and 100°F) are accounted for in this air modeling analysis to cover the range of steady-state turbine operations.

At very low load and cold temperature extremes, the turbine system must be controlled differently in order to assure stable operation. The required adjustments to the turbine controls at these conditions cause emissions of NOx, CO and VOC to increase (emission rates of other pollutants are unchanged). Low-load operation (non-normal SoLoNOx operation) of the turbines is expected to occur only during periods of startup and shutdown and for maintenance or unforeseen emergency events.

Similarly, Solar has provided emission estimates for low temperature operation (inlet combustion air temperature less than 0° F and greater than -20° F) in Solar PIL 167 (SoLoNOx Products: Emissions in Non-SoLoNOx Modes). Solar PIL 167 provides estimated pre-control emissions from the turbines at low temperature conditions.

- 120 ppmvd NOx;
- 150 ppmvd CO;
- 50 ppmvd unburned hydrocarbons (UHC); and
- 10 ppmvd VOC.

Mountain Valley reviewed historic meteorological data from the previous five years for the region to estimate the worst-case number of hours per year under sub-zero (less than 0° F) conditions. The annual hours of operation during sub-zero conditions was assumed to be not more than 24 hours per year.

2.2.2 Ancillary Equipment

Mountain Valley is proposing to install five (5) new natural gas fired Capstone C200 (200 kW) microturbines to provide electrical power to the Station. Emissions of NOx, CO, and VOC are based on vendor data. Emission rates for SO_2, particulates, and hazardous air pollutants (HAPs) are based on USEPA AP-42 emission factors (Table 3.1-2a). The emission rates are based on the microturbines operating at peak load.

2.3 Proposed Project Emission Potential

Table 2-1 presents project emission potentials from the new units to be installed as a part of the proposed Lambert Compressor Station.

Table 2-1: Proposed Facility Emissions (tons/year)

Pollutant	Solar Taurus 70 Turbine	Solar Mars 100 Turbine	Capstone Microturbines	Heater	Produced Fluids Tanks	Station Blowdowns	Station Fugitives	Proposed Project Total
NOx	21.81	31.66	1.81	0.31	-	-	-	55.58
VOC	3.16	3.85	0.44	0.02	0.43	0.46	0.72	9.07
CO	25.85	35.18	4.79	0.26	-	-	-	66.08

3.0 AIR QUALITY MODELING ANALYSIS

3.1 Background Ambient Air Quality

Background ambient air quality data was obtained from various existing monitoring locations. Based on a review of the locations of Virginia and North Carolina ambient air quality monitoring sites, the closest representative monitoring sites were used to represent the current background air quality in the site area.

The monitoring data for the most recent three years (2015 – 2017) are presented and compared to the NAAQS in Table 3-1. The maximum measured concentrations for each of these pollutants during the last three years are all below applicable standards and are used as representative background values for comparison of facility concentrations to the NAAQS.

3.2 Modeling Methodology

An air quality modeling analysis was performed consistent with the procedures found in the following documents: Virginia Modeling Guideline for Air Quality Permits (VADEQ, 2015), Guideline on Air Quality Models (Revised) (USEPA, 2017), and New Source Review Workshop Manual (USEPA, 1990).

3.2.1 Model Selection

The USEPA has compiled a set of preferred and alternative computer models for the calculation of pollutant impacts. The selection of a model depends on the characteristics of the source, as well as the nature of the surrounding study area. Of the four classes of models available, the Gaussian type model is the most widely used technique for estimating the impacts of nonreactive pollutants.

The AERMOD model was designed for assessing pollutant concentrations from a wide variety of sources (point, area, and volume). AERMOD is currently recommended by the USEPA for modeling studies in rural or urban areas, flat or complex terrain, and transport distances less than 50 kilometers, with one hour to annual averaging times.

Table 3-1: Maximum Measured Ambient Air Quality Concentrations

a/ ppm = parts per million by volume. ppb = parts per billion by volume. µg/m3 = micrograms per cubic meter.

The latest version of USEPA's AERMOD model (Version 18081) was used in the analysis. AERMOD was applied with the regulatory default options and 5-years (2013-2017) of hourly meteorological data consisting of surface data observed at the Danville Regional Airport meteorological station (WBAN #13728) and upper air data collected from Greensboro, North Carolina upper air sounding station (WBAN #13723).

3.2.2 Urban/Rural Area Analysis

A land cover classification analysis was performed to determine whether the URBAN option in the AERMOD model should be used in quantifying ground-level concentrations. The methodology utilized to determine whether the project is located in an urban or rural area is described below.

The following classifications relate the colors on a United States Geological Survey (USGS) topographic quadrangle map to the land use type that they represent:

- Blue – water (rural);
- Green – wooded areas (rural);
- White – parks, unwooded, non-densely packed structures (rural);
- Purple – industrial; identified by large buildings, tanks, sewage disposal or filtration plants, rail yards, roadways, and, intersections (urban);
- Pink – densely packed structures (urban); and,
- Red – roadways and intersections (urban)

The USGS map covering the area within a 3-kilometer radius of the facility (Figure 2-1) was reviewed and indicated that the clear majority of the surrounding area is denoted as green or white, which represent wooded areas, parks, and non-densely packed structures (all designated as rural land uses). Although a small percent of the surrounding area is designated as urban land use, the "AERMOD Implementation Guide" published on August 3, 2015 cautions users against applying the Land Use Procedure on a source-by-source basis and instead to consider the potential for urban heat island influences across the full modeling domain. This approach is consistent with the fact that the urban heat island is not a localized effect, but is more regional in character.

Because the urban heat island is more of a regional effect, the Urban Source option in AERMOD was not utilized since the area within 3 kilometers of the facility as well as the full modeling domain (20 kilometers by 20 kilometers) is predominantly rural.

3.2.3 Good Engineering Practice Stack Height

Section 123 of the Clean Air Act (CAA) required the USEPA to promulgate regulations to assure that the degree of emission limitation for the control of any air pollutant under an applicable State Implementation Plan (SIP) was not affected by (1) stack heights that exceed Good Engineering Practice (GEP) or (2) any other dispersion technique. The USEPA provides specific guidance for determining GEP stack height and for determining whether building downwash will occur in the Guidance for Determination of Good Engineering Practice Stack Height (Technical Support Document for the Stack Height Regulations), (USEPA, 1985). GEP is defined as "...the height necessary to ensure that emissions from the stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies, and wakes that may be created by the source itself, or nearby structures, or nearby terrain "obstacles"."

The GEP definition is based on the observed phenomenon of atmospheric flow in the immediate vicinity of a structure. It identifies the minimum stack height at which significant adverse aerodynamics (downwash) are avoided. The USEPA GEP stack height regulations (40 CFR 51.100) specify that the GEP stack height (H_{GEP}) be calculated in the following manner:

$$H_{GEP} = H_B + 1.5L$$

Where: H_B = the height of adjacent or nearby structures, and
L = the lesser dimension (height or projected width of the adjacent or nearby structures).

A detailed plot plan of the proposed facility is shown in Figure 2-2. A GEP stack height analysis was conducted using the USEPA approved Building Profile Input Program with PRIME (BPIPPRM, version 04274). The maximum calculated GEP stack height for the new emission sources is 117.9 feet; the controlling structure is the proposed compressor building (peak height of 47.17 feet). As such, all of the exhaust stacks are subject to downwash and the downwash parameters from the BPIP program were included in the AERMOD analysis.

While the proposed exhaust stacks are lower than the calculated GEP height, the modeling analysis demonstrates that the proposed exhaust stack heights will result in potential air quality impacts that are lower than the NAAQS and VADEQ's Significant Ambient Air Concentrations for toxic air pollutants.

3.2.4 Meteorological Data

If at least one year of hourly on-site meteorological data is not available, the application of the AERMOD dispersion model requires five years of hourly meteorological data that are representative of the project site. In addition to being representative, the data must meet quality and completeness requirements per USEPA guidelines. The closest source of representative hourly surface meteorological data is Danville Regional Airport located in Danville, VA, approximately 18 miles to the south of the Lambert Compressor Station.

The meteorological data at the Danville Regional Airport is recorded by an Automated Surface Observing System (ASOS) that records 1-minute measurements of wind direction and wind speed along with hourly surface observations necessary. The USEPA AERMINUTE program was used by the VADEQ to process 1-minute ASOS wind data (2013 – 2017) from the Danville Regional Airport surface station in order to generate hourly averaged wind speed and wind direction data to supplement the standard hourly ASOS observations. The hourly averaged wind speed and direction data generated by AERMINUTE was merged with the aforementioned hourly surface data.

The AERMOD assessment utilized five (5) years (2013–2017) of concurrent meteorological data collected from a meteorological tower at the Danville Regional Airport and from radiosondes launched from Greensboro, North Carolina. Both the surface and upper air sounding data were processed by the VADEQ using AERMOD's meteorological processor, AERMET (version 18081). The output from AERMET was used as the meteorological database for the modeling analysis and consists of a surface data file and a vertical profile data file. This data, which were prepared and processed to AERMOD format by the VADEQ, was provided for use in the modeling analyses for the proposed facility.

3.3 Receptor Grid

3.3.1 Basic Grid

The AERMOD model requires receptor data consisting of location coordinates and ground-level elevations. The receptor generating program, AERMAP (Version 18081), was used to develop a complete receptor grid to a distance of 10 kilometers from the proposed facility. AERMAP uses digital elevation model (DEM) or the National Elevation Dataset (NED) data obtained from the USGS. The preferred elevation dataset based on NED data was used in AERMAP to process the receptor grid. This is currently the preferred data to be used with AERMAP as indicated in the USEPA AERMOD

Implementation Guide published August 3, 2015. AERMAP was run to determine the representative elevation for each receptor using 1/3 arc second NED files that were obtained for an area covering at least 10 kilometers in all directions from the proposed facility. The NED data was obtained through the USGS Seamless Data Server (http://seamless.usgs.gov/index.php).

The following rectangular (i.e. Cartesian) receptors were used to assess the air quality impact of the proposed facility:

- Fine grid receptors (100 meter spacing) for a 20 km (east-west) x 20 km (north-south) grid centered on the proposed facility site.
- Fine grid receptors (50 meter spacing) for a 2 km (east-west) x 2 km (north-south) grid centered on the proposed facility site.

3.3.2 Property Line Receptors

The facility will have a fenced property line that precludes public access to the site. Ambient air is therefore defined as the area at and beyond the fence. The modeling receptor grid includes receptors spaced at 25-meter intervals along the entire fence line. Any Cartesian receptors located within the fence line were removed.

3.4 Selection of Sources for Modeling

The emission sources responsible for most of the potential emissions from the Lambert Compressor Station are the two Solar combustion turbines. These units were included in and are the main focus of the modeling analyses. The modeling includes consideration of operation over a range of turbine loads, ambient temperatures, and operating scenarios.

Ancillary sources (Capstone microturbines) were also included in the modeling for appropriate pollutants and averaging periods.

3.4.1 Emission Rates and Exhaust Parameters

The dispersion modeling analysis was conducted with emission rates and flue gas exhaust characteristics (flow rate and temperature) that are expected to represent the range of possible operation parameters for the proposed natural gas fired turbines. Because emission rates and flue gas characteristics for a given turbine load vary as a function of ambient temperature and fuel use, data were derived for a number of ambient temperature cases for natural gas fuel at 100%, 75% and 50% operating loads. The temperatures were:

- 0°F, 20°F, 40°F, 60°F, 80°F and 100°F.

To be conservative and limit the number of cases to be modeled, the modeling analyses were conducted using the lowest stack exhaust temperature and exit velocity coupled with the maximum emission rate over all ambient temperature cases for each operating load. Tables 3-2 and 3-3 summarize the stack parameters and emission rates that were used in the modeling for the two compressor turbines.

Table 3-2: Stack Parameters and Emission Rates – Proposed Solar Taurus 70 Compressor Turbine

Parameter		Values		
Load		50%	75	100%
Stack Height (m)		15.24	15.24	15.24
Stack Diameter (m)		1.52	1.52	1.52
Exhaust Velocity (m/s)		23.74	25.76	29.10

3.5 Maximum Modeled Facility Concentrations

Table 3-5 presents the maximum modeled air quality concentrations of the proposed facility calculated by AERMOD. As shown in this table, the maximum modeled concentrations when combined with a representative background concentration as provided in Table 3-5, are less than the applicable NAAQS for all pollutants.

Table 3-5: Facility Maxi mum Modeled Concentrations Compared to NAAQS

Pollutant	Averaging Period	NAAQS (µg/m³)	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Total Concentration (µg/m³)
CO	1-Hour	40,000	59.1	1,265	1,324.1
	8-Hour	10,000	54.0	805	859.0
SO_2	1-Hour	196	4.1	10.5	14.6
	3-Hour	1,300	3.7	10.5	14.2
PM10	24-Hour	150	7.4	35	42.4
PM2.5	24-Hour	35	3.3[a]	15.7	19.0
	Annual	12	0.2	7	7.2
NO_2	1-Hour	188	31.5[b]	62.6	94.1
	Annual	100	0.9[b]	10.7	11.6

[a]Conservatively based upon maximum 98% percentile daily maximum modeled concentrations.

[b]Based upon USEPA Ambient Ratio Method 2 (ARM2) modeling guidance.

3.6 Toxic Air Pollutant Analysis

New and modified sources that emit toxic pollutants must meet the standards in 9 VAC 5-60-300. Virginia defines a toxic pollutant in 9 VAC 5-60-310 as "any air pollutant listed in §112(b) of the federal Clean Air Act, as revised by 40 CFR §63.60, or any other air pollutant that the board determines, through adoption of regulation, to present a significant risk to public health." As HAPs are emitted from the proposed sources at the Lambert Compressor Station, Mountain Valley completed a dispersion modeling evaluation to confirm the Project complies with toxic air pollutant requirements in Virginia.

The Project emissions of toxic air pollutants were compared to the exemption thresholds contained in 9VAC5-60-300C. The only toxic air pollutant that is potentially emitted above the exemption thresholds is formaldehyde. Thus, an air quality dispersion modeling analysis is required by VADEQ to demonstrate that the emissions of formaldehyde will not cause, or contribute to, any significant ambient air concentration that may cause, or contribute to, the endangerment of human health.

An air toxics modeling analysis was conducted for formaldehyde by comparing the modeled 1-hour and annual formaldehyde impacts to the VADEQ's Significant Ambient Air Concentrations (SAAC) for formaldehyde. The SAAC is the concentration of a toxic pollutant in the ambient air that, if exceeded, may have an adverse effect to human health.

As shown in Table 3-6, the maximum modeled impacts are well below the SAACs and thus, the Project complies with the VADEQ toxic pollutant requirements.

Table 3-6: Toxic Air Pollutant Impact Analysis

Pollutant	Averaging Period	VADEQ Screening Level(µg/m3)	Maximum Modeled Concentration (µg/m3)
Formaldehyde	1-Hour	62.5	2.1
	Annual	2.4	0.1

MVP Southgate Project

Traffic and Transportation Management Plan, Revision 2

(May 2020)

MVP Southgate Project

Traffic and Transportation Management Plan

Revision 2

May 2020

TABLE OF CONTENTS

ATTACHMENTS

1.0 INTRODUCTION

Mountain Valley Pipeline, LLC ("Company") has developed this Traffic and Transportation Management Plan to describe the measures the MVP Southgate ("Project") and their Contractors ("Contractor") will take to minimize potential impacts on state and local roadways during the construction of the Project. This plan outlines traffic impact minimization measures, noxious weed control measures, and dust control methods that will be used on the Project to reduce impacts during construction.

Operations and maintenance activities will be conducted with light vehicles at very few occasions that should have no impact to roadways and traffic once the Project is in-service.

1.1 Traffic Impacts

Prior to construction, the Company will obtain applicable Federal, State/Commonwealth, and local road use and crossing permits, as required. The Company and Contractor personnel will comply with all permit requirements and conditions to provide for public safety and minimize impacts on public roads. Copies of this *Traffic and Transportation Management Plan* and applicable road use and crossing permits will be provided to the appropriate personnel and maintained at each Contractors' field office.

Increased temporary traffic from Project-related activities will include transportation for construction workers in light and heavy-duty trucks, construction equipment (e.g. tractor trailers hauling machinery and materials), and truck deliveries. Prior to construction, the Company and Contractor will work together to determine the number of workers' cars, equipment, and trucks that would use local roads and commuting periods. The Company will establish routes to and from the Project work areas to ensure that traffic impacts are minimized. These established routes will be provided to the Contractors' and utilized during construction. The contractor will develop an appropriate work zone plan to ensure the safe and efficient travel of vehicles during the construction phase. The Company shall coordinate with the following transportation districts to obtain the required permits or agreements for any operations within a state right-of-way:

- Virginia Department of Transportation (VDOT) Lynchburg District (VDOT Land Use permit for any operations within the VDOT Right-of-way).
- North Carolina Department of Transportation (NCDOT) District 1 (Rockingham County) and District 3 (Alamance County) (encroachment agreement for construction or utility installation within the limits of the NCDOT right-of-way).

The Company will consult with State and local agencies regarding detour routes, speed/load limits, and other use limitations, conditions, or restrictions on the roads that will be utilized during construction. Before the start of construction, the Company will work with these agencies to obtain the most up-to-date traffic information for the roadways in the Project area as well as ongoing road reconstruction or improvement projects in the vicinity of the pipeline route and facilities area. At this time, no conflict is anticipated. Currently no active Six-Year Improvement Projects (SYIP) overlaps or falls adjacent to the proposed Project. The Contractor shall monitor the VDOT paving

schedule website map for any updates during construction of the Project and update the Company weekly.(https://vdot.maps.arcgis.com/apps/webappviewer/index.html?id=fbf 86e85fdcb43e482432f41ddbb51c7). The Pavement Status Map Application is updated to indicate new paving projects annually. The contractor shall also monitor the NCDOT State Improvement Program,(STIP),(https://www.ncdot.gov/initiatives-policies/Transportation/stip/development/Pages/default.aspx).

Where local, private roadways will be affected, the Company will coordinate with landowners and lessees of properties to mitigate potential impacts on those roads. Similarly, where roads on public lands will be affected, the Company will coordinate with the appropriate managing agency to mitigate potential impacts on roads or implement required traffic and transportation procedures. As discussed further in the following sections, the Contractor will place and maintain traffic control measures, such as flag persons, warning signs, lights, and/or barriers, as appropriate, to ensure the safety of construction workers and the public and to minimize traffic congestion. The Contractor will maintain traffic flow and emergency vehicle access on roadways with traffic control personnel or detour signs, where necessary. Please refer to Drawing Number MVPPL-VAR-200 for traffic control guidelines in Virginia and Drawing Number MVPPL-NCR-200B for traffic control guidelines in North Carolina. The Company will ensure coordination with local law enforcement, fire departments, and emergency medical services to coordinate access for effective emergency response during construction. Contractors will be directed to comply with local weight limitations and restrictions on area roadways.

The Company strives to mitigate the increase in construction-related truck traffic on local roads shared with community and school buses in suburban and more densely populated rural areas. Key components to a successful community partnership include:

- Central point of command for construction traffic route plan. The Company will have a Coordinator responsible for maintaining traffic related plans, procedures, records, and documents.

- School bus curfews. Often times construction vehicles can pose concern when school buses are traveling their established routes. The community expects that their children will have safe and timely travel to and from school. The Company will ensure coordination with the governing School Districts or the School Transportation Department in the Project area to identify the bus routes and times. To the extent practicable, construction traffic will be limited or refrained during the bus route times with a published school bus route curfew time period.

- Speed enforcement. In more rural areas, law enforcement is often not staffed to handle a sudden increase in traffic. Company will ensure monitoring of the speed of the route. This not only keeps contractor and the public safe but lends accountability to the Project. Inevitably, contractors will end up off of approved routes. The Traffic Coordinator will be able to actively monitor these issues and reduce unapproved travel that can become costly

if damage occurs. The Coordinator can also be useful in diffusing potential hostile situations with neighbors and landowners.

All impacts shall be within the guidelines of all applicable agencies, as well as approval from landowners. A list of state and county contacts is provided in the table below. Once construction is complete, the Company will ensure all roads are restored back to their original level of service or better, unless the Company is directed otherwise in writing by the landowner or regulatory agency. Pre-construction video will be used to document the roadway condition prior to Project usage.

2.0 PIPELINE ROAD CROSSINGS

The Company will ensure construction of road and highway crossings are in accordance with the permit requirements and the construction drawings for the crossing. No work on any such crossing shall be started before obtaining all applicable permits from the regulatory agencies. The Contractor will strive to maintain single lane traffic on all roads and shall provide flagmen, road signs and all other signaling required by the governing authority to supervise the flow of traffic. In the event a roadway needs to be closed and traffic detoured, the Company will ensure coordination with all applicable agencies and expediting of all work to mitigate inconveniences to the public. The Contractor will provide barricades, warning signs, flares, lanterns, flagmen and such other protective measures required to maintain traffic and to safeguard the public at all times.

Any damage to paved or blacktop roads shall be repaired per specifications provided by the regulatory agencies. Road surfaces other than hard surface roads (e.g., paved, blacktop, or concrete) shall be backfilled in well-tamped 6-inch layers and shall be finished with a well-tamped surface matching the existing road. If flowable fill is used, it will be in accordance with the appropriate mix per agency specifications. For all types of crossings, additional or other limitations may be provided by the governing municipality and must prevail.

At the end of each workday, the Contractor will make passable any open-cut driveways for ingress and egress. This may be accomplished by using steel plates. Any and all steel plates used for such purposes shall be properly pinned (i.e., secured in place) and ramped on each end to allow traffic flow. The backfilling road crossings shall be performed immediately after the pipe is installed and in accordance with requirements established by the applicable permit.

3.0 CONSTRUCTION TRAFFIC AND BUSSING PLAN

An increase in traffic to local and state roads will be expected throughout the day between the hours of 6:00 a.m. and 7:00 p.m. or sunset, whichever is later. Emergencies or other designated construction activities may necessitate nighttime work. The temporary traffic will include transportation for construction workers in light and heavy-duty trucks, as well as tractor trailers hauling machinery and materials. Prior to construction, the Contractor will determine locations of commuting workers collection points (it is anticipated the majority of the worker collection points will be the permitted Contractor Yards), and bus routes and associated traffic impacts. Large work crews will meet at the identified collection points and take a bus to the construction right-of-way. Smaller crews will use vans or will car pool with the foreman or straw boss. Impacts are expected to be minor and short term because construction spreads and personnel will be geographically dispersed, and personnel will commute to and from work areas in early morning and late evening during nonpeak traffic hours. Traffic will be entering and leaving off-site locations such as laydown yards, right-of-way and additional temporary workspace for the purpose of pipeline construction, hauling material and roadway maintenance. Once the material and heavy equipment are placed on the right-of-way, construction equipment will move in a linear manner along the right-of-way as work progresses, minimizing traffic on local roads. The amount of equipment moved by hauling from site to site will be reduced due to the accessibility created by the construction right-of-way.

The Company may arrange to have road improvements performed at areas that are not conducive to heavy hauling and large traffic volume, in addition to having all approved roads maintained during construction, and finally returning the roads back to their original or better level of service, meaning their original width and length, unless the Company is directed otherwise in writing by the landowner or state agency.

4.0 NOXIOUS WEEDS

To prevent noxious weeds from transporting along roadways, the Company developed the following measures:

- The prompt seeding and revegetation of areas of disturbed soils with certified weed-free seed.
- Encourage the cleaning of equipment and vehicles prior to entering or leaving each management area. (Pressure wash in a designated area only.)
- Minimize soil disturbance, where possible.
- Use certified weed-free mulch/straw for erosion control.

5.0 FUGITIVE DUST CONTROL

Dirt and gravel during construction periods in dry weather can create an inhospitable environment for neighbors and workers. The Company developed the following fugitive dust control measures to address this issue.

- Implementation of construction and restoration best management practices and operational controls will be used to mitigate fugitive dust emissions.
- The Project's earth disturbance permit will outline specific practices that control fugitive dust, including a construction sequence; use of rock construction entrances; and temporary soil stabilization methods.
- Operational controls are also implemented, including the use of a reduced speed limit on unpaved access roads as well as sweeping/vacuuming paved roadways when Project-related soils are tracked out onto paved surfaces.
- Wet suppression, using water, is the predominate method of suppressing fugitive dust on unpaved roads and gravel pads as it causes finer materials to adhere into larger particles.
    - Increasing the moisture content of the finer materials may be accomplished either naturally or mechanically.
    - Moisture content of unpaved road surfaces can be naturally increased through rainfall.
    - Moisture content can also be increased mechanically through the application of water.

- The amount of water required to sufficiently control fugitive dust emissions is dependent on the characteristics of materials (e.g., surface moisture content), ambient conditions (e.g., rainfall, humidity, temperature), and activities occurring in the area (e.g., vehicle traffic, vehicle weight, speeds).

The following measures will be taken to reduce fugitive dust from operations:

- Fugitive dust emissions from vegetation removal, clearing and grading, cutting and filling, topsoil removal, trenching, backfilling and stockpile storage will be controlled to a great extent by following the construction sequencing and disturbing limited areas at a time;
- Fugitive dust emissions generated by motorized equipment and miscellaneous vehicle traffic will be controlled by wet suppression as necessary;
- Fugitive dust emissions from paved roads will be controlled with a combination of water trucks, power washers, sweeping and/or vacuuming. If necessary, additional potential sources of water for dust control may include other municipal systems, groundwater supply wells, and/or approved surface waters;
- Track out of loose materials will be controlled using rock construction entrances on access roads that begin at a junction with paved roads; and
- When environmental conditions are dry, inspection of dust control measures will be conducted daily.

6.0 INSPECTION, MONITORING, AND RECORD KEEPING

The Contractor will implement the dust control measures specified in this plan. All construction personnel will be informed of the measures in this plan. Company will have primary responsibility for monitoring and enforcing the implementation of dust control measures by the Contractor. The Company will also be responsible for ensuring that these measures are effective and proper documentation is maintained. When environmental conditions are dry, inspection of dust control measures will be conducted daily, and the Company will be responsible for recording the following information on a daily basis:

- weather conditions, including temperature, wind speed and wind direction;
- number of water trucks in use;
- incidents where dust concentration is such that special abatement measures must be implemented;
- condition of soils (e.g., damp, crusted, unstable) on the right-of-way and other construction sites;
- condition of soils (e.g., damp, crusted, unstable) on access roads;
- condition of track-out pads;

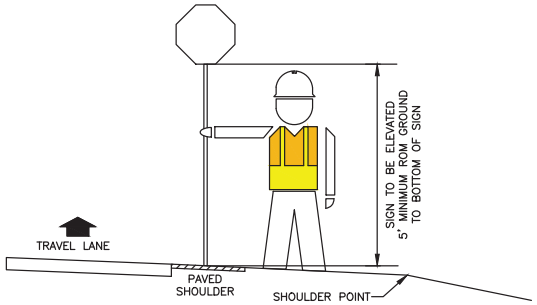
- overall status of dust control compliance.

This information will be incorporated into Company documentation, and significant instances of non-compliance with the plan will be reported to the Company as soon as they are discovered.

Attachment A Virginia Traffic Control Plan (MVPPL-VAR-200)

Attachment B North Carolina Traffic Control Plan (MVPPL-NCR-200B)

FLAGGERS



08-30-2019

FLAGGERS SHALL PERFORM THEIR DUTIES IN THE FOLLOWING MANNER:

1. ENSURE ALL SIGNS ARE INSTALLED PRIOR TO PERFORMING FLAGGING OPERATIONS.
2. BE ALERT AND ATTENTIVE AT ALL TIMES.
3. THE FLAGGER SHALL STAND ALONE, NEVER PERMITTING A GROUP OF WORKERS TO CONGREGATE AROUND THE FLAGGER STATION OR ALLOW WORK VEHICLES NEAR THE FLAGGER STATION.
4. ALWAYS STAND WHILE WAITING FOR TRAFFIC.
5. HAVE AN AVENUE OF ESCAPE IF APPROACHED BY AN ERRANT VEHICLE.
6. USE PROPER HAND SIGNALS WITH THE STOP/SLOW PADDLE.
7. MAKE EYE CONTACT WITH MOTORISTS.
8. DO NOT LEAVE YOUR POST UNTIL YOU ARE PROPERLY RELIEVED.
9. COORDINATE WITH OTHER FLAGGERS.
10. HAVE YOUR CERTIFICATION CARD IN YOUR POSSESSION WHILE PERFORMING FLAGGING DUTIES.

FLAGGERS SHALL ADHERE TO THE FOLLOWING DRESS CODE:

1. HARD HAT.
2. RETROREFLECTIVE HIGHLY-VISIBILITY SAFETY APPAREL MEETING ANSI/ISEA 107-2010 CLASS 3 RISK EXPOSURE FOR DAYTIME AND NIGHTTIME ANSI/ISEA 107-2010 CLASS 3 RISK EXPOSURE SHALL INCLUDE TYPE E TROUSERS.
3. PROTECTIVE FOOTWARE MUST COMPLY WITH ANSI Z41-1999, ASTM F-2412-2005, ASTM F-2413-2005 (OR MORE CURRENT ASTM).
4. SHIRT WITH SLEEVES AND LONG PANTS (REMOVAL OF SHIRT IS PROHIBITED).

METHODS OF FLAGGING TRAFFIC:

WHERE TO STAND

1. STAND WHERE YOU CAN SEE AND BE SEEN BY APPROACHING TRAFFIC. CLEAR SIGHT DISTANCE FROM THE GRAPHIC FLAGGER SIGN TO THE FLAGGER STATION SHOULD BE 350' TO 500' WHERE THE POSTED SPEED LIMIT IS 45 MPH OR 500' TO 800' WHERE THE POSTED SPEED LIMIT IS GREATER THAN 45 MPH.
2. STAND FACING TRAFFIC EITHER ON THE EDGE OF THE SHOULDER OF THE ROAD OR NEAR THE EDGE OF PAVEMENT.
3. FLAGGER STATIONS SHOULD BE LOCATED SUCH THAT AN ERRANT VEHICLE HAS ADDITIONAL SPACE TO STOP WITHOUT ENTERING THE WORK AREA. THE DISTANCE FROM THE FLAGGER STATION TO THE WORK AREA SHOULD BE AS SHOWN IN THE TABLE BELOW:

POSTED SPEED	25	30	35	40	45	50	55	60
DISTANCE (FT)	155-165	200-210	250-260	305-320	360-380	425-445	500-520	570-600

HOW TO STOP TRAFFIC

1. STAND ON THE SHOULDER OF THE ROADWAY FACING TRAFFIC.
2. HOLD THE STOP SIGN PADDLE IN A STATIONARY POSITION. LOOK DIRECTLY AT THE APPROACHING TRAFFIC. RAISE YOUR FREE HAND WITH PALM EXPOSED TO APPROACHING DRIVER AND MAKE EYE CONTACT WITH THE DRIVER.
3. IF TIME PERMITS, DRIVERS MAY BE INFORMED CONCERNING THE REASON FOR THE DELAY. SPEAKING IN ENGLISH BE COURTEOUS AND BRIEF.

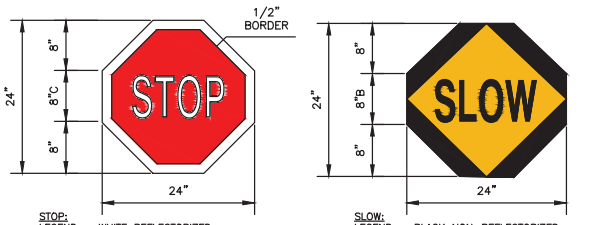
HOW TO RELEASE TRAFFIC

1. BEFORE RELEASING TRAFFIC THE FLAGGER WILL RETURN TO THE NORMAL FLAGGING LOCATION. KEEP YOUR PADDLE ON STOP UNTIL YOU ARE SAFELY ON THE SHOULDER OF THE ROADWAY.
2. STAND FACING TRAFFIC. HOLD THE SLOW SIGN PADDLE IN A STATIONARY POSITION WITH THE PADDLE FACING THE ROAD USER. WITH YOUR FREE ARM SIGNAL THE DRIVERS TO PROCEED INTO THE OPEN LANE.
3. WHERE TRAFFIC IS STOPPED TEMPORARILY IN ONE LANE, RELEASE TRAFFIC BY TURNING THE PADDLE A QUARTER TURN SO THAT THE WORD "STOP" FACES YOU AND IS PARALLEL TO THE ROADWAY. WITH YOUR FREE ARM SIGNAL THE DRIVERS TO PROCEED INTO THE OPEN LANE.

HOW TO ALERT AND SLOW TRAFFIC BUT NOT STOP IT

1. STAND FACING TRAFFIC.
2. HOLD THE SLOW SIGN PADDLE IN A STATIONARY POSITION WITH THE ARM EXTENDED HORIZONTALLY AWAY FROM THE BODY. FOR ADDED EMPHASIS, THE FLAGGER MAY RAISE AND LOWER THE FREE HAND WITH THE PALM DOWN.

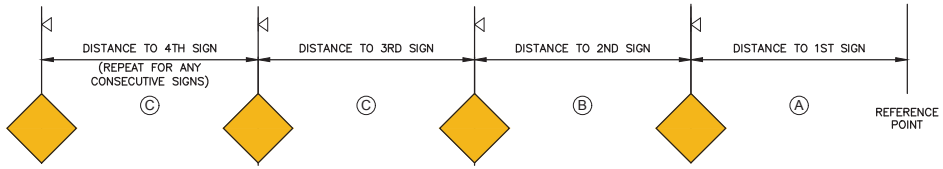
STOP / SLOW PADDLE



STOP / SLOW PADDLE NOTE:

1. FOR OPERATIONS THAT ARE RESTRICTED TO DAYLIGHT HOURS ONLY, USE NON-REFLECTORIZED LEGENDS, BORDERS AND BACKGROUNDS.
2. FOR OPERATIONS THAT EXTEND INTO NIGHTTIME, RETROREFLECTIVE AND/OR ILLUMINATE DEVICES SHALL BE USED.

SPACING FOR TEMPORARY SIGNS IN SERIES (STATIONARY OR PORTABLE SIGNS)



RECOMMENDED SPACING OF ADVANCE WARNING SIGNS	
ROAD TYPE	SPACING (FEET±) AT (A), (B) OR (C)
URBAN STREET, ≤25MPH POSTED SPEED	100-200
URBAN STREET, 30-40MPH POSTED SPEED	250-350
URBAN STREET, >40MPH POSTED SPEED	350-500
OTHER ROADWAYS, ≤45MPH POSTED SPEED	350-500
OTHER ROADWAYS, >45PH POST SPEED	500-800
LIMITED ACCESS HIGHWAYS	1300-1500

SPACING OF TEMPORARY SIGNS NOTE:

1. APPLY THE ADVANCE WARNING SIGNS SPACING CHART WHERE A SERIES OF 2 OR MORE SIGNS ARE USED. ALL SIGN SPACING DIMENSIONS ARE APPROXIMATE. FIELD ADJUST AS VARIOUS CONDITIONS OCCUR, SUCH AS ADDITIONAL REACTION TIME FOR A CONDITION, LIMITED SIGHT DISTANCE, ETC.

TEMPORARY TRAFFIC CONTROL ZONE SIGN NOTES:

1. FLAGGING STATIONS SHALL BE PRECEDED BY PROPER ADVANCE WARNING SIGNS. SIGNS SHALL BE REMOVED WHEN THE FLAGGER IS NO LONGER AT THEIR STATION.
2. SIGNS MUST BE RETROREFLECTIVE AND MADE FROM VDOT APPROVED MATERIALS. MESH SIGNS ARE NOT ALLOWED.
3. SIGNS SHALL BE LOCATED ON THE RIGHT SIDE OF THE ROADWAY.
4. ALL SIGNS MAY BE PORTABLE MOUNTED.
5. USE PROPER BALLAST SUCH AS SAND BAGS ON PORTABLE SIGN STAND LEGS TO PREVENT OVERTURNING OR USE STATIONARY MOUNTED SIGNS IN HIGH WIND AREAS.
6. SIGNS SHOULD BE POSITIONED SO THE SIGN FACE IS TURNED SLIGHTLY AWAY FROM THE TRAVEL LANE TO REDUCE SUN AND HEADLIGHT GLARE.
7. SIGNS SHOULD USE MESSAGES THAT ARE CLEARLY UNDERSTANDABLE BY THE MOTORIST, CLEAN AND LEGIBLE FROM AT LEAST THE DISTANCE REQUIRED IN THE ADVANCE WARNING SIGN SPACING CHART SHOWN ABOVE.

MISCELLANEOUS NOTE:

1. TRAFFIC CONTROL MEASURES SHALL BE IN ACCORDANCE WITH PREVAILING FEDERAL, STATE, LOCAL, AND VDOT POLICIES, STANDARDS AND PROCEDURES. THESE POLICIES, STANDARDS, AND PROCEDURES INCLUDE BUT ARE NOT LIMITED TO THE FOLLOWING: (1) MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD), (2) VIRGINIA WORK AREA PROTECTION MANUAL, AND (3) VIRGINIA ROAD AND BRIDGE SPECIFICATIONS.

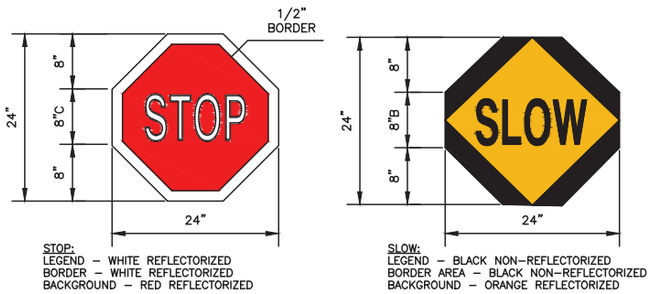
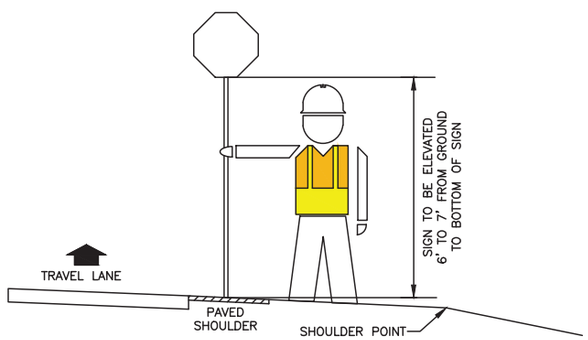
STOP / SLOW PADDLE



STOP / SLOW PADDLE NOTE:

1. FOR OPERATIONS THAT ARE RESTRICTED TO DAYLIGHT HOURS ONLY, USE NON–REFLECTORIZED LEGENDS, BORDERS AND BACKGROUNDS.

FLAGGERS

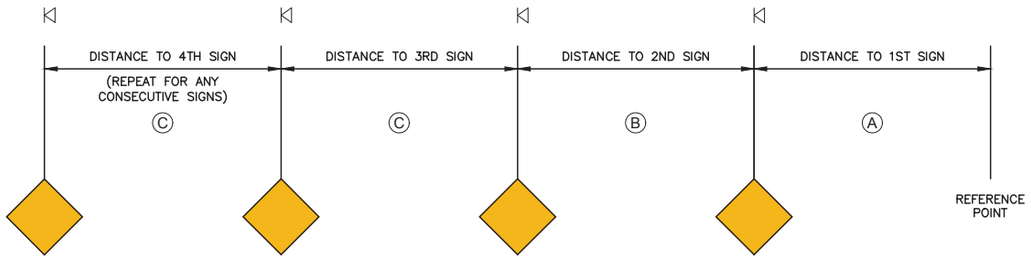


FLAGGER NOTES:

1. FLAGGERS ARE REQUIRED TO BE QUALIFIED THRU AN NCDOT APPROVED FLAGGER TRAINING COURSE.
2. ALWAYS SELECT A LEAD FLAGGER TO COORDINATE THE FLAGGING OPERATION.
3. LOCATION OF THE FLAGGER– ALWAYS START ON GRASS SIDE OF WHITE EDGE LINE.
4. HAND SIGNALS– STOP (PALM OUT AT 90 DEGREES PERPENDICULAR), PROCEED (USE HAND FINGERS AND ARM TO SWEEP ACROSS BODY TOWARD OPEN LANE FOR TRAVEL), SLOW ("PAT THE DOG" WITH PALM DOWN AND MOVE PALM UP AND DOWN).
5. FACE TRAFFIC. NEVER TURN YOUR BACK ON MOVING TRAFFIC. NEVER STOP TRAFFIC FROM IN THE ROADWAY. NEVER RELEASE TRAFFIC FROM IN THE ROADWAY.
6. RADIO COMMUNICATION BETWEEN FLAGGERS IS RECOMMENDED.
7. ALWAYS HAVE AN ESCAPE ROUTE PLANNED.
8. NEVER USE CONES OR OTHER DEVICES AS A "FLAGGER STATION".
9. AT A MINIMUM, WEAR ANSI CLASS II SAFETY VEST. RECOMMEND WEARING ORANGE HARD HAT OR ORANGE HARD HAT COVER DURING FLAGGING OPERATIONS.
10. PREPARE FOR EMERGENCIES BY CARRYING "STOP AND SLOW" PADDLES WITH TELESCOPING OR SECTIONED STAFFS THAT REACH 7 FEET AND LIGHTS TO ILLUMINATE THE FLAGGER AT NIGHT.
11. WHEN WORKERS STOP TRAFFIC TO ALLOW WORK VEHICLES TO DELIVER MATERIALS OR UNLOAD EQUIPMENT THEY MUST USE ADVANCE WARNING SIGNS AND "STOP AND SLOW" PADDLES.
12. ROTATE FLAGGERS EVERY 2 TO 3 HOURS TO GIVE THEM BREAKS TO KEEP THEM FRESH AND ALERT.
13. ALTERNATE TRAFFIC FLOW EVERY 2 TO 3 MINUTES UNDER HEAVY TRAFFIC CONDITIONS.
14. LOCATE FLAGGER POSITION TO PROVIDE STOPPING SIGHT DISTANCE AS A MINIMUM VIEWING DISTANCE FROM MOTORIST TO FLAGGER (SEE ADVANCE WARNING SIGN SPACING CHART).
15. ILLUMINATE FLAGGER STATIONS DURING NIGHT OPERATIONS.

10-28-2019

SPACING FOR TEMPORARY SIGNS IN SERIES (STATIONARY OR PORTABLE SIGNS)



ADVANCE WARNING SIGN SPACING CHART			
POSTED SPEED LIMIT (MPH)	RECOMMENDED DISTANCE BETWEEN SIGNS (FEET ±)		
	Ⓐ	Ⓑ	Ⓒ
≤35	200	200	200
40–50	350	350	350
55	500	500	500
CONTROLLED ACCESS ROAD ≥55	1000	1500	2700

SPACING OF TEMPORARY SIGNS NOTE:

1. APPLY THE ADVANCE WARNING SIGN SPACING CHART WHERE A SERIES OF 2 OR MORE SIGNS ARE USED. ALL SIGN SPACING DIMENSIONS ARE APPROXIMATE. FIELD ADJUST AS VARIOUS CONDITIONS OCCUR, SUCH AS LIMITED SIGHT DISTANCE, OBSTRUCTION INTERFERENCE, ETC.

TEMPORARY TRAFFIC CONTROL ZONE SIGN NOTES:

1. SIGNS MUST BE RETROREFLECTIVE AND MADE FROM NCDOT APPROVED MATERIALS. MESH SIGNS ARE NOT ALLOWED.
2. ROAD WORK AHEAD OR BEGIN WORK ZONE SIGNS ARE REQUIRED IF THE WORK AREA IS NOT INSIDE A LARGER LONG TERM STATIONARY WORK ZONE THAT HAS THESE SIGNS ALREADY IN PLACE, AND THAT WILL REMAIN IN EFFECT OVERNIGHT.
3. ALL SIGNS MAY BE PORTABLE MOUNTED.
4. SIGNS SHOULD USE MESSAGES THAT ARE CLEARLY UNDERSTANDABLE BY THE MOTORIST, CLEAN AND LEGIBLE FROM AT LEAST THE DISTANCE REQUIRED IN THE ADVANCE WARNING SIGN SPACING CHART SHOWN ABOVE.
5. SIGNS SHOULD BE POSITIONED SO THE SIGN FACE IS TURNED SLIGHTLY AWAY FROM THE TRAVEL LANE TO REDUCE SUN AND HEADLIGHT GLARE.
6. USE PROPER BALLAST SUCH AS SAND BAGS ON PORTABLE SIGN STAND LEGS TO PREVENT OVERTURNING OR USE STATIONARY MOUNTED SIGNS IN HIGH WIND AREAS.
7. DURING PERIODS OF CONSTRUCTION INACTIVITY (LONGER THAN 30 MINUTES) SIGNS SHOULD BE REMOVED AND TURNED AWAY FROM THE MOTORIST'S VIEW (OR LAID DOWN TO REMOVE THE SIGN FROM THE MOTORIST'S VIEW).

MISCELLANEOUS NOTE:

1. TRAFFIC CONTROL MEASURES SHALL BE IN ACCORDANCE WITH PREVAILING FEDERAL, STATE, LOCAL, AND NCODT POLICIES, STANDARDS AND PROCEDURES. THESE POLICIES, STANDARDS, AND PROCEDURES INCLUDE BUT ARE NOT LIMITED TO THE FOLLOWING: (1) MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES (MUTCD), (2) NCDOT MAINTENANCE/UTILITY TRAFFIC CONTROL GUIDELINES, AND (3) NCDOT ROADWAY STANDARD DRAWINGS.

APPLICABLE CONSTRUCTION PHASE:

☒ Pre-construction ☒ During construction ☐ Post-construction

APPLICABLE CONSTRUCTION SEQUENCE:

☐ Survey ☒ Clearing, Grading, Fencing ☒ Aboveground Facility Construction ☒ Trenching ☒ Pipe installation
☒ Padding and Backfilling ☒ Hydrostatic Testing and Tie-in ☐ Clean up and restoration ☐ Post-construction monitoring

ENVIRONMENTAL RESOURCES:

☒ Cultural ☒ Wetlands ☒ Waterbodies ☒ Agricultural
☒ Rare, Threatened, and Endangered Species ☒ Drinking Water

SPECIFIC IFC STATION LOCATIONS (If Applicable):	GENERAL LOCATION INFORMATION:
Not Applicable	Project wide

STATE SPECIFIC ITEMS (If Applicable):

Includes state-specific DOT agency contacts, state-specific road project websites to monitor, and state specific drawings for traffic control plans (Attachment A and Attachment B).

PLAN SUMMARY

This Plan describes the measures MVP and their Contractors will take to minimize potential impacts on state and local roadways during the construction of the Project.

Prior to Construction, MVP will:

- Appoint a Traffic Coordinator reporting to the Safety Program Manager or Construction Manager responsible for maintaining traffic related plans, procedures, records, and documents.
- Determine the number of workers' cars, equipment, and trucks that would use local roads and commuting periods.
  - Large work crews will meet at the identified collection points and take a bus to the construction right-of-way.
  - Smaller crews will use vans or will car pool with the foreman or straw boss.
- Establish routes to and from the Project work areas to ensure that traffic impacts are minimized.
- Coordinate with the VDOT AND NCDOT to obtain the required permits or agreements for any operations within a state right-of-way (see Plan for a list of state agency contacts, agencies).

During Construction:

- MVP will coordinate with landowners and lessees of properties to mitigate potential impacts on where local, private roadways will be affected.
- MVP will coordinate with the appropriate managing agency to mitigate potential impacts on roads or implement required traffic and transportation procedures on roads where public lands will be affected.
- MVP will maintain traffic flow and emergency vehicle access on roadways with traffic control personnel or detour signs, where necessary.
- MVP's Traffic Coordinator will work with local law enforcement, fire departments, and emergency medical services to coordinate access for effective emergency response during construction.
- MVP will work with the governing School Districts or the School Transportation Department in the project area to identify the bus routes and times.
- Contractor will develop an appropriate work zone plan to ensure the safe and efficient travel of vehicles during the construction phase and will comply with local weight limitations and restrictions on area roadways.
- Noxious weeds will be prevented from transporting along roadways by cleaning equipment and vehicles prior to entering or leaving each management area. Pressure wash in a designated area only.
- Certified week-free mulch/straw for erosion control will be used.
- Fugitive dust control measures such as wet suppression, using water, will be implemented to mitigate fugitive dust emissions from a variety of construction-related operations. EIs will monitor and enforce implementation of dust control measures by the construction contractor.

Appendix P

TRC Engineers, Inc.,

Lambert Compressor Site Traffic Impacts and Mitigation

(September 14, 2020)

September 14, 2020

Douglas K. Iles, PE
TRC, Inc.
781 Science Boulevard, Suite 200
Gahanna, Ohio 43230

Mountain Valley Pipeline, LLC
2200 Energy Drive
Canonsburg, PA 15317
Attn: Mr. James Sabol

Re: Lambert Compressor Station Traffic Impacts and Mitigation

Dear Mr. Sabol,

Mountain Valley Pipeline, LLC is proposing a natural gas pumping station, the Lambert Compressor Station (Station) is required for the safe and reliable operation of the MVP Southgate project. The Station will be located in Pittsylvania County, Virginia. These findings concur with the conclusion in the FERC's Final Environmental Impact Statement (February 2020) that construction activities associated with the MVP Southgate project will not have a significant impact to traffic along Transco Road.

The proposed Station will have a single driveway located along Transco Road (CR 692), north of Halifax Road (SR 57) and south of Chalk Level Road (CR 685). Transco Road is a rural road with (2) two 10-foot lanes, no shoulders. The latest traffic count data available from the Virginia Department of Transportation (VDOT) show an average daily traffic (ADT) on Transco Road of 330 trips.

Traffic in the project vicinity is predicted to increase temporarily during the construction phase of the project. This includes daily morning and evening peaks for construction laborers entering and exiting the station site and periodic delivery of construction materials and equipment. The on-site staff trips are expected to occur between 6:00-8:00 am and 4:00-6:00 pm, deliveries will mostly occur outside the peak travel periods. The use of rail delivery is not anticipated for construction of this project.

During construction the station is expected to employ 110 on-site construction staff. There will also be infrequent delivery of materials and supplies. Under ideal conditions a two-lane roadway can accommodate 2000 or more trips per hour. Transco Road currently has an ADT of 330 trips per day. Therefore, even if all staff drive separately, an additional 110 peak hour trips can be easily accommodated by Transco Road. Most likely the entering and exiting trips will be split, with some coming to and from Chalk Level Road and others coming to and from Halifax Road; therefore, not all 110 trips will occur on the full length of Transco Road.

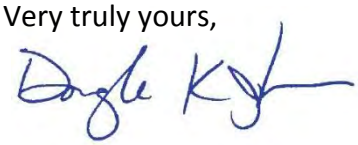
Appropriate signage and traffic directing will occur as necessary to increase driver safety and reduce risk of collisions for approaching traffic. There are no anticipated damages to the existing roadway infrastructure.

Land disturbing activities associated with the proposed project may temporarily contribute to airborne materials. To reduce wind erosion of recently disturbed areas, appropriate revegetation measures, application of water, mulching or covering of spoil piles may occur. The size of the project site, distance to nearby structures and roadways, combined with vegetated buffers along the property boundaries and fencerows will aid in managing off-site dust impacts. Internal roads will be compacted gravel, which may result in an increase in airborne dust particles during dry conditions and when internal road traffic is heavy. During construction activities water may be applied to the internal road system to reduce dust generation.

Upon completion of the project, Station operation and maintenance tasks are only expected to require 1-2 on site employees.

If you have any questions, please feel free to contact me.

Very truly yours,



TRC Engineers, Inc.

Douglas Iles, PE
Project Manager/Senior Traffic Engineer
diles@trccompanies.com

DOUGLAS K. ILES, PE

EDUCATION

M.B.A., University of Central Florida, 2003

B.S., Civil Engineering, Ohio State University, 1998

PROFESSIONAL REGISTRATIONS/CERTIFICATIONS

Professional Engineer, Ohio, (#69097)

AREAS OF EXPERTISE

Mr. Douglas K. Iles, PE, has project management and technical experience in the following general areas:

- Transportation Planning
- Local and Regional Long-Range Transportation Plans
- Traffic Impact Studies
- Safety Studies
- Speed Zone Studies
- Parking & Circulation Studies
- IMS/IJS
- ITS Plans
- Traffic Signal Plans
- Signing and Marking Plans
- Traffic Signal Timing & Coordination

REPRESENTATIVE EXPERIENCE

Mr. Iles has nearly 25 years of experience in both the public and private sector. His experience includes corridor studies, signal coordination studies using Synchro/SimTraffic software, parking studies, facility and event traffic planning, traffic impact studies, planning, construction plans, traffic calming studies, safety and speed studies, and detailed assessments of traffic operations and traffic controls. Working for the Franklin County Engineer's office, he analyzed all the county-maintained signals; implementing and fine-tuning the new timings. Mr. Iles was the lead engineer for a traffic signal retiming project for the City of Fort Lauderdale that included seven key corridors and over 30 signals throughout the City. In addition to modeling existing and recommended timing patterns, he worked with City staff to input the optimized timings and fine-tune the system. Mr. Iles also worked for the Florida DOT doing traffic analysis. In this position, he forecast and modeled traffic for projects in the planning stages. Eventually Mr. Iles became the District 5 Bituminous Engineer, managing approximately 15 staff members including professional engineers, roadway project inspectors and laboratory staff. As the Bituminous Engineer he was responsible not only for construction projects but also responding to roadway closures resulting from crash damage to pavement. Mr. Iles has been responsible for training and oversight of junior staff and QA/QC of many construction plans and studies. Additionally, he prepares contracts scope and fee documents.

Traffic Studies

Franklin County Engineer's Office, Corridor Evaluation & Coordination – Columbus, OH (Project Manager: 2017)

The Franklin County Engineers Office (FCEO) wanted to reevaluate traffic signals installed along the corridor serving the Hollywood Casino. Mr. Iles supervised an evaluation of inventory the signal equipment, evaluate crashes, capacity to determine if changes to timing, cycle length or phasing could improve traffic flow and safety.

RGLP Group, Campus Gateway – Columbus, OH (Project Manager/Engineer: 2017)

This TIS was for five buildings totaling over 2.3SKF, including the Amazon warehouse. Mr. Iles study included 10 intersections (six site driveways).

Minelli Builders, Heritage Preserve TIS – Hilliard, OH (Project Manager/Engineer: 2015)

This TIS was for a residential development that included single family units and apartments. Mr. Iles recommended a mix of roundabouts and stop control intersections to calm traffic and maintain safe residential streets.

Minelli Builders, Diersing Yarnell Vinmar TIS – Delaware, OH (Project Manager/Engineer: 2015)

This TIS involved traffic flow for an expanding subdivision. Mr. Iles analysis showed link volumes expected for various site layout plans.

Minelli Builders, Shamrock TIS – Delaware, OH (Project Manager/Engineer: 2014)

Mr. Iles was the design engineer for the Traffic Impact Study for a 162-unit residential development at the Shamrock Golf Club in Delaware County.

Minelli Builders, Crownover TIS – Delaware, OH (Project Manager/Engineer: 2013)

Mr. Iles was the design engineer for the Traffic Impact Study for a 106-unit residential development in Delaware County.

Traffic Operations

Texas DOT, Frontage Road Signal Timing – Dallas, TX (Project Engineer: 2013)

Mr. Iles designed signal timing plans for use at ramp locations, the timings were used to allow traffic to be diverted from the interstate onto frontage roads during emergencies.

Illinois DOT, I55 Managed Lane – Chicago, IL (Project Manager: 2015)

IDOT prepared plans to add a managed lane to I64. Mr. Iles managed the traffic, signing and ITS components of the project. The planned lane used dynamic pricing to create LOS C or better in the toll lane by increasing the toll as demand increased. He also coordinated the study to identify entry/exit points to the managed lanes.

ODOT, Eastern Corridor Safety Study – Newtown, OH (Project Engineer: 2010)

Mr. Iles summarized crash data and identified improvements based on the crash type, facility characteristic and input from the maintaining agency.
